# Part IV

## Hölder Spaces as Banach Spaces

- 15.1 Exercises

## Hilbert Space Basics

- 16.1 Hilbert Space Basis
- 16.2 Supplement 1: Converse of the Parallelogram Law
- 16.3 Supplement 2: Non-complete inner product spaces
- 16.4 Exercises

## Topological Space Basics

- 17.1 Constructing Topologies and Checking Continuity
- 17.2 Product Spaces I
- 17.3 Closure operations
- 17.4 Countability Axioms
- 17.5 Connectedness
- 17.6 Compactness
- 17.7 Exercises
  - 17.7.1 General Topological Space Problems
  - 17.7.2 Connectedness Problems
  - 17.7.3 Metric Spaces as Topological Spaces
  - 17.7.4 Compactness Problems

## L^p Spaces and Geometric Measures

## L^p-spaces

- 18.1 Jensen’s Inequality
- 18.2 Modes of Convergence
- 18.3 Completeness of L^p – spaces
  - 18.3.1 Summary
- 18.4 Converse of Hölder’s Inequality
- 18.5 Uniform Integrability
- 18.6 Exercises

## Approximation Theorems and Convolutions

- 19.1 Density Theorems
- 19.2 Convolution and Young’s Inequalities
  - 19.2.1 Smooth Partitions of Unity
- 19.3 Exercises
20 Geometric Integration

20.1 Surface Integrals

20.2 More spherical coordinates

20.3 n-dimensional manifolds with boundaries

20.4 Divergence Theorem

20.5 The proof of the Divergence Theorem

20.5.1 The Proof of the Divergence Theorem

20.5.2 Extensions of the Divergence Theorem to Lipschitz domains

20.6 Application to Holomorphic functions

20.7 Dirichlet Problems on \( D \)

20.7.1 Appendix: More Proofs of Proposition 20.32

20.8 Exercises

21 Sard’s Theorem

22 Complex Measures, Radon-Nikodym Theorem and the Dual of \( L^p \)

22.1 The Radon-Nikodym Theorem

22.2 The Structure of Signed Measures

22.2.1 Hahn Decomposition Theorem

22.2.2 Jordan Decomposition

22.3 Complex Measures

22.4 Absolute Continuity on an Algebra

22.5 Exercises

23 Lebesgue Differentiation and the Fundamental Theorem of Calculus

23.1 A Covering Lemma and Averaging Operators

23.2 Maximal Functions

23.3 Lebesque Set

23.4 The Fundamental Theorem of Calculus

23.4.1 Increasing Functions

23.4.2 Functions of Bounded Variation

23.4.3 Alternative method to Proving Theorem 23.29

23.5 The connection of Weak and pointwise derivatives

23.6 Exercises
### Part VIII The Fourier Transform and Distributions

34 Fourier Transform
- 34.1 Fourier Transform
- 34.2 Schwartz Test Functions
- 34.3 Fourier Inversion Formula
- 34.4 Summary of Basic Properties of $F$ and $F^{-1}$
- 34.5 Fourier Transforms of Measures and Bochner's Theorem
- 34.6 Supplement: Heisenberg Uncertainty Principle
  - 34.6.1 Exercises
  - 34.6.2 More Proofs of the Fourier Inversion Theorem

35 Constant Coefficient partial differential equations
- 35.1 Elliptic examples
- 35.2 Poisson Semi-Group
- 35.3 Heat Equation on $\mathbb{R}^n$
- 35.4 Wave Equation on $\mathbb{R}^n$
- 35.5 Elliptic Regularity
- 35.6 Exercises

36 Elementary Generalized Functions / Distribution Theory
- 36.1 Distributions on $U \subset_0 \mathbb{R}^n$
- 36.2 Examples of distributions and related computations
- 36.3 Other classes of test functions
- 36.4 Compactly supported distributions
- 36.5 Tempered Distributions and the Fourier Transform
- 36.6 Wave Equation
- 36.7 Appendix: Topology on $C_c^\infty(U)$

37 Convolutions involving distributions
- 37.1 Tensor Product of Distributions
- 37.2 Elliptic Regularity
- 37.3 Appendix: Old Proof of Theorem 37.4

### Part IX Functional Analysis

38 Polar Decomposition of an Operator

Part I

Prequel
Introduction / User Guide

Not written as of yet. Topics to mention.

1. A better and more general integral.
   a) Convergence Theorems
   b) Integration over diverse collection of sets. (See probability theory.)
   c) Integration relative to different weights or densities including singular weights.
   d) Characterization of dual spaces.
   e) Completeness.
2. Infinite dimensional Linear algebra.
3. ODE and PDE.
4. Harmonic and Fourier Analysis.
5. Probability Theory
Set Operations

Let \( \mathbb{N} \) denote the positive integers, \( \mathbb{N}_0 := \mathbb{N} \cup \{0\} \) be the non-negative integers and \( \mathbb{Z} = \mathbb{N}_0 \cup (-\mathbb{N}) \) – the positive and negative integers including 0, \( \mathbb{Q} \) the rational numbers, \( \mathbb{R} \) the real numbers (see Chapter 3 below), and \( \mathbb{C} \) the complex numbers. We will also use \( \mathbb{F} \) to stand for either of the fields \( \mathbb{R} \) or \( \mathbb{C} \).

**Notation 2.1** Given two sets \( X \) and \( Y \), let \( Y^X \) denote the collection of all functions \( f : X \to Y \). If \( X = \mathbb{N} \), we will say that \( f \in Y^\mathbb{N} \) is a sequence with values in \( Y \) and often write \( f_n \) for \( f(n) \) and express \( f \) as \( \{f_n\}_{n=1}^\infty \). If \( X = \{1, 2, \ldots, N\} \), we will write \( Y^N \) in place of \( Y^{\{1, 2, \ldots, N\}} \) and denote \( f \in Y^N \) by \( f = (f_1, f_2, \ldots, f_N) \) where \( f_n = f(n) \).

**Notation 2.2** More generally if \( \{X_\alpha : \alpha \in A\} \) is a collection of non-empty sets, let \( X_A = \prod_{\alpha \in A} X_\alpha \) and \( \pi_\alpha : X_A \to X_\alpha \) be the canonical projection map defined by \( \pi_\alpha(x) = x_\alpha \). If \( X_\alpha = X \) for some fixed space \( X \), then we will write \( \prod_{\alpha \in A} X_\alpha \) as \( X^A \) rather than \( X_A \).

Recall that an element \( x \in X_\alpha \) is a “choice function,” i.e. an assignment \( x_\alpha := x(\alpha) \in X_\alpha \) for each \( \alpha \in A \). The axiom of choice (see Appendix ??) states that \( X_A \neq \emptyset \) provided that \( X_\alpha \neq \emptyset \) for each \( \alpha \in A \).

**Notation 2.3** Given a set \( X \), let \( 2^X \) denote the power set of \( X \) – the collection of all subsets of \( X \) including the empty set.

The reason for writing the power set of \( X \) as \( 2^X \) is that if we think of 2 meaning \( \{0, 1\} \), then an element of \( a \in 2^X = \{0, 1\}^X \) is completely determined by the set

\[
A := \{x \in X : a(x) = 1\} \subset X.
\]

In this way elements in \( \{0, 1\}^X \) are in one to one correspondence with subsets of \( X \).

For \( A \in 2^X \) let

\[
A^c := X \setminus A = \{x \in X : x \notin A\}
\]

and more generally if \( A, B \subset X \) let

\[
B \setminus A := \{x \in B : x \notin A\} = A \cap B^c.
\]

We also define the symmetric difference of \( A \) and \( B \) by

\[
A \triangle B := (B \setminus A) \cup (A \setminus B).
\]

As usual if \( \{A_\alpha\}_{\alpha \in I} \) is an indexed collection of subsets of \( X \) we define the union and the intersection of this collection by

\[
\bigcup_{\alpha \in I} A_\alpha := \{x \in X : \exists \alpha \in I \; \exists x \in A_\alpha\} \quad \text{and} \quad \bigcap_{\alpha \in I} A_\alpha := \{x \in X : x \in A_\alpha \forall \alpha \in I\}.
\]

**Notation 2.4** We will also write \( \prod_{\alpha \in I} A_\alpha \) for \( \bigcup_{\alpha \in I} A_\alpha \) in the case that \( \{A_\alpha\}_{\alpha \in I} \) are pairwise disjoint, i.e. \( A_\alpha \cap A_\beta = \emptyset \) if \( \alpha \neq \beta \).

Notice that \( \cup \) is closely related to \( \exists \) and \( \cap \) is closely related to \( \forall \). For example let \( \{A_n\}_{n=1}^\infty \) be a sequence of subsets from \( X \) and define

\[
\{A_n \text{ i.o.}\} := \{x \in X : \# \{n : x \in A_n\} = \infty\}\text{ and }\{A_n \text{ a.a.}\} := \{x \in X : x \in A_n \text{ for all } n \text{ sufficiently large}\}.
\]

(One should read \( \{A_n \text{ i.o.}\} \) as \( A_n \) infinitely often and \( \{A_n \text{ a.a.}\} \) as \( A_n \) almost always.) Then \( x \in \{A_n \text{ i.o.}\} \) iff

\[
\forall N \in \mathbb{N} \exists n \geq N \exists x \in A_n
\]

and this may be expressed as

\[
\{A_n \text{ i.o.}\} = \bigcap_{n=1}^\infty \bigcup_{n \geq N} A_n.
\]

Similarly, \( x \in \{A_n \text{ a.a.}\} \) iff

\[
\exists N \in \mathbb{N} \exists n \geq N, x \in A_n
\]

which may be written as

\[
\{A_n \text{ a.a.}\} = \bigcup_{n=1}^\infty \bigcap_{n \geq N} A_n.
\]

**Definition 2.5.** A set \( X \) is said to be **countable** if is empty or there is an injective function \( f : X \to \mathbb{N} \), otherwise \( X \) is said to be **uncountable**.

**Lemma 2.6 (Basic Properties of Countable Sets).**
6. Let us begin by showing \(2^\mathbb{N} = \{0,1\}^\mathbb{N}\) is uncountable. For sake of contradiction suppose \(f : \mathbb{N} \rightarrow \{0,1\}^\mathbb{N}\) is a surjection and write \(f(n)\) as \((f_1(n), f_2(n), f_3(n), \ldots)\). Now define \(a \in \{0,1\}^\mathbb{N}\) by \(a_n := 1 - f_n(n)\). By construction \(f_n(n) \neq a_n\) for all \(n\) and so \(a \notin f(\mathbb{N})\). This contradicts the assumption that \(f\) is surjective and shows \(2^\mathbb{N}\) is uncountable. For the general case, since \(Y_0^X \subset Y^X\) for any subset \(Y_0 \subset Y\), if \(Y_0^X\) is uncountable then so is \(Y^X\). In this way we may assume \(Y_0\) is a two point set which may as well be \(Y_0 = \{0,1\}\). Moreover, since \(X\) is an infinite set we may find an injective map \(i : \mathbb{N} \rightarrow X\) and use this to set up an injection, \(i : 2^\mathbb{N} \rightarrow 2^X\) by setting \(i(A) := \{x_n : n \in \mathbb{N}\} \subset X\) for all \(A \subset \mathbb{N}\). If \(2^X\) were countable we could find a surjective map \(f : 2^X \rightarrow \mathbb{N}\) in which case \(f \circ i : 2^\mathbb{N} \rightarrow \mathbb{N}\) would be surjective as well. However this is impossible since we have already seed that \(2^\mathbb{N}\) is uncountable.

We end this section with some notation which will be used frequently in the sequel.

**Notation 2.7** If \(f : X \rightarrow Y\) is a function and \(\mathcal{E} \subset 2^Y\) let

\[
\begin{align*}
\text{then } & f^{-1}\mathcal{E} := \big\{ f^{-1}(E) \big| E \in \mathcal{E} \big\}.
\end{align*}
\]

If \(\mathcal{G} \subset 2^X\), let

\[
\begin{align*}
\text{then } & f_\mathcal{G} := \big\{ A \in 2^Y \big| f^{-1}(A) \in \mathcal{G} \big\}.
\end{align*}
\]

**Definition 2.8** Let \(\mathcal{E} \subset 2^X\) be a collection of sets, \(A \subset X\), \(i_A : A \rightarrow X\) be the inclusion map \((i_A(x)) = x\) for all \(x \in A\) and

\[
\mathcal{E}_A = i_A^{-1}\mathcal{E} = \{ A \cap E : E \in \mathcal{E} \}.
\]

### 2.1 Exercises

Let \(f : X \rightarrow Y\) be a function and \(\{A_i\}_{i \in I}\) be an indexed family of subsets of \(Y\), verify the following assertions.

**Exercise 2.1**. \((\cap_{i \in I} A_i)^c = \cup_{i \in I} A_i^c\).

**Exercise 2.2**. Suppose that \(B \subset Y\), show that \(B \setminus (\cup_{i \in I} A_i) = \cap_{i \in I} (B \setminus A_i)\).

**Exercise 2.3**. \(f^{-1}(\cup_{i \in I} A_i) = \cup_{i \in I} f^{-1}(A_i)\).

**Exercise 2.4**. \(f^{-1}(\cap_{i \in I} A_i) = \cap_{i \in I} f^{-1}(A_i)\).

**Exercise 2.5**. Find a counterexample which shows that \(f(C \cap D) = f(C) \cap f(D)\) need not hold.
A Brief Review of Real and Complex Numbers

Although it is assumed that the reader of this book is familiar with the properties of the real numbers, \( \mathbb{R} \), nevertheless I feel it is instructive to define them here and sketch the development of their basic properties. It will most certainly be assumed that the reader is familiar with basic algebraic properties of the natural numbers \( \mathbb{N} \) and the ordered field of rational numbers, 

\[
\mathbb{Q} = \left\{ \frac{m}{n} : m, n \in \mathbb{Z} : n \neq 0 \right\}.
\]

As usual, for \( q \in \mathbb{Q} \), we define

\[
|q| = \begin{cases} 
 q & \text{if } q \geq 0 \\
 -q & \text{if } q \leq 0.
\end{cases}
\]

Notice that if \( q \in \mathbb{Q} \) and \( |q| \leq n^{-1} := \frac{1}{n} \) for all \( n \), then \( q = 0 \). Since if \( q \neq 0 \), then \( |q| = \frac{m}{n} \) for some \( m, n \in \mathbb{N} \) and hence \( |q| \geq \frac{1}{n} \). A similar argument shows \( q \geq 0 \) iff \( q \geq -\frac{1}{n} \) for all \( n \in \mathbb{N} \). These trivial remarks will be used in the future without further reference.

**Definition 3.1.** A sequence \( \{q_n\}_{n=1}^{\infty} \subset \mathbb{Q} \) converges to \( q \in \mathbb{Q} \) if \( |q - q_n| \to 0 \) as \( n \to \infty \), i.e. if for all \( N \in \mathbb{N} \), \( |q - q_n| \leq \frac{1}{N} \) for a.a. \( n \). As usual if \( \{q_n\}_{n=1}^{\infty} \) converges to \( q \) we will write \( q_n \to q \) as \( n \to \infty \) or \( q = \lim_{n \to \infty} q_n \).

**Definition 3.2.** A sequence \( \{q_n\}_{n=1}^{\infty} \subset \mathbb{Q} \) is Cauchy if \( |q_n - q_m| \to 0 \) as \( m, n \to \infty \). More precisely we require for each \( N \in \mathbb{N} \) that \( |q_n - q_m| \leq \frac{1}{N} \) for a.a. pairs \( (m, n) \).

**Exercise 3.1.** Show that all convergent sequences \( \{q_n\}_{n=1}^{\infty} \subset \mathbb{Q} \) are Cauchy and that all Cauchy sequences \( \{q_n\}_{n=1}^{\infty} \) are bounded — i.e. there exists \( M \in \mathbb{N} \) such that \( |q_n| \leq M \) for all \( n \in \mathbb{N} \).

**Exercise 3.2.** Suppose \( \{q_n\}_{n=1}^{\infty} \) and \( \{r_n\}_{n=1}^{\infty} \) are Cauchy sequences in \( \mathbb{Q} \).

1. Show \( \{q_n + r_n\}_{n=1}^{\infty} \) and \( \{q_n \cdot r_n\}_{n=1}^{\infty} \) are Cauchy.

Now assume that \( \{q_n\}_{n=1}^{\infty} \) and \( \{r_n\}_{n=1}^{\infty} \) are convergent sequences in \( \mathbb{Q} \).

2. Show \( \{q_n + r_n\}_{n=1}^{\infty} \) and \( \{q_n \cdot r_n\}_{n=1}^{\infty} \) are convergent in \( \mathbb{Q} \) and

\[
\lim_{n \to \infty} (q_n + r_n) = \lim_{n \to \infty} q_n + \lim_{n \to \infty} r_n \quad \text{and} \quad \lim_{n \to \infty} (q_n r_n) = \lim_{n \to \infty} q_n \cdot \lim_{n \to \infty} r_n.
\]

3. If we further assume \( q_n \leq r_n \) for all \( n \), show \( \lim_{n \to \infty} q_n \leq \lim_{n \to \infty} r_n \). (It suffices to consider the case where \( q_n = 0 \) for all \( n \).)

The rational numbers \( \mathbb{Q} \) suffer from the defect that they are not complete, i.e. not all Cauchy sequences are convergent. In fact, according to Corollary 3.13 below, “most” Cauchy sequences of rational numbers do not converge to a rational number.

**Exercise 3.3.** Use the following outline to construct a Cauchy sequence \( \{q_n\}_{n=1}^{\infty} \subset \mathbb{Q} \) which is not convergent in \( \mathbb{Q} \).

1. Recall that there is no element \( q \in \mathbb{Q} \) such that \( q^2 = 2 \). To each \( n \in \mathbb{N} \) let \( m_n \in \mathbb{N} \) be chosen so that

\[
\frac{m_n^2}{n^2} < 2 < \frac{(m_n + 1)^2}{n^2} \quad (3.1)
\]

and let \( q_n := \frac{m_n}{n} \).

2. Verify that \( q_n^2 \to 2 \) as \( n \to \infty \) and that \( \{q_n\}_{n=1}^{\infty} \) is a Cauchy sequence in \( \mathbb{Q} \).

3. Show \( \{q_n\}_{n=1}^{\infty} \) does not have a limit in \( \mathbb{Q} \).

### 3.1 The Real Numbers

Let \( \mathcal{C} \) denote the collection of Cauchy sequences \( a = \{a_n\}_{n=1}^{\infty} \subset \mathbb{Q} \) and say \( a, b \in \mathcal{C} \) are equivalent (write \( a \sim b \)) iff \( \lim_{n \to \infty} |a_n - b_n| = 0 \). (The reader should check that “\( \sim \)” is an equivalence relation.)

**Definition 3.3.** A **real number** is an equivalence class, \( \bar{a} := \{b \in \mathbb{C} : b \sim a\} \) associated to some element \( a \in \mathcal{C} \). The collection of real numbers will be denoted by \( \mathbb{R} \). For \( q \in \mathbb{Q} \), let \( i(q) = \bar{a} \) where \( a \) is the constant sequence \( a_n = q \) for all \( n \in \mathbb{N} \). We will simply write \( 0 \) for \( i(0) \) and 1 for \( i(1) \).

1 This fact also shows that the intermediate value theorem, (see Theorem 17.50 below,) fails when working with continuous functions defined over \( \mathbb{Q} \).
Exercise 3.4. Given $\bar{a}, \bar{b} \in \mathbb{R}$ show that the definitions
$$-\bar{a} = (-\bar{a}), \quad \bar{a} + \bar{b} := (\bar{a} + \bar{b}) \quad \text{and} \quad \bar{a} \cdot \bar{b} := \bar{a} \cdot \bar{b}$$
are well defined. Here $-\bar{a}$, $\bar{a} + \bar{b}$ and $\bar{a} \cdot \bar{b}$ denote the sequences $\{-a_n\}_{n=1}^{\infty}$, $\{a_n + b_n\}_{n=1}^{\infty}$ and $\{a_n \cdot b_n\}_{n=1}^{\infty}$ respectively. Further verify that with these operations, $\mathbb{R}$ becomes a field and the map $i: \mathbb{Q} \to \mathbb{R}$ is injective homomorphism of fields. Hint: if $\bar{a} \neq 0$ show that $\bar{a}$ may be represented by a sequence $a \in \mathbb{C}$ with $|a_n| \geq \frac{1}{N}$ for all $n$ and some $N \in \mathbb{N}$. For this representative show the sequence $a^{-1} := \{a^{-1}_n\}_{n=1}^{\infty} \in \mathbb{C}$. The multiplicative inverse to $\bar{a}$ may now be constructed as: $\frac{1}{\bar{a}} = -\bar{a}^{-1} := \{\bar{a}^{-1}_n\}_{n=1}^{\infty}$.

Definition 3.4. Let $\bar{a}, \bar{b} \in \mathbb{R}$. Then

1. $\bar{a} > 0$ if there exists an $N \in \mathbb{N}$ such that $a_n > \frac{1}{N}$ for a.a. $n$.
2. $\bar{a} \geq 0$ if either $\bar{a} > 0$ or $\bar{a} = 0$. Equivalently (as the reader should verify), $\bar{a} \geq 0$ iff for all $N \in \mathbb{N}$, $|a_n| \geq \frac{1}{N}$ for a.a. $n$.
3. Write $\bar{a} > \bar{b}$ or $\bar{b} < \bar{a}$ if $\bar{a} - \bar{b} > 0$
4. Write $\bar{a} \geq \bar{b}$ or $\bar{b} \leq \bar{a}$ if $\bar{a} - \bar{b} \geq 0$.

Exercise 3.5. Show “$\geq$” make $\mathbb{R}$ into a linearly ordered field and the map $i: \mathbb{Q} \to \mathbb{R}$ preserves order. Namely if $\bar{a}, \bar{b} \in \mathbb{R}$ then

1. exactly one of the following relations hold: $\bar{a} < \bar{b}$ or $\bar{a} > \bar{b}$ or $\bar{a} = \bar{b}$.
2. If $\bar{a} \geq 0$ and $\bar{b} \geq 0$ then $\bar{a} + \bar{b} \geq 0$ and $\bar{a} \cdot \bar{b} \geq 0$.
3. If $q, r \in \mathbb{Q}$ then $q \leq r$ iff $i(q) \leq i(r)$.

The absolute value of a real number $\bar{a}$ is defined analogously to that of a rational number by
$$|\bar{a}| = \begin{cases} 
\bar{a} & \text{if } \bar{a} \geq 0 \\
-\bar{a} & \text{if } \bar{a} < 0
\end{cases}$$
Observe this definition is consistent with our previous definition of the absolute value on $\mathbb{Q}$, namely $i(|q|) = |i(q)|$. Also notice that $\bar{a} = 0$ (i.e. $a \sim 0$ where 0 denotes the constant sequence of all zeros) iff for all $N \in \mathbb{N}$, $|a_n| \leq \frac{1}{N}$ for a.a. $n$. This is equivalent to saying $|\bar{a}| \leq i \left(\frac{1}{N}\right)$ for all $N \in \mathbb{N}$ iff $\bar{a} = 0$.

Definition 3.5. A sequence $\{\bar{a}_n\}_{n=1}^{\infty} \subset \mathbb{R}$ converges to $\bar{a} \in \mathbb{R}$ if $|\bar{a} - \bar{a}_n| \to 0$ as $n \to \infty$, i.e. if for all $N \in \mathbb{N}$, $|\bar{a} - \bar{a}_n| \leq i \left(\frac{1}{N}\right)$ for a.a. $n$. As before (for rational numbers) if $\{\bar{a}_n\}_{n=1}^{\infty}$ converges to $\bar{a}$ we will write $\bar{a}_n \to \bar{a}$ as $n \to \infty$ or $\bar{a} = \lim_{n \to \infty} \bar{a}_n$.

Exercise 3.6. Given $\bar{a}, \bar{b} \in \mathbb{R}$ show
$$|\bar{a} \bar{b}| = |\bar{a}| |\bar{b}| \quad \text{and} \quad |\bar{a} + \bar{b}| \leq |\bar{a}| + |\bar{b}|.$$ 
The latter inequality being referred to as the triangle inequality.

By exercise 3.6
$$|\bar{a}| = |\bar{a} - \bar{b} + \bar{b}| \leq |\bar{a} - \bar{b}| + |\bar{b}|$$
and hence
$$|\bar{a}| - |\bar{b}| \leq |\bar{a} - \bar{b}|$$
and by reversing the roles of $\bar{a}$ and $\bar{b}$ we also have
$$-(|\bar{a}| - |\bar{b}|) = |\bar{b}| - |\bar{a}| \leq |\bar{b} - \bar{a}| = |\bar{a} - \bar{b}|.$$ 
Therefore,
$$||\bar{a}_n| - |\bar{a}|| \leq |\bar{a}_n - \bar{a}| \to 0$$ as $n \to \infty$.

Remark 3.6. The field $i(\mathbb{Q})$ is dense in $\mathbb{R}$ in the sense that if $\bar{a} \in \mathbb{R}$ there exists $\{q_n\}_{n=1}^{\infty} \subset \mathbb{Q}$ such that $i(q_n) \to \bar{a}$ as $n \to \infty$. Indeed, simply let $q_n = a_n$ where $a$ represents $\bar{a}$. Since $a$ is a Cauchy sequence, to any $N \in \mathbb{N}$ there exists $M \in \mathbb{N}$ such that
$$-\frac{1}{N} \leq a_m - a_n \leq \frac{1}{N}$$
for all $m, n \geq M$.

and therefore
$$-i\left(\frac{1}{N}\right) \leq i(a_m) - \bar{a} \leq i\left(\frac{1}{N}\right)$$
for all $m \geq M$.

This shows
$$i(q_m) - \bar{a} = |i(a_m) - \bar{a}| \leq i\left(\frac{1}{N}\right)$$
and since $N$ is arbitrary it follows that $i(q_m) \to \bar{a}$ as $m \to \infty$.

Definition 3.7. A sequence $\{\bar{a}_n\}_{n=1}^{\infty} \subset \mathbb{R}$ is Cauchy if $|\bar{a}_n - \bar{a}_m| \to 0$ as $m, n \to \infty$. More precisely we require for each $N \in \mathbb{N}$ that $|\bar{a}_m - \bar{a}_n| \leq i\left(\frac{1}{N}\right)$ for a.a. pairs $(m, n)$.

Exercise 3.7. The analogues of the results in Exercises 3.1 and 3.2 hold with $\mathbb{Q}$ replaced by $\mathbb{R}$. (We now say a subset $A \subset \mathbb{R}$ is bounded if there exists $M \in \mathbb{N}$ such that $|\lambda| \leq i(M)$ for all $\lambda \in A$.)

For the purposes of real analysis the most important property of $\mathbb{R}$ is that it is “complete.”

Theorem 3.8. The ordered field $\mathbb{R}$ is complete, i.e. all Cauchy sequences in $\mathbb{R}$ are convergent.
Proof. Suppose that \( \{\bar{a}(m)\}_{m=1}^{\infty} \) is a Cauchy sequence in \( \mathbb{R} \). By Remark 3.6 we may choose \( q_m \in \mathbb{Q} \) such that

\[
|\bar{a}(m) - i(q_m)| \leq i(m^{-1}) \quad \text{for all } m \in \mathbb{N}.
\]

Given \( N \in \mathbb{N} \), choose \( M \in \mathbb{N} \) such that \( |\bar{a}(m) - \bar{a}(n)| \leq i(N^{-1}) \) for all \( m, n \geq M \). Then

\[
|i(q_m) - i(q_n)| \leq |i(q_m) - \bar{a}(m)| + |\bar{a}(m) - \bar{a}(n)| + |\bar{a}(n) - i(q_n)| \\
\leq i(m^{-1}) + i(n^{-1}) + i(N^{-1})
\]

and therefore

\[
|q_m - q_n| \leq m^{-1} + n^{-1} + N^{-1} \quad \text{for all } m, n \geq M.
\]

It now follows that \( q = \{q_m\}_{m=1}^{\infty} \in \mathcal{C} \) and therefore \( q \) represents a point \( \bar{q} \in \mathbb{R} \).

Using Remark 3.6 and the triangle inequality,

\[
|\bar{a}(m) - \bar{q}| \leq |\bar{a}(m) - i(q_m)| + |i(q_m) - \bar{q}| \\
\leq i(m^{-1}) + |i(q_m) - \bar{q}| \to 0 \quad \text{as } m \to \infty
\]

and therefore \( \lim_{m \to \infty} \bar{a}(m) = \bar{q} \).

Definition 3.9. A number \( M \in \mathbb{R} \) is an upper bound for a set \( \Lambda \subset \mathbb{R} \) if \( \lambda \leq M \) for all \( \lambda \in \Lambda \) and a number \( m \in \mathbb{R} \) is an lower bound for a set \( \Lambda \subset \mathbb{R} \) if \( m \geq \lambda \) for all \( \lambda \in \Lambda \). Upper and lower bounds need not exist. If \( \Lambda \) has an upper (lower) bound, \( \Lambda \) is said to be bounded from above (below).

Theorem 3.10. To each non-empty set \( \Lambda \subset \mathbb{R} \) which is bounded from above (below) there is a unique least upper bound denoted by \( \sup \Lambda \in \mathbb{R} \) (respectively greatest lower bound denoted by \( \inf \Lambda \in \mathbb{R} \)).

Proof. Suppose \( \Lambda \) is bounded from above and for each \( n \in \mathbb{N} \), let \( m_n \in \mathbb{Z} \) be the smallest integer such that \( i\left(\frac{m_n}{2^n}\right) \) is an upper bound for \( \Lambda \). The sequence \( q_n := \frac{m_n}{2^n} \) is Cauchy because \( q_m \in [q_n - 2^{-n}, q_n] \cap \mathbb{Q} \) for all \( m \geq n \), i.e.

\[
|q_m - q_n| \leq 2^{-\min(m,n)} \to 0 \quad \text{as } m, n \to \infty.
\]

Passing to the limit, \( n \to \infty \), in the inequality \( i(q_n) \geq \lambda \), which is valid for all \( \lambda \in \Lambda \) implies

\[
\bar{q} = \lim_{n \to \infty} i(q_n) \geq \lambda \quad \text{for all } \lambda \in \Lambda.
\]

Thus \( \bar{q} \) is an upper bound for \( \Lambda \). If there were another upper bound \( M \in \mathbb{R} \) for \( \Lambda \) such that \( M < \bar{q} \), it would follow that \( \lambda \leq i(q_n) < \bar{q} \) for some \( n \). But this is a contradiction because \( \{q_n\}_{n=1}^{\infty} \) is a decreasing sequence, \( i(q_n) \geq i(q_m) \) for all \( m \geq n \) and therefore \( i(q_n) \geq \bar{q} \) for all \( n \). Therefore \( \bar{q} \) is the unique least upper bound for \( \Lambda \). The existence of lower bounds is proved analogously.

Proposition 3.11. If \( \{a_n\}_{n=1}^{\infty} \subset \mathbb{R} \) is an increasing (decreasing) sequence which is bounded from above (below), then \( \{a_n\}_{n=1}^{\infty} \) is convergent and

\[
\lim_{n \to \infty} a_n = \sup \{a_n : n \in \mathbb{N}\} \quad \left( \lim_{n \to \infty} a_n = \inf \{a_n : n \in \mathbb{N}\} \right).
\]

If \( A \subset \mathbb{R} \) is a set bounded from above then there exists \( \{\lambda_n\} \subset A \) such that \( \lambda_n \uparrow M := \sup A \), as \( n \to \infty \), i.e. \( \{\lambda_n\} \) is increasing and \( \lim_{n \to \infty} \lambda_n = M \).

Proof. Let \( M := \sup \{a_n : n \in \mathbb{N}\} \), then for each \( N \in \mathbb{N} \) there must exist \( m \in \mathbb{N} \) such that \( M - i(N^{-1}) < a_m \leq M \). Since \( a_n \) is increasing, it follows that

\[
M - i(N^{-1}) < a_n \leq M \quad \text{for all } n \geq m.
\]

From this we conclude that \( \lim a_n \) exists and \( \lim a_n = M \). If \( M = \sup A \), for each \( n \in \mathbb{N} \) we may choose \( \lambda_n \in A \) such that

\[
M - i(N^{-1}) < \lambda_n \leq M.
\]

By replacing \( \lambda_n \) by \( \max\{\lambda_1, \ldots, \lambda_n\} \) if necessary we may assume that \( \lambda_n \) is increasing in \( n \). It now follows easily from Eq. (3.2) that \( \lim_{n \to \infty} \lambda_n = M \).

3.1.1 The Decimal Representation of a Real Number

Let \( \alpha \in \mathbb{R} \) or \( \alpha \in \mathbb{Q} \), \( m, n \in \mathbb{Z} \) and \( S := \sum_{k=n}^{m} \alpha^k \). If \( \alpha = 1 \) then \( \sum_{k=n}^{m} \alpha^k = m - n + 1 \) while for \( \alpha \neq 1 \),

\[
\alpha S - S = \alpha^{m+1} - \alpha^n
\]

and solving for \( S \) gives the important geometric summation formula,

\[
\sum_{k=n}^{m} \alpha^k = \frac{\alpha^{m+1} - \alpha^n}{\alpha - 1} \quad \text{if } \alpha \neq 1.
\]

(3.3)

Taking \( \alpha = 10^{-1} \) in Eq. (3.3) implies

\[
\sum_{k=n}^{m} 10^{-k} = \frac{10^{-(m+1)} - 10^{-n}}{10^{-1} - 1} = \frac{10^{1-n} - 10^{-(m-n+1)}}{9}
\]

and in particular, for all \( M \geq n \),

\[
\lim_{m \to \infty} \sum_{k=n}^{m} 10^{-k} = \frac{1}{9} \cdot \frac{1}{10^{-n-1}} \geq \sum_{k=n}^{M} 10^{-k}.
\]

Let \( \mathbb{D} \) denote those sequences \( \alpha \in \{0,1,2, \ldots, 9\}^\mathbb{Z} \) with the following properties:

2 The notation, \( \max \Lambda \), denotes \( \sup \Lambda \) along with the assertion that \( \sup \Lambda \in \Lambda \). Similarly, \( \min \Lambda = \inf \Lambda \) along with the assertion that \( \inf \Lambda \in \Lambda \).
1. there exists \( N \in \mathbb{N} \) such that \( \alpha_{-n} = 0 \) for all \( n \geq N \) and 
\[ a_n \neq 0 \text{ for some } n \in \mathbb{Z}. \]

Associated to each \( \alpha \in \mathbb{D} \) is the sequence \( a = a(\alpha) \) defined by 
\[ a_n := \sum_{k=-\infty}^{n} \alpha_k 10^{-k}. \]

Since for \( m > n \), 
\[ |a_m - a_n| = \left| \sum_{k=n+1}^{m} \alpha_k 10^{-k} \right| \leq \sum_{k=n+1}^{m} 10^{-k} \leq 9 \cdot \frac{1}{10^n} = \frac{1}{10^n}, \]

it follows that 
\[ |a_m - a_n| \leq \frac{1}{10^{\min(m,n)}} \to 0 \text{ as } m, n \to \infty. \]

Therefore \( a = a(\alpha) \in \mathcal{C} \) and we may define a map \( D : \{ \pm 1 \} \times \mathbb{D} \to \mathbb{R} \) defined by 
\[ D(\varepsilon, \alpha) = \varepsilon a(\alpha). \]

As customary we will denote \( D(\varepsilon, \alpha) = \varepsilon a(\alpha) \) as 
\[ \varepsilon \cdot a_m \ldots a_0.01\alpha_2 \ldots \alpha_n \ldots \tag{3.4} \]

where \( m \) is the largest integer in \( \mathbb{Z} \) such that \( \alpha_k = 0 \) for all \( k < m \). If \( m > 0 \) the expression in Eq. (3.4) should be interpreted as 
\[ \varepsilon \cdot 0.0 \ldots 0 a_m a_{m+1} \ldots. \]

An element \( \alpha \in \mathbb{D} \) has a tail of all 9’s starting at \( N \in \mathbb{N} \) if \( \alpha_n = 9 \) and for all \( n \geq N \) and \( \alpha_{N-1} \neq 9 \). If \( \alpha \) has a tail of 9’s starting at \( N \in \mathbb{N} \), then for \( n > N \), 
\[ a_n(\alpha) = \sum_{k=-\infty}^{N-1} \alpha_k 10^{-k} + 9 \sum_{k=N}^{n} 10^{-k} \]
\[ = \sum_{k=-\infty}^{N-1} \alpha_k 10^{-k} + \frac{9}{10^N - 1} - \frac{10^{-(n-N)}}{9} \]
\[ \to \sum_{k=-\infty}^{N-1} \alpha_k 10^{-k} + 10^{-(N-1)} \text{ as } n \to \infty. \]

If \( \alpha' \) is the digits in the decimal expansion of \( \sum_{k=-\infty}^{N-1} \alpha_k 10^{-k} + 10^{-(N-1)} \), then 
\[ \alpha' \in \mathbb{D}' : = \{ \alpha \in \mathbb{D} : \alpha \text{ does not have a tail of all 9's} \}. \]

and we have just shown that \( D(\varepsilon, \alpha') = D(\varepsilon, \alpha'). \) In particular this implies 
\[ D(\{ \pm 1 \} \times \mathbb{D}') = D(\{ \pm 1 \} \times \mathbb{D}). \tag{3.5} \]

**Theorem 3.12 (Decimal Representation).** The map 
\[ D : \{ \pm 1 \} \times \mathbb{D}' \to \mathbb{R} \setminus \{ 0 \} \]

is a bijection.

**Proof.** Suppose \( D(\varepsilon, \alpha) = D(\delta, \beta) \) for some \( (\varepsilon, \alpha) \) and \( (\delta, \beta) \) in \( \{ \pm 1 \} \times \mathbb{D} \).
Since \( D(\varepsilon, \alpha) > 0 \) if \( \varepsilon = 1 \) and \( D(\varepsilon, \alpha) < 0 \) if \( \varepsilon = -1 \) it follows that \( \varepsilon = \delta \). Let \( a = a(\alpha) \) and \( b = a(\beta) \) be the sequences associated to \( \alpha \) and \( \beta \) respectively. Suppose that \( \alpha \neq \beta \) and let \( j \in \mathbb{Z} \) be the position where \( \alpha \) and \( \beta \) first disagree, i.e. \( \alpha_n = \beta_n \) for all \( n < j \) while \( \alpha_j \neq \beta_j \). For sake of definiteness suppose \( \beta_j > \alpha_j \). Then for \( n > j \) we have 
\[ b_n - a_n = (\beta_j - \alpha_j) 10^{-j} + \sum_{k=j+1}^{n} (\beta_k - \alpha_k) 10^{-k} \]
\[ \geq 10^{-j} - 9 \sum_{k=j+1}^{n} 10^{-k} \geq 10^{-j} - 9 \cdot \frac{1}{9 \cdot 10^j} = 0. \]

Therefore \( b_n - a_n \geq 0 \) for all \( n \) and \( \lim (b_n - a_n) = 0 \) if \( \beta_j = \alpha_j + 1 \) and \( \beta_k = 9 \) and \( \alpha_k = 0 \) for all \( k > j \). In summary, \( D(\varepsilon, \alpha) = D(\delta, \beta) \) with \( \alpha \neq \beta \) implies either \( \alpha \) or \( \beta \) has an infinite tail of nines which shows that \( D \) is injective when restricted to \( \{ \pm 1 \} \times \mathbb{D}' \). To see that \( D \) is surjective it suffices to show any \( b \in \mathbb{R} \) with \( 0 < b < 1 \) is in the range of \( D \). For each \( n \in \mathbb{N} \), let \( a_n = .\alpha_1 \ldots .\alpha_n \) with \( \alpha_i \in \{ 0, 1, 2, \ldots, 9 \} \) such that 
\[ i(\alpha_n) < b \leq i(\alpha_n) + i(10^{-n}). \tag{3.6} \]

Since \( a_{n+1} = a_n + a_{n+1} 10^{-(n+1)} \) for some \( a_{n+1} \in \{ 0, 1, 2, \ldots, 9 \} \), we see that \( a_{n+1} = .\alpha_1 \ldots .\alpha_n a_{n+1} \), i.e. the first \( n \) digits in the decimal expansion of \( a_{n+1} \) are the same as in the decimal expansion of \( a_n \). Hence this defines \( a_n \) uniquely for all \( n \geq 1 \). By setting \( a_n = 0 \) when \( n \leq 0 \), we have constructed from \( b \) an element \( \alpha \in \mathbb{D} \). Because of Eq. (3.6), \( D(1, \alpha) = b \).

**Notation 3.13** From now on we will identify \( \mathbb{Q} \) with \( i(\mathbb{Q}) \subset \mathbb{R} \) and elements in \( \mathbb{R} \) with their decimal expansions.

To summarize, we have constructed a complete ordered field \( \mathbb{R} \) “containing” \( \mathbb{Q} \) as a dense subset. Moreover every element in \( \mathbb{R} \) (modulo those of the form \( m10^{-n} \) for some \( m \in \mathbb{Z} \) and \( n \in \mathbb{N} \)) has a unique decimal expansion.

**Corollary 3.14.** The set \( \{ 0, 1 \} := \{ a \in \mathbb{R} : 0 < a < 1 \} \) is uncountable while \( \mathbb{Q} \cap (0, 1) \) is countable.
Proof. By Theorem 3.12, the set \( \{0, 1, 2, \ldots, 8\}^N \) can be mapped injectively into \((0, 1)\) and therefore it follows from Lemma 2.6 that \((0, 1)\) is uncountable. For each \(m \in \mathbb{N}\), let \(A_m := \{ \frac{n}{m} : n \in \mathbb{N} \text{ with } n < m \}\). Since \(Q \cap (0, 1) = \bigcup_{m=1}^{\infty} A_m\) and \(\#(A_m) < \infty\) for all \(m\), another application of Lemma 2.6 shows \(Q \cap (0, 1)\) is countable. 

### 3.2 The Complex Numbers

**Definition 3.15 (Complex Numbers).** Let \(\mathbb{C} = \mathbb{R}^2\) equipped with multiplication rule

\[(a, b)(c, d) := (ac - bd, bc + ad)\]  

(3.7)

and the usual rule for vector addition. As is standard we will write \(0 = (0, 0)\), \(1 = (1, 0)\) and \(i = (0, 1)\) so that every element \(z \in \mathbb{C}\) may be written as \(z = (x, y) = x + yi\) which in the future will be written simply as \(z = x + iy\). If \(z = x + iy\), let \(Re z = x\) and \(Im z = y\).

Writing \(z = a + ib\) and \(w = c + id\), the multiplication rule in Eq. (3.7) becomes

\[(a + ib)(c + id) := (ac - bd) + i(bc + ad)\] (3.8)

and in particular \(i^2 = 1\) and \(i^2 = -1\).

**Proposition 3.16.** The complex numbers \(\mathbb{C}\) with the above multiplication rule satisfies the usual definitions of a field. For example \(zw = zw\) and \(z(w_1 + w_2) = zw_1 + zw_2\), etc. Moreover if \(z \neq 0\), \(z\) has a multiplicative inverse given by

\[
z^{-1} = \frac{a}{a^2 + b^2} - i\frac{b}{a^2 + b^2}.\] (3.9)

**Proof.** The proof is a straightforward verification. Only the last assertion will be verified here. Suppose \(z = a + ib \neq 0\), we wish to find \(w = c + id\) such that \(zw = 1\) and this happens by Eq. (3.8) if

\[
ac - bd = 1 \quad \text{and} \quad bc + ad = 0.
\] (3.10) (3.11)

Solving these equations for \(c\) and \(d\) gives \(c = \frac{a}{a^2 + b^2}\) and \(d = -\frac{b}{a^2 + b^2}\) as claimed.

**Notation 3.17 (Conjugation and Modulus).** If \(z = a + ib\) with \(a, b \in \mathbb{R}\) let \(\bar{z} = a - ib\) and

\[
|z| := \sqrt{z\bar{z}} = \sqrt{a^2 + b^2} = \sqrt{|Re z|^2 + |Im z|^2}.
\]

See Exercise 3.8 for the existence of the square root as a positive real number.

Notice that

\[
Re z = \frac{1}{2}(z + \bar{z}) \quad \text{and} \quad Im z = \frac{1}{2i}(z - \bar{z}).\] (3.12)

**Proposition 3.18.** Complex conjugation and the modulus operators satisfy the following properties.

1. \(\bar{\bar{z}} = z\),
2. \(zw = \bar{z}\bar{w}\) and \(\bar{z} + \bar{w} = \bar{z} + \bar{w}\).
3. \(|\bar{z}| = |z|\)
4. \(|zw| = |z| |w|\) and in particular \(|z^n| = |z|^n\) for all \(n \in \mathbb{N}\).
5. \(|Re z| \leq |z|\) and \(|Im z| \leq |z|\).
6. \(|z + w| \leq |z| + |w|\).
7. \(z = 0\) iff \(|z| = 0\).
8. If \(z \neq 0\) then \(z^{-1} := \frac{\bar{z}}{|z|^2}\) (also written as \(\frac{1}{z}\)) is the inverse of \(z\).
9. \(|z^{-1}| = |z|^{-1}\) and more generally \(|z^n| = |z|^n\) for all \(n \in \mathbb{Z}\).

**Proof.** All of these properties are direct computations except for possibly the triangle inequality in item 6 which is verified by the following computation;

\[
|z + w|^2 = (z + w)(\bar{z} + \bar{w}) = |z|^2 + |w|^2 + w\bar{z} + \bar{w}z
\]

\[
= |z|^2 + |w|^2 + 2 |\bar{w}z| = |z|^2 + |w|^2 + 2 |z| |w|
\]

\[= (|z| + |w|)^2.
\]

**Definition 3.19.** A sequence \(\{z_n\}_{n=1}^{\infty} \subset \mathbb{C}\) is Cauchy if \(|z_n - z_m| \rightarrow 0\) as \(m, n \rightarrow \infty\) and is convergent to \(z \in \mathbb{C}\) if \(|z_n - z| \rightarrow 0\) as \(n \rightarrow \infty\). As usual if \(\{z_n\}_{n=1}^{\infty}\) converges to \(z\) we will write \(z_n \rightarrow z\) as \(n \rightarrow \infty\) or \(z = \lim_{n \rightarrow \infty} z_n\).

**Theorem 3.20.** The complex numbers are complete, i.e. all Cauchy sequences are convergent.

**Proof.** This follows from the completeness of real numbers and the easily proved observations that if \(z_n = a_n + ib_n \in \mathbb{C}\), then

1. \(\{z_n\}_{n=1}^{\infty} \subset \mathbb{C}\) is Cauchy iff \(\{a_n\}_{n=1}^{\infty} \subset \mathbb{R}\) and \(\{b_n\}_{n=1}^{\infty} \subset \mathbb{R}\) are Cauchy and
2. \(z_n \rightarrow z = a + ib\) as \(n \rightarrow \infty\) iff \(\{a_n\} \rightarrow a\) and \(\{b_n\} \rightarrow b\) as \(n \rightarrow \infty\).
3.3 Exercises

Exercise 3.8. Show to every $a \in \mathbb{R}$ with $a \geq 0$ there exists a unique number $b \in \mathbb{R}$ such that $b \geq 0$ and $b^2 = a$. Of course we will call $b = \sqrt{a}$. Also show that $a \to \sqrt{a}$ is an increasing function on $[0, \infty)$. **Hint:** To construct $b = \sqrt{a}$ for $a > 0$, to each $n \in \mathbb{N}$ let $m_n \in \mathbb{N}_0$ be chosen so that

$$
\frac{m_n^2}{n^2} < a \leq \frac{(m_n + 1)^2}{n^2} \quad \text{ i.e. } \quad i \left( \frac{m_n^2}{n^2} \right) < a \leq i \left( \frac{(m_n + 1)^2}{n^2} \right)
$$

and let $q_n := \frac{m_n}{n}$. Then show $b = \left\{ q_n \right\}_{n=1}^{\infty} \in \mathbb{R}$ satisfies $b > 0$ and $b^2 = a$. 
4.1 Limsups, Liminf s and Extended Limits

**Notation 4.1** The extended real numbers is the set \( \mathbb{R} \cup \{\pm \infty\} \), i.e. it is \( \mathbb{R} \) with two new points called \( \infty \) and \( -\infty \). We use the following conventions, \( \pm \infty \cdot 0 = 0, \pm \infty \cdot a = \pm \infty \) if \( a \in \mathbb{R} \) with \( a > 0 \), \( \pm \infty \cdot a = \mp \infty \) if \( a \in \mathbb{R} \) with \( a < 0 \), \( \pm \infty + \alpha = \pm \infty \) for any \( \alpha \in \mathbb{R} \). \( \infty + \infty = \infty \) and \( -\infty - -\infty = -\infty \) while \( \infty - \infty \) is not defined. A sequence \( a_n \in \mathbb{R} \) is said to converge to \( \infty \) (\( -\infty \)) if for all \( M \in \mathbb{R} \) there exists \( m \in \mathbb{N} \) such that \( a_n \geq M \) (\( a_n \leq M \)) for all \( n \geq m \).

**Lemma 4.2.** Suppose \( \{a_n\}_{n=1}^\infty \) and \( \{b_n\}_{n=1}^\infty \) are convergent sequences in \( \mathbb{R} \), then:

1. If \( a_n \leq b_n \) for all \( n \) then \( \lim_{n \to \infty} a_n \leq \lim_{n \to \infty} b_n \).
2. If \( c \in \mathbb{R} \), \( \lim_{n \to \infty} (c a_n) = c \lim_{n \to \infty} a_n \).
3. If \( \{a_n + b_n\}_{n=1}^\infty \) is convergent and

\[
\lim_{n \to \infty} (a_n + b_n) = \lim_{n \to \infty} a_n + \lim_{n \to \infty} b_n \tag{4.1}
\]

provided the right side is not of the form \( \infty - \infty \).
4. \( \{a_n b_n\}_{n=1}^\infty \) is convergent and

\[
\lim_{n \to \infty} (a_n b_n) = \lim_{n \to \infty} a_n \cdot \lim_{n \to \infty} b_n \tag{4.2}
\]

provided the right hand side is not of the form \( \pm \infty \cdot 0 \) of \( 0 \cdot (\pm \infty) \).

Before going to the proof consider the simple example where \( a_n = n \) and \( b_n = -an \) with \( \alpha > 0 \). Then

\[
\lim (a_n + b_n) = \begin{cases} 
\infty & \text{if } \alpha < 1 \\
0 & \text{if } \alpha = 1 \\
-\infty & \text{if } \alpha > 1 
\end{cases}
\]

while

\[
\lim a_n + \lim b_n = "\infty - \infty".
\]

This shows that the requirement that the right side of Eq. (4.1) is not of form \( \infty - \infty \) is necessary in Lemma 4.2. Similarly by considering the examples \( a_n = n \) and \( b_n = n^{-\alpha} \) with \( \alpha > 0 \) shows the necessity for assuming right hand side of Eq. (4.2) is not of the form \( \infty \cdot 0 \).

**Proof.** The proofs of items 1. and 2. are left to the reader.

**Proof of Eq. (4.1).** Let \( a := \lim_{n \to \infty} a_n \) and \( b := \lim_{n \to \infty} b_n \). Case 1., suppose \( b = \infty \) in which case we must assume \( a > -\infty \). In this case, for every \( M > 0 \), there exists \( N \) such that \( b_n > M \) and \( a_n \geq a - 1 \) for all \( n \geq N \) and this implies

\[
a_n + b_n \geq M + a - 1 \text{ for all } n \geq N.
\]

Since \( M \) is arbitrary it follows that \( a_n + b_n \to \infty \) as \( n \to \infty \). The cases where \( b = -\infty \) or \( a = \pm \infty \) are handled similarly. Case 2. If \( a, b \in \mathbb{R} \), then for every \( \varepsilon > 0 \) there exists \( N \in \mathbb{N} \) such that

\[
|a - a_n| \leq \varepsilon \text{ and } |b - b_n| \leq \varepsilon \text{ for all } n \geq N.
\]

Therefore,

\[
|a + b - (a_n + b_n)| = |a - a_n + b - b_n| \leq |a - a_n| + |b - b_n| \leq 2\varepsilon
\]

for all \( n \geq N \). Since \( n \) is arbitrary, it follows that \( \lim_{n \to \infty} (a_n + b_n) = a + b \).

**Proof of Eq. (4.2).** It will be left to the reader to prove the case where \( \lim a_n \) and \( \lim b_n \) exist in \( \mathbb{R} \). I will only consider the case where \( a = \lim_{n \to \infty} a_n \neq 0 \) and \( \lim_{n \to \infty} b_n = \infty \). Let us also suppose that \( a > 0 \) (the case \( a < 0 \) is handled similarly) and let \( \alpha := \min (\frac{1}{2}, 1) \). Given any \( M < \infty \), there exists \( N \in \mathbb{N} \) such that \( a_n \geq \alpha \) and \( b_n \geq M \) for all \( n \geq N \) and for this choice of \( N \), \( a_n b_n \geq M \alpha \) for all \( n \geq N \). Since \( \alpha > 0 \) is fixed and \( M \) is arbitrary it follows that \( \lim_{n \to \infty} (a_n b_n) = \infty \) as desired.

For any subset \( A \subset \mathbb{R} \), let \( \sup A \) and \( \inf A \) denote the least upper bound and greatest lower bound of \( A \) respectively. The convention being that \( \sup A = \infty \) if \( \infty \in A \) or \( A \) is not bounded from above and \( \inf A = -\infty \) if \( -\infty \in A \) or \( A \) is not bounded from below. We will also use the conventions that \( \sup \emptyset = -\infty \) and \( \inf \emptyset = +\infty \).

**Notation 4.3** Suppose that \( \{x_n\}_{n=1}^\infty \subset \mathbb{R} \) is a sequence of numbers. Then

\[
\lim \inf x_n = \lim \inf \{x_k : k \geq n\} \quad \text{and} \quad \lim \sup x_n = \lim \sup \{x_k : k \geq n\}.
\]

We will also write \( \lim \inf \) for \( \lim \inf \) and \( \lim \sup \) for \( \lim \sup \).
Remark 4.4. Notice that if \( a_k := \inf\{x_k : k \geq n\} \) and \( b_k := \sup\{x_k : k \geq n\} \), then \( \{a_k\} \) is an increasing sequence while \( \{b_k\} \) is a decreasing sequence. Therefore the limits in Eq. (4.3) and Eq. (4.4) always exist in \( \mathbb{R} \) and

\[
\lim_{n \to \infty} a_n = \lim_{n \to \infty} \inf\{x_k : k \geq n\} \quad \text{and} \quad \lim_{n \to \infty} b_n = \lim_{n \to \infty} \inf\{x_k : k \geq n\}.
\]

The following proposition contains some basic properties of liminfs and limsup.

Proposition 4.5. Let \( \{a_n\}_{n=1}^{\infty} \) and \( \{b_n\}_{n=1}^{\infty} \) be two sequences of real numbers. Then

1. \( \liminf_{n \to \infty} a_n \leq \limsup_{n \to \infty} a_n \) and \( \liminf_{n \to \infty} a_n \) exists in \( \mathbb{R} \) iff

\[
\lim_{n \to \infty} a_n = \limsup_{n \to \infty} a_n \in \mathbb{R}.
\]

2. There is a subsequence \( \{a_{n_k}\}_{k=1}^{\infty} \) of \( \{a_n\}_{n=1}^{\infty} \) such that \( \lim_{k \to \infty} a_{n_k} = \lim_{k \to \infty} \inf a_{n_k} \). Similarly, there is a subsequence \( \{a_{n_k}\}_{k=1}^{\infty} \) of \( \{a_n\}_{n=1}^{\infty} \) such that \( \lim_{k \to \infty} a_{n_k} = \lim_{k \to \infty} \inf a_{n_k} \).

3. \( \lim_{n \to \infty} (a_n + b_n) \leq \lim_{n \to \infty} a_n + \lim_{n \to \infty} b_n \) \quad (4.5)

whenever the right side of this equation is not of the form \( \infty - \infty \).

4. If \( a_n \geq 0 \) and \( b_n \geq 0 \) for all \( n \in \mathbb{N} \), then

\[
\lim_{n \to \infty} (a_n b_n) \leq \lim_{n \to \infty} a_n \cdot \lim_{n \to \infty} b_n
\]

provided the right hand side of (4.6) is not of the form \( 0 \cdot \infty \) or \( \infty \cdot 0 \).

Proof. Item 1. will be proved here leaving the remaining items as an exercise to the reader. Since

\[
\inf\{a_k : k \geq n\} \leq \sup\{a_k : k \geq n\} \quad \forall n,
\]

\[
\lim_{n \to \infty} a_n \leq \lim_{n \to \infty} \inf a_n.
\]

Now suppose that \( \lim_{n \to \infty} a_n = \limsup_{n \to \infty} a_n = a \in \mathbb{R} \). Then for all \( \varepsilon > 0 \), there is an integer \( N \) such that

\[
a - \varepsilon \leq \inf\{a_k : k \geq N\} \leq \sup\{a_k : k \geq N\} \leq a + \varepsilon,
\]

i.e.

\( a - \varepsilon \leq a_k \leq a + \varepsilon \) for all \( k \geq N \).

Hence by the definition of the limit, \( \lim_{k \to \infty} a_k = a \). If \( \liminf_{n \to \infty} a_n = \infty \), then we know for all \( M \in (0, \infty) \) there is an integer \( N \) such that

\[
M \leq \inf\{a_k : k \geq N\}
\]

and hence \( \lim_{n \to \infty} a_n = \infty \). The case where \( \limsup_{n \to \infty} a_n = -\infty \) is handled similarly.

Conversely, suppose that \( \lim_{n \to \infty} a_n = A \in \mathbb{R} \) exists. If \( A \in \mathbb{R} \), then for every \( \varepsilon > 0 \) there exists \( N(\varepsilon) \in \mathbb{N} \) such that \( |A - a_n| \leq \varepsilon \) for all \( n \geq N(\varepsilon) \), i.e.

\[
A - \varepsilon \leq a_n \leq A + \varepsilon \quad \text{for all} \quad n \geq N(\varepsilon).
\]

From this we learn that

\[
A - \varepsilon \leq \liminf_{n \to \infty} a_n \leq \limsup_{n \to \infty} a_n \leq A + \varepsilon.
\]

Since \( \varepsilon > 0 \) is arbitrary, it follows that

\[
\lim_{n \to \infty} a_n = \liminf_{n \to \infty} a_n \leq A,
\]

i.e. that \( A = \lim_{n \to \infty} a_n = \limsup_{n \to \infty} a_n \). If \( A = \infty \), then for all \( M > 0 \) there exists \( N = N(M) \) such that \( a_n \geq M \) for all \( n \geq N \). This show that \( \lim_{n \to \infty} a_n \geq M \) and since \( M \) is arbitrary it follows that

\[
\infty \leq \liminf_{n \to \infty} a_n \leq \limsup_{n \to \infty} a_n.
\]

The proof for the case \( A = -\infty \) is analogous to the \( A = \infty \) case. \( \square \)

4.2 Sums of positive functions

In this and the next few sections, let \( X \) and \( Y \) be two sets. We will write \( \alpha \subset X \) to denote that \( \alpha \) is a finite subset of \( X \) and write \( 2^X \) for those \( \alpha \subset X \).

Definition 4.6. Suppose that \( a : X \to [0, \infty] \) is a function and \( F \subset X \) is a subset, then

\[
\sum_F a := \sum_{x \in F} a(x) := \sup \left\{ \sum_{x \in \alpha} a(x) : \alpha \subset \subset F \right\}.
\]

Remark 4.7. Suppose that \( X = \mathbb{N} = \{1, 2, 3, \ldots\} \) and \( a : X \to [0, \infty] \), then

\[
\sum_{n=1}^{\infty} a(n) := \lim_{N \to \infty} \sum_{n=1}^{N} a(n).
\]
Indeed for all \( N \), \( \sum_{n=1}^{N} a(n) \leq \sum_{N} a \), and thus passing to the limit we learn that
\[
\sum_{n=1}^{\infty} a(n) \leq \sum_{N} a.
\]

Conversely, if \( \alpha \subset \subset \mathbb{N} \), then for all \( N \) large enough so that \( \alpha \subset \{1, 2, \ldots, N\} \), we have \( \sum_{\alpha} a \leq \sum_{n=1}^{N} a(n) \) which upon passing to the limit implies that
\[
\sum_{\alpha} a \leq \sum_{n=1}^{\infty} a(n).
\]

Taking the supremum over \( \alpha \) in the previous equation shows
\[
\sum_{N} a \leq \sum_{n=1}^{\infty} a(n).
\]

**Remark 4.8.** Suppose \( a : X \to [0, \infty] \) and \( \sum_{X} a < \infty \), then \( \{ x \in X : a(x) > 0 \} \) is at most countable. To see this first notice that for any \( \varepsilon > 0 \), the set \( \{ x : a(x) \geq \varepsilon \} \) must be finite for otherwise \( \sum_{X} a = \infty \). Thus
\[
\{ x \in X : a(x) > 0 \} = \bigcup_{k=1}^{\infty} \{ x : a(x) \geq 1/k \}
\]
which shows that \( \{ x \in X : a(x) > 0 \} \) is a countable union of finite sets and thus countable by Lemma 2.6

**Lemma 4.9.** Suppose that \( a, b : X \to [0, \infty] \) are two functions, then
\[
\sum_{X} (a + b) = \sum_{X} a + \sum_{X} b \quad \text{and} \quad \sum_{X} \lambda a = \lambda \sum_{X} a
\]
for all \( \lambda \geq 0 \).

I will only prove the first assertion, the second being easy. Let \( \alpha \subset \subset X \) be a finite set, then
\[
\sum_{\alpha} (a + b) = \sum_{\alpha} a + \sum_{\alpha} b \leq \sum_{X} a + \sum_{X} b
\]
which after taking sups over \( \alpha \) shows that
\[
\sum_{X} (a + b) \leq \sum_{X} a + \sum_{X} b.
\]

Similarly, if \( \alpha, \beta \subset \subset X \), then
\[
\sum_{\alpha} a + \sum_{\beta} b \leq \sum_{\alpha \cup \beta} a + \sum_{\alpha \cup \beta} b = \sum_{X} (a + b) \leq \sum_{X} (a + b).
\]
Taking sups over \( \alpha \) and \( \beta \) then shows that
\[
\sum_{X} a + \sum_{X} b \leq \sum_{X} (a + b).
\]

**Lemma 4.10.** Let \( X \) and \( Y \) be sets, \( R \subset X \times Y \) and suppose that \( a : R \to \mathbb{R} \) is a function. Let
\[
\mathcal{R} := \{ y \in Y : (x, y) \in R \} \quad \text{and} \quad \mathcal{R}_y := \{ x \in X : (x, y) \in R \}.
\]
Then
\[
\sup_{(x, y) \in R} a(x, y) = \sup_{x \in X, y \in \mathcal{R}} a(x, y) \quad \text{and} \quad \inf_{(x, y) \in R} a(x, y) = \inf_{x \in X, y \in \mathcal{R}} a(x, y).
\]
(Recall the conventions: \( \sup \emptyset = -\infty \) and \( \inf \emptyset = +\infty \).)

**Proof.** Let \( M = \sup_{(x, y) \in R} a(x, y) \), \( N_x := \sup_{y \in \mathcal{R}} a(x, y) \). Then \( a(x, y) \leq M \) for all \((x, y) \in R \) implies \( N_x = \sup_{y \in \mathcal{R}} a(x, y) \leq M \) and therefore that
\[
\sup_{x \in X, y \in \mathcal{R}} a(x, y) = \sup_{x \in X} N_x \leq M. \quad (4.7)
\]
Similarly for any \((x, y) \in R \),
\[
a(x, y) \leq N_x \leq \sup_{x \in X} N_x \leq \sup_{x \in X, y \in \mathcal{R}} a(x, y)
\]
and therefore
\[
M = \sup_{(x, y) \in R} a(x, y) \leq \sup_{x \in X, y \in \mathcal{R}} a(x, y), \quad (4.8)
\]
Equations (4.7) and (4.8) show that
\[
\sup_{(x, y) \in R} a(x, y) = \sup_{x \in X, y \in \mathcal{R}} a(x, y).
\]
The assertions involving infimums are proved analogously or follow from what we have just proved applied to the function \(-a\).

**Theorem 4.11 (Monotone Convergence Theorem for Sums).** Suppose that \( f_n : X \to [0, \infty] \) is an increasing sequence of functions and
\[
f(x) := \lim_{n \to \infty} f_n(x) = \sup_{n} f_n(x).
\]
Then
\[
\lim_{n \to \infty} \sum_{X} f_n = \sum_{X} f.
\]
Proof. We will give two proofs.

First proof. Let \( 2^X := \{ A \subset X : A \subset X \} \). Then

\[
\lim_{n \to \infty} \sum_{X} f_n = \sup_n \sum_{X} f_n = \sup_{\alpha \in 2^X} \sum_{\alpha} f_n = \sup_{\alpha \in 2^X} \lim_{n \to \infty} \sum_{\alpha} f_n
\]

\[
= \sup_{\alpha \in 2^X} \lim_{n \to \infty} \sum_{\alpha} f_n = \sum_{\alpha \in 2^X} \sup_n \lim_{n \to \infty} f_n
\]

Second Proof. Let \( S_n = \sum_X f_n \) and \( S = \sum_X f \). Since \( f_n \leq f_m \leq f \) for all \( n \leq m \), it follows that

\[
S_n \leq S_m \leq S
\]

which shows that \( \lim_{n \to \infty} S_n \) exists and is less that \( S \), i.e.

\[
A := \lim_{n \to \infty} \sum_{X} f_n \leq \sum_{X} f.
\]

(4.9)

Noting that \( \sum_{\alpha} f_n \leq \sum_X f_n = S_n \leq A \) for all \( \alpha \subset X \) and in particular,

\[
\sum_{\alpha} f_n \leq A \text{ for all } n \text{ and } \alpha \subset X.
\]

Letting \( n \) tend to infinity in this equation shows that

\[
\sum_{\alpha} f \leq A \text{ for all } \alpha \subset X
\]

and then taking the sup over all \( \alpha \subset X \) gives

\[
\sum_{X} f \leq A = \lim_{n \to \infty} \sum_{X} f_n
\]

(4.10)

which combined with Eq. (4.9) proves the theorem.

Lemma 4.12 (Fatou’s Lemma for Sums). Suppose that \( f_n : X \to [0, \infty] \) is a sequence of functions, then

\[
\sum_{X} \liminf_{n \to \infty} f_n \leq \liminf_{n \to \infty} \sum_{X} f_n.
\]

Proof. Define \( g_k := \inf_{n \geq k} f_n \) so that \( g_k \uparrow \liminf_{n \to \infty} f_n \) as \( k \to \infty \). Since \( g_k \leq f_n \) for all \( n \geq k \),

\[
\sum_{X} g_k \leq \sum_{X} f_n \text{ for all } n \geq k
\]

and therefore

\[
\sum_{X} g_k \leq \liminf_{n \to \infty} \sum_{X} f_n \text{ for all } k.
\]

We may now use the monotone convergence theorem to let \( k \to \infty \) to find

\[
\sum_{X} \liminf_{n \to \infty} f_n = \sum_{X} \lim_{k \to \infty} g_k \leq \liminf_{n \to \infty} \sum_{X} f_n.
\]

Remark 4.13. If \( A = \sum_{X} a < \infty \), then for all \( \varepsilon > 0 \) there exists \( \alpha_{\varepsilon} \subset X \) such that

\[
A \geq \sum_{\alpha} a \geq A - \varepsilon
\]

for all \( \alpha \subset X \) containing \( \alpha_{\varepsilon} \) or equivalently,

\[
|A - \sum_{\alpha} a| \leq \varepsilon
\]

(4.11)

for all \( \alpha \subset X \) containing \( \alpha_{\varepsilon} \). Indeed, choose \( \alpha_{\varepsilon} \) so that \( \sum_{\alpha_{\varepsilon}} a \geq A - \varepsilon \).
4.3 Sums of complex functions

Definition 4.14. Suppose that \( a : X \to \mathbb{C} \) is a function, we say that
\[
\sum_X a = \sum_{x \in X} a(x)
\]
exists and is equal to \( A \in \mathbb{C} \), if for all \( \varepsilon > 0 \) there is a finite subset \( \alpha_\varepsilon \subset X \) such that for all \( \alpha \subset \subset X \) containing \( \alpha_\varepsilon \) we have
\[
\left| A - \sum_\alpha a \right| \leq \varepsilon.
\]

The following lemma is left as an exercise to the reader.

Lemma 4.15. Suppose that \( a, b : X \to \mathbb{C} \) are two functions such that \( \sum_X a \) and \( \sum_X b \) exist, then \( \sum_X (a + \lambda b) \) exists for all \( \lambda \in \mathbb{C} \) and
\[
\sum_X (a + \lambda b) = \sum_X a + \lambda \sum_X b.
\]

Definition 4.16 (Summable). We call a function \( a : X \to \mathbb{C} \) summable if
\[
\sum_X |a| < \infty.
\]

Proposition 4.17. Let \( a : X \to \mathbb{C} \) be a function, then \( \sum_X a \) exists if \( \sum_X |a| < \infty \), i.e. if \( a \) is summable. Moreover if \( a \) is summable, then
\[
\left| \sum_X a \right| \leq \sum_X |a|.
\]

Proof. If \( \sum_X |a| < \infty \), then \( \sum_X (\text{Re } a)^\pm < \infty \) and \( \sum_X (\text{Im } a)^\pm < \infty \) and hence by Remark 4.13, these sums exist in the sense of Definition 4.14. Therefore by Lemma 4.15, \( \sum_X a \) exists and
\[
\sum_X a = \sum_X (\text{Re } a)^+ - \sum_X (\text{Re } a)^- + i \left( \sum_X (\text{Im } a)^+ - \sum_X (\text{Im } a)^- \right).
\]

Conversely, if \( \sum_X |a| = \infty \) then, because \( |a| \leq |\text{Re } a| + |\text{Im } a| \), we must have
\[
\sum_X |\text{Re } a| = \infty \text{ or } \sum_X |\text{Im } a| = \infty.
\]

Thus it suffices to consider the case where \( a : X \to \mathbb{R} \) is a real function. Write \( a = a^+ - a^- \) where
\[
a^+(x) = \max(a(x), 0) \text{ and } a^-(x) = \max(-a(x), 0).
\]

Then \( |a| = a^+ + a^- \) and
\[
\infty = \sum_X |a| = \sum_X a^+ + \sum_X a^-
\]
which shows that either \( \sum_X a^+ = \infty \) or \( \sum_X a^- = \infty \). Suppose, with out loss of generality, that \( \sum_X a^+ = \infty \). Let \( X' := \{ x \in X : a(x) \geq 0 \} \), then we know that \( \sum_{X'} a = \infty \) which means there are finite subsets \( \alpha_n \subset X' \subset X \) such that \( \sum_{\alpha_n} a \geq n \) for all \( n \). Thus if \( \alpha \subset \subset X \) is any finite set, it follows that \( \lim_{n \to \infty} \sum_{\alpha \cup \alpha_n} a = \infty \), and therefore \( \sum_X a \) can not exist as a number in \( \mathbb{R} \). Finally if \( a \) is summable, write \( \sum_X a = \rho e^{i\theta} \) with \( \rho \geq 0 \) and \( \theta \in \mathbb{R} \), then
\[
\left| \sum_X a \right| = \rho = e^{-i\theta} \sum_X a = \sum_X e^{-i\theta a}
\]
\[
= \sum_X \text{Re } [e^{-i\theta a}] \leq \sum_X (\text{Re } [e^{-i\theta a}])^+
\]
\[
\leq \sum_X |e^{-i\theta a}| \leq \sum_X |e^{-i\theta a}| \leq \sum_X |a|.
\]

Alternatively, this may be proved by approximating \( \sum_X a \) by a finite sum and then using the triangle inequality of \( |.| \).

Remark 4.18. Suppose that \( X = \mathbb{N} \) and \( a : \mathbb{N} \to \mathbb{C} \) is a sequence, then it is not necessarily true that
\[
\sum_{n=1}^\infty a(n) = \sum_{n \in \mathbb{N}} a(n). \tag{4.13}
\]

This is because
\[
\sum_{n=1}^\infty a(n) = \lim_{N \to \infty} \sum_{n=1}^N a(n)
\]
depends on the ordering of the sequence \( a \) where as \( \sum_{n \in \mathbb{N}} a(n) \) does not. For example, take \( a(n) = (-1)^n / n \) then \( \sum_{n \in \mathbb{N}} |a(n)| = \infty \) i.e. \( \sum_{n \in \mathbb{N}} a(n) \) does not exist while \( \sum_{n=1}^\infty a(n) \) does exist. On the other hand, if
\[
\sum_{n \in \mathbb{N}} |a(n)| = \sum_{n=1}^\infty |a(n)| < \infty
\]
then Eq. (4.13) is valid.
Theorem 4.19 (Dominated Convergence Theorem for Sums). Suppose that \( f_n : X \to \mathbb{C} \) is a sequence of functions on \( X \) such that \( f(x) = \lim_{n \to \infty} f_n(x) \in \mathbb{C} \) exists for all \( x \in X \). Further assume there is a dominating function \( g : X \to [0, \infty) \) such that
\[
|f_n(x)| \leq g(x) \text{ for all } x \in X \text{ and } n \in \mathbb{N}
\]
and that \( g \) is summable. Then
\[
\lim_{n \to \infty} \sum_{x \in X} f_n(x) = \sum_{x \in X} f(x).
\] (4.15)

**Proof.** Notice that \( |f| = \lim |f_n| \leq g \) so that \( f \) is summable. By considering the real and imaginary parts of \( f \) separately, it suffices to prove the theorem in the case where \( f \) is real. By Fatou’s Lemma,
\[
\sum_{X} (g \pm f) = \sum_{X} \lim \inf_{n \to \infty} (g \pm f_n) \leq \lim \inf_{n \to \infty} \sum_{X} (g \pm f_n) = \sum_{X} g + \lim \inf_{n \to \infty} \left( \pm \sum_{X} f_n \right).
\]
Since \( \lim \inf_{n \to \infty} (-a_n) = -\lim \sup_{n \to \infty} a_n \), we have shown,
\[
\sum_{X} g \pm \sum_{X} f \leq \sum_{X} g + \left\{ \lim \inf_{n \to \infty} \sum_{X} f_n - \lim \sup_{n \to \infty} \sum_{X} f_n \right\}
\]
and therefore
\[
\lim \sup_{n \to \infty} \sum_{X} f_n \leq \sum_{X} f \leq \lim \inf_{n \to \infty} \sum_{X} f_n.
\]
This shows that \( \lim_{n \to \infty} \sum_{X} f_n \) exists and is equal to \( \sum_{X} f \).

**Proof.** (Second Proof.) Passing to the limit in Eq. (4.14) shows that \( |f| \leq g \) and in particular that \( f \) is summable. Given \( \varepsilon > 0 \), let \( \alpha \subset \subset X \) such that
\[
\sum_{X \setminus \alpha} g \leq \varepsilon.
\]
Then for \( \beta \subset \subset X \) such that \( \alpha \subset \beta \),
\[
\left| \sum_{\beta} f - \sum_{\beta} f_n \right| = \left| \sum_{\beta} (f - f_n) \right| \leq \sum_{\beta} |f - f_n| = \sum_{\alpha} |f - f_n| + \sum_{\beta \setminus \alpha} |f - f_n| \leq \sum_{\alpha} |f - f_n| + 2 \sum_{\alpha} g \\
\leq \sum_{\alpha} |f - f_n| + 2 \varepsilon.
\]
and hence that
\[
\lim_{\beta} \left| \sum_{\beta} f - \sum_{\beta} f_n \right| \leq \lim_{\alpha} \left| \sum_{\alpha} f - \sum_{\alpha} f_n \right| + 2 \varepsilon.
\]
Since this last equation is true for all such \( \beta \subset \subset X \), we learn that
\[
\lim_{\alpha} \left| \sum_{\alpha} f - \sum_{\alpha} f_n \right| \leq \lim_{\alpha} \left| \sum_{\alpha} f - \sum_{\alpha} f_n \right| + 2 \varepsilon
\]
which then implies that
\[
\lim_{\beta} \sum_{\beta} f - \sum_{\beta} f_n \leq \lim_{\alpha} \sum_{\alpha} f - \sum_{\alpha} f_n + 2 \varepsilon
\]
Because \( \varepsilon > 0 \) is arbitrary we conclude that
\[
\lim_{\alpha} \sum_{\alpha} f - \sum_{\alpha} f_n = 0.
\]
which is the same as Eq. (4.15).

**Remark 4.20.** Theorem 4.19 may easily be generalized as follows. Suppose \( f_n, g_n, g \) are summable functions on \( X \) such that \( f_n \to f \) and \( g_n \to g \) pointwise, \( |f_n| \leq g_n \) and \( \sum_{X} g_n \to \sum_{X} g \) as \( n \to \infty \). Then \( f \) is summable and Eq. (4.15) still holds. For the proof we use Fatou’s Lemma to again conclude
\[
\sum_{X} (g \pm f) = \sum_{X} \lim \inf_{n \to \infty} (g_n \pm f_n) \leq \lim \inf_{n \to \infty} \sum_{X} (g_n \pm f_n) = \sum_{X} g + \lim \inf_{n \to \infty} \left( \pm \sum_{X} f_n \right)
\]
and then proceed exactly as in the first proof of Theorem 4.19.
### 4.4 Iterated sums and the Fubini and Tonelli Theorems

Let $X$ and $Y$ be two sets. The proof of the following lemma is left to the reader.

**Lemma 4.21.** Suppose that $a : X \to \mathbb{C}$ is function and $F \subset X$ is a subset such that $a(x) = 0$ for all $x \notin F$. Then $\sum_p a$ exists iff $\sum_X a$ exists and when the sums exists,

$$\sum_X a = \sum_F a.$$

**Theorem 4.22 (Tonelli’s Theorem for Sums).** Suppose that $a : X \times Y \to [0, \infty]$, then

$$\sum_{X \times Y} a = \sum_X \sum_Y a = \sum_Y \sum_X a.$$

**Proof.** It suffices to show, by symmetry, that

$$\sum_{X \times Y} a = \sum_{X \times Y} a \leq \sum_X a \leq \sum_Y \sum_X a,$$

i.e. $\sum a \leq \sum a$. Taking the sup over $\alpha$ in this last equation shows

$$\sum_{X \times Y} a \leq \sum_{X \times Y} a.$$

For the reverse inequality, for each $x \in X$ choose $\beta_n \subset Y$ such that $\sum_{\beta_n} a(x) \uparrow Y$ as $n \uparrow \infty$ and

$$\sum_{y \in Y} a(x, y) = \lim_{n \to \infty} \sum_{y \in \beta_n} a(x, y).$$

If $\alpha \subset X$ is a given finite subset of $X$, then

$$\sum_{y \in Y} a(x, y) = \lim_{n \to \infty} \sum_{y \in \beta_n} a(x, y)$$

where $\beta_n := \bigcup_{x \in \alpha} \beta_n \subset Y$. Hence

$$\sum_{x \in \alpha} \sum_{y \in Y} a(x, y) = \sum_{x \in \alpha} \lim_{n \to \infty} \sum_{y \in \beta_n} a(x, y) = \lim_{n \to \infty} \sum_{x \in \alpha} \sum_{y \in \beta_n} a(x, y) = \lim_{n \to \infty} \sum_{(x, y) \in \alpha \times \beta_n} a(x, y) \leq \sum_{X \times Y} a.$$

Since $\alpha$ is arbitrary, it follows that

$$\sum_{x \in X} \sum_{y \in Y} a(x, y) = \sup_{\alpha \subset X} \sum_{x \in \alpha} \sum_{y \in Y} a(x, y) \leq \sum_{X \times Y} a$$

which completes the proof.

**Theorem 4.23 (Fubini’s Theorem for Sums).** Now suppose that $a : X \times Y \to \mathbb{C}$ is a summable function, i.e. by Theorem 4.22 any one of the following equivalent conditions hold:

1. $\sum_{x \in X} \sum_{y \in Y} \left| a(x, y) \right| < \infty$,
2. $\sum_{x \in X} \sum_{y \in Y} \left| a(x, y) \right| < \infty$ or
3. $\sum_{y \in Y} \sum_{x \in X} \left| a(x, y) \right| < \infty$.

**Proof.** If $a : X \to \mathbb{R}$ is real valued the theorem follows by applying Theorem 4.22 to $a^+$ – the positive and negative parts of $a$. The general result holds for complex valued functions $a$ by applying the real version just proved to the real and imaginary parts of $a$.

### 4.5 $\ell^p$ – spaces, Minkowski and Holder Inequalities

In this chapter, let $\mu : X \to (0, \infty)$ be a given function. Let $\mathbb{F}$ denote either $\mathbb{R}$ or $\mathbb{C}$. For $p \in (0, \infty)$ and $f : X \to \mathbb{F}$, let

$$\|f\|_p := \left( \sum_{x \in X} |f(x)|^p \mu(x) \right)^{1/p}$$

and for $p = \infty$ let

$$\|f\|_\infty = \sup \{|f(x)| : x \in X\}.$$

Also, for $p > 0$, let

$$\ell^p(\mu) = \{f : X \to \mathbb{F} : \|f\|_p < \infty\}.$$

In the case where $\mu(x) = 1$ for all $x \in X$ we will simply write $\ell^p(X)$ for $\ell^p(\mu)$.

**Definition 4.24.** A norm on a vector space $Z$ is a function $\|\cdot\| : Z \to [0, \infty)$ such that

1. (Homogeneity) $\|\lambda f\| = |\lambda| \|f\|$ for all $\lambda \in \mathbb{F}$ and $f \in Z$.
2. (Triangle inequality) $\|f + g\| \leq \|f\| + \|g\|$ for all $f, g \in Z$. 

3. (Positive definite) \( \| f \| = 0 \) implies \( f = 0 \).

A function \( p : Z \to [0, \infty) \) satisfying properties 1. and 2. but not necessarily 3. above will be called a semi-norm on \( Z \).

A pair \((Z, \| \cdot \|)\) where \( Z \) is a vector space and \( \| \cdot \| \) is a norm on \( Z \) is called a normed vector space.

The rest of this section is devoted to the proof of the following theorem.

**Theorem 4.25.** For \( p \in [1, \infty) \), \((\ell^p(\mu), \| \cdot \|_p)\) is a normed vector space.

**Proof.** The only difficulty is the proof of the triangle inequality which is the content of Minkowski’s Inequality proved in Theorem 4.31 below.

**Proposition 4.26.** Let \( f : [0, \infty) \to [0, \infty) \) be a continuous strictly increasing function such that \( f(0) = 0 \) (for simplicity) and \( \lim_{s \to \infty} f(s) = \infty \). Let \( g = f^{-1} \) and for \( s, t \geq 0 \) let

\[
F(s) = \int_0^s f(s')ds' \quad \text{and} \quad G(t) = \int_0^t g(t')dt'.
\]

Then for all \( s, t \geq 0 \),

\[
st \leq F(s) + G(t)
\]

and equality holds iff \( t = f(s) \).

**Proof.** Let

\[
A_s := \{ (\sigma, \tau) : 0 \leq \tau \leq f(\sigma) \text{ for } 0 \leq \sigma \leq s \} \quad \text{and} \quad B_t := \{ (\sigma, \tau) : 0 \leq \sigma \leq g(\tau) \text{ for } 0 \leq \tau \leq t \}
\]

then as one sees from Figure 4.2, \([0, s] \times [0, t] \subset A_s \cup B_t \). (In the figure: \( s = 3 \), \( t = 1 \). \( A_2 \) is the region under \( t = f(s) \) for \( 0 \leq s \leq 3 \) and \( B_1 \) is the region to the left of the curve \( s = g(t) \) for \( 0 \leq t \leq 1 \).) Hence if \( m \) denotes the area of a region in the plane, then

\[
st = m ([0, s] \times [0, t]) \leq m(A_s) + m(B_t) = F(s) + G(t).
\]

As it stands, this proof is a bit on the intuitive side. However, it will become rigorous if one takes \( m \) to be “Lebesgue measure” on the plane which will be introduced later.

We can also give a calculus proof of this theorem under the additional assumption that \( f \) is \( C^1 \). (This restricted version of the theorem is all we need in this section.) To do this fix \( t \geq 0 \) and let

\[
h(s) = st - F(s) = \int_0^s (t - f(\sigma))d\sigma.
\]

If \( \sigma > g(t) = f^{-1}(t) \), then \( t - f(\sigma) < 0 \) and hence if \( s > g(t) \), we have

\[
h(s) = \int_0^s (t - f(\sigma))d\sigma = \int_0^{g(t)} (t - f(\sigma))d\sigma + \int_{g(t)}^s (t - f(\sigma))d\sigma
\]

\[
\leq \int_0^{g(t)} (t - f(\sigma))d\sigma = h(g(t)).
\]

Combining this with \( h(0) = 0 \) we see that \( h(s) \) takes its maximum at some point \( s \in (0, g(t)) \) and hence at a point where \( 0 = h'(s) = t - f(s) \). The only solution to this equation is \( s = g(t) \) and we have thus shown

\[
st - F(s) = h(s) \leq \int_0^{g(t)} (t - f(\sigma))d\sigma = h(g(t))
\]

with equality when \( s = g(t) \). To finish the proof we must show \( \int_0^{g(t)} (t - f(\sigma))d\sigma = G(t) \). This is verified by making the change of variables \( \sigma = g(\tau) \) and then integrating by parts as follows:

\[
\int_0^{g(t)} (t - f(\sigma))d\sigma = \int_0^t (t - f(g(\tau)))g'(\tau)d\tau = \int_0^t (t - \tau)g'(\tau)d\tau
\]

\[
= \int_0^t g(\tau)d\tau = G(t).
\]

**Fig. 4.2.** A picture proof of Proposition 4.26

**Definition 4.27.** The conjugate exponent \( q \in [1, \infty] \) to \( p \in [1, \infty) \) is \( q := \frac{p}{p-1} \) with the conventions that \( q = \infty \) if \( p = 1 \) and \( q = 1 \) if \( p = \infty \). Notice that \( q \) is characterized by any of the following identities:
\begin{equation}
\frac{1}{p} + \frac{1}{q} = 1, \ 1 + \frac{q}{p} = q, \ p - \frac{p}{q} = 1 \text{ and } q(p-1) = p.
\end{equation}

Lemma 4.28. Let \( p \in (1, \infty) \) and \( q := \frac{p}{p-1} \in (1, \infty) \) be the conjugate exponent. Then
\begin{equation}
st \leq \frac{s^p}{p} + \frac{t^q}{q} \text{ for all } s, t \geq 0
\end{equation}
with equality if and only if \( t^q = s^p \). (See Example 18.11 below for a generalization of the inequality in Eq. (4.17).)

Proof. Let \( F(s) = \frac{s^p}{p} \) for \( p > 1 \). Then \( f(s) = s^{p-1} = t \) and \( g(t) = t^\frac{1}{q-1} = t^q-1 \), wherein we have used \( q - 1 = p/(p-1) - 1 = 1/(p-1) \). Therefore \( G(t) = t^q/p \) and hence by Proposition 4.26, here is a direct calculus proof. Fix \( t > 0 \) and let
\begin{equation}
h(s) := st - \frac{s^p}{p}.
\end{equation}
Then \( h(0) = 0 \), \( \lim_{s \to \infty} h(s) = -\infty \) and \( h'(s) = t - s^{p-1} \) which equals zero iff \( s = t^\frac{1}{p-1} \). Since
\begin{equation}
h(t^\frac{1}{p-1}) = t^\frac{1}{p-1}t - t^\frac{p}{p-1} = t^\frac{p}{p-1} - t^q(1 - \frac{1}{p}) = t^q \left( 1 - \frac{1}{p} \right) = t^q \frac{q}{q},
\end{equation}
it follows from the first derivative test that
\begin{equation}
\max h = \max \left\{ h(0), h(t^\frac{1}{p-1}) \right\} = \max \left\{ 0, \frac{t^q}{q} \right\} = \frac{t^q}{q}.
\end{equation}
So we have shown
\begin{equation}
st - \frac{s^p}{p} \leq \frac{t^q}{q} \text{ with equality iff } t = s^{p-1}.
\end{equation}

\[ \Box \]

Theorem 4.29 (Hölder’s inequality). Let \( p, q \in [1, \infty) \) be conjugate exponents. For all \( f, g : X \to \mathbb{F} \),
\begin{equation}
\|fg\|_1 \leq \|f\|_p \cdot \|g\|_q.
\end{equation}
If \( p \in (1, \infty) \) and \( f \) and \( g \) are not identically zero, then equality holds in Eq. (4.18) iff
\begin{equation}
\left( \frac{|f|}{\|f\|_p} \right)^p = \left( \frac{|g|}{\|g\|_q} \right)^q.
\end{equation}

Proof. The proof of Eq. (4.18) for \( p \in \{1, \infty\} \) is easy and will be left to the reader. The cases where \( \|f\|_p = 0 \) or \( \|g\|_q = 0 \) or \( p, q \) are easily dealt with and are also left to the reader. So we will assume that \( p \in (1, \infty) \) and \( 0 < \|f\|_p, \|g\|_q < \infty \). Letting \( s = |f(x)| / \|f\|_p \) and \( t = \|g\|_q / \|g\|_q \) in Lemma 4.28 implies
\begin{equation}
\|f(x)g(x)\|_1 \leq \frac{1}{p} \|f\|_p^p + \frac{1}{q} \|g\|_q^q
\end{equation}
with equality iff
\begin{equation}
\|f(x)\|^p = s^p = t^q = \left( \frac{|g(x)|}{\|g\|_q} \right)^q.
\end{equation}
Multiplying this equation by \( \mu(x) \) and then summing on \( x \) gives
\begin{equation}
\|fg\|_1 \leq \frac{1}{p} \|f\|_p \cdot \|g\|_q
\end{equation}
with equality iff Eq. (4.20) holds for all \( x \in X \), i.e. iff Eq. (4.19) holds.

Definition 4.30. For a complex number \( \lambda \in \mathbb{C} \), let
\begin{equation}
\text{sgn}(\lambda) = \begin{cases} 
\frac{\lambda}{|\lambda|} & \text{if } \lambda \neq 0 \\
0 & \text{if } \lambda = 0.
\end{cases}
\end{equation}
For \( \lambda, \mu \in \mathbb{C} \) we will write \( \text{sgn}(\lambda) \doteq \text{sgn}(\mu) \) if \( \text{sgn}(\lambda) = \text{sgn}(\mu) \) or \( \lambda \mu = 0 \).

Theorem 4.31 (Minkowski’s Inequality). If \( 1 \leq p \leq \infty \) and \( f, g \in \ell^p(\mu) \) then
\begin{equation}
\|f + g\|_p \leq \|f\|_p + \|g\|_p.
\end{equation}
Moreover, assuming \( f \) and \( g \) are not identically zero, equality holds in Eq. (4.21) iff
\begin{equation}
\text{sgn}(f) \doteq \text{sgn}(g) \text{ when } p = 1 \text{ and } f = cg \text{ for some } c > 0 \text{ when } p \in (1, \infty).
\end{equation}

Proof. For \( p = 1 \),
\begin{equation}
\|f + g\|_1 = \sum_X |f + g| \mu \leq \sum_X (|f| \mu + |g| \mu) = \sum_X |f| \mu + \sum_X |g| \mu
\end{equation}
with equality iff
\begin{equation}
|f| + |g| = |f + g| \iff \text{sgn}(f) \doteq \text{sgn}(g).
\end{equation}
For \( p = \infty \),

\[ \Box \]
Now assume that \( p \in (1, \infty) \). Since
\[
|f + g|^p \leq (2 \max(|f|, |g|))^p = 2^p \max(|f|^p, |g|^p) \leq 2^p (|f|^p + |g|^p)
\]
it follows that
\[
\|f + g\|_p \leq 2^p (\|f\|_p + \|g\|_p) < \infty.
\]
Eq. (4.21) is easily verified if \( \|f + g\|_p = 0 \), so we may assume \( \|f + g\|_p > 0 \).
Multiplying the inequality,
\[
|f + g|^p = |f + g||f + g|^{p-1} \leq |f| |f + g|^{p-1} + |g| |f + g|^{p-1}
\]
by \( \mu \), then summing on \( x \) and applying Holder’s inequality on each term gives
\[
\sum_x |f + g|^p \mu \leq \sum_x |f| |f + g|^{p-1} \mu + \sum_x |g| |f + g|^{p-1} \mu
\]
\[
\leq (\|f\|_p + \|g\|_p) \|f + g\|^{p-1}_q.
\]
(4.23)
Since \( q(p - 1) = p \), as in Eq. (4.16),
\[
\|f + g\|^{p-1}_q = \sum_x (|f + g|^{p-1})^q \mu = \sum_x |f + g|^p \mu = \|f + g\|_p.
\]
(4.24)
Combining Eqs. (4.23) and (4.24) shows
\[
\|f + g\|_p \leq (\|f\|_p + \|g\|_p) \|f + g\|^{p/q}
\]
and solving this equation for \( \|f + g\|_p \) (making use of Eq. (4.16)) implies Eq. (4.21). Now suppose that \( f \) and \( g \) are not identically zero and \( p \in (1, \infty) \).
Equality holds in Eq. (4.21) iff equality holds in Eq. (4.25) and Eq. (4.22). The latter happens iff
\[
\text{sgn}(f) = \text{sgn}(g)
\]
\[
\left( \frac{|f|}{\|f\|_p} \right)^p = \frac{|f + g|^p}{\|f + g\|_p} = \left( \frac{|g|}{\|g\|_p} \right)^p.
\]
(4.26)
wherein we have used
\[
\left( \frac{|f + g|^{p-1}}{\|f + g\|^{p-1}_q} \right)^q = \frac{|f + g|^p}{\|f + g\|_p}.
\]
Finally Eq. (4.26) is equivalent to \( |f| = c |g| \) with \( c = (\|f\|_p/\|g\|_p) > 0 \) and this equality along with \( \text{sgn}(f) = \text{sgn}(g) \) implies \( f = cg \).

### 4.6 Exercises

**Exercise 4.1.** Now suppose for each \( n \in \mathbb{N} = \{1, 2, \ldots\} \) that \( f_n : X \to \mathbb{R} \) is a function. Let
\[
D := \{ x \in X : \lim_{n \to \infty} f_n(x) = +\infty \}
\]
show that
\[
D = \bigcap_{M=1}^{\infty} \bigcup_{N=1}^{\infty} \cap_{n \geq N} \{ x \in X : f_n(x) \geq M \}.
\]
(4.27)

**Exercise 4.2.** Let \( f_n : X \to \mathbb{R} \) be as in the last problem. Let
\[
C := \{ x \in X : \lim_{n \to \infty} f_n(x) \text{ exists in } \mathbb{R} \}.
\]
Find an expression for \( C \) similar to the expression for \( D \) in (4.27). (Hint: use the Cauchy criteria for convergence.)

### 4.6.1 Limit Problems

**Exercise 4.3.** Show \( \lim \inf_{n \to \infty} (-a_n) = - \lim \sup_{n \to \infty} a_n \).

**Exercise 4.4.** Suppose that \( \lim \sup_{n \to \infty} a_n = M \in \mathbb{R} \), show that there is a subsequence \( \{a_n\}_{k=1}^{\infty} \) of \( \{a_n\}_{n=1}^{\infty} \) such that \( \lim_{k \to \infty} a_k = M \).

**Exercise 4.5.** Show that
\[
\lim \sup_{n \to \infty} (a_n + b_n) \leq \lim \sup_{n \to \infty} a_n + \lim \sup_{n \to \infty} b_n
\]
(4.28)
provided that the right side of Eq. (4.28) is well defined, i.e. no \( \infty - \infty \) or \( -\infty + \infty \) type expressions. (It is OK to have \( \infty + \infty = \infty \) or \( -\infty - \infty = -\infty \), etc.)

**Exercise 4.6.** Suppose that \( a_n \geq 0 \) and \( b_n \geq 0 \) for all \( n \in \mathbb{N} \). Show
\[
\lim \sup_{n \to \infty} (a_n b_n) \leq \lim \sup_{n \to \infty} a_n \cdot \lim \sup_{n \to \infty} b_n,
\]
(4.29)
provided the right hand side of (4.29) is not of the form \( 0 \cdot \infty \) or \( \infty \cdot 0 \).

**Exercise 4.7.** Prove Lemma 4.15

**Exercise 4.8.** Prove Lemma 4.21
4.6.2 Monotone and Dominated Convergence Theorem Problems

Exercise 4.9. Let $M < \infty$, show there are polynomials $p_n(t)$ and $q_n(t)$ for $n \in \mathbb{N}$ such that
\[
\lim_{n \to \infty} \sup_{0 \leq t \leq M} |\sqrt{t} - q_n(t)| = 0 \tag{4.30}
\]
and
\[
\lim_{n \to \infty} \sup_{|t| \leq M} |t - p_n(t)| = 0 \tag{4.31}
\]
using the following outline.

1. Let $f(x) = \sqrt{1-x}$ for $|x| \leq 1$ and use Taylor's theorem with integral remainder (see Eq. ?? of Appendix ??), or analytic function theory if you know it, to show there are constants $c_n > 0$ for $n \in \mathbb{N}$ such that
\[
\sqrt{1-x} = 1 - \sum_{n=1}^{\infty} c_n x^n \text{ for all } |x| < 1. \tag{4.32}
\]
2. Let $\tilde{q}_m(x) := 1 - \sum_{n=1}^{m} c_n x^n$. Use (4.32) to show $\sum_{n=1}^{\infty} c_n = 1$ and conclude from this that
\[
\lim_{m \to \infty} \sup_{|x| \leq 1} |\sqrt{1-x} - \tilde{q}_m(x)| = 0. \tag{4.33}
\]
3. Conclude that $q_n(t) := \sqrt{M} \tilde{q}_m(1 - t/M)$ and $p_n(t) := q_n(t^2)$ for $n \in \mathbb{N}$ are polynomials verifying Eqs. (4.30) and (4.31) respectively.

Notation 4.32 For $u_0 \in \mathbb{R}^n$ and $\delta > 0$, let $B_{u_0}(\delta) := \{x \in \mathbb{R}^n : |x - u_0| < \delta\}$ be the ball in $\mathbb{R}^n$ centered at $u_0$ with radius $\delta$.

Exercise 4.10. Suppose $U \subset \mathbb{R}^n$ is a set and $u_0 \in U$ is a point such that $U \cap (B_{u_0}(\delta) \setminus \{u_0\}) \neq \emptyset$ for all $\delta > 0$. Let $G : U \setminus \{u_0\} \to \mathbb{C}$ be a function on $U \setminus \{u_0\}$. Show that $\lim_{u \to u_0} G(u)$ exists and is equal to $\lambda \in \mathbb{C}$ iff for all sequences $\{u_n\}_{n=1}^{\infty} \subset U \setminus \{u_0\}$ which converge to $u_0$ (i.e. $\lim_{n \to \infty} u_n = u_0$) we have $\lim_{n \to \infty} G(u_n) = \lambda$.

Exercise 4.11. Suppose that $Y$ is a set, $U \subset \mathbb{R}^n$ is a set, and $f : U \times Y \to \mathbb{C}$ is a function satisfying:

1. For each $y \in Y$, the function $u \mapsto f(u, y)$ is continuous on $U$.
2. There is a summable function $g : Y \to [0, \infty)$ such that
\[
|f(u, y)| \leq g(y) \text{ for all } y \in Y \text{ and } u \in U.
\]

Show that
\[
F(u) := \sum_{y \in Y} f(u, y) \tag{4.34}
\]
is a continuous function for $u \in U$.

Exercise 4.12. Suppose that $Y$ is a set, $J = (a, b) \subset \mathbb{R}$ is an interval, and $f : J \times Y \to \mathbb{C}$ is a function satisfying:

1. For each $y \in Y$, the function $u \mapsto f(u, y)$ is differentiable on $J$,
2. There is a summable function $g : J \to [0, \infty)$ such that
\[
\left| \frac{\partial}{\partial u} f(u, y) \right| \leq g(y) \text{ for all } y \in Y \text{ and } u \in J.
\]
3. There is a $u_0 \in J$ such that $\sum_{y \in Y} |f(u_0, y)| < \infty$.

Show:

a) for all $u \in J$ that $\sum_{y \in Y} |f(u, y)| < \infty$.
b) Let $F(u) := \sum_{y \in Y} f(u, y)$, show $F$ is differentiable on $J$ and that
\[
\dot{F}(u) = \sum_{y \in Y} \frac{\partial}{\partial u} f(u, y). \tag{4.35}
\]

(Hint: Use the mean value theorem.)

Exercise 4.13 (Differentiation of Power Series). Suppose $R > 0$ and $\{a_n\}_{n=0}^{\infty}$ is a sequence of complex numbers such that $\sum_{n=0}^{\infty} |a_n| r^n < \infty$ for all $r \in (0, R)$. Show, using Exercise 4.12, $f(x) := \sum_{n=0}^{\infty} a_n x^n$ is continuously differentiable for $x \in (-R, R)$ and
\[
f'(x) = \sum_{n=0}^{\infty} na_n x^{n-1} = \sum_{n=1}^{\infty} na_n x^{n-1}. \tag{4.36}
\]

Exercise 4.14. Show the functions
\[
e^x := \sum_{n=0}^{\infty} \frac{x^n}{n!}, \tag{4.35}
\]
\[
\sin x := \sum_{n=0}^{\infty} (-1)^n \frac{x^{2n+1}}{(2n+1)!} \text{ and } \cos x = \sum_{n=0}^{\infty} (-1)^n \frac{x^{2n}}{(2n)!} \tag{4.37}
\]

To say $g := f(\cdot, y)$ is continuous on $U$ means that $g : U \to \mathbb{C}$ is continuous relative to the metric on $\mathbb{R}^n$ restricted to $U$. 

\[1\] In fact $c_n := \frac{(2n-3)!}{(2n-1)!}$, but this is not needed.
\[2\] More explicitly, $\lim_{u \to u_0} G(u) = \lambda$ means for every $\epsilon > 0$ there exists a $\delta > 0$ such that
\[
|G(u) - \lambda| < \epsilon \text{ whenever } u \in U \cap (B_{u_0}(\delta) \setminus \{u_0\}).
\]
\[3\]
are infinitely differentiable and they satisfy

\[ \frac{d}{dx} e^x = e^x \text{ with } e^0 = 1 \]
\[ \frac{d}{dx} \sin x = \cos x \text{ with } \sin(0) = 0 \]
\[ \frac{d}{dx} \cos x = -\sin x \text{ with } \cos(0) = 1. \]

Exercise 4.15. Continue the notation of Exercise 4.14

1. Use the product and the chain rule to show,

\[ \frac{d}{dx} \left[ e^{-x} e^{(x+y)} \right] = 0 \]

and conclude from this, that \( e^{-x} e^{(x+y)} = e^y \) for all \( x, y \in \mathbb{R} \). In particular taking \( y = 0 \) this implies that \( e^{-x} = 1/e^x \) and hence that \( e^{(x+y)} = e^x e^y \).

Use this result to show \( e^x \uparrow \infty \) as \( x \uparrow \infty \) and \( e^x \downarrow 0 \) as \( x \downarrow -\infty \).

Remark: since \( e^x \geq \sum_{n=0}^{\infty} \frac{x^n}{n!} \) when \( x \geq 0 \), it follows that \( \lim_{x \to \infty} \frac{x^n}{n!} = 0 \) for any \( n \in \mathbb{N} \), i.e. \( e^x \) grows at a rate faster than any polynomial in \( x \) as \( x \to \infty \).

2. Use the product rule to show

\[ \frac{d}{dx} (\cos^2 x + \sin^2 x) = 0 \]

and use this to conclude that \( \cos^2 x + \sin^2 x = 1 \) for all \( x \in \mathbb{R} \).

Exercise 4.16. Let \( \{a_n\}_{n=-\infty}^{\infty} \) be a summable sequence of complex numbers, i.e. \( \sum_{n=-\infty}^{\infty} |a_n| < \infty \). For \( t \geq 0 \) and \( x \in \mathbb{R} \), define

\[ F(t, x) = \sum_{n=-\infty}^{\infty} a_n e^{-tn^2} e^{inx}, \]

where as usual \( e^{ix} = \cos(x) + i \sin(x) \), this is motivated by replacing \( x \) in Eq. (4.35) by \( ix \) and comparing the result to Eqs. (4.36) and (4.37).

1. \( F(t, x) \) is continuous for \( (t, x) \in [0, \infty) \times \mathbb{R} \). Hint: Let \( Y = \mathbb{Z} \) and \( u = (t, x) \) and use Exercise 4.11.

2. \( \partial F(t, x)/\partial t, \partial F(t, x)/\partial x \) and \( \partial^2 F(t, x)/\partial x^2 \) exist for \( t > 0 \) and \( x \in \mathbb{R} \).

Hint: Let \( Y = \mathbb{Z} \) and \( u = t \) for computing \( \partial F(t, x)/\partial t \) and \( u = x \) for computing \( \partial F(t, x)/\partial x \) and \( \partial^2 F(t, x)/\partial x^2 \) via Exercise 4.12.

In computing the \( t \) derivative, you should let \( \varepsilon > 0 \) and apply Exercise 4.12 with \( t = u > \varepsilon \) and then afterwards let \( \varepsilon \downarrow 0 \).

3. \( F \) satisfies the heat equation, namely

\[ \partial F(t, x)/\partial t = \partial^2 F(t, x)/\partial x^2 \text{ for } t > 0 \text{ and } x \in \mathbb{R}. \]

4.6.3 \( \ell^p \) Exercises

Exercise 4.17. Generalize Proposition 4.26 as follows. Let \( a \in [-\infty, 0] \) and \( f : \mathbb{R} \cap [a, \infty) \to [0, \infty) \) be a continuous strictly increasing function such that

\[ \lim_{s \to \infty} f(s) = \infty, \quad f(a) = 0 \text{ if } a > -\infty \text{ or } \lim_{s \to -\infty} f(s) = 0 \text{ if } a = -\infty. \]

Also let \( g = f^{-1}, \quad b = f(0) \geq 0, \)

\[ F(s) = \int_{a}^{s} f(s')ds' \text{ and } G(t) = \int_{0}^{t} g(t')dt'. \]

Then for all \( s, t \geq 0, \)

\[ st \leq F(s) + G(t \vee b) \leq F(s) + G(t) \]

and equality holds iff \( t = f(s) \). In particular, taking \( f(s) = e^s \), prove Young’s inequality stating

\[ st \leq e^s + (t \vee 1) \ln(t \vee 1) - (t \vee 1) \leq e^s + \ln t - t, \]

where \( s \vee t := \min(s, t) \). Hint: Refer to Figures 4.3 and 4.4.

Fig. 4.3. Comparing areas when \( t \geq b \) goes the same way as in the text.

Exercise 4.18. Using differential calculus, prove the following inequalities

1. For \( y > 0, \) let \( g(x) := xy - e^x \) for \( x \in \mathbb{R} \). Use calculus to compute the maximum of \( g(x) \) and use this prove Young’s inequality;

\[ xy \leq e^x + y \ln y - y \text{ for } x \in \mathbb{R} \text{ and } y > 0. \]
When \( t \leq b \), notice that \( g(t) \leq 0 \) but \( G(t) \geq 0 \). Also notice that \( G(t) \) is no longer needed to estimate \( st \).

2. For \( p > 1 \) and \( y \geq 0 \), let \( g(x) := xy - x^p/p \) for \( x \geq 0 \). Again use calculus to compute the maximum of \( g(x) \) and show that your result gives the following inequality:

\[
xy \leq \frac{x^p}{p} + \frac{y^q}{q} \text{ for all } x, y \geq 0.
\]

where \( q = \frac{p}{p-1} \), i.e. \( \frac{1}{q} = 1 - \frac{1}{p} \).

3. Suppose now that \( u : [0, \infty) \to [0, \infty) \) is a \( C^1 \) function such that: \( u(0) = 0 \), \( \lim_{x \to \infty} \frac{u(x)}{x} = \infty \), and \( u'(x) > 0 \) for all \( x > 0 \). Show

\[
xy \leq u(x) + v(y) \text{ for all } x, y \geq 0,
\]

where \( v(y) = y(u')^{-1}(y) - u\left((u')^{-1}(y)\right) \). **Hint:** consider the function, \( g(x) := xy - u(x) \).
Part II

Measure Theory I.
What are measures and why “measurable” sets

Throughout this chapter, we will let \( X \) and \( \Omega \) be sets. Our goal is to study “measures” and their related integrals on these sets. Before giving a (preliminary) definition of a measure let me give some “physical” examples;

1. Suppose that \( \Omega \) is a region in space filled with some material. To each subset \( A \subset \Omega \) we might let \( \mu (A) \) denote the weight (or volume, or monetary value, heat energy contained in \( A \)) of the material in \( A \).
2. Suppose that \( \Omega \) is a region in space filled with charged particles, to each subset \( A \subset \Omega \) we might let \( \mu (A) \) denote the total charge of the particles contained in \( A \). (This is an example of a signed measure, i.e. it might take both positive and negative values.)
3. Perhaps \( \Omega \) represents the face of a dart board at which drunk patrons are attempting to hit in the center. For \( A \subset \Omega \), we might let \( P(A) \) denote the total number of darts which landed in \( A \).

With these examples in mind let us formalize (preliminarily) the notion of a measure on a set \( X \). (Given the physical examples just mentioned, I hope the axioms in the next Definition 5.1 look reasonable to the reader.)

**Definition 5.1** (**Preliminary**). A positive[^1] measure \( \mu \) “on” a set \( X \) is a function \( \mu : 2^X \rightarrow [0, \infty] \) such that

1. \( \mu (\emptyset) = 0 \)
2. **Additivity.** If \( A \) and \( B \) are disjoint subsets of \( X \), i.e. \( A \cap B = AB = \emptyset \), then \( \mu (A \cup B) = \mu (A) + \mu (B) \).
3. **Continuity.** Suppose that \( \{ A_n \}_{n=1}^{\infty} \subset 2^X \) with \( A_n \uparrow \) (i.e. \( A_n \subset A_{n+1} \) for all \( n \)), then 
   \[
   \mu (\bigcup_{n=1}^{\infty} A_n) = \lim_{n \to \infty} \mu (A_n).
   \]

**Notation 5.2** Given \( \{ A_n \}_{n=1}^{\infty} \subset 2^X \), we write \( \sum_{n=1}^{\infty} A_n \) to denote \( \bigcup_{n=1}^{\infty} A_n \) under the additional assumption that \( A_n \cap A_m = \emptyset \) for all \( m \neq n \).

**Lemma 5.3** (**Reformulations of Continuity**). If \( \mu : 2^X \rightarrow [0, \infty] \) satisfies items 1. and 2. of **Definition 5.1** then \( \mu \) satisfies item 3. **Definition 5.1** (continuity). If \( A := \sum_{n=1}^{\infty} A_n \) and \( B_k := \sum_{n=1}^{k} A_n \), then \( B_k \uparrow A \) as \( k \uparrow \infty \) and therefore

\[
\mu (A) = \lim_{k \to \infty} \mu (B_k) = \lim_{k \to \infty} \mu \left( \sum_{n=1}^{k} A_n \right) = \lim_{k \to \infty} \sum_{n=1}^{k} \mu (A_n) \quad \text{(by finite additivity and induction)}
\]

Conversely, suppose that Eq. 5.1 holds whenever \( A_n \cap A_m = \emptyset \) for all \( m \neq n \). Given \( B_n \uparrow B \), let \( A_1 = B_1 \) and define \( A_n \) inductively by \( A_n = B_n \setminus A_{n-1} \). Then \( B = \sum_{n=1}^{\infty} A_n \) and therfore

\[
\mu (B) = \lim_{n \to \infty} \sum_{n=1}^{\infty} \mu (A_n) = \lim_{k \to \infty} \sum_{n=1}^{k} \mu (A_n) = \lim_{k \to \infty} \mu \left( \sum_{n=1}^{k} A_n \right) = \lim_{k \to \infty} \mu (B_k),
\]

i.e. \( \mu \) satisfies item 3. **Definition 5.1**. The second assertion is left as an exercise to the reader.

**Example 5.4** (**Counting Type Measures**). Let \( \mu (A) = \#(A) \) – the number of points in \( A \). Then \( \mu \) is a measure on \( X \). More generally, if \( A \subset X \) is any fixed subset of \( X \), then \( \mu_A (A) := \# (A \cap A) \) defines a measure on \( X \). Even more generally, if \( \lambda : X \rightarrow [0, \infty] \) is any function, then

\[
\mu (A) = \sum_{n=1}^{\infty} \mu (A_n) \quad \text{whenever} \quad A = \sum_{n=1}^{\infty} A_n.
\]

Moreover if \( \mu (X) < \infty \) then \( \mu \) satisfies item 3. iff \( \lim_{n \to \infty} \mu (A_n) = \mu (\bigcap_{n=1}^{\infty} A_n) \) whenever \( \{ A_n \}_{n=1}^{\infty} \subset 2^X \) with \( A_n \downarrow \), i.e. \( A_n \supset A_{n+1} \) for all \( n \).

**Proof.** First observe that if \( A \subset B \) then \( B = (B \setminus A) \cup A \) with \( (B \setminus A) \cap A = \emptyset \) and hence \( \mu (B) = \mu (B \setminus A) + \mu (A) \), i.e.

\[
\mu (B \setminus A) = \mu (B) - \mu (A) \quad \text{for all} \quad A \subset B \subset X.
\]

Now suppose that \( \mu \) satisfies item 3. **Definition 5.1** (continuity). If \( A := \sum_{n=1}^{\infty} A_n \) and \( B_k := \sum_{n=1}^{k} A_n \), then \( B_k \uparrow A \) as \( k \uparrow \infty \) and therefore

\[
\mu (A) = \lim_{k \to \infty} \mu (B_k) = \lim_{k \to \infty} \mu \left( \sum_{n=1}^{k} A_n \right) = \lim_{k \to \infty} \sum_{n=1}^{k} \mu (A_n) \quad \text{(by finite additivity and induction)}
\]

\[
= \sum_{n=1}^{\infty} \mu (A_n).
\]

[^1]: We will deal with signed measures later.
5 What are measures and why “measurable” sets

\[ \mu_{\lambda}(A) := \sum_{x \in A} \lambda(x) := \sup_{A \subseteq J} \sum_{x \in A} \lambda(x) \]
defined a measure on \( X \).

The measures we often most want to understand are those measure lengths, areas, or more generally \( n \)-dimensional volumes. For example, suppose we take \( X = \mathbb{R}^2 \) and let \( \mu(A) \) denote the “area” of a subset \( A \subset X \). I think we would all agree that

\[ \mu((a, b] \times (c, d]) = (b - a)(d - c) \]for \(-\infty < a < b < \infty \) and \(-\infty < c < d < \infty \).

With this basic building block we might want to compute the area the unit disk. By the additivity axiom of \( \mu \) we can compute the area of the approximations and then by using the continuity axiom we could take a limit of these approximations to find the area of the unit disk.

\[ \text{Fig. 5.1. Here is an indication of how one might approximate a disk by finite disjoint union of rectangles.} \]

Definition 5.1 is all well fine except for the unfortunate fact that measures (like areas and volumes) with vary natural and desirable properties often do not exist. We give a couple of example illustrating this point now.

**Theorem 5.5 (No-Go Theorem 1).** Let \( S = \{z \in \mathbb{C} : |z| = 1\} \) be the unit circle. Then there is no measure \( \mu : 2^S \rightarrow [0, 1] \) such that \( 0 < \mu(S) < \infty \) that is invariant under rotations.

**Proof.** We are going to use the fact proved below in Proposition 8.3 (of Lemma 5.3 above), that the continuity condition on \( \mu \) is equivalent to the \( \sigma \)-additivity of \( \mu \). For \( z \in S \) and \( N \subset S \) let

\[ zN := \{zn \in S : n \in N\}, \]

that is to say \( e^{i\theta}N \) is the set \( N \) rotated counter clockwise by angle \( \theta \). By assumption, we are supposing that

\[ \mu(zN) = \mu(N) \]

for all \( z \in S \) and \( N \subset S \).

Let

\[ R := \{z = e^{i2\pi t} : t \in \mathbb{Q}\} = \{z = e^{i2\pi t} : t \in [0, 1) \cap \mathbb{Q}\} \]

- a countable subgroup of \( S \). As above \( R \) acts on \( S \) by rotations and divides \( S \) up into equivalence classes, where \( z, w \in S \) are equivalent if \( z = rw \) for some \( r \in R \). Choose (using the axiom of choice) one representative point \( n \) from each of these equivalence classes and let \( N \subset S \) be the set of these representative points. Then every point \( z \in S \) may be uniquely written as \( z = nr \) with \( n \in N \) and \( r \in R \). That is to say

\[ S = \sum_{r \in R} (rN) \]

where \( \sum_{r \in R} A_r \) is used to denote the union of pair-wise disjoint sets \( \{A_r\} \). By Eqs. (5.3) and (5.4),

\[ 1 = \mu(S) = \sum_{r \in R} \mu(rN) = \sum_{r \in R} \mu(N). \]

We have thus arrived at a contradiction, since the right side of Eq. (5.5) is either equal to 0 or to \( \infty \) depending on whether \( \mu(N) = 0 \) or \( \mu(N) > 0 \).

**Theorem 5.6.** There is no measure \( \mu : 2^\mathbb{R} \rightarrow [0, \infty] \) such that

1. \( \mu([a, b]) = (b - a) \) for all \( a < b \) and
2. is translation invariant, i.e. \( \mu(A + x) = \mu(A) \) for all \( x \in \mathbb{R} \) and \( A \in 2^\mathbb{R} \), where

\[ A + x := \{y + x : y \in A\} \subset \mathbb{R}. \]

In fact the theorem is still true even if (1) is replaced by the weaker condition that \( 0 < \mu((0, 1]) < \infty \).

The counting measure \( \mu(A) = \#(A) \) is translation invariant. However \( \mu((0, 1]) = \infty \) in this case and so \( \mu \) does not satisfy condition 1.

**Proof. First proof.** Let us identify \([0, 1)\) with the unit circle \( S^1 := \{z \in \mathbb{C} : |z| = 1\} \) by the map
\[ \phi(t) = e^{i2\pi t} = (\cos 2\pi t + i \sin 2\pi t) \in S^1 \]

for \( t \in [0, 1) \). Using this identification we may use \( \mu \) to define a function \( \nu \) on \( S^1 \) by \( \nu(\phi(A)) = \mu(A) \) for all \( A \subset [0, 1) \). This new function is a measure on \( S^1 \) with the property that \( 0 < \nu((0, 1]) < \infty \). For \( z \in S^1 \) and \( N \subset S^1 \) let

\[ zN := \{zn \in S^1 : n \in N \}, \quad \text{(5.6)} \]

that is to say \( e^{i\theta}N \) is \( N \) rotated counter clockwise by angle \( \theta \). We now claim that \( \nu \) is invariant under these rotations, i.e.

\[ \nu(zN) = \nu(N) \quad \text{(5.7)} \]

for all \( z \in S^1 \) and \( N \subset S^1 \). To verify this, write \( N = \phi(A) \) and \( z = \phi(t) \) for some \( t \in [0, 1) \) and \( A \subset [0, 1) \). Then

\[ \phi(t)\phi(A) = \phi(t + A \mod 1) \]

where for \( A \subset [0, 1) \) and \( t \in [0, 1) \),

\[ t + A \mod 1 := \{a + t \mod 1 \in [0, 1) : a \in A\} = ((t + A) \cap \{a < 1 - t\}) \cup ([(t - 1) + A] \cap \{a \geq 1 - t\}) \].

Thus

\[ \nu(\phi(t)\phi(A)) = \mu(t + A \mod 1) = \mu((a + A \cap \{a < 1 - t\}) \cup ((t - 1) + A \cap \{a \geq 1 - t\})) = \mu((a + A \cap \{a < 1 - t\}) + \mu(((t - 1) + A \cap \{a \geq 1 - t\})) = \mu(A \cap \{a < 1 - t\}) + \mu(A \cap \{a \geq 1 - t\}) = \mu(A \cap \{a < 1 - t\}) \cup (A \cap \{a \geq 1 - t\})) = \mu(A) = \nu(\phi(A)). \]

Therefore it suffices to prove that no finite non-trivial measure \( \nu \) on \( S^1 \) such that Eq. (5.7) holds. To do this we will “construct” a non-measurable set \( N = \phi(A) \) for some \( A \subset [0, 1) \). Let

\[ R := \{z = e^{i2\pi t} : t \in \mathbb{Q}\} = \{z = e^{i2\pi t} : t \in [0, 1) \cap \mathbb{Q}\} \]

– a countable subgroup of \( S^1 \). As above \( R \) acts on \( S^1 \) by rotations and divides \( S^1 \) up into equivalence classes, where \( z, w \in S^1 \) are equivalent if \( z = rw \) for some \( r \in R \). Choose (using the axiom of choice) one representative point \( n \) from each of these equivalence classes and let \( N \subset S^1 \) be the set of these representative points. Then every point \( z \in S^1 \) may be uniquely written as \( z = nr \) with \( n \in N \) and \( r \in R \). That is to say

\[ S^1 = \bigsqcup_{r \in R} (rN) \quad \text{(5.8)} \]

where \( \bigsqcup_{r \in R} A_r \) is used to denote the union of pair-wise disjoint sets \( \{A_r\} \). By Eqs. (5.7) and (5.8),

\[ \nu(S^1) = \sum_{r \in R} \nu(rN) = \sum_{r \in R} \nu(N). \]

The right member from this equation is either 0 or \( \infty \), 0 if \( \nu(N) = 0 \) and \( \infty \) if \( \nu(N) > 0 \). In either case it is not equal \( \nu(S^1) \in (0, 1) \). Thus we have reached the desired contradiction. \[ \square \]

**Proof. Second proof of Theorem 5.6** For \( N \subset [0, 1) \) and \( \alpha \in [0, 1) \), let

\[ N^\alpha = N + \alpha \mod 1 = \{a + \alpha \mod 1 \in [0, 1) : a \in N\} = (\alpha + N \cap \{a < 1 - \alpha\}) \cup ((\alpha - 1) + N \cap \{a \geq 1 - \alpha\}). \]

Then

\[ \mu(N^\alpha) = \mu(\alpha + N \cap \{a < 1 - \alpha\}) + \mu((\alpha - 1) + N \cap \{a \geq 1 - \alpha\}) = \mu(N \cap \{a < 1 - \alpha\}) + \mu((\alpha - 1) + N \cap \{a \geq 1 - \alpha\}) = \mu(N). \quad \text{(5.9)} \]

We will now construct a bad set \( N \) which coupled with Eq. (5.9) will lead to a contradiction. Set

\[ Q_x := \{x + r \in \mathbb{R} : r \in \mathbb{Q}\} = x + \mathbb{Q}. \]

Notice that \( Q_x \cap Q_y \neq \emptyset \) implies that \( Q_x = Q_y \). Let \( O = \{Q_x : x \in \mathbb{R}\} \) – the orbit space of the \( \mathbb{Q} \) action. For all \( A \in O \) choose \( f(A) \in [0, 1/3) \cap A \)

\[ \text{and define } N = f(O). \]

Then observe:

1. \( f(A) = f(B) \) implies that \( A \cap B \neq \emptyset \) which implies that \( A = B \) so that \( f \) is injective.
2. \( O = \{Q_n : n \in N\}. \)

Let \( R \) be the countable set,

\[ R := \mathbb{Q} \cap [0, 1). \]

We now claim that

\[ 2 \text{ We have used the Axiom of choice here, i.e. } \prod_{A \in \mathcal{F}} (A \cap [0, 1/3]) \neq \emptyset \]
\[ N^r \cap N^s = \emptyset \text{ if } r \neq s \text{ and } \]
\[ (0, 1) = \bigcup_{r \in R} N^r. \]

Indeed, if \( x \in N^r \cap N^s \neq \emptyset \) then \( x = r + n \mod 1 \) and \( x = s + n' \mod 1 \), then \( n - n' \in \mathbb{Q} \), i.e. \( Q_n = Q_{n'} \). That is to say, \( n = f(Q_n) = f(Q_{n'}) = n' \) and hence that \( s = r \mod 1 \), but \( s, r \in [0, 1) \) implies that \( s = r \). Furthermore, if \( x \in [0, 1) \) and \( n := f(Q_x) \), then \( x - n = r \in \mathbb{Q} \) and \( x \in N^r \mod 1 \). Now that we have constructed \( N \), we are ready for the contradiction. By Equations (5.9–5.11) we find

\[
1 = \mu([0, 1)) = \sum_{r \in R} \mu(N^r) = \sum_{r \in R} \mu(N) = \begin{cases} 
\infty & \text{if } \mu(N) > 0 \\
0 & \text{if } \mu(N) = 0
\end{cases}.
\]

which is certainly inconsistent. Incidentally we have just produced an example of so called “non-measurable” set.

Because of Theorems 5.5 and 5.6, we have to in general relinquish the idea that measure \( \mu \) can be defined on all of \( 2^X \). In other words we are going to have to restrict our attention to only measuring some sub-collection, \( \mathcal{B} \subset 2^X \), of all subsets of \( X \). We will refer to \( \mathcal{B} \) as the collection of measurable sets. We will developed this below., it is necessary to modify Definition 5.1. Our revised notion of a measure will appear in Definition 43.19 of Chapter 44 below.
Set Operations

6.1

Let \(\mathbb{N}\) denote the positive integers, \(\mathbb{N}_0 := \mathbb{N} \cup \{0\}\) be the non-negative integers and \(\mathbb{Z} = \mathbb{N}_0 \cup (-\mathbb{N})\) – the positive and negative integers including 0, \(\mathbb{Q}\) the rational numbers, \(\mathbb{R}\) the real numbers, and \(\mathbb{C}\) the complex numbers. We will also use \(\mathbb{F}\) to stand for either of the fields \(\mathbb{R}\) or \(\mathbb{C}\).

**Notation 6.1** Given two sets \(X\) and \(Y\), let \(Y^X\) denote the collection of all functions \(f : X \to Y\). If \(X = \mathbb{N}\), we will say that \(f \in Y^\mathbb{N}\) is a sequence with values in \(Y\) and often write \(f_n\) for \(f(n)\) and express \(f\) as \(\{f_n\}_n\). If \(X = \{1, 2, \ldots, N\}\), we will write \(Y^N\) in place of \(Y^{\{1, 2, \ldots, N\}}\) and denote \(f \in Y^N\) by \(f = (f_1, f_2, \ldots, f_N)\) where \(f_n = f(n)\).

**Notation 6.2** More generally if \(\{X_\alpha : \alpha \in \mathbb{A}\}\) is a collection of non-empty sets, let \(X_\mathbb{A} = \prod_{\alpha \in \mathbb{A}} X_\alpha\) and \(\pi_\alpha : X_\mathbb{A} \to X_\alpha\) be the canonical projection map defined by \(\pi_\alpha(x) = x_\alpha\). If \(X_\alpha = X\) for some fixed space \(X\), then we will write \(\prod_{\alpha \in \mathbb{A}} X_\alpha\) as \(X^\mathbb{A}\) rather than \(X_\mathbb{A}\).

Recall that an element \(x \in X_\mathbb{A}\) is a "choice function," i.e. an assignment \(x_\alpha := x(\alpha) \in X_\alpha\) for each \(\alpha \in \mathbb{A}\). The axiom of choice states that \(X_\mathbb{A} \neq \emptyset\) provided that \(X_\alpha \neq \emptyset\) for each \(\alpha \in \mathbb{A}\).

**Notation 6.3** Given a set \(X\), let \(2^X\) denote the power set of \(X\) – the collection of all subsets of \(X\) including the empty set.

The reason for writing the power set of \(X\) as \(2^X\) is that if we think of \(2\) meaning \(\{0, 1\}\), then an element of \(a \in 2^X = \{0, 1\}^X\) is completely determined by the set

\[A := \{x \in X : a(x) = 1\} \subseteq X.\]

In this way elements in \(\{0, 1\}^X\) are in one to one correspondence with subsets of \(X\).

For \(A \in 2^X\) let

\[A^c := X \setminus A = \{x \in X : x \notin A\}\]

and more generally if \(A, B \subseteq X\) let

\[B \setminus A := \{x \in B : x \notin A\} = B \cap A^c.\]

We also define the symmetric difference of \(A\) and \(B\) by

\[A \triangle B := (B \setminus A) \cup (A \setminus B).\]

As usual if \(\{A_\alpha\}_{\alpha \in \mathbb{I}}\) is an indexed collection of subsets of \(X\) we define the union and the intersection of this collection by

\[\bigcup_{\alpha \in \mathbb{I}} A_\alpha := \{x \in X : \exists \alpha \in \mathbb{I} \quad \exists x \in A_\alpha\}\]

and

\[\bigcap_{\alpha \in \mathbb{I}} A_\alpha := \{x \in X : x \in A_\alpha \quad \forall \alpha \in \mathbb{I}\}.
\]

**Notation 6.4** We will also write \(\sum_{\alpha \in \mathbb{I}} A_\alpha\) for \(\bigcup_{\alpha \in \mathbb{I}} A_\alpha\) in the case that \(\{A_\alpha\}_{\alpha \in \mathbb{I}}\) are pairwise disjoint, i.e. \(A_\alpha \cap A_\beta = \emptyset\) if \(\alpha \neq \beta\).

Notice that \(\bigcup\) is closely related to \(\exists\) and \(\cap\) is closely related to \(\forall\). For example let \(\{A_n\}_n\) be a sequence of subsets from \(X\) and define

\[\inf A_n := \bigcap_{n \geq k} A_k, \quad \sup A_n := \bigcup_{n \geq k} A_k,\]

\[\limsup_{n \to \infty} A_n := \inf \sup_{k \geq n} A_k =: \{x \in X : \# \{n : x \in A_n\} = \infty\} =: \{A_n\ \text{i.o.}\}\]

and

\[\liminf_{n \to \infty} A_n := \sup \inf_{k \geq n} A_k =: \{x \in X : x \in A_n \text{ for all } n \text{ sufficiently large} \} =: \{A_n\ \text{a.a.}\}.\]

(One should read \(\{A_n\ \text{i.o.}\}\) as \(A_n\) infinitely often and \(\{A_n\ \text{a.a.}\}\) as \(A_n\) almost always.) Then \(x \in \{A_n\ \text{i.o.}\}\) iff

\[\forall N \in \mathbb{N} \exists n \geq N \exists x \in A_n\]

and this may be expressed as

\[\{A_n\ \text{i.o.}\} = \bigcap_{N=1}^\infty \bigcup_{n \geq N} A_n.\]

Similarly, \(x \in \{A_n\ \text{a.a.}\}\) iff

\[\exists N \in \mathbb{N} \forall n \geq N \quad x \in A_n\]

which may be written as

\[\{A_n\ \text{a.a.}\} = \bigcup_{N=1}^\infty \bigcap_{n \geq N} A_n.\]
Definition 6.5. Given a set $A \subset X$, let
$$1_A(x) = \begin{cases} 1 & \text{if } x \in A \\ 0 & \text{if } x \notin A \end{cases}$$
be the indicator function of $A$.

Lemma 6.6 (Properties of $\inf$ and $\sup$). We have:

1. $(\bigcup_n A_n)^c = \bigcap_n A_n^c$.
2. $\{0, 1\}^c = \{1\}$.
3. $\limsup A_n = \{x \in X : \sum_{n=1}^{\infty} 1_{A_n}(x) = \infty\}$.
4. $\liminf_{n \to \infty} A_n = \{x \in X : \sum_{n=1}^{\infty} 1_{A_n}(x) < \infty\}$.
5. $\sup_{k \geq \infty} 1_{A_k}(x) = 1_{\bigcup_{k \geq \infty} A_k} = \limsup_{n \to \infty} 1_{A_n}$.
6. $\inf_{k \geq \infty} 1_{A_k}(x) = 1_{\inf_{k \geq \infty} A_k} = \liminf_{n \to \infty} 1_{A_n}$.
7. $\limsup A_n = \limsup_{n \to \infty} 1_{A_n}$, and
8. $\liminf_{n \to \infty} A_n = \liminf_{n \to \infty} 1_{A_n}$.

Proof. These results follow fairly directly from the definitions and so the proof is left to the reader. (The reader should definitely provide a proof for herself.) \[Q.E.D.\]

Definition 6.7. A set $X$ is said to be countable if it is empty or there is an injective map $f : X \to \mathbb{N}$, otherwise $X$ is said to be uncountable.

Lemma 6.8 (Basic Properties of Countable Sets).

1. If $A \subset X$ is a subset of a countable set $X$ then $A$ is countable.
2. Any finite subset $A \subset N$ is in one to one correspondence with $N$.
3. A non-empty set $X$ is countable if there exists a surjective map, $g : N \to X$.
4. If $X$ and $Y$ are countable then $X \times Y$ is countable.
5. Suppose for each $m \in N$ that $A_m$ is a countable subset of a set $X$, then $A = \bigcup_{m=1}^{\infty} A_m$ is countable. In short, the countable union of countable sets is still countable.
6. If $X$ is an infinite set and $Y$ is a set with at least two elements, then $Y^X$ is uncountable. In particular $2^X$ is uncountable for any infinite set $X$.

Proof. 1. If $f : X \to \mathbb{N}$ is an injective map then so is the restriction, $f|_A$, of $f$ to the subset $A$. 2. Let $f(1) = \min A$ and define $f$ inductively by
$$f(n+1) = \min(A \setminus \{f(1), \ldots, f(n)\}).$$
Since $A$ is infinite the process continues indefinitely. The function $f : N \to A$ defined this way is a bijection.
3. If $g : \mathbb{N} \to X$ is a surjective map, let $f(x) = \min g^{-1}(\{x\}) = \min \{n \in N : f(n) = x\}$.

Then $f : X \to \mathbb{N}$ is injective which combined with item 2. (taking $A = f(X)$) shows $X$ is countable. Conversely if $f : X \to \mathbb{N}$ is injective let $x_0 \in X$ be a fixed point and define $g : \mathbb{N} \to X$ by $g(n) = f^{-1}(n)$ for $n \in f(X)$ and $g(n) = x_0$ otherwise.

4. Let us first construct a bijection, $h$, from $N$ to $\mathbb{N} \times \mathbb{N}$. To do this put the elements of $\mathbb{N} \times \mathbb{N}$ into an array of the form
$$\begin{pmatrix} (1,1) & (1,2) & (1,3) & \ldots \\ (2,1) & (2,2) & (2,3) & \ldots \\ (3,1) & (3,2) & (3,3) & \ldots \\ \vdots & \vdots & \vdots & \ddots \end{pmatrix}$$
and then “count” these elements by counting the sets $\{(i,j) : i + j = k\}$ one at a time. For example let $h(1) = (1, 1), h(2) = (2, 1), h(3) = (1, 2), h(4) = (3, 1), h(5) = (2, 2), h(6) = (1, 3)$ and so on. If $f : \mathbb{N} \to X$ and $g : \mathbb{N} \to Y$ are surjective functions, then the function $(f \times g) \circ h : \mathbb{N} \to X \times Y$ is surjective where $(f \times g)(m, n) := (f(m), g(n))$ for all $(m, n) \in \mathbb{N} \times \mathbb{N}$.

5. If $A = \emptyset$ then $A$ is countable by definition so we may assume $A \neq \emptyset$. With out loss of generality we may assume $A_1 \neq \emptyset$ and by replacing $A_m$ by $A_1$ if necessary we may also assume $A_m \neq \emptyset$ for all $m$. For each $m \in \mathbb{N}$ let $a_m : \mathbb{N} \to A_m$ be a surjective function and then define $f : \mathbb{N} \times \mathbb{N} \to \bigcup_{m=1}^{\infty} A_m$ by $(m, n) := a_m(n)$. The function $f$ is surjective and hence so is the composition, $f \circ h : \mathbb{N} \to \bigcup_{m=1}^{\infty} A_m$, where $h : \mathbb{N} \to \mathbb{N} \times \mathbb{N}$ is the bijection defined above.

6. Let us begin by showing $2^N = \{0, 1\}^N$ is uncountable. For sake of contradiction suppose $f : N \to \{0, 1\}^N$ is a surjection and write $f(n)$ as $(f_1(n), f_2(n), f_3(n), \ldots)$. Now define $a \in \{0, 1\}^N$ by $a_n := 1 - f_n(n)$. By construction $f_n(n) \neq a_n$ for all $n$ and so $a \notin f(N)$. This contradicts the assumption that $f$ is surjective and shows $2^N$ is uncountable. For the general case, since $Y^0_X \subset Y^X$ for any subset $Y_0 \subset Y$, if $Y^0_X$ is uncountable then so is $Y^X$. In this way we may assume $Y_0$ is a two point set which may as well be $Y_0 = \{0, 1\}$. Moreover, since $X$ is an infinite set we may find an injective map $i : N \to X$ and use this to set up an injection, $i : 2^N \to 2^X$ by setting $i(A) := \{x_n : n \in \mathbb{N}\} \subset X$ for all $A \subset \mathbb{N}$. If $2^X$ were countable we could find a surjective map $f : 2^X \to N$ in which case $f \circ i : 2^N \to N$ would be surjective as well. However this is impossible since we have already seed that $2^N$ is uncountable. \[Q.E.D.\]

6.2 Exercises

Let $f : X \to Y$ be a function and $\{A_i\}_{i \in I}$ be an indexed family of subsets of $Y$, verify the following assertions.
Exercise 6.1. \((\cap_{i \in I} A_i)^c = \cup_{i \in I} A_i^c\).

Exercise 6.2. Suppose that \(B \subseteq Y\), show that \(B \setminus (\cup_{i \in I} A_i) = \cap_{i \in I} (B \setminus A_i)\).

Exercise 6.3. \(f^{-1}(\cup_{i \in I} A_i) = \cup_{i \in I} f^{-1}(A_i)\).

Exercise 6.4. \(f^{-1}(\cap_{i \in I} A_i) = \cap_{i \in I} f^{-1}(A_i)\).

Exercise 6.5. Find a counterexample which shows that \(f(C \cap D) = f(C) \cap f(D)\) need not hold.

Example 6.9. Let \(X = \{a, b, c\}\) and \(Y = \{1, 2\}\) and define \(f(a) = f(b) = 1\) and \(f(c) = 2\). Then \(\emptyset = f(\{a\} \cap \{b\}) \neq f(\{a\}) \cap f(\{b\}) = \{1\}\) and \(\{1, 2\} = f(\{a\}^c) \neq f(\{a\})^c = \{2\}\).

6.3 Algebraic sub-structures of sets

Definition 6.10. A collection of subsets \(A\) of a set \(X\) is a \(\pi\) - system or multiplicative system if \(A\) is closed under taking finite intersections.

Definition 6.11. A collection of subsets \(A\) of a set \(X\) is an algebra (Field) if

1. \(\emptyset, X \in A\)
2. \(A \in A\) implies that \(A^c \in A\)
3. \(A\) is closed under finite unions, i.e. if \(A_1, \ldots, A_n \in A\) then \(A_1 \cup \cdots \cup A_n \in A\).

In view of conditions 1. and 2., 3. is equivalent to

3’. \(A\) is closed under finite intersections.

Definition 6.12. A collection of subsets \(B\) of \(X\) is a \(\sigma\) - algebra (or sometimes called a \(\sigma\) - field) if \(B\) is an algebra which also closed under countable unions, i.e. if \(\{A_i\}_{i=1}^\infty \subseteq B\), then \(\cup_{i=1}^\infty A_i \in B\). (Notice that since \(B\) is also closed under taking complements, \(B\) is also closed under taking countable intersections.)

Example 6.13. Here are some examples of algebras.

1. \(B = 2^X\), then \(B\) is a \(\sigma\) - algebra.
2. \(B = \{\emptyset, X\}\) is a \(\sigma\) - algebra called the trivial \(\sigma\) - field.
3. Let \(X = \{1, 2, 3\}\), then \(A = \{\emptyset, X, \{1\}, \{2, 3\}\}\) is an algebra while, \(S := \{\emptyset, X, \{2, 3\}\}\) is a not an algebra but is a \(\pi\) – system.

Proposition 6.14. Let \(E\) be any collection of subsets of \(X\). Then there exists a unique smallest algebra \(A(E)\) and \(\sigma\) - algebra \(\sigma(E)\) which contains \(E\).

Proof. Simply take

\[ A(E) := \bigcap\{A : A\text{ is an algebra such that } E \subseteq A\} \]

and

\[ \sigma(E) := \bigcap\{\mathcal{M} : \mathcal{M}\text{ is a }\sigma\text{-algebra such that } E \subseteq \mathcal{M}\}. \]

Example 6.15. Suppose \(X = \{1, 2, 3\}\) and \(E = \{\emptyset, X, \{1, 2\}, \{1, 3\}\}\), see Figure 6.1 Then

\[ A(E) = \sigma(E) = 2^X. \]

On the other hand if \(E = \{\{1, 2\}\}\), then \(A(E) = \{\emptyset, X, \{1, 2\}, \{3\}\}\).

Exercise 6.6. Suppose that \(E_i \subset 2^X\) for \(i = 1, 2\). Show that \(A(E_1) = A(E_2)\) iff \(E_1 \subset A(E_2)\) and \(E_2 \subset A(E_1)\). Similarly show, \(\sigma(E_1) = \sigma(E_2)\) if \(E_1 \subset \sigma(E_2)\) and \(E_2 \subset \sigma(E_1)\). Give a simple example where \(A(E_1) = A(E_2)\) while \(E_1 \neq E_2\).

In this course we will often be interested in the Borel \(\sigma\) – algebra on a topological space.

Definition 6.16 (Borel \(\sigma\) – field). The Borel \(\sigma\) – algebra, \(B = B_\mathbb{R} = B(\mathbb{R})\), on \(\mathbb{R}\) is the smallest \(\sigma\) -field containing all of the open subsets of \(\mathbb{R}\). More generally if \((X, \tau)\) is a topological space, the Borel \(\sigma\) – algebra on \(X\) is \(B_X := \sigma(\tau)\) – i.e. the smallest \(\sigma\) – algebra containing all open (closed) subsets of \(X\).
Exercise 6.7. Verify the Borel $\sigma$-algebra, $B_\mathbb{R}$, is generated by any of the following collection of sets:

1. $\{(a, \infty) : a \in \mathbb{R}\}$, 2. $\{(a, \infty) : a \in \mathbb{Q}\}$ or 3. $\{(a, \infty) : a \in \mathbb{Q}\}$.

Hint: make use of Exercise 6.6

We will postpone a more in depth study of $\sigma$-algebras until later. For now, let us concentrate on understanding the simpler notion of an algebra.

Definition 6.17. Let $X$ be a set. We say that a family of sets $\mathcal{F} \subset 2^X$ is a partition of $X$ if distinct members of $\mathcal{F}$ are disjoint and if $X$ is the union of the sets in $\mathcal{F}$.

Example 6.18. Let $X$ be a set and $\mathcal{E} = \{A_1, \ldots, A_n\}$ where $A_1, \ldots, A_n$ is a partition of $X$. In this case

$$\mathcal{A}(\mathcal{E}) = \sigma(\mathcal{E}) = \{\bigcup_{i \in A} A_i : A \subset \{1, 2, \ldots, n\}\}$$

where $\bigcup_{i \in A} A_i := \emptyset$ when $A = \emptyset$. Notice that

$$\#(\mathcal{A}(\mathcal{E})) = \#(2^{\{1, 2, \ldots, n\}}) = 2^n.$$

Example 6.19. Suppose that $X$ is a set and that $\mathcal{A} \subset 2^X$ is a finite algebra, i.e. $\#(\mathcal{A}) < \infty$. For each $x \in X$ let

$$A_x = \bigcap \{A \in \mathcal{A} : x \in A\} \in \mathcal{A},$$

wherein we have used $\mathcal{A}$ is finite to insure $A_x \in \mathcal{A}$. Hence $A_x$ is the smallest set in $\mathcal{A}$ which contains $x$.

Now suppose that $y \in X$. If $x \in A_y$ then $A_x \subset A_y$ so that $A_x \cap A_y = A_x$. On the other hand, if $x \notin A_y$ then $x \in A_x \setminus A_y$ and therefore $A_x \subset A_x \setminus A_y$, i.e. $A_x \cap A_y = \emptyset$. Therefore we have shown, either $A_x \cap A_y = \emptyset$ or $A_x \cap A_y = A_x$. By reversing the roles of $x$ and $y$ it also follows that either $A_y \cap A_x = \emptyset$ or $A_y \cap A_x = A_y$. Therefore we may conclude, either $A_x = A_y$ or $A_x \cap A_y = \emptyset$ for all $x, y \in X$.

Let us now define $\{B_i\}_{i=1}^k$ to be an enumeration of $\{A_x\}_{x \in X}$. It is a straightforward to conclude that

$$\mathcal{A} = \{\bigcup_{i \in A} B_i : A \subset \{1, 2, \ldots, k\}\}.$$ 

For example observe that for any $A \in \mathcal{A}$, we have $A = \bigcup_{x \in A} A_x = \bigcup_{i \in A} B_i$ where $A := \{i : B_i \subset A\}$.

Proposition 6.20. Suppose that $\mathcal{B} \subset 2^X$ is a $\sigma$-algebra and $\mathcal{B}$ is at most a countable set. Then there exists a unique finite partition $\mathcal{F}$ of $X$ such that $\mathcal{F} \subset \mathcal{B}$ and every element $B \in \mathcal{B}$ is of the form

$$B = \bigcup \{A \in \mathcal{F} : A \subset B\}.$$ 

(6.1)

In particular $\mathcal{B}$ is actually a finite set and $\#(\mathcal{B}) = 2^n$ for some $n \in \mathbb{N}$.

Proof. We proceed as in Example 6.19. For each $x \in X$ let

$$A_x = \bigcap \{A \in \mathcal{B} : x \in A\} \in \mathcal{B},$$

wherein we have used $\mathcal{B}$ is a countable $\sigma$-algebra to insure $A_x \in \mathcal{B}$. Just as above either $A_x \cap A_y = \emptyset$ or $A_x = A_y$ and therefore $\mathcal{F} = \{A_x : x \in X\} \subset \mathcal{B}$ is a (necessarily countable) partition of $X$ for which Eq. (6.1) holds for all $B \in \mathcal{B}$.

Enumerate the elements of $\mathcal{F}$ as $\mathcal{F} = \{P_n\}_{n=1}^\infty$ where $N \in \mathbb{N}$ or $N = \infty$. If $N = \infty$, then the correspondence

$$a \in \{0, 1\}^N \rightarrow A_a = \bigcup \{P_n : a_n = 1\} \in \mathcal{B}$$

is bijective and therefore, by Lemma 6.8, $\mathcal{B}$ is uncountable. Thus any countable $\sigma$-algebra is necessarily finite. This finishes the proof modulo the uniqueness assertion which is left as an exercise to the reader. □

Example 6.21 (Countable/Co-countable $\sigma$-Field). Let $X = \mathbb{R}$ and $\mathcal{E} := \{\{x\} : x \in \mathbb{R}\}$. Then $\sigma(\mathcal{E})$ consists of those subsets, $A \subset X$, such that $A$ is countable or $A^c$ is countable. Similarly, $\mathcal{A}(\mathcal{E})$ consists of those subsets, $A \subset X$, such that $A$ is finite or $A^c$ is finite. More generally we have the following exercise.

Exercise 6.8. Let $X$ be a set, $I$ be an infinite index set, and $\mathcal{E} = \{A_i\}_{i \in I}$ be a partition of $X$. Prove the algebra, $\mathcal{A}(\mathcal{E})$, and that $\sigma$ -- algebra, $\sigma(\mathcal{E})$, generated by $\mathcal{E}$ are given by

$$\mathcal{A}(\mathcal{E}) = \{\bigcup_{\Lambda} A_{\Lambda} : A \subset I\text{ with } \#(\Lambda) < \infty\} \text{ or } \#(A^c) < \infty\}$$

and

$$\sigma(\mathcal{E}) = \{\bigcup_{\Lambda} A_{\Lambda} : A \subset I\text{ with } A \text{ countable or } A^c \text{ countable}\}$$

respectively. Here we are using the convention that $\bigcup_{i \in A} A_i := \emptyset$ when $A = \emptyset$. In particular if $I$ is countable, then

$$\sigma(\mathcal{E}) = \{\bigcup_{i \in A} A_i : A \subset I\}.$$ 

Proposition 6.22. Let $X$ be a set and $\mathcal{E} \subset 2^X$. Let $\mathcal{E}^c := \{A^c : A \in \mathcal{E}\}$ and $\mathcal{E}_c := \mathcal{E} \cup \{X, \emptyset\} \cup \mathcal{E}^c$. Then

$$\mathcal{A}(\mathcal{E}) := \{\text{finite unions of finite intersections of elements from } \mathcal{E}_c\}.$$ 

(6.2)
Proof. Let \( A \) denote the right member of Eq. (6.2). From the definition of an algebra, it is clear that \( E \subset A \subset A(E) \). Hence to finish that proof it suffices to show \( A \) is an algebra. The proof of these assertions are routine except for possibly showing that \( A \) is closed under complementation. To check \( A \) is closed under complementation, let \( Z \in A \) be expressed as
\[
Z = \bigcup_{i=1}^{N} \bigcap_{j=1}^{K} A_{ij}
\]
where \( A_{ij} \in E_c \). Therefore, writing \( B_{ij} = A_{ij}^c \in E_c \), we find that
\[
Z^c = \bigcup_{i=1}^{N} \bigcap_{j=1}^{K} B_{ij} = \bigcup_{j_1, \ldots, j_N=1}^{K} (B_{1j_1} \cap B_{2j_2} \cap \cdots \cap B_{Nj_N}) \in A
\]
wherein we have used the fact that \( B_{1j_1} \cap B_{2j_2} \cap \cdots \cap B_{Nj_N} \) is a finite intersection of sets from \( E_c \).

Remark 6.23. One might think that in general \( \sigma(E) \) may be described as the countable unions of countable intersections of sets in \( E^c \). However this is in general false, since if
\[
Z = \bigcup_{i=1}^{\infty} \bigcap_{j=1}^{\infty} A_{ij}
\]
with \( A_{ij} \in E_c \), then
\[
Z^c = \bigcup_{j_1=1}^{\infty} \bigcap_{j_2=1}^{\infty} \cdots \bigcap_{j_N=1}^{\infty} \left( \bigcap_{i=1}^{\infty} A_{i,j_i}^c \right)
\]
which is now an uncountable union. Thus the above description is not correct. In general it is complicated to explicitly describe \( \sigma(E) \), see Proposition 1.23 on page 39 of Folland for details. Also see Proposition 6.20.

Exercise 6.9. Let \( \tau \) be a topology on a set \( X \) and \( A = A(\tau) \) be the algebra generated by \( \tau \). Show \( A \) is the collection of subsets of \( X \) which may be written as finite union of sets of the form \( F \cap V \) where \( F \) is closed and \( V \) is open.

Definition 6.24. A set \( S \subset 2^X \) is said to be an semialgebra or elementary class provided that
- \( \emptyset \in S \)
- \( S \) is closed under finite intersections
- if \( E \in S \), then \( E^c \) is a finite disjoint union of sets from \( S \). (In particular \( X = \emptyset^c \) is a finite disjoint union of elements from \( S \)).
Finately Additive Measures / Integration

**Definition 7.1.** Suppose that \( \mathcal{E} \subset 2^X \) is a collection of subsets of \( X \) and \( \mu : \mathcal{E} \to [0, \infty] \) is a function. Then

1. \( \mu \) is **additive or finitely additive on** \( \mathcal{E} \) if
   \[
   \mu(E) = \sum_{i=1}^{n} \mu(E_i) \quad (7.1)
   \]
   whenever \( E = \bigcup_{i=1}^{n} E_i \in \mathcal{E} \) with \( E_i \in \mathcal{E} \) for \( i = 1, 2, \ldots, n < \infty \).
2. \( \mu \) is \( \sigma \)-**additive (or countable additive) on** \( \mathcal{E} \) if Eq. (7.1) holds even when \( n = \infty \).
3. \( \mu \) is **sub-additive (finitely sub-additive)** on \( \mathcal{E} \) if
   \[
   \mu(E) \leq \sum_{i=1}^{n} \mu(E_i) \quad (7.2)
   \]
   whenever \( E = \bigcup_{i=1}^{n} E_i \in \mathcal{E} \) with \( n \in \mathbb{N} \setminus \{\infty\} \) (\( n \in \mathbb{N} \)).
4. \( \mu \) is a **finitely additive measure** if \( \mathcal{E} = A \) is an algebra, \( \mu(\emptyset) = 0 \), and \( \mu \) is finitely additive on \( A \).
5. \( \mu \) is a **premeasure** if \( \mu \) is a finitely additive measure which is \( \sigma \)-additive on \( A \).
6. \( \mu \) is a **measure** if \( \mu \) is a premeasure on a \( \sigma \)-algebra. Furthermore if \( \mu(X) = 1 \), we say \( \mu \) is a **probability measure** on \( X \).

**Proposition 7.2** (Basic properties of finitely additive measures). Suppose \( \mu \) is a finitely additive measure on an algebra, \( A \subset 2^X \), \( A, B \in A \) with \( A \subset \text{Ban} \) \( \{A_j\}_{j=1}^{n} \subset A \), then:

1. (\( \mu \) is **monotone**) \( \mu(A) \leq \mu(B) \) if \( A \subset B \).
2. For \( A, B \in A \), the following **strong additivity formula** holds;
   \[
   \mu(A \cup B) + \mu(A \cap B) = \mu(A) + \mu(B) \quad (7.2)
   \]
3. (\( \mu \) is **finitely subadditive**) \( \mu(\bigcup_{j=1}^{n} A_j) \leq \sum_{j=1}^{n} \mu(A_j) \).
4. \( \mu \) is sub-additive on \( A \) iff
   \[
   \mu(A) \leq \sum_{i=1}^{\infty} \mu(A_i) \quad (7.3)
   \]
   where \( A \in A \) and \( \{A_i\}_{i=1}^{\infty} \subset A \) are pairwise disjoint sets.
5. (\( \mu \) is **countably superadditive**) If \( A = \sum_{i=1}^{\infty} A_i \) with \( A_i \in A \), then
   \[
   \mu\left(\sum_{i=1}^{\infty} A_i\right) \geq \sum_{i=1}^{\infty} \mu(A_i) \quad (7.4)
   \]
   (See Remark 7.9 for example where this inequality is strict.)
6. A finitely additive measure, \( \mu \), is a premeasure iff \( \mu \) is subadditive.

**Proof.**

1. Since \( B \) is the disjoint union of \( A \) and \( (B \setminus A) \) and \( B \setminus A = B \cap A^c \in A \) it follows that
   \[
   \mu(B) = \mu(A) + \mu(B \setminus A) \geq \mu(A).
   \]
2. Since
   \[
   A \cup B = [A \setminus (A \cap B)] \bigsqcup [B \setminus (A \cap B)] \bigsqcup A \cap B,
   \]
   
   \[
   \mu(A \cup B) = \mu(A \cup B \setminus (A \cap B)) + \mu(A \cap B)
   \]
   
   \[
   = \mu(A \setminus (A \cap B)) + \mu(B \setminus (A \cap B)) + \mu(A \cap B).
   \]
   Adding \( \mu(A \cap B) \) to both sides of this equation proves Eq. (7.2).
3. Let \( \tilde{E}_j = E_j \setminus (E_1 \cup \cdots \cup E_{j-1}) \) so that the \( \tilde{E}_j \)'s are pair-wise disjoint and \( E = \bigcup_{j=1}^{\infty} \tilde{E}_j \). Since \( \tilde{E}_j \subset E_j \) it follows from the monotonicity of \( \mu \) that
   \[
   \mu(E) = \sum_{j=1}^{n} \mu(\tilde{E}_j) \leq \sum_{j=1}^{n} \mu(E_j).
   \]
4. If \( A = \bigcup_{i=1}^{\infty} B_i \) with \( A \in A \) and \( B_i \in A \), then \( A = \sum_{i=1}^{\infty} A_i \) where \( A_i := B_i \setminus (B_1 \cup \cdots \cup B_{i-1}) \in A \) and \( B_0 = \emptyset \). Therefore using the monotonicity of \( \mu \) and Eq. (7.3)
   \[
   \mu(A) \leq \sum_{i=1}^{\infty} \mu(A_i) \leq \sum_{i=1}^{\infty} \mu(B_i).
   \]
5. Suppose that \( A = \sum_{i=1}^{\infty} A_i \) with \( A_i \in A \), then \( \sum_{i=1}^{n} A_i \subset A \) for all \( n \) and so by the monotonicity and finite additivity of \( \mu \), \( \sum_{i=1}^{\infty} \mu(A_i) \leq \mu(A) \).
   Letting \( n \to \infty \) in this equation shows \( \mu \) is superadditive.
6. This is a combination of items 5. and 6. ■
7.1 Examples of Measures

Most σ-algebras and σ-additive measures are somewhat difficult to describe and define. However, there are a few special cases where we can describe explicitly what is going on.

**Example 7.3.** Suppose that \( \Omega \) is a finite set, \( \mathcal{B} := 2^\Omega \), and \( p: \Omega \rightarrow [0,1] \) is a function such that

\[
\sum_{\omega \in \Omega} p(\omega) = 1.
\]

Then

\[
P(A) := \sum_{\omega \in A} p(\omega)
\]

defines a measure on \( 2^\Omega \).

**Example 7.4.** Suppose that \( X \) is any set and \( x \in X \) is a point. For \( A \subset X \), let

\[
\delta_x(A) = \begin{cases} 1 & \text{if } x \in A \\ 0 & \text{if } x \notin A. \end{cases}
\]

Then \( \mu = \delta_x \) is a measure on \( X \) called the Dirac delta measure at \( x \).

**Example 7.5.** Suppose \( \mathcal{B} \subset 2^X \) is a σ algebra, \( \mu \) is a measure on \( \mathcal{B} \), and \( \lambda > 0 \), then \( \lambda \cdot \mu \) is also a measure on \( \mathcal{B} \). Moreover, if \( J \) is an index set and \( \{ \mu_j \}_{j \in J} \) are all measures on \( \mathcal{B} \), then \( \mu = \sum_{j=1}^{\infty} \mu_j \), i.e.

\[
\mu(A) := \sum_{j=1}^{\infty} \mu_j(A)
\]

defines another measure on \( \mathcal{B} \). To prove this we must show that \( \mu \) is countably additive. Suppose that \( A = \sum_{i=1}^{\infty} A_i \) with \( A_i \in \mathcal{B} \), then (using Tonelli for sums, Proposition ??),

\[
\mu(A) = \sum_{j=1}^{\infty} \mu_j(A) = \sum_{j=1}^{\infty} \sum_{i=1}^{\infty} \mu_j(A_i) = \sum_{i=1}^{\infty} \sum_{j=1}^{\infty} \mu_j(A_i) = \sum_{i=1}^{\infty} \mu(A_i).
\]

We will now show this measure is independent of our choice of enumeration of \( X \) by showing,

\[
\mu(A) = \sum_{x \in A} \lambda(x) := \sup_{A \subset X} \sum_{x \in A} \lambda(x) \forall A \subset X.
\]

(7.5)

Here we are using the notation, \( A \subset X \) to indicate that \( A \) is a finite subset of \( X \).

To verify Eq. (7.5), let \( M := \sup_{A \subset X} \sum_{x \in A} \lambda(x) \) and for each \( N \in \mathbb{N} \) let

\[
A_N := \{ x_n : x_n \in A \text{ and } 1 \leq n \leq N \}.
\]

Then by definition of \( \mu \),

\[
\mu(A) = \lim_{N \to \infty} \sum_{x \in A_N} \lambda(x) \leq M.
\]

On the other hand if \( A \subset A \), then

\[
\sum_{x \in A} \lambda(x) = \sum_{n : x_n \in A} \lambda(x_n) = \mu(A) \leq \mu(A)
\]

from which it follows that \( M \leq \mu(A) \). This shows that \( \mu \) is independent of how we enumerate \( X \).

The above example has a natural extension to the case where \( X \) is uncountable and \( \lambda : X \rightarrow [0, \infty] \) is any function. In this setting we simply may define \( \mu : 2^X \rightarrow [0, \infty] \) using Eq. (7.5). We leave it to the reader to verify that this is indeed a measure on \( 2^X \).

We will construct many more measure in Chapter 8 below. The starting point of these constructions will be the construction of finitely additive measures using the next proposition.

**Proposition 7.7 (Construction of Finitely Additive Measures).** Suppose \( \mathcal{S} \subset 2^X \) is a semi-algebra (see Definition 6.24) and \( \mathcal{A} = \mathcal{A}(\mathcal{S}) \) is the algebra generated by \( \mathcal{S} \). Then every additive function \( \mu : \mathcal{S} \rightarrow [0, \infty] \) such that \( \mu(\emptyset) = 0 \) extends uniquely to an additive measure (which we still denote by \( \mu \)) on \( \mathcal{A} \).

**Proof.** Since (by Proposition 6.25) every element \( A \in \mathcal{A} \) is of the form \( A = \sum E_i \) for a finite collection of \( E_i \in \mathcal{S} \), it is clear that if \( \mu \) extends to a measure then the extension is unique and must be given by
Conversely, given an increasing function \( F : \mathbb{R} \rightarrow [0, 1] \) as in the statement of the theorem is given. Define \( \mu \) on \( S \) using the formula in Eq. \((7.9)\). The argument will be completed by showing \( \mu \) is additive on \( S \) and hence, by Proposition \(7.7\), has a unique extension to a finitely additive measure on \( \mathcal{A} \). Suppose that

\[
(a, b] = \sum_{i=1}^{n} (a_i, b_i].
\]

By reordering \((a_i, b_i]\) if necessary, we may assume that

\[
a = a_1 < b_1 < a_2 < b_2 < \cdots < b_{n-1} = a_n < b_n = b.
\]

Therefore, by the telescoping series argument,

\[
\mu((a, b] \cap \mathbb{R}) = F(b) - F(a) = \sum_{i=1}^{n} [F(b_i) - F(a_i)] = \sum_{i=1}^{n} \mu((a_i, b_i] \cap \mathbb{R}).
\]

**Remark 7.9.** Suppose that \( F : \mathbb{R} \rightarrow \mathbb{R} \) is any non-decreasing function such that \( F(\mathbb{R}) \subset \mathbb{R} \). Then the same methods used in the proof of Proposition \(7.8\) shows that there exists a unique finitely additive measure, \( \mu = \mu_F \), on \( \mathcal{A} = \mathcal{A}(S) \) such that Eq. \((7.9)\) holds. If \( F(\infty) > \lim_{n \rightarrow \infty} F(b) \) and \( A_i = (i, i+1] \) for \( i \in \mathbb{N} \), then

\[
\sum_{i=1}^{\infty} \mu_F(A_i) = \sum_{i=1}^{\infty} (F(i+1) - F(i)) = \lim_{N \rightarrow \infty} \sum_{i=1}^{N} (F(i+1) - F(i)) = \lim_{N \rightarrow \infty} (F(N+1) - F(1)) < F(\infty) - F(1) = \mu_F(\bigcup_{i=1}^{\infty} A_i).
\]

This shows that strict inequality can hold in Eq. \((7.4)\) and that \( \mu_F \) is not a premeasure. Similarly one shows \( \mu_F \) is not a premeasure if \( F(-\infty) < \lim_{n \rightarrow -\infty} F(a) \) or if \( F \) is not right continuous at some point \( a \in \mathbb{R} \). Indeed, in the latter case consider

\[
(a, a+1] = \sum_{n=1}^{\infty} (a + \frac{1}{n+1}, a + \frac{1}{n}].
\]

Working as above we find,

\[
\sum_{n=1}^{\infty} \mu_F \left( (a + \frac{1}{n+1}, a + \frac{1}{n}] \right) = F(a+1) - F(a+),
\]

while \( \mu_F((a, a+1]] = F(a+1) - F(a) \). We will eventually show in Chapter 8 below that \( \mu_F \) extends uniquely to a \( \sigma \)-additive measure on \( \mathcal{B}_R \) whenever \( F \) is increasing, right continuous, and \( F(\pm \infty) = \lim_{x \rightarrow \pm \infty} F(x) \).
Before constructing \( \sigma \)-additive measures (see Chapter 8 below), we are going to pause to discuss a preliminary notion of integration and develop some of its properties. Hopefully this will help the reader to develop the necessary intuition before heading to the general theory. First we need to describe the functions we are (currently) able to integrate.

### 7.2 Simple Random Variables

**Definition 7.10 (Simple random variables).** A function, \( f : \Omega \to Y \) is said to be simple if \( f(\Omega) \subset Y \) is a finite set. If \( \mathcal{A} \subset 2^\Omega \) is an algebra, we say that a simple function \( f : \Omega \to Y \) is measurable if \( \{ f = y \} := f^{-1}(\{ y \}) \in \mathcal{A} \) for all \( y \in Y \). A measurable simple function, \( f : \Omega \to \mathbb{C} \), is called a simple random variable relative to \( \mathcal{A} \).

**Notation 7.11** Given an algebra, \( \mathcal{A} \subset 2^\Omega \), let \( \mathbb{S}(\mathcal{A}) \) denote the collection of simple random variables from \( \Omega \) to \( \mathbb{C} \). For example if \( \mathcal{A} = \mathcal{A}_\Omega \), then \( 1_\Omega = \mathbb{S}(\mathcal{A}) \) is a measurable simple function.

**Lemma 7.12.** Let \( \mathcal{A} \subset 2^\Omega \) be an algebra, then;

1. \( \mathbb{S}(\mathcal{A}) \) is a sub-algebra of all functions from \( \Omega \) to \( \mathbb{C} \).
2. \( f : \Omega \to \mathbb{C} \), is a \( \mathcal{A} \)–simple random variable iff there exists \( \alpha_i \in \mathbb{C} \) and \( \mathcal{A}_i \in \mathcal{A} \) for \( 1 \leq i \leq n \) such that
   \[
   f = \sum_{i=1}^{n} \alpha_i 1_{\mathcal{A}_i}.
   \]
3. For any function, \( F : \mathbb{C} \to \mathbb{C} \), \( F \circ f \in \mathbb{S}(\mathcal{A}) \) for all \( f \in \mathbb{S}(\mathcal{A}) \). In particular, \( |f| \in \mathbb{S}(\mathcal{A}) \) if \( f \in \mathbb{S}(\mathcal{A}) \).

**Proof.** 1. Let us observe that \( 1_\Omega = 1 \) and \( 1_\emptyset = 0 \) are in \( \mathbb{S}(\mathcal{A}) \). If \( f, g \in \mathbb{S}(\mathcal{A}) \) and \( c \in \mathbb{C} \setminus \{0\} \), then
   \[
   \{ f + cg = \lambda \} = \bigcup_{a, b \in \mathbb{C} : \alpha + cb = \lambda} (\{ f = a \} \cap \{ g = b \}) \in \mathcal{A}
   \]
   and
   \[
   \{ f \cdot g = \lambda \} = \bigcup_{a, b \in \mathbb{C} : \alpha \cdot b = \lambda} (\{ f = a \} \cap \{ g = b \}) \in \mathcal{A}
   \]
   from which it follows that \( f + cg \) and \( f \cdot g \) are back in \( \mathbb{S}(\mathcal{A}) \).

2. Since \( \mathbb{S}(\mathcal{A}) \) is an algebra, every \( f \) of the form in Eq. (7.10) is in \( \mathbb{S}(\mathcal{A}) \). Conversely if \( f \in \mathbb{S}(\mathcal{A}) \) it follows by definition that
   \[
   f = \sum_{\alpha \in f(\Omega)} \alpha 1_{\{ f = \alpha \}}
   \]
   which is of the form in Eq. (7.10).

3. If \( F : \mathbb{C} \to \mathbb{C} \), then
   \[
   F \circ f = \sum_{\alpha \in f(\Omega)} F(\alpha) \cdot 1_{\{ f = \alpha \}} \in \mathbb{S}(\mathcal{A}).
   \]

**Exercise 7.1 (\( \mathcal{A} \)–measurable simple functions).** As in Example 6.19 let \( \mathcal{A} \subset 2^X \) be a finite algebra and \( \{ B_1, \ldots, B_k \} \) be the partition of \( X \) associated to \( \mathcal{A} \). Show that a function, \( f : X \to \mathbb{C} \), is an \( \mathcal{A} \)–simple function iff \( f \) is constant on \( B_i \) for each \( i \). Thus any \( \mathcal{A} \)–simple function is of the form,
   \[
   f = \sum_{i=1}^{k} \alpha_i 1_{B_i}
   \]
   for some \( \alpha_i \in \mathbb{C} \).

**Corollary 7.13.** Suppose that \( \Lambda \) is a finite set and \( Z : X \to \Lambda \) is a function. Let
   \[
   \mathcal{A} := \mathcal{A}(Z) := Z^{-1}(\mathcal{2}^{\Lambda}) := \{ Z^{-1}(E) : E \subset \Lambda \}.
   \]
   Then \( \mathcal{A} \) is an algebra and \( f : X \to \mathbb{C} \) is an \( \mathcal{A} \)–simple function iff \( f = F \circ Z \) for some function \( F : \Lambda \to \mathbb{C} \).

**Proof.** For \( \lambda \in \Lambda \), let
   \[
   \mathcal{A}_\lambda := \{ Z = \lambda \} = \{ x \in X : Z(x) = \lambda \}.
   \]
   The \( \{ \mathcal{A}_\lambda \}_{\lambda \in \Lambda} \) is the partition of \( X \) determined by \( \mathcal{A} \). Therefore \( f \) is an \( \mathcal{A} \)–simple function iff \( f|_{\mathcal{A}_\lambda} \) is constant for each \( \lambda \in \Lambda \). Let us denote this constant value by \( F(\lambda) \). As \( Z = \lambda \) on \( \mathcal{A}_\lambda \), \( F : \Lambda \to \mathbb{C} \) is a function such that \( f = F \circ Z \).

Conversely if \( F : \Lambda \to \mathbb{C} \) is a function and \( f = F \circ Z \), then \( f = F(\lambda) \) on \( \mathcal{A}_\lambda \), i.e. \( f \) is an \( \mathcal{A} \)–simple function.

#### 7.2.1 The algebraic structure of simple functions*

**Definition 7.14.** A simple function algebra, \( \mathbb{S} \), is a subalgebra\(^1\) of the bounded complex functions on \( X \) such that \( 1 \in \mathbb{S} \) and each function in \( \mathbb{S} \) is a simple function. If \( \mathbb{S} \) is a simple function algebra, let
   \[
   \mathcal{A}(\mathbb{S}) := \{ \mathcal{A} \subset X : 1_\mathcal{A} \in \mathbb{S} \}.
   \]

(\( \text{It is easily checked that } \mathcal{A}(\mathbb{S}) \text{ is a sub-algebra of } 2^X. \))

\(^1\)To be more explicit, we are assuming that \( \mathbb{S} \) is a linear subspace of bounded functions which is closed under pointwise multiplication.
Lemma 7.15. Suppose that $\mathcal{S}$ is a simple function algebra, $f \in \mathcal{S}$ and $\alpha \in f(X)$ – the range of $f$. Then $\{f = \alpha\} \in \mathcal{A}(\mathcal{S})$.

Proof. Let $\{\lambda_i\}_{i=0}^n$ be an enumeration of $f(X)$ with $\lambda_0 = \alpha$. Then

$$g := \prod_{i=1}^n (\alpha - \lambda_i)^{-1} \prod_{i=1}^n (f - \lambda_i) \in \mathcal{S}.$$ 

Moreover, we see that $g = 0$ on $\cup_{i=1}^n \{f = \lambda_i\}$ while $g = 1$ on $\{f = \alpha\}$. So we have shown $g = 1_{\{f = \alpha\}} \in \mathcal{S}$ and therefore that $\{f = \alpha\} \in \mathcal{A}(\mathcal{S})$. ■

Exercise 7.2. Continuing the notation introduced above:

1. Show $\mathcal{A}(\mathcal{S})$ is an algebra of sets.
2. Show $\mathcal{S}(\mathcal{A})$ is a simple function algebra.
3. Show that the map

$$A \in \{\text{Algebras } \subset 2^X\} \to \mathcal{S}(\mathcal{A}) \in \{\text{simple function algebras on } X\},$$

is bijective and the map, $\mathcal{S} \to \mathcal{A}(\mathcal{S})$, is the inverse map.

7.3 Simple Integration

Definition 7.16 (Simple Integral). Suppose now that $P$ is a finitely additive probability measure on an algebra $\mathcal{A} \subset 2^X$. For $f \in \mathcal{S}(\mathcal{A})$ the integral or expectation, $\mathbb{E}(f) = \mathbb{E}_P(f)$, is defined by

$$\mathbb{E}_P(f) = \int_X f \, dP = \sum_{y \in \mathbb{C}} yP(f = y). \quad (7.14)$$

Example 7.17. Suppose that $A \in \mathcal{A}$, then

$$\mathbb{E}_{1_A} = 0 \cdot P(A^c) + 1 \cdot P(A) = P(A). \quad (7.15)$$

Remark 7.18. Let us recall that our intuitive notion of $P(A)$ was given as in Eq. (7.2) by

$$P(A) = \lim_{N \to \infty} \frac{1}{N} \sum_{k=1}^N 1_A(\omega(k))$$

where $\omega(k) \in \Omega$ was the result of the $k$-th “independent” experiment. If we use this interpretation back in Eq. (7.14) we arrive at,

$$\mathbb{E}(f) = \sum_{y \in \mathbb{C}} yP(f = y) = \sum_{y \in \mathbb{C}} y \cdot \lim_{N \to \infty} \frac{1}{N} \sum_{k=1}^N 1_{f(\omega(k))=y}$$

$$= \lim_{N \to \infty} \frac{1}{N} \sum_{y \in \mathbb{C}} \sum_{k=1}^N 1_{f(\omega(k))=y}$$

$$= \lim_{N \to \infty} \frac{1}{N} \sum_{k=1}^N f(\omega(k)) \cdot 1_{f(\omega(k))=y}$$

$$= \lim_{N \to \infty} \frac{1}{N} \sum_{k=1}^N f(\omega(k)).$$

Thus informally, $\mathbb{E}f$ should represent the limiting average of the values of $f$ over many “independent” experiments. We will come back to this later when we study the strong law of large numbers.

Proposition 7.19. The expectation operator, $\mathbb{E} = \mathbb{E}_P : \mathcal{S}(\mathcal{A}) \to \mathbb{C}$, satisfies:

1. If $f \in \mathcal{S}(\mathcal{A})$ and $\lambda \in \mathbb{C}$, then

$$\mathbb{E}(\lambda f) = \lambda \mathbb{E}(f). \quad (7.16)$$

2. If $f, g \in \mathcal{S}(\mathcal{A})$, then

$$\mathbb{E}(f + g) = \mathbb{E}(g) + \mathbb{E}(f). \quad (7.17)$$

Items 1. and 2. say that $\mathbb{E}(\cdot)$ is a linear functional on $\mathcal{S}(\mathcal{A})$.

3. If $f = \sum_{j=1}^N \lambda_j 1_{A_j}$ for some $\lambda_j \in \mathbb{C}$ and some $A_j \in \mathcal{C}$, then

$$\mathbb{E}(f) = \sum_{j=1}^N \lambda_j P(A_j). \quad (7.18)$$

4. $\mathbb{E}$ is positive, i.e. $\mathbb{E}(f) \ge 0$ for all $0 \le f \in \mathcal{S}(\mathcal{A})$. More generally, if $f, g \in \mathcal{S}(\mathcal{A})$ and $f \le g$, then $\mathbb{E}(f) \le \mathbb{E}(g)$.

5. For all $f \in \mathcal{S}(\mathcal{A}),$

$$|\mathbb{E}f| \le \mathbb{E}|f|. \quad (7.19)$$

Proof.

1. If $\lambda \neq 0$, then

$$\mathbb{E}(\lambda f) = \sum_{y \in \mathbb{C}} y \cdot P(\lambda f = y) = \sum_{y \in \mathbb{C}} y \cdot P(f = y/\lambda)$$

$$= \sum_{z \in \mathbb{C}} \lambda z \cdot P(f = z) = \lambda \mathbb{E}(f).$$

The case $\lambda = 0$ is trivial.
2. Writing \( \{f = a, g = b\} \) for \( f^{-1}(\{a\}) \cap g^{-1}(\{b\}) \), then
\[
\mathbb{E}(f + g) = \sum_{z \in \mathbb{C}} z P(f + g = z)
\]
\[
= \sum_{z \in \mathbb{C}} z \left( \sum_{a+b=z} \{f = a, g = b\} \right)
\]
\[
= \sum_{z \in \mathbb{C}} \sum_{a+b=z} P(\{f = a, g = b\})
\]
\[
= \sum_{z \in \mathbb{C}} \sum_{a+b=z} (a + b) P(\{f = a, g = b\})
\]
\[
= \sum_{a,b} (a + b) P(\{f = a, g = b\}).
\]

But
\[
\sum_{a,b} a P(\{f = a, g = b\}) = \sum_a a \sum_b P(\{f = a, g = b\})
\]
\[
= \sum_a a P(\cup_b \{f = a, g = b\})
\]
\[
= \sum_a a P(\{f = a\}) = \mathbb{E} f
\]
and similarly,
\[
\sum_{a,b} b P(\{f = a, g = b\}) = \mathbb{E} g.
\]
Equation (7.17) is now a consequence of the last three displayed equations.

3. If \( f = \sum_{j=1}^{\infty} \lambda_j 1_{A_j} \), then
\[
\mathbb{E} f = \mathbb{E} \left[ \sum_{j=1}^{\infty} \lambda_j 1_{A_j} \right] = \sum_{j=1}^{\infty} \lambda_j \mathbb{E} 1_{A_j} = \sum_{j=1}^{\infty} \lambda_j P(A_j).
\]

4. If \( f \geq 0 \) then
\[
\mathbb{E}(f) = \sum_{a \geq 0} a P(f = a) \geq 0
\]
and if \( g \leq f \), then \( g - f \geq 0 \) so that
\[
\mathbb{E}(g) - \mathbb{E}(f) = \mathbb{E}(g - f) \geq 0.
\]

5. By the triangle inequality,
\[
|\mathbb{E} f| = \left| \sum_{\lambda \in \mathbb{C}} \lambda P(f = \lambda) \right| \leq \sum_{\lambda \in \mathbb{C}} |\lambda| P(f = \lambda) = \mathbb{E} |f|,
\]
wherein the last equality we have used Eq. (7.18) and the fact that \( |f| = \sum_{\lambda \in \mathbb{C}} |\lambda| 1_{f=\lambda} \).

**Remark 7.20.** If \( \Omega \) is a finite set and \( \mathbb{A} = 2^\Omega \), then
\[
f(\cdot) = \sum_{\omega \in \Omega} f(\omega) 1_{(\omega)}
\]
and hence
\[
\mathbb{E}_P f = \sum_{\omega \in \Omega} f(\omega) P(\{\omega\}).
\]

**Remark 7.21.** All of the results in Proposition 7.19 and Remark 7.20 remain valid when \( P \) is replaced by a finite measure, \( \mu : \mathbb{A} \to [0, \infty) \), i.e. it is enough to assume \( \mu(X) < \infty \).

**Exercise 7.3.** Let \( P \) is a finitely additive probability measure on an algebra \( \mathbb{A} \subset 2^\mathbb{X} \) and for \( A, B \in \mathbb{A} \) let \( \rho(A, B) := P(A \Delta B) \) where \( A \Delta B = (A \setminus B) \cup (B \setminus A) \). Show:

1. \( \rho(A, B) = \mathbb{E}[1_A - 1_B] \) and then use this (or not) to show
2. \( \rho(A, C) \leq \rho(A, B) + \rho(B, C) \) for all \( A, B, C \in \mathbb{A} \).

Remark: it is now easy to see that \( \rho : \mathbb{A} \times \mathbb{A} \to [0, 1] \) satisfies the axioms of a metric except for the condition that \( \rho(A, B) = 0 \) does not imply that \( A = B \) but only that \( A = B \) modulo a set of probability zero.

**Remark 7.22 (Chebyshev’s Inequality).** Suppose that \( f \in \mathcal{S}(\mathbb{A}), \varepsilon > 0 \), and \( p > 0 \), then
\[
1_{|f| \geq \varepsilon} \leq \frac{|f|^p}{\varepsilon^p} 1_{|f| \geq \varepsilon} \leq \varepsilon^{-p} |f|^p
\]
and therefore, see item 4. of Proposition 7.19,
\[
P(\{|f| \geq \varepsilon\}) = \mathbb{E} 1_{|f| \geq \varepsilon} \leq \mathbb{E} \left[ \frac{|f|^p}{\varepsilon^p} 1_{|f| \geq \varepsilon} \right] \leq \varepsilon^{-p} \mathbb{E} |f|^p.
\]
(7.20)

Observe that
\[
|f|^p = \sum_{\lambda \in \mathbb{C}} |\lambda|^p 1_{f=\lambda}
\]
is a simple random variable and \( \{|f| \geq \varepsilon\} = \sum_{|\lambda| \geq \varepsilon} \{f = \lambda\} \in \mathbb{A} \) as well. Therefore, \( \varepsilon^{-p} |f|^p 1_{|f| \geq \varepsilon} \) is still a simple random variable.
Lemma 7.23 (Inclusion Exclusion Formula). If \( A_n \in \mathcal{A} \) for \( n = 1, 2, \ldots, M \) such that \( \mu \left( \bigcup_{n=1}^{M} A_n \right) < \infty \), then

\[
\mu \left( \bigcup_{n=1}^{M} A_n \right) = \sum_{k=1}^{M} (-1)^{k+1} \sum_{1 \leq n_1 < n_2 < \cdots < n_k \leq M} \mu \left( A_{n_1} \cap \cdots \cap A_{n_k} \right). \tag{7.21}
\]

Proof. This may be proved inductively from Eq. (7.2). We will give a different and perhaps more illuminating proof here. Let \( A := \bigcup_{n=1}^{M} A_n \).

Since \( A^c = \left( \bigcup_{n=1}^{M} A_n \right)^c = \bigcap_{n=1}^{M} A^c_n \), we have

\[
1 - 1_A = 1_{A^c} = \prod_{n=1}^{M} 1_{A^c_n} = \prod_{n=1}^{M} (1 - 1_{A_n})
\]

\[
= 1 + \sum_{k=1}^{M} (-1)^{k} \sum_{1 \leq n_1 < n_2 < \cdots < n_k \leq M} 1_{A_{n_1} \cdots A_{n_k}}
\]

\[
= 1 + \sum_{k=1}^{M} (-1)^{k} \sum_{1 \leq n_1 < n_2 < \cdots < n_k \leq M} 1_{A_{n_1} \cap \cdots \cap A_{n_k}}
\]

from which it follows that

\[
1_{\bigcup_{n=1}^{M} A_n} = 1_A = \sum_{k=1}^{M} (-1)^{k+1} \sum_{1 \leq n_1 < n_2 < \cdots < n_k \leq M} 1_{A_{n_1} \cap \cdots \cap A_{n_k}}. \tag{7.22}
\]

Integrating this identity with respect to \( \mu \) gives Eq. (7.21). \( \square \)

Remark 7.24. The following identity holds even when \( \mu \left( \bigcup_{n=1}^{M} A_n \right) = \infty \),

\[
\mu \left( \bigcup_{n=1}^{M} A_n \right) + \sum_{k=2}^{M} \sum_{\substack{k \text{ even} \\ 1 \leq n_1 < n_2 < \cdots < n_k \leq M}} \mu \left( A_{n_1} \cap \cdots \cap A_{n_k} \right)
\]

\[
= \sum_{k=1}^{M} \sum_{\substack{k \text{ odd} \\ 1 \leq n_1 < n_2 < \cdots < n_k \leq M}} \mu \left( A_{n_1} \cap \cdots \cap A_{n_k} \right). \tag{7.23}
\]

This can be proved by moving every term with a negative sign on the right side of Eq. (7.22) to the left side and then integrate the resulting identity. Alternatively, Eq. (7.23) follows directly from Eq. (7.21) if \( \mu \left( \bigcup_{n=1}^{M} A_n \right) < \infty \) and when \( \mu \left( \bigcup_{n=1}^{M} A_n \right) = \infty \) one easily verifies that both sides of Eq. (7.23) are infinite.

To better understand Eq. (7.22), consider the case \( M = 3 \) where,

\[
1 - 1_A = (1 - 1_{A_1})(1 - 1_{A_2})(1 - 1_{A_3})
\]

\[
= 1 - (1_{A_1} + 1_{A_2} + 1_{A_3}) + 1_{A_1}1_{A_2} + 1_{A_1}1_{A_3} + 1_{A_2}1_{A_3} - 1_{A_1}1_{A_2}1_{A_3}
\]

so that

\[
1_{A_1 \cup A_2 \cup A_3} = 1_{A_1} + 1_{A_2} + 1_{A_3} - (1_{A_1 \cap A_2} + 1_{A_1 \cap A_3} + 1_{A_2 \cap A_3}) + 1_{A_1 \cap A_2 \cap A_3}
\]

Here is an alternate proof of Eq. (7.22). Let \( \omega \in \Omega \) and by relabeling the sets \( \{ A_n \} \) if necessary, we may assume that \( \omega \in A_1 \cap \cdots \cap A_m \) and \( \omega \notin A_{m+1} \cup \cdots \cup A_M \) for some \( 0 \leq m \leq M \). (When \( m = 0 \), both sides of Eq. (7.22) are zero and so we will only consider the case where \( 1 \leq m \leq M \).) With this notation we have

\[
\sum_{k=1}^{M} (-1)^{k+1} \sum_{1 \leq n_1 < n_2 < \cdots < n_k \leq M} 1_{A_{n_1} \cap \cdots \cap A_{n_k}}(\omega)
\]

\[
= \sum_{k=1}^{m} (-1)^{k+1} \sum_{1 \leq n_1 < n_2 < \cdots < n_k \leq m} 1_{A_{n_1} \cap \cdots \cap A_{n_k}}(\omega)
\]

\[
= \sum_{k=1}^{m} (-1)^{k+1} \binom{m}{k}
\]

\[
= 1 - \sum_{k=0}^{m} (-1)^k \left( \frac{n}{k} \right)
\]

\[
= 1 - (1 - 1)^m = 1.
\]

This verifies Eq. (7.22) since \( 1_{\bigcup_{n=1}^{M} A_n}(\omega) = 1 \).

Example 7.25 (Coincidences). Let \( \Omega \) be the set of permutations (think of card shuffling), \( \omega : \{1, 2, \ldots, n\} \to \{1, 2, \ldots, n\} \), and define \( P(A) := \frac{\#(A)}{n!} \) to be the uniform distribution (Haar measure) on \( \Omega \). We wish to compute the probability of the event, \( B \), that a random permutation fixes some index \( i \). To do this, let \( A_i := \{ \omega \in \Omega : \omega(i) = i \} \) and observe that \( B = \bigcup_{i=1}^{n} A_i \). So by the Inclusion Exclusion Formula, we have

\[
P(B) = \sum_{k=1}^{n} (-1)^{k+1} \sum_{1 \leq i_1 < i_2 < \cdots < i_k \leq n} P(A_{i_1} \cap \cdots \cap A_{i_k}).
\]

Since

\[
P(A_{i_1} \cap \cdots \cap A_{i_k}) = P(\{ \omega \in \Omega : \omega(i_1) = i_1, \ldots, \omega(i_k) = i_k \})
\]

\[
= \frac{(n-k)!}{n!}
\]
and
\[ \# \{ 1 \leq i_1 < i_2 < \cdots < i_k \leq n \} = \binom{n}{k}, \]
we find
\[ P(B) = \sum_{k=1}^{n} (-1)^{k+1} \binom{n}{k} \frac{(n-k)!}{n!} = \sum_{k=1}^{n} (-1)^{k+1} \frac{1}{k!}. \]  
(7.24)

For large \( n \) this gives,
\[ P(B) = -\sum_{k=1}^{n} \frac{1}{k!} (-1)^{k} \simeq 1 - \sum_{k=0}^{\infty} \frac{1}{k!} (-1)^{k} = 1 - e^{-1} \simeq 0.632. \]

**Example 7.26 (Expected number of coincidences).** Continue the notation in Example 7.25. We now wish to compute the expected number of fixed points of a random permutation, \( \omega \), i.e. how many cards in the shuffled stack have not moved on average. To this end, let
\[ X_i = 1_{A_i}, \]
and observe that
\[ N(\omega) = \sum_{i=1}^{n} X_i(\omega) = \sum_{i=1}^{n} 1_{\omega(i)=i} = \# \{ i : \omega(i) = i \}. \]
denote the number of fixed points of \( \omega \). Hence we have
\[ \mathbb{E}N = \sum_{i=1}^{n} \mathbb{E}X_i = \sum_{i=1}^{n} P(A_i) = \sum_{i=1}^{n} \frac{(n-1)!}{n!} = 1. \]

Let us check the above formulas when \( n = 3 \). In this case we have
\[
\begin{array}{ccc}
\omega & N(\omega) \\
1 & 2 & 3 & 3 \\
1 & 3 & 2 & 1 \\
2 & 1 & 3 & 1 \\
2 & 3 & 1 & 0 \\
3 & 1 & 2 & 0 \\
3 & 2 & 1 & 1 \\
\end{array}
\]
and so
\[ P(\exists \text{ a fixed point}) = \frac{4}{6} = \frac{2}{3} \simeq 0.67 \simeq 0.632 \]
while
\[ \sum_{k=1}^{3} (-1)^{k+1} \frac{1}{k!} = 1 - \frac{1}{2} + \frac{1}{6} = \frac{2}{3}, \]
and
\[ \mathbb{E}N = \frac{1}{6} (3 + 1 + 1 + 0 + 0 + 1) = 1. \]

The next three problems generalize the results above. The following notation will be used throughout these exercises.

1. \((\Omega, A, P)\) is a finitely additive probability space, so \( P(\Omega) = 1 \),
2. \( A_i \in A \) for \( i = 1, 2, \ldots, n \),
3. \( N(\omega) := \sum_{i=1}^{n} 1_{A_i}(\omega) = \# \{ i : \omega \in A_i \} \), and
4. \( \{ S_k \}_{k=1}^{n} \) are given by
\[ S_k := \sum_{1 \leq i_1 < \cdots < i_k \leq n} P(A_{i_1} \cap \cdots \cap A_{i_k}) \]
\[ = \sum_{A \subseteq \{1, 2, \ldots, n\} \exists |A| = k} P(\cap_{i \in A} A_i). \]

**Exercise 7.4.** For \( 1 \leq k \leq n \), show;
1. (as functions on \( \Omega \)) that
\[ \left( \begin{array}{c} n \\ k \end{array} \right) = \sum_{|A| = k} 1_{\cap_{i \in A} A_i}, \]
(7.25)
where by definition
\[ \left( \begin{array}{c} m \\ k \end{array} \right) = \left\{ \begin{array}{ll}
0 & \text{if } k > m \\
\frac{m!}{k!(m-k)!} & \text{if } 1 \leq k \leq m \\
1 & \text{if } k = 0
\end{array} \right. . \]
(7.26)
2. Conclude from Eq. (7.25) that for all \( z \in \mathbb{C} \),
\[ (1+z)^N = 1 + \sum_{k=1}^{n} z^k \sum_{1 \leq i_1 < \cdots < i_k \leq n} 1_{A_{i_1} \cap \cdots \cap A_{i_k}} \]
(7.27)
provided \((1+z)^0 = 1\) even when \( z = -1 \).
3. Conclude from Eq. (7.25) that \( S_k = \mathbb{E}P(\left( \begin{array}{c} N \\ k \end{array} \right). \]

**Exercise 7.5.** Taking expectations of Eq. (7.27) implies,
\[ \mathbb{E}[(1+z)^N] = 1 + \sum_{k=1}^{n} S_k z^k. \]
(7.28)

Show that setting \( z = -1 \) in Eq. (7.28) gives another proof of the inclusion exclusion formula. **Hint:** use the definition of the expectation to write out \( \mathbb{E}[(1+z)^N] \) explicitly.
Exercise 7.6. Let $1 \leq m \leq n$. In this problem you are asked to compute the probability that there are exactly $m$ coincidences. Namely you should show,

$$P(N = m) = \sum_{k=m}^{n} (-1)^{k-m} \binom{k}{m} S_k$$

$$= \sum_{k=m}^{n} (-1)^{k-m} \binom{k}{m} \sum_{1 \leq i_1 < \cdots < i_k \leq n} P(A_{i_1} \cap \cdots \cap A_{i_k})$$

**Hint:** differentiate Eq. (7.28) $m$ times with respect to $z$ and then evaluate the result at $z = -1$. In order to do this you will find it useful to derive formulas for:

$$\frac{d^m}{dz^m}|_{z=-1} (1 + z)^n$$ and $$\frac{d^m}{dz^m}|_{z=-1} z^k$$

**Example 7.27.** Let us again go back to Example 7.26 where we computed,

$$S_k = \binom{n}{k} \frac{(n-k)!}{n!} = \frac{1}{k!}.$$ 

Therefore it follows from Exercise 7.6 that

$$P(\exists \text{ exactly } m \text{ fixed points}) = P(N = m)$$

$$= \sum_{m=1}^{n} \sum_{k=m}^{n} (-1)^{k-m} \binom{k}{m} \frac{1}{k!}$$

$$= \sum_{m=1}^{n} \sum_{k=m}^{n} (-1)^{k-m} \binom{k}{m} \frac{1}{k!}$$

$$= \sum_{k=1}^{n} \left[ \sum_{m=0}^{k} (-1)^{k-m} \binom{k}{m} - (-1)^{k} \right] \frac{1}{k!}$$

$$= -\sum_{k=1}^{n} (-1)^{k} \frac{1}{k!}.$$ 

wherein we have used,

$$\sum_{m=0}^{k} (-1)^{k-m} \binom{k}{m} = (1 - 1)^k = 0.$$ 

7.3.1 Appendix: Bonferroni Inequalities

In this appendix (see Feller Volume 1., p. 106-111 for more) we want to discuss what happens if we truncate the sums in the inclusion exclusion formula of Lemma 7.23. In order to do this we will need the following lemma whose combinatorial meaning was explained to me by Jeff Remmel.

**Lemma 7.28.** Let $n \in \mathbb{N}_0$ and $0 \leq k \leq n$, then

$$\sum_{l=0}^{k} (-1)^l \binom{n}{l} = (-1)^k \binom{n-1}{k} 1_{n>0} + 1_{n=0}. \quad (7.29)$$

**Proof.** The case $n = 0$ is trivial. We give two proofs for when $n \in \mathbb{N}$.

**First proof.** Just use induction on $k$. When $k = 0$, Eq. (7.29) holds since $1 = 1$. The induction step is as follows,
\[
\sum_{l=0}^{k+1} (-1)^l \binom{n}{l} = (-1)^k \binom{n-1}{k} + \binom{n}{k+1}
\]

\[
= \frac{(-1)^{k+1}}{(k+1)!} (n(n-1) \ldots (n-k) - (k+1)(n-1) \ldots (n-k))
\]

\[
= \frac{(-1)^{k+1}}{(k+1)!} [(n-1) \ldots (n-k)(n-(k+1))] = (-1)^{k+1} \binom{n-1}{k+1}.
\]

**Second proof.** Let \( X = \{1, 2, \ldots, n\} \) and observe that

\[
m_k := \sum_{l=0}^{k} (-1)^l \binom{n}{l} = \sum_{l=0}^{k} (-1)^l \cdot \#(A \in 2^X : \#(A) = l)
\]

\[
= \sum_{A \in 2^X : \#(A) \leq k} (-1)^{\#(A)}
\]

(7.30)

Define \( T : 2^X \rightarrow 2^X \) by

\[
T(S) = \begin{cases} 
S \cup \{1\} & \text{if } 1 \notin S \\
S \setminus \{1\} & \text{if } 1 \in S.
\end{cases}
\]

Observe that \( T \) is a bijection of \( 2^X \) such that \( T \) takes even cardinality sets to odd cardinality sets and visa versa. Moreover, if we let

\[
\Gamma_k := \{ A \in 2^X : \#(A) \leq k \text{ and } 1 \in A \text{ if } \#(A) = k \},
\]

then \( T(\Gamma_k) = \Gamma_k \) for all \( 1 \leq k \leq n \). Since

\[
\sum_{A \in \Gamma_k} (-1)^{\#(A)} = \sum_{A \in \Gamma_k} (-1)^{\#(T(A))} = \sum_{A \in \Gamma_k} (-1)^{\#(A)}
\]

we see that \( \sum_{A \in \Gamma_k} (-1)^{\#(A)} = 0 \). Using this observation with Eq. (7.30) implies

\[
m_k = \sum_{A \in \Gamma_k} (-1)^{\#(A)} + \sum_{A \in \Gamma_k} (-1)^{\#(A)} = 0 + (-1)^k \binom{n-1}{k}.
\]

Corollary 7.29 (Bonferroni Inequalities). Let \( \mu : \mathcal{A} \rightarrow [0, \mu(X)] \) be a finitely additive finite measure on \( \mathcal{A} \subseteq 2^X \), \( A_n \in \mathcal{A} \) for \( n = 1, 2, \ldots, M \), \( N := \sum_{n=1}^{M} A_n \), and

\[
S_k := \sum_{1 \leq i_1 < \cdots < i_k \leq M} \mu(A_{i_1} \cap \cdots \cap A_{i_k}) = \mathbb{E}_\mu \left[ \binom{N}{k} \right].
\]

Then for \( 1 \leq k \leq M \),

\[
\mu \left( \bigcup_{n=1}^{M} A_n \right) = \sum_{l=1}^{k} (-1)^{l+1} S_l + (-1)^k \mathbb{E}_\mu \left[ \binom{N-1}{k} \right].
\]

(7.31)

This leads to the Bonferroni inequalities;

\[
\mu \left( \bigcup_{n=1}^{M} A_n \right) \leq \sum_{l=1}^{k} (-1)^{l+1} S_l \text{ if } k \text{ is odd}
\]

and

\[
\mu \left( \bigcup_{n=1}^{M} A_n \right) \geq \sum_{l=1}^{k} (-1)^{l+1} S_l \text{ if } k \text{ is even}.
\]

**Proof.** By Lemma 7.28

\[
\sum_{l=0}^{k} (-1)^l \binom{N}{l} = (-1)^k \binom{N-1}{k} 1_{N>0} + 1_{N=0}.
\]

Therefore integrating this equation with respect to \( \mu \) gives,

\[
\mu(X) + \sum_{l=1}^{k} (-1)^l S_l = \mu(N = 0) + (-1)^k \mathbb{E}_\mu \binom{N-1}{k}
\]

and therefore,

\[
\mu \left( \bigcup_{n=1}^{M} A_n \right) = \mu(N > 0) = \mu(X) - \mu(N = 0)
\]

\[
= - \sum_{l=1}^{k} (-1)^l S_l + (-1)^k \mathbb{E}_\mu \left[ \binom{N-1}{k} \right].
\]

The Bonferroni inequalities are a simple consequence of Eq. (7.31) and the fact that

\[
\binom{N-1}{k} \geq 0 \implies \mathbb{E}_\mu \left[ \binom{N-1}{k} \right] \geq 0.
\]

7.3.2 Appendix: Riemann Stieljtes integral

In this subsection, let \( X \) be a set, \( \mathcal{A} \subseteq 2^X \) be an algebra of sets, and \( P := \mu : \mathcal{A} \rightarrow [0, \infty) \) be a finitely additive measure with \( \mu(X) < \infty \). As above let

\[
\mathbb{E}_\mu f := \int_X f d\mu := \sum_{\lambda \in \mathcal{C}} \lambda \mu(f = \lambda) \forall f \in \mathcal{S}(\mathcal{A}).
\]

(7.32)
Let $S := S(A)$ denote those functions, $f : X \to \mathbb{C}$ such that there exists $f_n \in S(A)$ such that $\lim_{n \to \infty} \|f - f_n\|_u = 0$.

**Exercise 7.7.** Prove the following statements.

1. For all $f \in S(A)$,
   \[ |\mathbb{E}_f| \leq \mu(X) \|f\|_u. \tag{7.33} \]
2. If $f \in S$ and $f_n \in S := S(A)$ such that $\lim_{n \to \infty} \|f - f_n\|_u = 0$, show $\lim_{n \to \infty} \mathbb{E}_f f_n$ exists. Also show that defining $\mathbb{E}_f := \lim_{n \to \infty} \mathbb{E}_f f_n$ is well defined, i.e. you must show that $\lim_{n \to \infty} \mathbb{E}_f f_n = \lim_{n \to \infty} \mathbb{E}_f g_n$ if $g_n \in S$ such that $\lim_{n \to \infty} \|f - g_n\|_u = 0$.
3. Show $\mathbb{E}_f : S \to \mathbb{C}$ is still linear and still satisfies Eq. (7.33).
4. Show that $|f| \in S$ if $f \in S$ and that Eq. (7.19) is still valid, i.e. $|\mathbb{E}_f| \leq \mathbb{E}_|f|$ for all $f \in S$.

Let us now specialize the above results to the case where $X = [0, T]$ for some $T < \infty$. Let $\mathcal{S} := \{(a, b) : 0 \leq a \leq b \leq T\} \cup \{0\}$ which is easily seen to be a semi-algebra. The following proposition is fairly straightforward and will be left to the reader.

**Proposition 7.31 (Riemann Stieljes integral).** Let $F : [0, T] \to \mathbb{R}$ be an increasing function, then:

1. there exists a unique finitely additive measure, $\mu_F$, on $\mathcal{A} := S(\mathcal{S})$ such that $\mu_F((a, b)) = F(b) - F(a)$ for all $0 \leq a \leq b \leq T$ and $\mu_F(\{0\}) = 0$. (In fact one could allow for $\mu_F(\{0\}) = \lambda$ for any $\lambda \geq 0$, but we would then have to write $\mu_{F, \lambda}$ rather than $\mu_F$.)
2. Show $C([0, 1], \mathbb{C}) \subset S(\mathcal{S})$. More precisely, suppose $\pi := \{0 = t_0 < t_1 < \cdots < t_n = T\}$ is a partition of $[0, T]$ and $c = (c_1, \ldots, c_n) \in [0, T]^n$ with $t_{i-1} \leq c_i \leq t_i$ for each $i$. Then for $f \in C([0, 1], \mathbb{C})$, let
   \[ f_{\pi, c} := f(0) 1_{\{0\}} + \sum_{i=1}^{n} f(c_i) 1_{(t_{i-1}, t_i)}. \tag{7.34} \]
   Show that $\|f - f_{\pi, c}\|_u$ is small provided, $|\pi| := \max \{|t_i - t_{i-1}| : i = 1, 2, \ldots, n\}$ is small.
3. Using the above results, show
   \[ \int_{[0, T]} f d\mu_F = \lim_{|\pi| \to 0} \sum_{i=1}^{n} f(c_i) (F(t_i) - F(t_{i-1})) \]
   where the $c_i$ may be chosen arbitrarily subject to the constraint that $t_{i-1} \leq c_i \leq t_i$.

It is customary to write $\int_{0}^{T} f d\mu_F$ for $\int_{[0, T]} f d\mu_F$. This integral satisfies the estimates,
\[ \left| \int_{[0, T]} f d\mu_F \right| \leq \int_{[0, T]} |f| d\mu_F \leq \|f\|_u (F(T) - F(0)) \forall f \in S(\mathcal{S}). \]

When $F(t) = t$,
\[ \int_{0}^{T} f dF = \int_{0}^{T} f(t) dt, \]
is the usual Riemann integral.

**Exercise 7.8.** Let $\alpha \in (0, T)$, $\lambda > 0$, and
\[ G(x) = \lambda \cdot 1_{x \geq \alpha} = \begin{cases} \lambda & \text{if } x \geq \alpha \\ 0 & \text{if } x < \alpha \end{cases} \]
1. Explicitly compute $\int_{[0, T]} f d\mu_G$ for all $f \in C([0, 1], \mathbb{C})$.
2. If $F(x) = x + \lambda \cdot 1_{x \geq \alpha}$ describe $\int_{[0, T]} f d\mu_F$ for all $f \in C([0, 1], \mathbb{C})$. Hint: if $F(x) = G(x) + H(x)$ where $G$ and $H$ are two increasing functions on $[0, T]$, show
   \[ \int_{[0, T]} f d\mu_F = \int_{[0, T]} f d\mu_G + \int_{[0, T]} f d\mu_H. \]

**Exercise 7.9.** Suppose that $F, G : [0, T] \to \mathbb{R}$ are two increasing functions such that $F(0) = G(0)$, $F(T) = G(T)$, and $F(x) \neq G(x)$ for at most countably many points, $x \in (0, T)$, show
\[ \int_{[0, T]} f d\mu_F = \int_{[0, T]} f d\mu_G \text{ for all } f \in C([0, 1], \mathbb{C}). \tag{7.35} \]

Note well, given $F(0) = G(0), \mu_F = \mu_G$ on $\mathcal{A}$ if $F = G$.

One of the points of the previous exercise is to show that Eq. (7.35) holds when $G(x) := F(x+) - \text{the right continuous version of} \ F$. The exercise applies since and increasing function can have at most countably many jumps, see Remark 77. So if we only want to integrate continuous functions, we may always assume that $F : [0, T] \to \mathbb{R}$ is right continuous.

### 7.4 Simple Independence and the Weak Law of Large Numbers

To motivate the exercises in this section, let us imagine that we are following the outcomes of two “independent” experiments with values $\{\alpha_k\}_{k=1}^{\infty} \subset A_1$ and
Finitely Additive Measures / Integration

\{\beta_k\}_{k=1}^{\infty} \subset A_2 \text{ where } A_1 \text{ and } A_2 \text{ are two finite set of outcomes. Here we are using term independent in an intuitive form to mean that knowing the outcome of one of the experiments gives us no information about outcome of the other.}

As an example of independent experiments, suppose that one experiment is the outcome of spinning a roulette wheel and the second is the outcome of rolling a dice. We expect these two experiments will be independent.

As an example of dependent experiments, suppose that dice roller now has two dice – one red and one black. The person rolling dice throws his black or red dice after the roulette ball has stopped and landed on either black or red respectively. If the black and the red dice are weighted differently, we expect that these two experiments are no longer independent.

**Lemma 7.32 (Heuristic).** Suppose that \(\{\alpha_k\}_{k=1}^{\infty} \subset A_1\) and \(\{\beta_k\}_{k=1}^{\infty} \subset A_2\) are the outcomes of repeatedly running two experiments independent of each other for \(x \in A_1\) and \(y \in A_2\),

\[
p(x, y) := \lim_{N \to \infty} \frac{1}{N} \sum_{k=1}^{N} \{1 \leq k \leq N : \alpha_k = x \text{ and } \beta_k = y\},
\]

\[
p_1(x) := \lim_{N \to \infty} \frac{1}{N} \sum_{k=1}^{N} \{1 \leq k \leq N : \alpha_k = x\}, \text{ and}
\]

\[
p_2(y) := \lim_{N \to \infty} \frac{1}{N} \sum_{k=1}^{N} \{1 \leq k \leq N : \beta_k = y\}.
\]

(7.36)

Then \(p(x, y) = p_1(x)p_2(y)\). In particular, this then implies for any \(h : A_1 \times A_2 \to \mathbb{R}\) we have,

\[
E[h] = \lim_{N \to \infty} \frac{1}{N} \sum_{k=1}^{N} h(\alpha_k, \beta_k) = \sum_{(x,y) \in A_1 \times A_2} h(x, y)p_1(x)p_2(y).
\]

**Proof.** (Heuristic.) Let us imagine running the first experiment repeatedly with the results being recorded as, \(\{\alpha^\ell_k\}_{k=1}^{\infty}\), where \(\ell \in \mathbb{N}\) indicates the \(\ell\)-th run of the experiment. Then we have postulated that, independent of \(\ell\),

\[
p(x, y) := \lim_{N \to \infty} \frac{1}{N} \sum_{k=1}^{N} \{1 \leq k \leq N : \alpha^\ell_k = x \text{ and } \beta_k = y\} = \lim_{N \to \infty} \frac{1}{N} \sum_{k=1}^{N} \{1 \leq k \leq N : \alpha^\ell_k = x\} \cdot \{1 \beta_k = y\}
\]

So for any \(L \in \mathbb{N}\) we must also have,

\[
p(x, y) = \frac{1}{L} \sum_{\ell=1}^{L} p(x, y) = \frac{1}{L} \sum_{\ell=1}^{L} \lim_{N \to \infty} \frac{1}{N} \sum_{k=1}^{N} \{1 \leq k \leq N : \alpha^\ell_k = x\} \cdot \{1 \beta_k = y\}
\]

= \lim_{N \to \infty} \frac{1}{N} \sum_{k=1}^{N} \frac{1}{L} \sum_{\ell=1}^{L} \{1 \leq k \leq N : \alpha^\ell_k = x\} \cdot \{1 \beta_k = y\}.
\]

Taking the limit of this equation as \(L \to \infty\) and interchanging the order of the limits (this is faith based) implies,

\[
p(x, y) = \lim_{N \to \infty} \frac{1}{N} \sum_{k=1}^{N} \{1(\beta_k = y) \cdot \lim_{L \to \infty} \frac{1}{L} \sum_{\ell=1}^{L} \{1(\alpha^\ell_k = x)\}.
\]

(7.37)

Since for fixed \(k\), \(\{\alpha^\ell_k\}_{\ell=1}^{\infty}\) is just another run of the first experiment, by our postulate, we conclude that

\[
\lim_{L \to \infty} \frac{1}{L} \sum_{\ell=1}^{L} \{1(\alpha^\ell_k = x)\} = p_1(x)
\]

(7.38)

independent of the choice of \(k\). Therefore combining Eqs. (7.36), (7.37), and (7.38) implies,

\[
p(x, y) = \lim_{N \to \infty} \frac{1}{N} \sum_{k=1}^{N} \{1(\beta_k = y) \cdot p_1(x) = p_2(y)p_1(x).
\]

To understand this “Lemma” in another but equivalent way, let \(X_1 : A_1 \times A_2 \to A_1\) and \(X_2 : A_1 \times A_2 \to A_2\) be the projection maps, \(X_1(x, y) = x\) and \(X_2(x, y) = y\) respectively. Further suppose that \(f : A_1 \to \mathbb{R}\) and \(g : A_2 \to \mathbb{R}\) are functions, then using the heuristics Lemma 7.32 implies,

\[
E[f(X_1)g(X_2)] = \sum_{(x,y) \in A_1 \times A_2} f(x)g(y)p_1(x)p_2(y)
\]

\[= \sum_{x \in A_1} f(x)p_1(x) \sum_{y \in A_2} g(y)p_2(y) = Ef(X_1) \cdot Eg(X_2).
\]

Hopefully these heuristic computations will convince you that the mathematical notion of independence developed below is relevant. In what follows, we will use the obvious generalization of our “results” above to the setting of \(n\) independent experiments. For notational simplicity we will now assume that \(A_1 = A_2 = \cdots = A_n = A\).

Let \(\Omega\) be a finite set, \(n \in \mathbb{N}\), \(\Omega = A^n\), and \(X_i : \Omega \to A\) be defined by \(X_i(\omega) = \omega_i\) for \(\omega \in \Omega\) and \(i = 1, 2, \ldots, n\). We further suppose \(p : \Omega \to [0,1]\) is a function such that

\[
\sum_{\omega \in \Omega} p(\omega) = 1
\]

and \(P : 2^\Omega \to [0,1]\) is the probability measure defined by

\[
P(A) := \sum_{\omega \in A} p(\omega) \text{ for all } A \in 2^\Omega.
\]

(7.39)
Exercise 7.10 (Simple Independence 1.). Suppose $q_i : A \to [0, 1]$ are functions such that $\sum_{\lambda \in A} q_i (\lambda) = 1$ for $i = 1, 2, \ldots, n$ and now define $p (\omega) = \prod_{i=1}^n q_i (\omega_i)$. Show for any functions, $f_i : A \to \mathbb{R}$ that

$$
\mathbb{E}_P \left[ \prod_{i=1}^n f_i (X_i) \right] = \prod_{i=1}^n \mathbb{E}_P [f_i (X_i)] = \prod_{i=1}^n \mathbb{E}_Q f_i
$$

where $Q_i$ is the measure on $A$ defined by, $Q_i (\gamma) = \sum_{\lambda \in \gamma} q_i (\lambda)$ for all $\gamma \subset A$.

Exercise 7.11 (Simple Independence 2.). Prove the converse of the previous exercise. Namely, if

$$
\mathbb{E}_P \left[ \prod_{i=1}^n f_i (X_i) \right] = \prod_{i=1}^n \mathbb{E}_P [f_i (X_i)]
$$

for any functions, $f_i : A \to \mathbb{R}$, then there exists functions $q_i : A \to [0, 1]$ with $\sum_{\lambda \in A} q_i (\lambda) = 1$, such that $p (\omega) = \prod_{i=1}^n q_i (\omega_i)$.

Definition 7.33 (Independence). We say simple random variables, $X_1, \ldots, X_n$ with values in $A$ on some probability space, $(\Omega, \mathcal{A}, P)$ are independent (more precisely $P$ - independent) if Eq. (7.40) holds for all functions, $f_i : A \to \mathbb{R}$.

Exercise 7.12 (Simple Independence 3.). Let $X_1, \ldots, X_n : \Omega \to A$ and $P : 2^\Omega \to [0, 1]$ be as described before Exercise 7.10. Show $X_1, \ldots, X_n$ are independent iff

$$
P (X_1 \in A_1, \ldots, X_n \in A_n) = P (X_1 \in A_1) \cdots P (X_n \in A_n)
$$

for all choices of $A_i \subset A$. Also explain why it is enough to restrict the $A_i$ to single point subsets of $A$.

Exercise 7.13 (A Weak Law of Large Numbers). Suppose that $A \subset \mathbb{R}$ is a finite set, $n \in \mathbb{N}$, $\Omega = A^n$, $p (\omega) = \prod_{i=1}^n q (\omega_i)$ where $q : A \to [0, 1]$ such that $\sum_{\lambda \in A} q (\lambda) = 1$, and let $P : 2^\Omega \to [0, 1]$ be the probability measure defined as in Eq. (7.39). Further let $X_i (\omega) = \omega_i$ for $i = 1, 2, \ldots, n$, $\xi := \mathbb{E} X_i$, $\sigma^2 := \mathbb{V} (X_i - \xi)^2$, and

$$
S_n = \frac{1}{n} \sum_{i=1}^n X_i.
$$

1. Show, $\xi = \sum_{\lambda \in A} \lambda q (\lambda)$ and

$$
\sigma^2 = \sum_{\lambda \in A} (\lambda - \xi)^2 q (\lambda) = \sum_{\lambda \in A} \lambda^2 q (\lambda) - \xi^2.
$$

2. Show, $\mathbb{E} S_n = \xi$.

3. Let $\delta_{ij} = 1$ if $i = j$ and $\delta_{ij} = 0$ if $i \neq j$. Show

$$\mathbb{E} [(X_i - \xi) (X_j - \xi)] = \delta_{ij} \sigma^2.
$$

4. Using $S_n - \xi$ may be expressed as, $\frac{1}{n} \sum_{i=1}^n (X_i - \xi)$, show

$$
\mathbb{E} (S_n - \xi)^2 = \frac{1}{n} \sigma^2.
$$

5. Conclude using Eq. (7.43) and Remark 7.22 that

$$
P (\{|S_n - \xi| \geq \varepsilon\} \geq \frac{1}{n \varepsilon^2} \sigma^2.
$$

So for large $n$, $S_n$ is concentrated near $\xi = \mathbb{E} X_i$ with probability approaching 1 for $n$ large. This is a version of the weak law of large numbers.

Definition 7.34 (Covariance). Let $(\Omega, B, P)$ is a finitely additive probability. The covariance, $\text{Cov} (X, Y)$, of $X, Y \in \mathbb{S} (B)$ is defined by

$$
\text{Cov} (X, Y) = \mathbb{E} [(X - \xi_X) (Y - \xi_Y)] = \mathbb{E} [XY] - \mathbb{E} X \cdot \mathbb{E} Y
$$

where $\xi_X := \mathbb{E} X$ and $\xi_Y := \mathbb{E} Y$. The variance of $X$,

$$
\text{Var} (X) := \text{Cov} (X, X) = \mathbb{E} [X^2] - (\mathbb{E} X)^2
$$

We say that $X$ and $Y$ are uncorrelated if $\text{Cov} (X, Y) = 0$, i.e. $\mathbb{E} [XY] = \mathbb{E} X \cdot \mathbb{E} Y$. More generally we say $\{X_k\}_{k=1}^n \subset \mathbb{S} (B)$ are uncorrelated iff $\text{Cov} (X_i, X_j) = 0$ for all $i \neq j$.

Remark 7.35. 1. Observe that $X$ and $Y$ are independent iff $f (X)$ and $g (Y)$ are uncorrelated for all functions, $f$ and $g$ on the range of $X$ and $Y$ respectively. In particular if $X$ and $Y$ are independent then $\text{Cov} (X, Y) = 0$.

2. If you look at your proof of the weak law of large numbers in Exercise 7.13 you will see that it suffices to assume that $\{X_i\}_{i=1}^n$ are uncorrelated rather than the stronger condition of being independent.

Exercise 7.14 (Bernoulli Random Variables). Let $A = \{0, 1\}$, $X : A \to \mathbb{R}$ be defined by $X (0) = 0$ and $X (1) = 1$, $x \in [0, 1]$, and define $Q = x \delta_1 + (1-x) \delta_0$, i.e. $Q \{0\} = 1 - x$ and $Q \{1\} = x$. Verify,

$$
\xi (x) := \mathbb{E}_Q X = x
$$

$$
\sigma^2 (x) := \mathbb{E}_Q (X - \xi)^2 = (1 - x) x \leq 1/4.
$$
Theorem 7.36 (Weierstrass Approximation Theorem via Bernstein’s Polynomials.). Suppose that \( f \in C([0, 1], \mathbb{C}) \) and

\[
p_n(x) := \sum_{k=0}^{n} \binom{n}{k} f \left( \frac{k}{n} \right) x^k (1-x)^{n-k}.
\]

Then

\[
\lim_{n \to \infty} \sup_{x \in [0, 1]} |f(x) - p_n(x)| = 0.
\]

**Proof.** Let \( x \in [0, 1] \), \( A = \{0, 1\} \), \( q(0) = 1 - x \), \( q(1) = x \), \( \Omega = A^n \), and

\[
P_x(\{\omega\}) = q(\omega_1) \cdots q(\omega_n) = x^{\sum_{i=1}^{n} \omega_i} (1-x)^{1-\sum_{i=1}^{n} \omega_i}.
\]

As above, let \( S_n = \frac{1}{n} (X_1 + \cdots + X_n) \), where \( X_i(\omega) = \omega_i \), and observe that

\[
P_x \left( S_n = \frac{k}{n} \right) = \binom{n}{k} x^k (1-x)^{n-k}.
\]

Therefore, writing \( \mathbb{E}_x \) for \( \mathbb{E}_{P_x} \), we have

\[
\mathbb{E}_x[f(S_n)] = \sum_{k=0}^{n} \binom{n}{k} f \left( \frac{k}{n} \right) x^k (1-x)^{n-k} = p_n(x).
\]

Hence we find

\[
|p_n(x) - f(x)| = |\mathbb{E}_x[f(S_n)] - f(x)| = |\mathbb{E}_x[f(S_n) - f(x)]| \\
\leq \mathbb{E}_x[|f(S_n) - f(x)|] \\
= \mathbb{E}_x[|f(S_n) - f(x)| : |S_n - x| \geq \varepsilon] \\
+ \mathbb{E}_x[|f(S_n) - f(x)| : |S_n - x| < \varepsilon] \\
\leq 2M \cdot P_x(|S_n - x| \geq \varepsilon) + \delta(\varepsilon)
\]

where

\[
M := \max_{y \in [0, 1]} |f(y)| \quad \text{and} \quad \delta(\varepsilon) := \sup \{|f(y) - f(x)| : x, y \in [0, 1] \text{ and } |y - x| \leq \varepsilon\}
\]

is the modulus of continuity of \( f \). Now by the above exercises,

\[
P_x(|S_n - x| \geq \varepsilon) \leq \frac{1}{4n\varepsilon^2} \quad \text{(see Figure 7.1)} \tag{7.45}
\]

and hence we may conclude that

\[
\max_{x \in [0, 1]} |p_n(x) - f(x)| \leq \frac{M}{2n\varepsilon^2} + \delta(\varepsilon)
\]

and therefore, that

\[
\lim_{n \to \infty} \sup_{x \in [0, 1]} |p_n(x) - f(x)| \leq \delta(\varepsilon).
\]

This completes the proof, since by uniform continuity of \( f \), \( \delta(\varepsilon) \downarrow 0 \) as \( \varepsilon \downarrow 0 \). \( \blacksquare \)

**Fig. 7.1.** Plots of \( P_x(S_n = k/n) \) versus \( k/n \) for \( n = 100 \) with \( x = 1/4 \) (black), \( x = 1/2 \) (red), and \( x = 5/6 \) (green).

### 7.4.1 Complex Weierstrass Approximation Theorem

The main goal of this subsection is to prove Theorem 7.42 which states that any continuous \( 2\pi \)–periodic function on \( \mathbb{R} \) may be well approximated by trigonometric polynomials. The main ingredient is the following two-dimensional generalization of Theorem 7.36. All of the results in this section have natural generalization to higher dimensions as well, see Theorem 7.46.

**Theorem 7.37 (Weierstrass Approximation Theorem).** Suppose that \( K = [0, 1]^2 \), \( f \in C(K, \mathbb{C}) \), and

\[
p_n(x) := \sum_{k,l=0}^{n} \binom{k}{n} \binom{n}{l} x^k (1-x)^{n-k} y^l (1-y)^{n-l}. \tag{7.46}
\]

Then \( p_n \to f \) uniformly on \( K \).
Proof. We are going to follow the argument given in the proof of Theorem 7.36. By considering the real and imaginary parts of \( f \) separately, it suffices to assume \( f \in C([0,1]^2, \mathbb{R}) \). For \( (x,y) \in K \) and \( n \in \mathbb{N} \) we may choose a collection of independent Bernoulli simple random variables \( \{X_i, Y_i\}_{i=1}^n \) such that \( P(X_i = 1) = x \) and \( P(Y_i = 1) = y \) for all \( 1 \leq i \leq n \). Then letting \( S_n := \frac{1}{n} \sum_{i=1}^n X_i \) and \( T_n := \frac{1}{n} \sum_{i=1}^n Y_i \), we have

\[
\begin{align*}
\mathbb{E}[f(S_n, T_n)] &= \frac{1}{n} \sum_{k,l=0}^n f \left( \frac{k}{n}, \frac{l}{n} \right) P(n \cdot S_n = k, n \cdot T_n = l) = p_n(x, y)
\end{align*}
\]

where \( p_n(x, y) \) is the polynomial given in Eq. (7.46) wherein the assumed independence is needed to show,

\[
P(n \cdot S_n = k, n \cdot T_n = l) = \binom{n}{k} \binom{n}{l} x^k (1-x)^{n-k} y^l (1-y)^{n-l}.
\]

Thus if \( M = \sup \{|f(x, y)| \mid (x, y) \in K \}, \varepsilon > 0 \),

\[
\delta_\varepsilon = \sup \{|f(x', y') - f(x, y)| \mid (x, y), (x', y') \in K \text{ and } |(x', y') - (x, y)| \leq \varepsilon \},
\]

and

\[
A := \{\|(S_n, T_n) - (x, y)\| > \varepsilon\},
\]

we have,

\[
|f(x, y) - p_n(x, y)| = |\mathbb{E}(f(x, y) - f((S_n, T_n)))|
\leq \mathbb{E}|f(x, y) - f((S_n, T_n))|
= \mathbb{E}[|f(x, y) - f(S_n, T_n)| : A]
\leq 2M \cdot P(A) + \delta_\varepsilon \cdot P(A^c)
\leq 2M \cdot P(A) + \delta_\varepsilon.
\quad (7.47)
\]

To estimate \( P(A) \), observe that if

\[
\|(S_n, T_n) - (x, y)\|^2 = (S_n - x)^2 + (T_n - y)^2 > \varepsilon^2,
\]

then either,

\[
(S_n - x)^2 > \varepsilon^2/2 \text{ or } (T_n - y)^2 > \varepsilon^2/2
\]

and therefore by sub-additivity and Eq. (7.45) we know

\[
P(A) \leq P\left(|S_n - x| > \varepsilon/\sqrt{2} \right) + P\left(|T_n - y| > \varepsilon/\sqrt{2} \right)
\leq \frac{1}{2n \varepsilon^2} + \frac{1}{2n \varepsilon^2} = \frac{1}{n \varepsilon^2}.
\quad (7.48)
\]

Using this estimate in Eq. (7.47) gives,

\[
|f(x, y) - p_n(x, y)| \leq 2M \cdot \frac{1}{n \varepsilon^2} + \delta_\varepsilon
\]

and as right is independent of \((x,y) \in K \) we may conclude,

\[
\limsup_{n \to \infty} \sup_{(x, y) \in K} |f(x, y) - p_n(x, y)| \leq \delta_\varepsilon
\]

which completes the proof since \( \delta_\varepsilon \downarrow 0 \) as \( \varepsilon \downarrow 0 \) because \( f \) is uniformly continuous on \( K \).

**Remark 7.38.** We can easily improve our estimate on \( P(A) \) in Eq. (7.48) by a factor of two as follows. As in the proof of Theorem 7.36

\[
\mathbb{E}\left[\|(S_n, T_n) - (x, y)\|^2\right] = \mathbb{E}\left[(S_n - x)^2 + (T_n - y)^2\right]
\]

\[= \operatorname{Var}(S_n) + \operatorname{Var}(T_n)
\]

\[= \frac{1}{n} x(1-x) + y(1-y) \leq \frac{1}{2n}.
\]

Therefore by Chebyshev’s inequality,

\[
P(A) = P\left(\|(S_n, T_n) - (x, y)\| > \varepsilon\right) \leq \frac{1}{\varepsilon^2} \mathbb{E}\left[\|(S_n, T_n) - (x, y)\|^2\right] \leq \frac{1}{2n \varepsilon^2}.
\]

**Corollary 7.39.** Suppose that \( K = [a,b] \times [c,d] \) is any compact rectangle in \( \mathbb{R}^2 \). Then every function, \( f \in C(K, \mathbb{C}) \), may be uniformly approximated by polynomial functions in \((x, y) \in \mathbb{R}^2 \).

**Proof.** Let \( F(x, y) := f((a + x(b-a), c + y(d-c)) - a \text{ a continuous function of } (x, y) \in [0,1]^2 \). Given \( \varepsilon > 0 \), we may use Theorem 7.37 to find a polynomial, \( p(x, y) \), such that \( \sup_{(x,y) \in [0,1]^2} |F(x, y) - p(x, y)| \leq \varepsilon \). Letting \( \xi = a + x(b-a) \) and \( \eta := c + y(d-c) \), it now follows that

\[
\sup_{(\xi, \eta) \in K} \left| f(\xi, \eta) - p\left(\frac{\xi - a}{b - a}, \frac{\eta - c}{d - c}\right) \right| \leq \varepsilon
\]

which completes the proof since \( p\left(\frac{\xi - a}{b - a}, \frac{\eta - c}{d - c}\right) \) is a polynomial in \((\xi, \eta)\).

Here is a version of the complex Weierstrass approximation theorem.

**Theorem 7.40 (Complex Weierstrass Approximation Theorem).** Suppose that \( K \subset \mathbb{C} \) is a compact rectangle. Then there exists polynomials in \((z = x + iy, \bar{z} = x - iy)\), \( p_n(z, \bar{z}) \) for \( z \in K \), such that \( \sup_{z \in K} |p_n(z, \bar{z}) - f(z)| \to 0 \) as \( n \to \infty \) for every \( f \in C(K, \mathbb{C}) \).
**Theorem 7.42 (Density of Trigonometric Polynomials).** Let \( \theta \in \{ \text{all other solutions are of the form } z \} \). Therefore under this identification any polynomial \( f(x, y) \) on \( \mathbb{R} \times \mathbb{R} \) may be written as a polynomial \( q(z, \bar{z}) \), namely

\[
q(z, \bar{z}) = p \left( \frac{z + \bar{z}}{2}, \frac{z - \bar{z}}{2i} \right).
\]

Conversely a polynomial \( q(z, \bar{z}) \) may be thought of as a polynomial \( p \) in \((x, y)\), namely \( p(x, y) = q(x + iy, x - iy) \). Hence the result now follows from Theorem 7.37.

**Example 7.41.** Let \( K = S^1 = \{ z \in \mathbb{C} : |z| = 1 \} \) and \( A \) be the set of polynomials in \((z, \bar{z})\) restricted to \( S^1 \). Then \( A \) is dense in \( C(S^1) \). To prove this first observe if \( f \in C(S^1) \) then \( F(z) = |f \left( \frac{z}{|z|} \right) | \) for \( z \neq 0 \) and \( F(0) = 0 \) defines \( F \in C(\mathbb{C}) \) such that \( F|_{S^1} = f \). By applying Theorem 7.40 to \( F \) restricted to a compact rectangle containing \( S^1 \) we may find \( q_n(z, \bar{z}) \) converging uniformly to \( F \) on \( K \) and hence on \( S^1 \). Since \( \bar{z} = z^{-1} \) on \( S^1 \), we have shown polynomials in \( z \) and \( z^{-1} \) are dense in \( C(S^1) \).

**Theorem 7.42 (Density of Trigonometric Polynomials).** Any \( 2\pi - \) periodic continuous function, \( f : \mathbb{R} \to \mathbb{C} \), may be uniformly approximated by a trigonometric polynomial of the form

\[
p(x) = \sum_{\lambda \in A} a_{\lambda} e^{i\lambda x}
\]

where \( A \) is a finite subset of \( \mathbb{Z} \) and \( a_{\lambda} \in \mathbb{C} \) for all \( \lambda \in A \).

**Proof.** For \( z \in S^1 \), define \( F(z) := f(\theta) \) where \( \theta \in \mathbb{R} \) is chosen so that \( z = e^{i\theta} \). Since \( f \) is \( 2\pi \) - periodic, \( F \) is well defined since \( e^{i\theta} = z \) then all other solutions are of the form \( \{ \theta + 2\pi n : n \in \mathbb{Z} \} \). Since the map \( \theta \to e^{i\theta} \) is a local homeomorphism, i.e. for any \( J = (a, b) \) with \( b - a < 2\pi \), the map \( \theta \in J \to \hat{J} := \{ e^{i\theta} : \theta \in J \} \subset S^1 \) is a homeomorphism, it follows that \( F(z) = f \circ \phi^{-1}(z) \) for \( z \in \hat{J} \). This shows \( F \) is continuous when restricted to \( \hat{J} \). Since such sets cover \( S^1 \), it follows that \( F \) is continuous.

By Example 7.41 the polynomials in \( z \) and \( \bar{z} \) are dense in \( C(S^1) \). Hence for any \( \varepsilon > 0 \) there exists

\[
p(z, \bar{z}) = \sum_{0 \leq m, n \leq N} a_{m, n} z^m \bar{z}^n
\]

such that \( |F(z) - p(z, \bar{z})| \leq \varepsilon \) for all \( z \in S^1 \). Taking \( z = e^{i\theta} \) then implies

\[
\sup_{\theta} |f(\theta) - p(e^{i\theta}, e^{-i\theta})| \leq \varepsilon
\]

where

\[
p(e^{i\theta}, e^{-i\theta}) = \sum_{0 \leq m, n \leq N} a_{m, n} e^{i(m-n)\theta}
\]

is the desired trigonometry polynomial.

**7.4.2 Product Measures and Fubini’s Theorem.** In the last part of this section we will extend some of the above ideas to more general “finitely additive measure spaces.” A **finitely additive measure space** is a triple, \((X, \mathcal{A}, \mu)\), where \( X \) is a set, \( \mathcal{A} \subset 2^X \) is an algebra, and \( \mu : \mathcal{A} \to [0, \infty] \) is a finitely additive measure. Let \((Y, \mathcal{B}, \nu)\) be another finitely additive measure space.

**Definition 7.43.** Let \( A \otimes B \) be the smallest sub-algebra of \( 2^X \times 2^Y \) containing all sets of the form \( S := \{ A \times B : A \in \mathcal{A} \text{ and } B \in \mathcal{B} \} \). As we have seen in Exercise 6.10 \( S \) is a semi-algebra and therefore \( A \otimes B \) consists of subsets, \( C \subset X \times Y \), which may be written as;

\[
C = \bigoplus_{i=1}^{n} A_i \times B_i \text{ with } A_i \times B_i \in S.
\]

**Theorem 7.44 (Product Measure and Fubini’s Theorem).** Assume that \( \mu (X) < \infty \) and \( \nu (Y) < \infty \) for simplicity. Then there is a unique **finitely additive measure**, \( \mu \otimes \nu \), on \( A \otimes B \) such that \( \mu \otimes \nu (A \times B) = \mu (A) \nu (B) \) for all \( A \in \mathcal{A} \text{ and } B \in \mathcal{B} \). Moreover if \( f \in S(A \otimes B) \) then;

1. \( y \to f(x, y) \) is in \( S(B) \) for all \( x \in X \) and \( x \to f(x, y) \) is in \( S(A) \) for all \( y \in Y \).
2. \( x \to \int_{Y} f(x, y) d\nu (y) \) is in \( S(A) \) and \( y \to \int_{X} f(x, y) d\mu (x) \) is in \( S(B) \).
3. we have,

\[
\int_{X} \left[ \int_{Y} f(x, y) d\nu (y) \right] d\mu (x) = \int_{X} f(x, y) d(\mu \otimes \nu) (x, y) = \int_{Y} \left[ \int_{X} f(x, y) d\mu (x) \right] d\nu (y).
\]

We will refer to \( \mu \otimes \nu \) as the **product measure** of \( \mu \) and \( \nu \).

**Proof.** According to Eq. (7.49),

\[
1_C (x, y) = \sum_{i=1}^{n} 1_{A_i \times B_i} (x, y) = \sum_{i=1}^{n} 1_{A_i} (x) \cdot 1_{B_i} (y)
\]
from which it follows that \( 1_C (x, \cdot) \in \mathcal{S} (\mathcal{B}) \) for each \( x \in X \) and
\[
\int_Y 1_C (x, y) \, d \nu (y) = \sum_{i=1}^n 1_{A_i} (x) \, \nu (B_i) .
\]
It now follows from this equation that \( x \to \int_Y 1_C (x, y) \, d \nu (y) \in \mathcal{S} (\mathcal{A}) \) and that
\[
\int_X \left[ \int_Y 1_C (x, y) \, d \nu (y) \right] \, d \mu (x) = \sum_{i=1}^n \mu (A_i) \, \nu (B_i) .
\]
Similarly one shows that
\[
\int_Y \left[ \int_X 1_C (x, y) \, d \mu (x) \right] \, d \nu (y) = \sum_{i=1}^n \mu (A_i) \, \nu (B_i) .
\]
In particular this shows that we may define
\[
(\mu \circ \nu) (C) = \sum_{i=1}^n \mu (A_i) \, \nu (B_i)
\]
and with this definition we have,
\[
\int_X \left[ \int_Y 1_C (x, y) \, d \nu (y) \right] \, d \mu (x) = (\mu \circ \nu) (C) = \int_Y \left[ \int_X 1_C (x, y) \, d \mu (x) \right] \, d \nu (y) .
\]
From either of these representations it is easily seen that \( \mu \circ \nu \) is a finitely additive measure on \( \mathcal{A} \circ \mathcal{B} \) with the desired properties. Moreover, we have already verified the Theorem in the special case where \( f = 1_C \) with \( C \in \mathcal{A} \circ \mathcal{B} \). Since the general element, \( f \in \mathcal{S} (\mathcal{A} \circ \mathcal{B}) \), is a linear combination of such functions, it is easy to verify using the linearity of the integral and the fact that \( \mathcal{S} (\mathcal{A}) \) and \( \mathcal{S} (\mathcal{B}) \) are vector spaces that the theorem is true in general.

**Example 7.45.** Suppose that \( f \in \mathcal{S} (\mathcal{A}) \) and \( g \in \mathcal{S} (\mathcal{B}) \). Let \( f \otimes g (x, y) : = f (x) \, g (y) \). Since we have,
\[
f \otimes g (x, y) = \left( \sum_a a 1_{f=a} (x) \right) \left( \sum_b b 1_{g=b} (y) \right)
= \sum_{a,b} ab 1_{\{f=a\} \times \{g=b\}} (x, y)
\]
it follows that \( f \otimes g \in \mathcal{S} (\mathcal{A} \circ \mathcal{B}) \). Moreover, using Fubini’s Theorem 7.44 it follows that
\[
\int_{X \times Y} f \otimes g \, d (\mu \otimes \nu) = \left[ \int_X f \, d \mu \right] \left[ \int_Y g \, d \nu \right] .
\]

### 7.5 Appendix: A Multi-dimensional Weierstrass Approximation Theorem

The following theorem is the multi-dimensional generalization of Theorem 7.36.

**Theorem 7.46 (Weierstrass Approximation Theorem).** Suppose that \( K = [a_1, b_1] \times \cdots [a_d, b_d] \) with \( -\infty < a_i < b_i < \infty \) is a compact rectangle in \( \mathbb{R}^d \). Then for every \( f \in C (K, \mathbb{C}) \), there exists polynomials \( p_n \) on \( \mathbb{R}^d \) such that \( p_n \to f \) uniformly on \( K \).

**Proof.** By a simple scaling and translation of the arguments of \( f \) we may assume without loss of generality that \( K = [0, 1]^d \). By considering the real and imaginary parts of \( f \) separately, it suffices to assume \( f \in C ([0, 1], \mathbb{R}) \).

Given \( x \in K \), let \( \{ X_n = (X_1^n, \ldots, X_d^n) \}_{n=1}^\infty \) be i.i.d. random vectors with values in \( \mathbb{R}^d \) such that
\[
P (X_n = \eta) = \prod_{i=1}^d (1 - x_i)^{1-\eta_i} \, x_i^{\eta_i}
\]
for all \( \eta = (\eta_1, \ldots, \eta_d) \in \{0, 1\}^d \). Since each \( X_n^j \) is a Bernoulli random variable with \( P (X_n^j = 1) = x_j \), we know that
\[
\mathbb{E} X_n = x \quad \text{and} \quad \text{Var} (X_n^j) = x_j - x_j^2 = x_j (1 - x_j).
\]
As usual let \( S_n = S_n := X_1 + \cdots + X_n \in \mathbb{R}^d \), then
\[
\mathbb{E} \left[ \frac{S_n}{n} \right] = x \quad \text{and} \quad \mathbb{E} \left[ \left\| \frac{S_n}{n} - x \right\|^2 \right] = \sum_{j=1}^d \mathbb{E} \left( \frac{S_n^j}{n} - x_j \right)^2 = \sum_{j=1}^d \text{Var} \left( \frac{S_n^j}{n} - x_j \right)
\]
\[
= \sum_{j=1}^d \text{Var} \left( \frac{S_n^j}{n} \right) = \frac{1}{n^2} \sum_{j=1}^d \sum_{k=1}^n \text{Var} (X_k^j)
\]
\[
= \frac{1}{n} \sum_{j=1}^d x_j (1 - x_j) \leq \frac{d}{4n}.
\]
This shows $S_n/n \to x$ in $L^2(P)$ and hence by Chebyshev’s inequality, $S_n/n \xrightarrow{P} x$ in and by a continuity theorem, $f \left( \frac{S_n}{n} \right) \xrightarrow{P} f(x)$ as $n \to \infty$. This along with the dominated convergence theorem shows

$$p_n(x) := \mathbb{E} \left[ f \left( \frac{S_n}{n} \right) \right] \to f(x) \text{ as } n \to \infty,$$

(7.50)

where

$$p_n(x) = \sum_{\eta \{1,2,...,n\} \to \{0,1\}^d} f \left( \frac{\eta(1) + \cdots + \eta(n)}{n} \right) P(X_1 = \eta(1), \ldots, X_n = \eta(n))$$

is a polynomial of degree $nd$. In fact more is true.

Suppose $\varepsilon > 0$ is given, $M = \sup \{ |f(x)| : x \in K \}$, and

$$\delta_\varepsilon = \sup \{ |f(y) - f(x)| : x, y \in K \text{ and } \|y - x\| \leq \varepsilon \}.$$

By uniform continuity of $f$ on $K$, $\lim_{\varepsilon \searrow 0} \delta_\varepsilon = 0$. Therefore,

$$|f(x) - p_n(x)| = |\mathbb{E} \left[ f \left( x - \frac{S_n}{n} \right) \right] - \mathbb{E} \left[ f(x) - f \left( \frac{S_n}{n} \right) \right]| \leq \mathbb{E} \left[ |f(x) - f \left( \frac{S_n}{n} \right)| : \|S_n - x\| > \varepsilon \right]$$

$$+ \mathbb{E} \left[ f(x) - f \left( \frac{S_n}{n} \right) : \|S_n - x\| \leq \varepsilon \right]$$

$$\leq 2M \mathbb{P}(\|S_n - x\| > \varepsilon) + \delta_\varepsilon.$$

(7.51)

By Chebyshev’s inequality,

$$\mathbb{P}(\|S_n - x\| > \varepsilon) \leq \frac{1}{\varepsilon^2} \mathbb{E} \|S_n - x\|^2 = \frac{d}{4n\varepsilon^2},$$

and therefore, Eq. (7.51) yields the estimate

$$\sup_{x \in K} |f(x) - p_n(x)| \leq \frac{2M}{n\varepsilon^2} + \delta_\varepsilon$$

and hence

$$\limsup_{n \to \infty} \sup_{x \in K} |f(x) - p_n(x)| \leq \delta_\varepsilon \to 0 \text{ as } \varepsilon \downarrow 0.$$

Here is a version of the complex Weierstrass approximation theorem.

**Theorem 7.47 (Complex Weierstrass Approximation Theorem).** Suppose that $K \subset \mathbb{C}^d \cong \mathbb{R}^d \times \mathbb{R}^d$ is a compact rectangle. Then there exists polynomials in $(z = x + iy, \bar{z} = x - iy)$, $p_n(z, \bar{z})$ for $z \in \mathbb{C}^d$, such that $\sup_{z \in K} |q_n(z, \bar{z}) - f(z)| \to 0$ as $n \to \infty$ for every $f \in C(K, \mathbb{C})$.

**Proof.** The mapping $(x, y) \in \mathbb{R}^d \times \mathbb{R}^d \to z = x + iy \in \mathbb{C}^d$ is an isomorphism of vector spaces. Letting $\bar{z} = x - iy$ as usual, we have $x = \frac{z + \bar{z}}{2}$ and $y = \frac{z - \bar{z}}{2i}$. Therefore under this identification any polynomial $p(x, y)$ on $\mathbb{R}^d \times \mathbb{R}^d$ may be written as a polynomial $q$ in $(z, \bar{z})$, namely

$$q(z, \bar{z}) = p\left(\frac{z + \bar{z}}{2}, \frac{z - \bar{z}}{2i}\right).$$

Conversely a polynomial $q$ in $(z, \bar{z})$ may be thought of as a polynomial $p$ in $(x, y)$, namely $p(x, y) = q(x + iy, x - iy)$. Hence the result now follows from Theorem 7.46.

**Example 7.48.** Let $K = S^1 = \{ z \in \mathbb{C} : |z| = 1 \}$ and $A$ be the set of polynomials in $(z, \bar{z})$ restricted to $S^1$. Then $A$ is dense in $C(S^1)$. To prove this first observe if $f \in C(S^1)$ then $F(z) = |z| f\left(\frac{z}{|z|}\right)$ for $z \neq 0$ and $F(0) = 0$ defines $F \in C(\mathbb{C})$. By applying Theorem 7.47 to $F$ restricted to a compact rectangle containing $S^1$ we may find $q_n(z, \bar{z})$ converging uniformly to $F$ on $K$ and hence on $S^1$. Since $z = z^{-1}$ on $S^1$, we have shown polynomials in $z$ and $z^{-1}$ are dense in $C(S^1)$. This example generalizes in an obvious way to $K = (S^1)^d \subset \mathbb{C}^d$.

**Exercise 7.15.** Use Example 7.48 to show that any $2\pi$-periodic continuous function, $g : \mathbb{R}^d \to \mathbb{C}$, may be uniformly approximated by a trigonometric polynomial of the form

$$p(x) = \sum_{\lambda \in \Lambda} a_{\lambda} e^{i\lambda \cdot x}$$

where $\Lambda$ is a finite subset of $\mathbb{Z}^d$ and $a_{\lambda} \in \mathbb{C}$ for all $\lambda \in \Lambda$. **Hint:** start by showing there exists a unique continuous function, $f : (S^1)^d \to \mathbb{C}$ such that $f(e^{ix_1}, \ldots, e^{ix_d}) = F(x)$ for all $x = (x_1, \ldots, x_d) \in \mathbb{R}^d$.

**Exercise 7.16.** Suppose $f \in C(\mathbb{R}, \mathbb{C})$ is a $2\pi$-periodic function (i.e. $f(x + 2\pi) = f(x)$ for all $x \in \mathbb{R}$) and

$$\int_0^{2\pi} f(x) e^{inx} dx = 0$$

for all $n \in \mathbb{Z}$, show again that $f \equiv 0$. **Hint:** Use Exercise 7.15.
Countably Additive Measures

Let $\mathcal{A} \subset 2^\Omega$ be an algebra and $\mu : \mathcal{A} \to [0, \infty]$ be a finitely additive measure. Recall that $\mu$ is a premeasure on $\mathcal{A}$ if $\mu$ is $\sigma$–additive on $\mathcal{A}$. If $\mu$ is a premeasure on $\mathcal{A}$ and $\mathcal{A}$ is a $\sigma$–algebra (Definition 6.12), we say that $\mu$ is a measure on $(\Omega, \mathcal{A})$ and that $(\Omega, \mathcal{A})$ is a measurable space.

**Definition 8.1.** Let $(\Omega, \mathcal{B})$ be a measurable space. We say that $P : \mathcal{B} \to [0, 1]$ is a probability measure on $(\Omega, \mathcal{B})$ if $P$ is a measure on $\mathcal{B}$ such that $P(\Omega) = 1$. In this case we say that $(\Omega, \mathcal{B}, P)$ a probability space.

8.1 Overview

The goal of this chapter is to develop methods for proving the existence of probability measures with desirable properties. The main results of this chapter may be summarized in the following theorem.

**Theorem 8.2.** A finitely additive probability measure $P$ on an algebra, $\mathcal{A} \subset 2^\Omega$, extends to $\sigma$–additive measure on $\sigma(\mathcal{A})$ iff $P$ is a premeasure on $\mathcal{A}$. If the extension exists it is unique.

**Proof.** The uniqueness assertion is proved Proposition 8.15 below. The existence assertion of the theorem in the content of Theorem 8.27. 

In order to use this theorem it is necessary to determine when a finitely additive probability measure in is in fact a premeasure. The following Proposition is sometimes useful in this regard.

**Proposition 8.3 (Equivalent premeasure conditions).** Suppose that $P$ is a finitely additive probability measure on an algebra, $\mathcal{A} \subset 2^\Omega$. Then the following are equivalent:

1. $P$ is a premeasure on $\mathcal{A}$, i.e. $P$ is $\sigma$–additive on $\mathcal{A}$.
2. For all $A_n \in \mathcal{A}$ such that $A_n \uparrow A \in \mathcal{A}$, $P(A_n) \uparrow P(A)$.
3. For all $A_n \in \mathcal{A}$ such that $A_n \downarrow A \in \mathcal{A}$, $P(A_n) \downarrow P(A)$.
4. For all $A_n \in \mathcal{A}$ such that $A_n \uparrow \Omega$, $P(A_n) \uparrow 1$.
5. For all $A_n \in \mathcal{A}$ such that $A_n \downarrow \emptyset$, $P(A_n) \downarrow 0$.

**Proof.** We will start by showing 1 $\iff$ 2 $\iff$ 3.

1. $\implies$ 2. Suppose $A_n \in \mathcal{A}$ such that $A_n \uparrow A \in \mathcal{A}$. Let $A'_n := A_n \setminus A_{n-1}$ with $A_0 := \emptyset$. Then $\{A'_n\}_{n=1}^\infty$ are disjoint, $A_n = \cup_{k=1}^n A'_k$ and $A = \cup_{k=1}^\infty A'_k$. Therefore,

$$P(A) = \sum_{k=1}^\infty P(A'_k) = \lim_{n \to \infty} \sum_{k=1}^n P(A'_k) = \lim_{n \to \infty} P(\cup_{k=1}^n A'_k) = \lim_{n \to \infty} P(A_n).$$

2. $\implies$ 1. If $\{A_n\}_{n=1}^\infty \subset \mathcal{A}$ are disjoint and $A := \bigcup_{n=1}^\infty A_n \in \mathcal{A}$, then $\cup_{n=1}^N A_n \uparrow A$. Therefore,

$$P(A) = \lim_{N \to \infty} P(\bigcup_{n=1}^N A_n) = \lim_{N \to \infty} \sum_{n=1}^N P(A_n) = \sum_{n=1}^\infty P(A_n).$$

3. $\implies$ 2. If $A_n \in \mathcal{A}$ such that $A_n \uparrow A \in \mathcal{A}$, then $A'_n \uparrow A^c$ and therefore we again have,

$$\lim_{n \to \infty} (1 - P(A_n)) = \lim_{n \to \infty} P(A'_n) = P(A^c) = 1 - P(A).$$

The same proof used for 2. $\iff$ 3. shows 4. $\iff$ 5 and it is clear that 3. $\implies$ 5. To finish the proof we will show 5. $\implies$ 2.

5. $\implies$ 2. If $A_n \in \mathcal{A}$ such that $A_n \uparrow A \in \mathcal{A}$, then $A \setminus A_n \downarrow \emptyset$ and therefore

$$\lim_{n \to \infty} [P(A) - P(A_n)] = \lim_{n \to \infty} P(A \setminus A_n) = 0.$$

**Remark 8.4.** Observe that the equivalence of items 1. and 2. in the above proposition hold without the restriction that $P(\Omega) = 1$ and in fact $P(\Omega) = \infty$ may be allowed for this equivalence.

**Lemma 8.5.** If $\mu : \mathcal{A} \to [0, \infty]$ is a premeasure, then $\mu$ is countably sub-additive on $\mathcal{A}$.
Proof. Suppose that \( A_n \in \mathcal{A} \) with \( \cup_{n=1}^\infty A_n \in \mathcal{A} \). Let \( A'_1 := A_1 \) and for \( n \geq 2 \), let \( A'_n := A_n \setminus (A_1 \cup \ldots \cup A_{n-1}) \in \mathcal{A} \). Then \( \cup_{n=1}^\infty A_n = \sum_{n=1}^\infty A'_n \) and therefore by the countable additivity and monotonicity of \( \mu \) we have,

\[
\mu (\cup_{n=1}^\infty A_n) = \mu \left( \sum_{n=1}^\infty A'_n \right) = \sum_{n=1}^\infty \mu (A'_n) \leq \sum_{n=1}^\infty \mu (A_n) .
\]

Let us now specialize to the case where \( \Omega = \mathbb{R} \) and \( \mathcal{A} = \mathcal{B}_{\mathbb{R}} \{ (a, b] \cap \mathbb{R} : -\infty \leq a \leq b \leq \infty \} \). In this case we will describe probability measures, \( P \), on \( \mathcal{B}_{\mathbb{R}} \) by their “cumulative distribution functions.”

Definition 8.6. Given a probability measure, \( P \) on \( \mathcal{B}_{\mathbb{R}} \), the cumulative distribution function (CDF) of \( P \) is defined as the function, \( F = F_P : \mathbb{R} \to [0, 1] \) given as

\[
F(x) := P ((-\infty, x]) . \tag{8.1}
\]

Example 8.7. Suppose that

\[
P = p\delta_{-1} + q\delta_1 + r\delta_\pi
\]

with \( p, q, r > 0 \) and \( p + q + r = 1 \). In this case,

\[
F(x) = \begin{cases} 
0 & \text{for } x < -1 \\
p & \text{for } -1 \leq x < 1 \\
p + q & \text{for } 1 \leq x < \pi \\
1 & \text{for } \pi \leq x < \infty
\end{cases}
\]

A plot of \( F(x) \) with \( p = .2, q = .3, \) and \( r = .5 \).

Lemma 8.8. If \( F = F_P : \mathbb{R} \to [0, 1] \) is a distribution function for a probability measure, \( P \), on \( \mathcal{B}_{\mathbb{R}} \), then:

1. \( F \) is non-decreasing,
2. \( F \) is right continuous,
3. \( F (-\infty) := \lim_{x \to -\infty} F(x) = 0 \), and \( F (\infty) := \lim_{x \to \infty} F(x) = 1 \).

Proof. The monotonicity of \( P \) shows that \( F \) is non-decreasing. For \( b \in \mathbb{R} \) let \( A_n = (-\infty, b_n] \) with \( b_n \downarrow b \) as \( n \to \infty \). The continuity of \( P \) implies

\[
F(b_n) = P((-\infty, b_n]) \downarrow \mu((-\infty, b]) = F(b).
\]

Since \( \{b_n\}_{n=1}^\infty \) was an arbitrary sequence such that \( b_n \downarrow b \), we have shown \( F(b+) := \lim_{y \to b} F(y) = F(b) \). This show that \( F \) is right continuous. Similar arguments show that \( F(\infty) = 1 \) and \( F(-\infty) = 0 \).

It turns out that Lemma 8.8 has the following important converse:

Theorem 8.9. To each function \( F : \mathbb{R} \to [0, 1] \) satisfying properties 1. – 3. in Lemma 8.8, there exists a unique probability measure, \( P_F \), on \( \mathcal{B}_{\mathbb{R}} \) such that

\[
P_F ((a, b]) = F(b) - F(a) \quad \text{for all } -\infty < a \leq b < \infty .
\]

Proof. The uniqueness assertion is proved in Corollary 8.17 below or see Exercises 8.2 and 8.11 below. The existence portion of the theorem is a special case of Theorem 8.33 below.

Example 8.10 (Uniform Distribution). The function,

\[
F(x) = \begin{cases} 
0 & \text{for } x \leq 0 \\
x & \text{for } 0 \leq x < 1 \\
1 & \text{for } 1 \leq x < \infty
\end{cases}
\]

is the distribution function for a measure, \( m \) on \( \mathcal{B}_{\mathbb{R}} \) which is concentrated on \((0, 1]\). The measure, \( m \) is called the uniform distribution or Lebesgue measure on \((0, 1]\).

With this summary in hand, let us now start the formal development. We begin with uniqueness statement in Theorem 8.2.

8.2 \( \pi - \lambda \) Theorem

Recall that a collection, \( \mathcal{P} \subset 2^\Omega \), is a \( \pi \) class or \( \pi \) system if it is closed under finite intersections. We also need the notion of a \( \lambda \) system.

Definition 8.11 (\( \lambda \) - system). A collection of sets, \( \mathcal{L} \subset 2^\Omega \), is \( \lambda \) class or \( \lambda \) system if

a. \( \Omega \in \mathcal{L} \)
Lemma 8.13 (Alternate Axioms for a \(\lambda\) - system). Let \(\Omega\) be a \(\lambda\) - system.

b. If \(A, B \in \mathcal{L}\) and \(A \subset B\), then \(B \setminus A \in \mathcal{L}\). (Closed under proper differences.)
c. If \(A_n \in \mathcal{L}\) and \(A_n \uparrow A\), then \(A \in \mathcal{L}\). (Closed under countable increasing unions.)

Remark 8.12. If \(\mathcal{L}\) is a collection of subsets of \(\Omega\) which is both a \(\lambda\) - class and a \(\pi\) - system then \(\mathcal{L}\) is a \(\sigma\) - algebra. Indeed, since \(A^c = \Omega \setminus A\), we see that any \(\lambda\) - system is closed under complementation. If \(\mathcal{L}\) is also a \(\pi\) - system, it is closed under intersections and therefore \(\mathcal{L}\) is an algebra. Since \(\mathcal{L}\) is also closed under increasing unions, \(\mathcal{L}\) is a \(\sigma\) - algebra.

Lemma 8.13 (Alternate Axioms for a \(\lambda\) - System*). Suppose that \(\mathcal{L} \subset 2^\Omega\) is a collection of subsets \(\Omega\). Then \(\mathcal{L}\) is a \(\lambda\) - class iff \(\lambda\) satisfies the following postulates:

1. \(\Omega \in \mathcal{L}\)
2. \(A \in \mathcal{L}\) implies \(A^c \in \mathcal{L}\). (Closed under complementation.)
3. If \(\{A_n\}_{n=1}^{\infty} \subset \mathcal{L}\) are disjoint, then \(\sum_{n=1}^{\infty} A_n \in \mathcal{L}\). (Closed under disjoint unions.)

Proof. Suppose that \(\mathcal{L}\) satisfies a. – c. above. Clearly then postulates 1. and 2. hold. Suppose that \(A, B \in \mathcal{L}\) such that \(A \cap B = \emptyset\), then \(A \subset B^c\) and

\[A^c \cap B^c = B^c \setminus A \in \mathcal{L}.\]

Now suppose that \(\mathcal{L}\) satisfies postulates 1. – 3. above. Notice that \(\emptyset \in \mathcal{L}\) and by postulate 3., \(\mathcal{L}\) is closed under finite disjoint unions. Therefore if \(A, B \in \mathcal{L}\) with \(A \subset B\), then \(B^c \in \mathcal{L}\) and \(A \cap B^c = \emptyset\) allows us to conclude that \(A \cup B^c \in \mathcal{L}\). Taking complements of this result shows \(B \setminus A = A^c \cap B \in \mathcal{L}\) as well, i.e. postulate b. holds. If \(A_n \in \mathcal{L}\) with \(A_n \uparrow A\), then \(B_n := A_n \setminus A_{n-1} \in \mathcal{L}\) for all \(n\), where by convention \(A_0 = \emptyset\). Hence it follows by postulate 3 that \(\bigcup_{n=1}^{\infty} A_n = \sum_{n=1}^{\infty} B_n \in \mathcal{L}\).

Theorem 8.14 (Dykin’s \(\pi - \lambda\) Theorem). If \(\mathcal{L}\) is a \(\lambda\) class which contains a \(\pi\) - class, \(\mathcal{P}\), then \(\sigma(\mathcal{P}) \subset \mathcal{L}\).

Proof. We start by proving the following assertion; for any element \(C \in \mathcal{L}\), the collection of sets,

\[\mathcal{L}^C := \{D \in \mathcal{L} : C \cap D \in \mathcal{L}\},\]

is a \(\sigma\) - system. To prove this claim, observe that: a. \(\Omega \in \mathcal{L}^C\), b. if \(A \subset B\) with \(A, B \in \mathcal{L}^C\), then \(A \cap C, B \cap C \in \mathcal{L}\) with \(A \cap C \subset B \cap C\) and therefore,

\[(B \setminus A) \cap C = [B \cap C] \setminus A = [B \cap C] \setminus [A \cap C] \in \mathcal{L}.\]

This shows that \(\mathcal{L}^C\) is closed under proper differences. c. If \(A_n \in \mathcal{L}^C\) with \(A_n \uparrow A\), then \(A_n \cap C \in \mathcal{L}\) and \(A_n \cap C \uparrow A \cap C \in \mathcal{L}\), i.e. \(A \in \mathcal{L}^C\). Hence we have verified \(\mathcal{L}^C\) is still a \(\lambda\) - system.

For the rest of the proof, we may assume without loss of generality that \(\mathcal{L}\) is the smallest \(\lambda\) - class containing \(\mathcal{P}\) – if not just replace \(\mathcal{L}\) by the intersection of all \(\lambda\) - classes containing \(\mathcal{P}\). Then for \(C \in \mathcal{P}\) we know that \(\mathcal{L}^C \subset \mathcal{L}\) is a \(\lambda\) - class containing \(\mathcal{P}\) and hence \(\mathcal{L}^C = \mathcal{L}\). Since \(\mathcal{C} \in \mathcal{P}\) was arbitrary, we have shown, \(\cap D \in \mathcal{L}\) for all \(\mathcal{C} \in \mathcal{P}\) and \(D \in \mathcal{L}\). We may now conclude that if \(C \in \mathcal{L}\), then \(\mathcal{P} \subset \mathcal{L}^C \subset \mathcal{L}\) and hence again \(\mathcal{L}^C = \mathcal{L}\). Since \(\mathcal{L}\) is arbitrary, we have shown \(C \cap D \in \mathcal{L}\) for all \(C, D \in \mathcal{L}\), i.e. \(\mathcal{L}\) is a \(\pi\) – system. So by Remark 8.12 \(\mathcal{L}\) is a \(\sigma\) algebra. Since \(\sigma(\mathcal{P})\) is the smallest \(\sigma\) – algebra containing \(\mathcal{P}\) it follows that \(\sigma(\mathcal{P}) \subset \mathcal{L}\).

As an immediate corollary, we have the following uniqueness result.

Proposition 8.15. Suppose that \(\mathcal{P} \subset 2^\Omega\) is a \(\pi\) – system. If \(P\) and \(Q\) are two probability measures on \(\sigma(\mathcal{P})\) such that \(P = Q\) on \(\mathcal{P}\), then \(P = Q\) on \(\sigma(\mathcal{P})\).

Proof. Let \(\mathcal{L} := \{A \in \sigma(\mathcal{P}) : P(A) = Q(A)\}\). One easily shows \(\mathcal{L}\) is a \(\lambda\) – class which contains \(\mathcal{P}\) by assumption. Indeed, \(\Omega \in \mathcal{P} \subset \mathcal{L}\), if \(A, B \in \mathcal{L}\) with \(A \subset B\), then

\[P(B \setminus A) = P(B) - P(A) = Q(B) - Q(A) = Q(B \setminus A)\]

More generally, \(P\) and \(Q\) could be two measures such that \(P(\Omega) = Q(\Omega) < \infty\).
so that $B \setminus A \in \mathcal{L}$, and if $A_n \in \mathcal{L}$ with $A_n \uparrow A$, then $P (A) = \lim_{n \to \infty} P (A_n) = \lim_{n \to \infty} Q (A_n) = Q (A)$ which shows $A \in \mathcal{L}$. Therefore $\sigma (\mathcal{P}) \subset \mathcal{L} = \sigma (\mathcal{P})$ and the proof is complete. \hfill \blacksquare

**Example 8.16.** Let $\Omega := \{a, b, c, d\}$ and let $\mu$ and $\nu$ be the probability measure on $2^\Omega$ determined by, $\mu \{\{x\}\} = \frac{1}{2}$ for all $x \in \Omega$ and $\nu \{\{a\}\} = \nu \{\{d\}\} = \frac{1}{8}$ and $\nu \{\{b\}\} = \nu \{\{c\}\} = 3/8$. In this example,

$$\mathcal{L} := \{A \in 2^\Omega : P (A) = Q (A)\}$$

is $\lambda$–system which is not an algebra. Indeed, $A = \{a, b\}$ and $B = \{a, c\}$ are in $\mathcal{L}$ but $A \cap B \notin \mathcal{L}$.

**Exercise 8.1.** Suppose that $\mu$ and $\nu$ are two measures (not assumed to be finite) on a measure space, $(\Omega, \mathcal{B}, \rho)$ such that $\mu = \nu$ on a $\pi$–system, $\mathcal{P}$. Further assume $\mathcal{B} = \sigma (\mathcal{P})$ and there exists $\Omega_n \in \mathcal{P}$ such that: i) $\mu (\Omega_n) = \nu (\Omega_n) < \infty$ for all $n$ and ii) $\Omega_n \uparrow \Omega$ as $n \uparrow \infty$. Show $\mu = \nu$ on $\mathcal{B}$.

**Hint:** Consider the measures, $\mu_n (A) := \mu (A \cap \Omega_n)$ and $\nu_n (A) = \nu (A \cap \Omega_n)$.

**Corollary 8.17.** A probability measure, $P$, on $(\mathbb{R}, \mathcal{B}_\mathbb{R})$ is uniquely determined by its cumulative distribution function,

$$F (x) := P ([\infty, x]) .$$

**Proof.** This follows from Proposition [8.15] wherein we use the fact that $\mathcal{P} := \{[\infty, x] : x \in \mathbb{R}\}$ is a $\pi$–system such that $\mathcal{B}_\mathbb{R} = \sigma (\mathcal{P})$.

**Remark 8.18.** Corollary [8.17] generalizes to $\mathbb{R}^n$. Namely a probability measure, $P$, on $(\mathbb{R}^n, \mathcal{B}_\mathbb{R}^n)$ is uniquely determined by its CDF,

$$F (x) := P ([\infty, x]) \text{ for all } x \in \mathbb{R}^n$$

where now

$$[\infty, x] := [\infty, x_1] \times [\infty, x_2] \times \cdots \times [\infty, x_n] .$$

**8.2.1 A Density Result**

**Exercise 8.2 (Density of $A$ in $\sigma (A)$).** Suppose that $A \subset 2^\Omega$ is an algebra, $\mathcal{B} := \sigma (A)$, and $P$ is a probability measure on $\mathcal{B}$. Let $\rho (A, B) := P (A \Delta B)$.

The goal of this exercise is to use the $\pi$–$\lambda$ theorem to show that $A$ is dense in $\mathcal{B}$ relative to the “metric,” $\rho$. More precisely you are to show using the following outline that for every $B \in \mathcal{B}$ there exists $A \in \mathcal{A}$ such that that $P (A \Delta B) < \varepsilon$.

1. Recall from Exercise [7.3] that $\rho (a, b) = P (A \Delta B) = E |1_A - 1_B| .$

2. Observe; if $B = \bigcup B_i$ and $A = \bigcup_i A_i$, then

$$B \setminus A = \bigcup_i (B_i \setminus A) \subset \bigcup_i (B_i \setminus A_i) \subset \bigcup_i A_i \setminus B_i$$

and so that

$$A \Delta B \subset \bigcup_i (A_i \setminus B_i) .$$

3. We also have

$$(B_2 \setminus B_1) \setminus (A_2 \setminus A_1) = B_2 \cap B_1^c \cap (A_2 \setminus A_1)^c$$

$$= B_2 \cap B_1^c \cap (A_2 \cap A_1^c)^c$$

$$= B_2 \cap B_1^c \cap (A_2 \cup A_1)^c$$

$$= [B_2 \cap B_1^c \cap A_2^c] \cup [B_2 \cap B_1^c \cap A_1]$$

$$\subset (B_2 \setminus A_2) \cup (A_1 \setminus B_1)$$

and similarly,

$$(A_2 \setminus A_1) \setminus (B_2 \setminus B_1) \subset (A_2 \setminus B_2) \cup (B_1 \setminus A_1)$$

so that

$$(A_2 \setminus A_1) \Delta (B_2 \setminus B_1) \subset (A_2 \setminus A_2) \cup (A_1 \setminus B_2) \cup (A_2 \setminus B_2) \cup (B_1 \setminus A_1) = (A_1 \setminus B_1) \cup (A_2 \Delta B_2) .$$

4. Observe that $A_n \in \mathcal{B}$ and $A_n \uparrow A$

$$P (B \Delta A_n) = P (B \setminus A_n) + P (A_n \setminus B)$$

$$\to P (B \setminus A) + P (A \setminus B) = P (A \Delta B) .$$

5. Let $\mathcal{L}$ be the collection of sets $B \in \mathcal{B}$ for which the assertion of the theorem holds. Show $\mathcal{L}$ is a $\lambda$–system which contains $\mathcal{A}$.

**8.3 Construction of Measures**

**Definition 8.19.** Given a collection of subsets, $\mathcal{E}$, of $\Omega$, let $\mathcal{E}_{\sigma}$ denote the collection of subsets of $\Omega$ which are finite or countable unions of sets from $\mathcal{E}$. Similarly let $\mathcal{E}_{\delta}$ denote the collection of subsets of $\Omega$ which are finite or countable intersections of sets from $\mathcal{E}$. We also write $\mathcal{E}_{\sigma\delta} = (\mathcal{E}_{\sigma})_{\delta}$ and $\mathcal{E}_{\delta\sigma} = (\mathcal{E}_{\delta})_{\sigma}$, etc.

**Lemma 8.20.** Suppose that $A \subset 2^\Omega$ is an algebra. Then:
1. $\mathcal{A}_\sigma$ is closed under taking countable unions and finite intersections.

2. $\mathcal{A}_\delta$ is closed under taking countable intersections and finite unions.

3. $\{A^n : A \in \mathcal{A}_\sigma\} = \mathcal{A}_\delta$ and $\{A^n : A \in \mathcal{A}_\delta\} = \mathcal{A}_\sigma$.

Proof. By construction $\mathcal{A}_\sigma$ is closed under countable unions. Moreover if $A = \bigcup_{i=1}^\infty A_i$ and $B = \bigcup_{j=1}^\infty B_j$ with $A_i, B_j \in \mathcal{A}$, then

$$A \cap B = \bigcup_{i,j=1}^\infty A_i \cap B_j \in \mathcal{A}_\sigma,$$

which shows that $\mathcal{A}_\sigma$ is also closed under finite intersections. Item 3. is straightforward and item 2. follows from items 1. and 3.

Remark 8.21. Let us recall from Proposition 8.3 and Remark 8.4 that a finitely additive measure $\mu : \mathcal{A} \to [0, \infty]$ is a premeasure on $\mathcal{A}$ if $\mu(\{A\}) \uparrow \mu(A)$ for all $\{A_n\}_{n=1}^\infty \subset \mathcal{A}$ such that $A_n \uparrow A \in \mathcal{A}$. Furthermore if $\mu(\Omega) < \infty$, then $\mu$ is a premeasure on $\mathcal{A}$ if $\mu(A_n) \downarrow 0$ for all $\{A_n\}_{n=1}^\infty \subset \mathcal{A}$ such that $A_n \downarrow \emptyset$.

Proposition 8.22. Given a premeasure, $\mu : \mathcal{A} \to [0, \infty]$, we extend $\mu$ to $\mathcal{A}_\sigma$ by defining

$$\mu(B) := \sup \{\mu(A) : A \supset A \subset B\}. \quad (8.2)$$

This function $\mu : \mathcal{A}_\sigma \to [0, \infty]$ then satisfies:

1. (Monotonicity) If $A, B \in \mathcal{A}_\sigma$ with $A \subset B$ then $\mu(A) \leq \mu(B)$.

2. (Continuity) If $A_n \supseteq A$ and $A_n \uparrow A \in \mathcal{A}_\sigma$, then $\mu(A_n) \uparrow \mu(A)$ as $n \to \infty$.

3. (Strong Additivity) If $A, B \in \mathcal{A}_\sigma$, then

$$\mu(A \cup B) + \mu(A \cap B) = \mu(A) + \mu(B). \quad (8.3)$$

4. (Sub-Additivity on $\mathcal{A}_\sigma$) The function $\mu$ is sub-additive on $\mathcal{A}_\sigma$, i.e. if $\{A_n\}_{n=1}^\infty \subset \mathcal{A}_\sigma$, then

$$\mu(\bigcup_{n=1}^\infty A_n) \leq \sum_{n=1}^\infty \mu(A_n). \quad (8.4)$$

5. (Additivity on $\mathcal{A}_\sigma$) The function $\mu$ is countably additive on $\mathcal{A}_\sigma$.

Proof. 1 and 2. Monotonicity follows directly from Eq. (8.2) which then implies $\mu(A_n) \leq \mu(B)$ for all $n$. Therefore $M := \lim_{n \to \infty} \mu(A_n) \leq \mu(B)$. To prove the reverse inequality, let $A \supset A \subset B$. Then by the continuity of $\mu$ on $\mathcal{A}$ and the fact that $A_n \uparrow A \uparrow A$ we have $\mu(A_n \uparrow A) \uparrow \mu(A)$. As $\mu(A_n) \geq \mu(A_n \cap A)$ for all $n$ it follows that $M := \lim_{n \to \infty} \mu(A_n) \geq \mu(A)$. As $A \in \mathcal{A}$ with $A \subset B$ was arbitrary we may conclude,

$$\mu(B) = \sup \{\mu(A) : A \supset A \subset B\} \leq M.$$

3. Suppose that $A, B \in \mathcal{A}_\sigma$ and $\{A_n\}_{n=1}^\infty$ and $\{B_n\}_{n=1}^\infty$ are sequences in $\mathcal{A}$ such that $A_n \uparrow A$ and $B_n \uparrow B$ as $n \to \infty$. Then passing to the limit as $n \to \infty$, in the identity,

$$\mu(A_n \cup B_n) + \mu(A_n \cap B_n) = \mu(A_n) + \mu(B_n)$$

proves Eq. (8.3). In particular, it follows that $\mu$ is finitely additive on $\mathcal{A}_\sigma$.

4 and 5. Let $\{A_n\}_{n=1}^\infty$ be any sequence in $\mathcal{A}_\sigma$ and choose $\{A_{n,i}\}_{i=1}^\infty \subset \mathcal{A}_\sigma$ such that $A_{n,i} \uparrow A_n$ as $i \to \infty$. Then we have,

$$\mu\left(\bigcup_{n=1}^N A_{n,N}\right) \leq \sum_{n=1}^N \mu(A_{n,N}) \leq \sum_{n=1}^N \mu(A_n) \leq \sum_{n=1}^\infty \mu(A_n). \quad (8.5)$$

Since $\mathcal{A} \supseteq \bigcup_{n=1}^\infty A_{n,N} \uparrow \bigcup_{n=1}^\infty A_n \in \mathcal{A}_\sigma$, we may let $N \to \infty$ in Eq. (8.5) to conclude Eq. (8.4) holds. If we further assume that $\{A_n\}_{n=1}^\infty \subset \mathcal{A}_\sigma$ are pairwise disjoint, by the finite additivity and monotonicity of $\mu$ on $\mathcal{A}_\sigma$, we have

$$\sum_{n=1}^\infty \mu(A_n) = \lim_{N \to \infty} \sum_{n=1}^N \mu(A_n) = \lim_{N \to \infty} \mu\left(\bigcup_{n=1}^N A_{n,N}\right) \leq \mu(\bigcup_{n=1}^\infty A_n)\).$$

This inequality along with Eq. (8.4) shows that $\mu$ is $\sigma$-additive on $\mathcal{A}_\sigma$.

Suppose $\mu$ is a finite premeasure on an algebra, $\mathcal{A} \subset 2^\Omega$, and $A \in \mathcal{A}_\delta \cap \mathcal{A}_\sigma$. Since $\mathcal{A}, A' \in \mathcal{A}_\sigma$ and $\Omega = A \cup A'$, it follows that $\mu(\Omega) = \mu(A) + \mu(A')$. From this observation we may extend $\mu$ to a function on $\mathcal{A}_3 \cup \mathcal{A}_\sigma$ by defining

$$\mu(A) := \mu(\Omega) - \mu(A'). \quad (8.6)$$

Lemma 8.23. Suppose $\mu$ is a finite premeasure on an algebra, $\mathcal{A} \subset 2^\Omega$, and $\mu$ has been extended to $\mathcal{A}_3 \cup \mathcal{A}_\sigma$ as described in Proposition 8.22 and Eq. (8.6) above.

1. If $A \in \mathcal{A}_3$ then $\mu(A) = \inf \{\mu(B) : A \subset B \in \mathcal{A}\}$.

2. If $A \in \mathcal{A}_3$ and $A_n \in \mathcal{A}$ such that $A_n \downarrow A$, then $\mu(A) = \lim_{n \to \infty} \mu(A_n)$. 3. $\mu$ is strongly additive when restricted to $\mathcal{A}_3$.

4. If $A \in \mathcal{A}_3$ and $C \in \mathcal{A}_\sigma$ such that $A \subset C$, then $\mu(C \setminus A) = \mu(C) - \mu(A)$.

Proof. 1. Since $\mu(B) = \mu(\Omega) - \mu(B')$ and $A \subset B$ iff $B' \subset A'$, it follows that

$$\inf \{\mu(B) : A \subset B \in \mathcal{A}\} = \inf \{\mu(\Omega) - \mu(B') : A \supset B' \subset A'\} = \mu(\Omega) - \sup \{\mu(B) : A \supset B' \subset A'\} = \mu(\Omega) - \mu(A') = \mu(A).$$
2. Similarly, since \( A_n^c \uparrow A^c \in \mathcal{A}_\sigma \), by the definition of \( \mu (A) \) and Proposition \[ \text{iii} \] it follows that
\[
\mu (A) = \mu (\Omega) - \mu (A^c) = \mu (\Omega) - \lim_{n \to \infty} \mu (A_n^c)
\]
\[
= \lim_{n \to \infty} \mu (\Omega) - \mu (A_n^c) = \lim_{n \to \infty} \mu (A_n).
\]

3. Suppose \( A, B \in \mathcal{A}_\delta \) and \( A_n, B_n \in \mathcal{A} \) such that \( A_n \downarrow A \) and \( B_n \downarrow B \), then \( A_n \cup B_n \downarrow A \cup B \) and \( A_n \cap B_n \downarrow A \cap B \) and therefore,
\[
\mu (A \cup B) + \mu (A \cap B) = \lim_{n \to \infty} [\mu (A_n \cup B_n) + \mu (A_n \cap B_n)]
\]
\[
= \lim_{n \to \infty} [\mu (A_n) + \mu (B_n)] = \mu (A) + \mu (B).
\]

All we really need is the finite additivity of \( \mu \) which can be proved as follows. Suppose that \( A, B \in \mathcal{A}_\delta \) are disjoint, then \( A \cap B = \emptyset \) implies \( A^c \cup B^c = \Omega \). So by the strong additivity of \( \mu \) on \( \mathcal{A}_\sigma \) it follows that
\[
\mu (\Omega) + \mu (A^c \cap B^c) = \mu (A^c) + \mu (B^c)
\]
from which it follows that
\[
\mu (A \cup B) = \mu (\Omega) - \mu (A^c \cap B^c)
\]
\[
= \mu (\Omega) - [\mu (A^c) + \mu (B^c) - \mu (\Omega)]
\]
\[
= \mu (A) + \mu (B).
\]

4. Since \( A^c, C \in \mathcal{A}_\sigma \) we may use the strong additivity of \( \mu \) on \( \mathcal{A}_\sigma \) to conclude,
\[
\mu (A^c \cup C) + \mu (A^c \cap C) = \mu (A^c) + \mu (C).
\]

Because \( \Omega = A^c \cup C \), and \( \mu (A^c) = \mu (\Omega) - \mu (A) \), the above equation may be written as
\[
\mu (\Omega) + \mu (C \setminus A) = \mu (\Omega) - \mu (A) + \mu (C)
\]
which finishes the proof.

**Notation 8.24 (Inner and outer measures)** Let \( \mu : \mathcal{A} \to [0, \infty) \) be a finite premeasure extended to \( \mathcal{A}_\sigma \cup \mathcal{A}_\delta \) as above. The for any \( B \subset \Omega \) let
\[
\mu_* (B) := \sup \{ \mu (A) : A_\delta \ni A \subset B \}
\]
and
\[
\mu^* (B) := \inf \{ \mu (C) : B \subset C \in \mathcal{A}_\sigma \}.
\]

We refer to \( \mu_* (B) \) and \( \mu^* (B) \) as the **inner and outer** content of \( B \) respectively.

If \( B \subset \Omega \) has the same inner and outer content it is reasonable to define the measure of \( B \) as this common value. As we will see in Theorem \[ \text{iv} \] below, this extension becomes a \( \sigma \) – additive measure on a \( \sigma \) – algebra of subsets of \( \Omega \).

**Definition 8.25 (Measurable Sets).** Suppose \( \mu \) is a finite premeasure on an algebra \( \mathcal{A} \subset 2^\Omega \). We say that \( B \subset \Omega \) is measurable if \( \mu_* (B) = \mu^* (B) \). We will denote the collection of measurable subsets of \( \Omega \) by \( \mathcal{B} = \mathcal{B} (\mu) \) and define \( \tilde{\mu} : \mathcal{B} \to [0, \mu (\Omega)] \) by
\[
\tilde{\mu} (B) := \mu_* (B) = \mu^* (B) \quad \text{for all } B \in \mathcal{B}.
\]

**Remark 8.26.** Observe that \( \mu_* (B) = \mu^* (B) \) if and only if \( \in \varepsilon > 0 \) there exists \( A \in \mathcal{A}_\delta \) and \( C \in \mathcal{A}_\sigma \) such that \( A \subset B \subset C \) and
\[
\mu (C \setminus A) = \mu (C) - \mu (A) < \varepsilon,
\]
whence we have used Lemma \[ \text{iii} \] for the first equality. Moreover we will use below that if \( B \in \mathcal{B} \) and \( \mathcal{A}_\delta \ni A \subset B \subset C \in \mathcal{A}_\sigma \), then
\[
\mu (A) \leq \mu_* (B) = \tilde{\mu} (B) = \mu^* (B) \leq \mu (C).
\]

**Theorem 8.27 (Finite Premeasure Extension Theorem).** Suppose \( \mu \) is a finite premeasure on an algebra \( \mathcal{A} \subset 2^\Omega \) and \( \tilde{\mu} : \mathcal{B} := \mathcal{B} (\mu) \to [0, \mu (\Omega)] \) be as in Definition \[ \text{iii} \] Then \( \mathcal{B} \) is a \( \sigma \) – algebra on \( \Omega \) which contains \( \mathcal{A} \) and \( \tilde{\mu} \) is a \( \sigma \) – additive measure on \( \mathcal{B} \). Moreover, \( \tilde{\mu} \) is the unique measure on \( \mathcal{B} \) such that \( \tilde{\mu} |_{\mathcal{A}} = \mu \).

**Proof.** 1. \( \mathcal{B} \) is an algebra. It is clear that \( \mathcal{A} \subset \mathcal{B} \) and that \( \mathcal{B} \) is closed under complementation – see Eq. \( \text{iii} \) and use the fact that \( A^c \setminus \mathcal{C} \cap A \subset \mathcal{A} \). Now suppose that \( B_i \in \mathcal{B} \) for \( i = 1, 2 \) and \( \varepsilon > 0 \) is given. We may then choose \( A_i \subset B_i \subset C_i \) such that \( A_i \in \mathcal{A}_\delta \), \( C_i \in \mathcal{A}_\sigma \), and \( \mu (C_i \setminus A_i) < \varepsilon \) for \( i = 1, 2 \). Then with \( A = A_1 \cup A_2, B = B_1 \cup B_2 \) and \( C = C_1 \cup C_2 \), we have \( \mathcal{A}_\delta \ni A \subset B \subset C \in \mathcal{A}_\sigma \). Since
\[
C \setminus A = (C_1 \setminus A) \cup (C_2 \setminus A) \subset (C_1 \setminus A) \cup (C_2 \setminus A_2),
\]

it follows from the sub-additivity of \( \mu \) that with
\[
\mu (C \setminus A) \leq \mu (C_1 \setminus A_1) + \mu (C_2 \setminus A_2) < 2 \varepsilon.
\]

Since \( \varepsilon > 0 \) was arbitrary, we have shown that \( B \in \mathcal{B} \) which completes the proof that \( \mathcal{B} \) is an algebra.

2. \( \mathcal{B} \) is a \( \sigma \) – algebra. As we know \( \mathcal{B} \) is an algebra, to show \( \mathcal{B} \) is a \( \sigma \) – algebra it suffices to show that \( B = \sum_{n=1}^{\infty} B_n \in \mathcal{B} \) whenever \( \{B_n\}_{n=1}^{\infty} \) is a disjoint sequence in \( \mathcal{B} \). To this end, let \( \varepsilon > 0 \) be given and choose \( A_i \subset B_i \subset C_i \) such
that $A_i \in \mathcal{A}_\delta$, $C_i \in \mathcal{A}_\sigma$, and $\mu(C_i \setminus A_i) < \varepsilon 2^{-i}$ for all $i$. Let $C := \bigcup_{i=1}^{\infty} C_i \in \mathcal{A}_\sigma$ and for $n \in \mathbb{N}$ let $A^n := \bigcup_{i=1}^{n} A_i \in \mathcal{A}_\delta$. Since the $\{A_i\}_{i=1}^{\infty}$ are pairwise disjoint, we may use Lemma 8.23 to show,

$$\sum_{i=1}^{n} \mu(C_i) = \sum_{i=1}^{n} (\mu(A_i) + \mu(C_i \setminus A_i)) = \mu(A^n) + \sum_{i=1}^{n} \mu(C_i \setminus A_i) \leq \mu(\Omega) + \sum_{i=1}^{n} \varepsilon 2^{-i},$$

which on letting $n \to \infty$ implies

$$\sum_{i=1}^{\infty} \mu(C_i) \leq \mu(\Omega) + \varepsilon < \infty. \quad (8.10)$$

Using

$$C \setminus A^n = \bigcup_{i=n+1}^{\infty} (C_i \setminus A^n) \subseteq [\bigcup_{i=n+1}^{\infty} (C_i \setminus A^n)] \cup [\bigcup_{i=n+1}^{\infty} C_i] \in \mathcal{A}_\sigma,$$

and the sub-additivity of $\mu$ on $\mathcal{A}_\sigma$ it follows that

$$\mu(C \setminus A^n) \leq \sum_{i=n+1}^{\infty} \mu(C_i \setminus A_i) + \sum_{i=n+1}^{\infty} \mu(C_i) \leq \varepsilon \sum_{i=n+1}^{\infty} \varepsilon 2^{-i} + \sum_{i=n+1}^{\infty} \mu(C_i) \leq \varepsilon + \sum_{i=n+1}^{\infty} \mu(C_i) \to \varepsilon \text{ as } n \to \infty,$$

wherein we have used Eq. (8.10) in computing the limit. In summary, $B = \bigcup_{i=1}^{\infty} B_i$, $A_\delta \supseteq A^n \subset B \subset C \in \mathcal{A}_\sigma$, $C \setminus A^n \in \mathcal{A}_\sigma$ with $\mu(C \setminus A^n) \leq 2\varepsilon$ for all $n$ sufficiently large. Since $\varepsilon > 0$ is arbitrary, it follows that $B \in \mathcal{B}$.

3. $\bar{\mu}$ is a measure. Continuing the notation in step 2, we have

$$\sum_{i=1}^{\infty} \mu(A_i) \leq \sum_{i=1}^{\infty} \mu(B_i) \leq \bar{\mu}(B) \leq \mu(C) \leq \sum_{i=1}^{\infty} \mu(C_i). \quad (8.11)$$

On the other hand, since $A_i \subset B_i \subset C_i$, it follows (see Eq. 8.9) that $\mu(A_i) \leq \bar{\mu}(B_i) \leq \mu(C_i)$ and therefore that

$$\sum_{i=1}^{\infty} \mu(A_i) \leq \sum_{i=1}^{\infty} \bar{\mu}(B_i) \leq \sum_{i=1}^{\infty} \mu(C_i). \quad (8.12)$$

Equations (8.11) and (8.12) show that $\bar{\mu}(B)$ and $\sum_{i=1}^{\infty} \bar{\mu}(B_i)$ are both between $\sum_{i=1}^{\infty} \mu(A_i)$ and $\sum_{i=1}^{\infty} \mu(C_i)$ and so

$$\left| \bar{\mu}(B) - \sum_{i=1}^{\infty} \bar{\mu}(B_i) \right| \leq \sum_{i=1}^{\infty} \mu(C_i) - \sum_{i=1}^{\infty} \mu(A_i) = \sum_{i=1}^{\infty} \mu(C_i \setminus A_i) \leq \sum_{i=1}^{\infty} \varepsilon 2^{-i} = \varepsilon.$$
Suppose that \(\mu\) is a premeasure on \(A\) then \(\mu\) is \(\sigma\) - additive and hence sub-additive on \(S\). Because of Proposition 7.2 to prove the converse it suffices to show that the sub-additivity of \(\mu\) on \(S\) implies the sub-additivity of \(\mu\) on \(A\).

So suppose \(A = \sum_{n=1}^{\infty} A_n \in A\) with each \(A_n \in A\). By Proposition 6.25 we may write \(A = \sum_{j=1}^{k} E_j\) and \(A_n = \sum_{i=1}^{N_n} E_{n,i}\) with \(E_j, E_{n,i} \in S\). Intersecting the identity, \(A = \sum_{n=1}^{\infty} A_n\), with \(E_j\) implies

\[
E_j = A \cap E_j = \sum_{n=1}^{\infty} A_n \cap E_j = \sum_{n=1}^{\infty} \sum_{i=1}^{N_n} E_{n,i} \cap E_j.
\]

By the assumed sub-additivity of \(\mu\) on \(S\),

\[
\mu(E_j) \leq \sum_{n=1}^{\infty} \sum_{i=1}^{N_n} \mu(E_{n,i} \cap E_j).
\]

Summing this equation on \(j\) and using the finite additivity of \(\mu\) shows

\[
\mu(A) = \sum_{j=1}^{k} \mu(E_j) \leq \sum_{j=1}^{k} \sum_{n=1}^{\infty} \sum_{i=1}^{N_n} \mu(E_{n,i} \cap E_j) = \sum_{n=1}^{\infty} \sum_{i=1}^{N_n} \mu(E_{n,i}) = \sum_{n=1}^{\infty} \mu(A_n).
\]

Suppose now that \(\mu\) is a Radon measure on \((\mathbb{R}, B_{\mathbb{R}})\) and \(F : \mathbb{R} \to \mathbb{R}\) is chosen so that

\[
\mu((a,b]) = F(b) - F(a) \text{ for all } -\infty < a < b < \infty. \tag{8.14}
\]

For example if \(\mu(\mathbb{R}) < \infty\) we can take \(F(x) = \mu((-\infty, x])\) while if \(\mu(\mathbb{R}) = \infty\) we might take

\[
F(x) = \begin{cases} 
\mu((0, x]) & \text{if } x \geq 0 \\
-\mu((x, 0]) & \text{if } x \leq 0
\end{cases}
\]

The function \(F\) is uniquely determined modulo translation by a constant.

**Lemma 8.32.** If \(\mu\) is a Radon measure on \((\mathbb{R}, B_{\mathbb{R}})\) and \(F : \mathbb{R} \to \mathbb{R}\) is chosen so that \(\mu((a,b]) = F(b) - F(a)\), then \(F\) is increasing and right continuous.

**Proof.** The function \(F\) is increasing by the monotonicity of \(\mu\). To see that \(F\) is right continuous, let \(b \in \mathbb{R}\) and choose \(a \in (-\infty, b)\) and any sequence \(\{b_n\}_{n=1}^{\infty} \in (b, \infty)\) such that \(b_n \downarrow b\) as \(n \to \infty\). Since \(\mu((a, b_1]) < \infty\) and \((a, b_n] \downarrow (a, b]\) as \(n \to \infty\), it follows that

\[
F(b_n) - F(a) = \mu((a, b_n]) \downarrow \mu((a, b]) = F(b) - F(a).
\]
Since \( \{b_n\}_{n=1}^{\infty} \) was an arbitrary sequence such that \( b_n \downarrow b \), we have shown \( \lim_{y \downarrow b} F(y) = F(b) \).

The key result of this section is the converse to this lemma.

**Theorem 8.33.** Suppose \( F: \mathbb{R} \to \mathbb{R} \) is a right continuous increasing function. Then there exists a unique Radon measure, \( \mu = \mu_F \), on \((\mathbb{R}, \mathcal{B}_\mathbb{R})\) such that \( Eq. (8.14) \) holds.

**Proof.** Let \( S := \{(a, b] \cap \mathbb{R} : -\infty \leq a \leq b \leq \infty\} \), and \( \mathcal{A} = \mathcal{A}(S) \) consists of those sets, \( A \subset \mathbb{R} \) which may be written as finite disjoint unions of sets from \( S \) as in Example 6.26. Recall that \( \mathcal{B}_\mathbb{R} = \sigma(\mathcal{A}) = \sigma(S) \). Further define \( F(\pm \infty) := \lim_{x \to \pm \infty} F(x) \) and let \( \mu = \mu_F \) be the finitely additive measure on \((\mathbb{R}, \mathcal{A})\) described in Proposition 7.8 and Remark 7.9. To finish the proof it suffices by Theorem 8.29 to show that \( \mu \) is a premeasure on \( \mathcal{A} = \mathcal{A}(S) \) where \( S := \{(a, b] \cap \mathbb{R} : -\infty \leq a \leq b \leq \infty\} \). So in light of Proposition 8.31 to finish the proof it suffices to show \( \mu \) is subadditive on \( S \), i.e. we must show

\[
\mu(J) \leq \sum_{n=1}^{\infty} \mu(J_n).
\]

where \( J = \sum_{n=1}^{\infty} J_n \) with \( J = (a, b] \cap \mathbb{R} \) and \( J_n = (a_n, b_n] \cap \mathbb{R} \). Recall from Proposition 7.2 that the finite additivity of \( \mu \) implies

\[
\sum_{n=1}^{\infty} \mu(J_n) \leq \mu(J).
\]

We begin with the special case where \( -\infty < a < b < \infty \). Our proof will be by “continuous induction.” The strategy is to show \( a \in A \) where

\[
A := \left\{ \alpha \in [a, b] : \mu(J \cap (\alpha, b]) \leq \sum_{n=1}^{\infty} \mu(J_n \cap (\alpha, b]) \right\}.
\]

As \( b \in J \), there exists a \( k \) such that \( b \in J_k \) and hence \( (a_k, b_k] = (a, b] \) for this \( k \). It now easily follows that \( J_k \subset A \) so that \( A \) is not empty. To finish the proof we are going to show \( \bar{a} := \inf A \in A \) and that \( \bar{a} = a \).

- Let \( \alpha_m \in A \) such that \( \alpha_m \downarrow \bar{a} \), i.e.

\[
\mu(J \cap (\alpha_m, b]) \leq \sum_{n=1}^{\infty} \mu(J_n \cap (\alpha_m, b]).
\]

The right continuity of \( F \) implies \( \alpha \to \mu(J_n \cap (\alpha, b]) \) is right continuous. So by the dominated convergence theorem for sums, \( \sum_{n=1}^{\infty} \mu(J_n) \leq \mu(J) < \infty \) by Eq. 8.18.

\[\mu(J \cap (\bar{a}, b]) = \lim_{m \to \infty} \mu(J \cap (\alpha_m, b]) \]

\[\leq \lim_{m \to \infty} \sum_{n=1}^{\infty} \mu(J_n \cap (\alpha_m, b]) \]

\[= \sum_{n=1}^{\infty} \lim_{m \to \infty} \mu(J_n \cap (\alpha_m, b]) = \sum_{n=1}^{\infty} \mu(J_n \cap (\bar{a}, b]) \]

i.e. \( \bar{a} \in A \).

- If \( \bar{a} > a \), then \( \bar{a} \in J_l = (a_l, b_l] \) for some \( l \). Letting \( \alpha = a_l < \bar{a} \), we have

\[
\mu(J \cap (\alpha, b]) = \mu(J \cap (\alpha, \bar{a})] + \mu(J \cap (\bar{a}, b])
\]

\[\leq \mu(J_l \cap (\alpha, \bar{a})] + \lim_{n \to \infty} \sum_{n=1}^{\infty} \mu(J_n \cap (\alpha, b])
\]

\[= \mu(J_l \cap (\alpha, \bar{a})] + \mu(J_l \cap (\bar{a}, b]) + \sum_{n \neq l} \mu(J_n \cap (\bar{a}, b])
\]

\[= \mu(J_l \cap (\alpha, b]) + \sum_{n \neq l} \mu(J_n \cap (\bar{a}, b])
\]

\[\leq \sum_{n=1}^{\infty} \mu(J_n \cap (\alpha, b])
\]

This shows \( \alpha \in A \) and \( \alpha < \bar{a} \) which violates the definition of \( \bar{a} \). Thus we must conclude that \( \bar{a} = a \).

The hard work is now done but we still have to check the cases where \( a = -\infty \) or \( b = \infty \). For example, suppose that \( b = \infty \) so that

\[
J = (a, \infty) = \sum_{n=1}^{\infty} J_n
\]

with \( J_n = (a_n, b_n] \cap \mathbb{R} \). Then

\[
I_M := (a, M] = J \cap I_M = \sum_{n=1}^{\infty} J_n \cap I_M
\]

and so by what we have already proved,

\[
F(M) - F(a) = \mu(I_M) \leq \sum_{n=1}^{\infty} \mu(J_n \cap I_M) \leq \sum_{n=1}^{\infty} \mu(J_n).
\]

Now let \( M \to \infty \) in this last inequality to find that
\[ \mu((a, \infty)) = F(\infty) - F(a) \leq \sum_{n=1}^{\infty} \mu(J_n). \]

The other cases where \( a = -\infty \) and \( b \in \mathbb{R} \) and \( a = -\infty \) and \( b = \infty \) are handled similarly.

8.4.1 Lebesgue Measure

If \( F(x) = x \) for all \( x \in \mathbb{R} \), we denote \( \mu_F \) by \( m \) and call \( m \) Lebesgue measure on \((\mathbb{R}, \mathcal{B}_R)\).

**Theorem 8.34.** Lebesgue measure \( m \) is invariant under translations, i.e. for \( B \in \mathcal{B}_R \) and \( x \in \mathbb{R} \),

\[ m(x + B) = m(B). \]  \( \text{(8.19)} \)

Lebesgue measure, \( m \), is the unique measure on \( \mathcal{B}_R \) such that \( m((0,1]) = 1 \) and Eq. \( \text{(8.19)} \) holds for \( B \in \mathcal{B}_R \) and \( x \in \mathbb{R} \). Moreover, \( m \) has the scaling property

\[ m(\lambda B) = |\lambda| m(B) \]  \( \text{(8.20)} \)

where \( \lambda \in \mathbb{R}, B \in \mathcal{B}_R \) and \( \lambda B := \{\lambda x : x \in B\} \).

**Proof.** Let \( m_x(B) := m(x+B) \), then one easily shows that \( m_x \) is a measure on \( \mathcal{B}_R \) such that \( m_x((a,b]) = b-a \) for all \( a < b \). Therefore, \( m_x = m \) by the uniqueness assertion in Exercise 8.11. For the converse, suppose that \( m \) is translation invariant and \( m((0,1]) = 1 \). Given \( n \in \mathbb{N} \), we have

\[ (0,1] = \bigcup_{k=1}^{n} \left( \frac{k-1}{n}, \frac{k}{n} \right] = \bigcup_{k=1}^{n} \left( \frac{k-1}{n}, \frac{1}{n} \right] \cdot \left( \frac{k-1}{n}, \frac{1}{n} \right) \right). \]

Therefore,

\[ 1 = m((0,1]) = \sum_{k=1}^{n} m \left( \frac{k-1}{n}, \frac{1}{n} \right] \]

\[ = \sum_{k=1}^{n} m \left( 0, \frac{1}{n} \right] = n \cdot m((0, \frac{1}{n}] \right). \]

That is to say

\[ m((0, \frac{1}{n}]) = 1/n. \]

Similarly, \( m((0, \frac{l}{n}]) = l/n \) for all \( l, n \in \mathbb{N} \) and therefore by the translation invariance of \( m \),

\[ m((a,b]) = b-a \text{ for all } a, b \in \mathbb{Q} \text{ with } a < b. \]

Finally for \( a, b \in \mathbb{R} \) such that \( a < b \), choose \( a_n, b_n \in \mathbb{Q} \) such that \( b_n \downarrow b \) and \( a_n \uparrow a \), then \( (a_n, b_n) \downarrow (a, b] \) and thus

\[ m((a, b]) = \lim_{n \to \infty} m((a_n, b_n]) = \lim_{n \to \infty} (b_n - a_n) = b - a, \]

i.e. \( m \) is Lebesgue measure. To prove Eq. \( \text{(8.20)} \) we may assume that \( \lambda \neq 0 \) since this case is trivial to prove. Now let \( m_\lambda(B) := |\lambda|^{-1} m(\lambda B) \). It is easily checked that \( m_\lambda \) is again a measure on \( \mathcal{B}_R \) which satisfies

\[ m_\lambda((a,b]) = \lambda^{-1} m((\lambda a, \lambda b]) = \lambda^{-1} (\lambda b - \lambda a) = b - a \]

if \( \lambda > 0 \) and

\[ m_\lambda((a,b]) = |\lambda|^{-1} m((\lambda b, \lambda a)) = -|\lambda|^{-1} (\lambda b - \lambda a) = b - a \]

if \( \lambda < 0 \). Hence \( m_\lambda = m \).

8.5 A Discrete Kolmogorov’s Extension Theorem

For this section, let \( S \) be a finite or countable set (we refer to \( S \) as state space), \( \Omega := S^\infty := S^\infty \) (think of \( \mathbb{N} \) as time and \( \Omega \) as path space).

\[ A_n := \{B \times \Omega : B \subset S^n\} \text{ for all } n \in \mathbb{N}, \]

\[ A := \bigcup_{n=1}^{\infty} A_n, \text{ and } B := \sigma(A). \]

We call the elements, \( A \subset \Omega \), the cylinder subsets of \( \Omega \). Notice that \( A \subset \Omega \) is a cylinder set if there exists \( n \in \mathbb{N} \) and \( B \subset S^n \) such that

\[ A = B \times \Omega := \{\omega \in \Omega : (\omega_1, \ldots, \omega_n) \in B\}. \]

Also observe that we may write \( A \) as \( A = A' \times \Omega \) where \( A' = B \times S^k \subset S^{n+k} \) for any \( k \geq 0 \).

**Exercise 8.5.** Show;

1. \( A_n \) is a \( \sigma \)-algebra for each \( n \in \mathbb{N} \),
2. \( A_n \subset A_{n+1} \) for all \( n \), and
3. \( A \subset 2^\Omega \) is an algebra of subsets of \( \Omega \). (In fact, you might show that \( A = \bigcup_{n=1}^{\infty} A_n \) is an algebra whenever \( \{A_n\}_{n=1}^{\infty} \) is an increasing sequence of algebras.)

**Lemma 8.35 (Baby Tychonov Theorem).** Suppose \( \{C_n\}_{n=1}^{\infty} \subset A \) is a decreasing sequence of non-empty cylinder sets. Further assume there exists \( N_n \in \mathbb{N} \) and \( B_n \subset S^{N_n} \) such that \( C_n = B_n \times \Omega \). (This last assumption is vacuous when \( S \) is a finite set. Recall that we write \( A \subset A \) to indicate that \( A \) is a finite subset of \( A \).) Then \( \bigcap_{n=1}^{\infty} C_n \neq \emptyset \).
Proof. Since $C_{n+1} \subset C_n$, if $N_n > N_{n+1}$, we would have $B_{n+1} \times S^{N_{n+1} - N_n} \subset B_n$. If $S$ is an infinite set this would imply $B_n$ is an infinite set and hence we must have $N_{n+1} \geq N_n$ for all $n$ when $(S) = \infty$. On the other hand, if $S$ is a finite set, we can always replace $B_{n+1}$ by $B_{n+1} \times S^k$ for some appropriate $k$ and arrange it so that $N_{n+1} \geq N_n$ for all $n$. So from now we assume that $N_{n+1} \geq N_n$.

**Case 1.** \[\lim_{n \to \infty} N_n < \infty\] in which case there exists some $N \in \mathbb{N}$ such that $N_n = N$ for all large $n$. Thus for large $N$, $C_n = B_n \times \Omega$ with $B_n \subset S^N$ and $B_{n+1} \subset B_n$ and hence $\#(B_n) \downarrow$ as $n \to \infty$. By assumption, \[\lim_{n \to \infty} \#(B_n) = 0\] and therefore $\#(B_n) = k > 0$ for all large $n$. It then follows that there exists $n_0 \in \mathbb{N}$ such that $B_n = B_{n_0}$ for all $n \geq n_0$. Therefore $\cap_{n=1}^\infty C_n = B_{n_0} \times \Omega \neq \emptyset$.

**Case 2.** \[\lim_{n \to \infty} N_n = \infty\]. By assumption, there exists $\omega(n) = (\omega_1(n), \omega_2(n), \ldots) \in \Omega$ such that $\omega(n) \in C_n$ for all $n$. Moreover, since $\omega(n) \in C_n \subset C_k$ for all $k \leq n$, it follows that

\[(\omega_1(n), \omega_2(n), \ldots, \omega_{N_n}(n)) \in B_k \quad \forall n \geq k \quad (8.21)\]

and as $B_k$ is a finite set $\{\omega_i(n)\}_{n=1}^\infty$ must be a finite set for all $1 \leq i \leq N_k$. As $N_k \to \infty$ as $k \to \infty$ it follows that $\{\omega_i(n)\}_{n=1}^\infty$ is a finite set for all $i \in \mathbb{N}$.

Using this observation, we may find, $s_1 \in S$ and an infinite subset, $\Gamma_1 \subset \mathbb{N}$ such that $\omega_1(n) = s_1$ for all $n \in \Gamma_1$. Similarly, there exists $s_2 \in S$ and an infinite subset, $\Gamma_2 \subset \mathbb{N}$, such that $\omega_2(n) = s_2$ for all $n \in \Gamma_2$. Continuing this procedure inductively, there exists (for all $j \in \mathbb{N}$) infinite subsets, $\Gamma_j \subset \mathbb{N}$ and points $s_j \in S$ such that $\Gamma_1 \supset \Gamma_2 \supset \Gamma_3 \supset \ldots$ and $\omega_j(n) = s_j$ for all $n \in \Gamma_j$.

We are now going to complete the proof by showing $s := (s_1, s_2, \ldots) \in \cap_{n=1}^\infty C_n$. By the construction above, for all $N \in \mathbb{N}$ we have

\[(\omega_1(n), \ldots, \omega_N(n)) = (s_1, \ldots, s_N) \quad \forall n \in \Gamma_N.\]

Taking $N = N_k$ and $n \in \Gamma_{N_k}$ with $n \geq k$, we learn from Eq. (8.21) that

\[(s_1, \ldots, s_{N_k}) = (\omega_1(n), \ldots, \omega_{N_k}(n)) \in B_k.\]

But this is equivalent to showing $s \in C_k$. Since $k \in \mathbb{N}$ was arbitrary it follows that $s \in \cap_{n=1}^\infty C_n$.

Let $\tilde{S} := S$ is a finite set and $\bar{S} = S \cup \{\infty\}$ if $S$ is an infinite set. Here, $\infty$ is simply another point not in $S$ which we call infinity. Let $\{x_n\}_{n=1}^\infty \subset \bar{S}$ be a sequence, then we may limit $x_{n} \to \infty$ if for every $A \subset S$, $x_n \notin A$ for almost all $n$ and we say that limit $x_{n} = s \in S$ if $x_{n} = s$ for almost all $n$. For example this is the usual notion of convergence for $S = \{\frac{1}{n} \mid n \in \mathbb{N}\}$ and $\bar{S} = S \cup \{0\} \subset [0,1]$, where $0$ is playing the role of infinity here. Observe that either limit $x_{n} \to \infty$ or there exists a finite subset $F \subset S$ such that $x_{n} \in F$ infinitely often. Moreover, there must be some point, $s \in F$ such that $x_{n} = s$ infinitely often. Thus if we let $\{n_1 < n_2 < \ldots\} \subset \mathbb{N}$ be chosen such that $x_{n_k} = s$ for all $k$, then $\lim_{k \to \infty} x_{n_k} = s$. Thus we have shown that every sequence in $\bar{S}$ has a convergent subsequence.

**Lemma 8.36 (Baby Tychonov Theorem I.).** Let $\Omega := \tilde{S}^\infty$ and $\{\omega(n)\}_{n=1}^\infty$ be a sequence in $\Omega$. Then there is a subsequence, $\{n_k\}_{k=1}^\infty$ of $\{n\}_{n=1}^\infty$ such that $\lim_{k \to \infty} \omega(n_k)$ exists in $\Omega$ by which we mean, $\lim_{k \to \infty} \omega_i(n_k)$ exists in $\tilde{S}$ for all $i \in \mathbb{N}$.

Proof. This follows by the usual cantor’s diagonalization argument. Indeed, let $\{n_k\}_{k=1}^\infty \subset \{n\}_{n=1}^\infty$ be chosen so that $\lim_{k \to \infty} \omega_i(n_k) = s_i \in \tilde{S}$ exists. Then choose $\{n_k\}_{k=1}^\infty \subset \{n\}_{n=1}^\infty$ so that $\lim_{k \to \infty} \omega_2(n_k^2) = s_2 \in \tilde{S}$ exists. Continue on this way to inductively choose

$$\{n_k\}_{k=1}^\infty \supset \{n_k^2\}_{k=1}^\infty \supset \ldots \supset \{n_k^{i}\}_{k=1}^\infty \supset \ldots$$

such that $\lim_{k \to \infty} \omega_i(n_k^i) = s_i \in \bar{S}$. The subsequence, $\{n_k\}_{k=1}^\infty$ of $\{n\}_{n=1}^\infty$ may now be defined by, $n_k = n_k^i_i$.

**Corollary 8.37 (Baby Tychonov Theorem II.).** Suppose that $\{F_n\}_{n=1}^\infty \subset \Omega$ is decreasing sequence of non-empty sets which are closed under taking sequential limits, then $\cap_{n=1}^\infty F_n \neq \emptyset$.

Proof. Since $F_n \neq \emptyset$ there exists $\omega(n) \in F_n$ for all $n$. Using Lemma 8.36 there exists $\{n_k\}_{k=1}^\infty \subset \{n\}_{n=1}^\infty$ such that $\omega := \lim_{k \to \infty} \omega(n_k)$ exists in $\tilde{S}$. Since $\omega(n_k) \in F_n$ for all $k \geq n$, it follows that $\omega \in F_n$ for all $n$, i.e. $\omega \in \cap_{n=1}^\infty F_n$ and hence $\cap_{n=1}^\infty F_n \neq \emptyset$.

**Example 8.38.** Suppose that $1 \leq N_1 < N_2 < N_3 < \ldots$ $F_n = K_n \times \Omega$ with $K_n \subset S^{N_n}$ such that $\{F_n\}_{n=1}^\infty \subset \Omega$ is a decreasing sequence of non-empty sets. Then $\cap_{n=1}^\infty F_n \neq \emptyset$. To prove this, let $F_n := K_n \times \Omega$ in which case $F_n$ are non-empty sets closed under taking limits. Therefore by Corollary 8.37 $\cap_{n=1}^\infty F_n \neq \emptyset$. This completes the proof since it is easy to check that $\cap_{n=1}^\infty F_n = \cap_{n=1}^\infty \bar{F_n} \neq \emptyset$.

**Corollary 8.39.** If $S$ is a finite set and $\{A_n\}_{n=1}^\infty \subset \mathcal{A}$ is a decreasing sequence of non-empty cylinder sets, then $\cap_{n=1}^\infty A_n \neq \emptyset$.

Proof. This follows directly from Example 8.38 since necessarily, $A_n = K_n \times \Omega$, for some $K_n \subset S^{N_n}$.

**Theorem 8.40 (Kolmogorov’s Extension Theorem I.).** Let us continue the notation above with the further assumption that $S$ is a finite set. Then every finitely additive probability measure, $P : \mathcal{A} \to [0,1]$, has a unique extension to a probability measure on $\mathcal{B} := \sigma(\mathcal{A})$.

**job: newanal**

**macro: svmonob.cls**

**date/time: 6-Jan-2012/17:01**
Proof. From Theorem 8.27 it suffices to show \( \lim_{n \to \infty} P (A_n) = 0 \) whenever \( \{A_n\}_{n=1}^\infty \subseteq \mathcal{A} \) with \( A_n \downarrow \emptyset \). However, by Lemma 8.35 with \( C_n = A_n \), \( A_n \in \mathcal{A} \) and \( A_\infty \downarrow \emptyset \), we must have that \( A_n = \emptyset \) for a.a.\( n \) and in particular \( P (A_n) = 0 \) for a.a.\( n \). This certainly implies \( \lim_{n \to \infty} P (A_n) = 0 \).

For the next three exercises, suppose that \( S \) is a finite set and continue the notation from above. Further suppose that \( P : \sigma (A) \to [0, 1] \) is a probability measure and for \( n \in \mathbb{N} \) and \((s_1, \ldots, s_n) \in S^n\), let

\[
p_n (s_1, \ldots, s_n) := P (\{ \omega \in \Omega : \omega_1 = s_1, \ldots, \omega_n = s_n \}). \tag{8.22}
\]

Exercise 8.6 (Consistency Conditions). If \( p_n \) is defined as above, show:

1. \( \sum_{s \in S} p_1 (s) = 1 \) and
2. for all \( n \in \mathbb{N} \) and \((s_1, \ldots, s_n) \in S^n\),

\[
p_n (s_1, \ldots, s_n) = \sum_{s \in S} p_{n+1} (s_1, \ldots, s_n, s).
\]

Exercise 8.7 (Converse to 8.6). Suppose for each \( n \in \mathbb{N} \) we are given functions, \( p_n : S^n \to [0, 1] \) such that the consistency conditions in Exercise 8.6 hold. Then there exists a unique probability measure, \( P \) on \( \sigma (A) \) such that Eq. (8.22) holds for all \( n \in \mathbb{N} \) and \((s_1, \ldots, s_n) \in S^n\).

Example 8.41 (Existence of iid simple R.V.s). Suppose now that \( q : S \to [0, 1] \) is a function such that \( \sum_{s \in S} q (s) = 1 \). Then there exists a unique probability measure \( P \) on \( \sigma (A) \) such that, for all \( n \in \mathbb{N} \) and \((s_1, \ldots, s_n) \in S^n\), we have

\[
P (\{ \omega \in \Omega : \omega_1 = s_1, \ldots, \omega_n = s_n \}) = q (s_1) \cdots q (s_n).
\]

This is a special case of Exercise 8.7 with \( p_n (s_1, \ldots, s_n) := q (s_1) \cdots q (s_n) \).

Theorem 8.42 (Kolmogorov’s Extension Theorem II). Suppose now that \( S \) is countably infinite set and \( P : \sigma (A) \to [0, 1] \) is a finitely additive measure such that \( P|A_n \) is a \( \sigma - \)additive measure for each \( n \in \mathbb{N} \). Then \( P \) extends uniquely to a probability measure on \( B := \sigma (A) \).

Proof. From Theorem 8.27 it suffice to show: if \( \{A_m\}_{m=1}^\infty \subseteq \mathcal{A} \) is a decreasing sequence of subsets such that \( \varepsilon := \inf_m P (A_m) > 0 \), then \( \bigcap_{m=1}^\infty A_m \neq \emptyset \). You are asked to verify this property of \( P \) in the next couple of exercises.

For the next couple of exercises the hypothesis of Theorem 8.42 are to be assumed.

Exercise 8.8. Show for each \( n \in \mathbb{N} \), \( A \in A_n \), and \( \varepsilon > 0 \) are given. Show there exists \( F \in A_n \) such that \( F \subseteq A \), \( F = K \times \Omega \) with \( K \subseteq S^n \), and \( P (A \setminus F) < \varepsilon \).

Exercise 8.9. Let \( \{A_m\}_{m=1}^\infty \subseteq \mathcal{A} \) be a decreasing sequence of subsets such that \( \varepsilon := \inf_m P (A_m) > 0 \). Using Exercise 8.8 choose \( F_m = K_m \times \Omega \subseteq A_m \) with \( K_m \subseteq S^{n_m} \) and \( P (A_m \setminus F_m) \leq \varepsilon / 2^{m+1} \). Further define \( C_m := F_1 \cap \cdots \cap F_m \) for each \( m \).

1. Show \( A_m \setminus C_m \subseteq (A_1 \setminus F_1) \cup (A_2 \setminus F_2) \cup \cdots \cup (A_m \setminus F_m) \) and use this to conclude that \( P (A_m \setminus C_m) \leq \varepsilon / 2 \).
2. Conclude \( C_m \) is not empty for \( m \).
3. Use Lemma 8.35 to conclude that \( \emptyset \neq \bigcap_{m=1}^\infty C_m \subseteq \bigcap_{m=1}^\infty A_m \).

Exercise 8.10. Convince yourself that the results of Exercise 8.6 and 8.7 are valid when \( S \) is a countable set. (See Example 7.6.)

In summary, the main result of this section states, to any sequence of functions, \( p_n : S^n \to [0, 1] \), such that \( \sum_{s \in S} p_n (\lambda) = 1 \) and \( \sum_{s \in S} p_{n+1} (\lambda, s) = p_n (\lambda) \) for all \( n, \lambda \in S^n \), there exists a unique probability measure, \( P \), on \( B := \sigma (A) \) such that

\[
P (B \times \Omega) = \sum_{\lambda \in B} p_n (\lambda) \quad \forall B \subseteq S^n \quad \text{and} \quad n \in \mathbb{N}.
\]

Example 8.43 (Markov Chain Probabilities). Let \( S \) be a finite or at most countable state space and \( p : S \times S \to [0, 1] \) be a Markov kernel, i.e.

\[
\sum_{y \in S} p (x, y) = 1 \quad \text{for all} \; x \in S. \tag{8.23}
\]

Also let \( \pi : S \to [0, 1] \) be a probability function, i.e. \( \sum_{x \in S} \pi (x) = 1 \). We now take

\[
\Omega := S^{n_0} = \{ (s = (s_0, s_1, \ldots) : s_j \in S \}
\]

and let \( X_n : \Omega \to S \) be given by

\[
X_n (s_0, s_1, \ldots) = s_n \quad \text{for all} \; n \in \mathbb{N}_0.
\]

Then there exists a unique probability measure, \( P_\pi \), on \( \sigma (A) \) such that

\[
P_\pi (X_0 = x_0, \ldots, X_n = x_n) = \pi (x_0) p (x_0, x_1) \cdots p (x_{n-1}, x_n)
\]

for all \( n \in \mathbb{N}_0 \) and \( x_0, x_1, \ldots, x_n \in S \). To see such a measure exists, we need only verify that

\[
p_n (x_0, \ldots, x_n) := \pi (x_0) p (x_0, x_1) \cdots p (x_{n-1}, x_n)
\]

verifies the hypothesis of Exercise 8.6 taking into account a shift of the \( n \) index.
8.6 Appendix: Regularity and Uniqueness Results*

The goal of this appendix it to approximating measurable sets from inside and outside by classes of sets which are relatively easy to understand. Our first few results are already contained in Carathéodory’s existence of measures proof. Nevertheless, we state these results again and give another somewhat independent proof.

**Theorem 8.44 (Finite Regularity Result).** Suppose \( A \subset 2^\Omega \) is an algebra, \( B = \sigma(A) \) and \( \mu : B \to [0, \infty) \) is a finite measure, i.e. \( \mu(\Omega) < \infty \). Then for every \( \varepsilon > 0 \) and \( B \in \mathcal{B} \) there exists \( A \in \mathcal{A}_\delta \) and \( C \in \mathcal{A}_\sigma \) such that \( A \subset B \subset C \) and \( \mu( C \setminus A ) < \varepsilon \).

**Proof.** Let \( B_0 \) denote the collection of \( B \in \mathcal{B} \) such that for every \( \varepsilon > 0 \) there exists \( A \in \mathcal{A}_\delta \) and \( C \in \mathcal{A}_\sigma \) such that \( A \subset B \subset C \) and \( \mu( C \setminus A ) < \varepsilon \). It is now clear that \( A \subset B_0 \) and that \( B_0 \) is closed under complementation. Now suppose that \( B_i \in B_0 \) for \( i = 1, 2, \ldots \) and \( \varepsilon > 0 \) is given. By assumption there exists \( A_i \in \mathcal{A}_\delta \) and \( C_i \in \mathcal{A}_\sigma \) such that \( A_i \subset B_i \subset C_i \) and \( \mu( C_i \setminus A_i ) < 2^{-i} \varepsilon \).

Let \( A := \bigcup_{i=1}^{\infty} A_i \), \( A^N := \bigcup_{i=1}^{\infty} A_i \setminus C_i \in \mathcal{A}_\delta \), \( B := \bigcup_{i=1}^{\infty} B_i \), and \( C := \bigcup_{i=1}^{\infty} C_i \in \mathcal{A}_\sigma \).

Then \( \bigcup_{i=1}^{\infty} A_i \subset B \subset C \) and

\[
C \setminus A = \left( \bigcup_{i=1}^{\infty} C_i \right) \setminus A = \bigcup_{i=1}^{\infty} \left( C_i \setminus A_i \right) \subset \bigcup_{i=1}^{\infty} \left( C_i \setminus A_i \right).
\]

Therefore,

\[
\mu( C \setminus A ) = \mu\left( \bigcup_{i=1}^{\infty} \left( C_i \setminus A_i \right) \right) \leq \sum_{i=1}^{\infty} \mu( C_i \setminus A_i ) \leq \sum_{i=1}^{\infty} \mu( C_i \setminus A_i ) < \varepsilon.
\]

Since \( C \setminus A \downarrow C \setminus A \), it also follows that \( \mu( C \setminus A^N ) < \varepsilon \) for sufficiently large \( N \) and this shows \( B = \bigcup_{i=1}^{\infty} B_i \in B_0 \). Hence \( B_0 \) is a sub-\( \sigma \)-algebra of \( \mathcal{B} = \sigma(A) \) which contains \( A \) which shows \( B_0 = \mathcal{B} \).

Many theorems in the sequel will require some control on the size of a measure \( \mu \). The relevant notion for our purposes (and most purposes) is that of a \( \sigma \)-finite measure defined next.

**Definition 8.45.** Suppose \( \Omega \) is a set, \( \mathcal{E} \subset \mathcal{B} \subset 2^\Omega \) and \( \mu : \mathcal{B} \to [0, \infty) \) is a function. The function \( \mu \) is \( \sigma \)-finite on \( \mathcal{E} \) if there exists \( E_n \in \mathcal{E} \) such that \( \mu(E_n) < \infty \) and \( \Omega = \bigcup_{n=1}^{\infty} E_n \). If \( \mathcal{B} \) is a \( \sigma \)-algebra and \( \mu \) is a measure on \( \mathcal{B} \) which is \( \sigma \)-finite on \( \mathcal{B} \) we will say \( (\Omega, \mathcal{B}, \mu) \) is a \( \sigma \)-finite measure space.

The reader should check that if \( \mu \) is a finitely additive measure on an algebra, \( \mathcal{B} \), then \( \mu \) is \( \sigma \)-finite on \( \mathcal{B} \) iff there exists \( \Omega_n \in \mathcal{B} \) such that \( \Omega_n \uparrow \Omega \) and \( \mu(\Omega_n) < \infty \).

**Corollary 8.46 (\( \sigma \)-Finite Regularity Result).** Theorem 8.44 continues to hold under the weaker assumption that \( \mu : B \to [0, \infty) \) is a measure which is \( \sigma \)-finite on \( A \).

**Proof.** Let \( \Omega_n \in \mathcal{A} \) such that \( \bigcup_{n=1}^{\infty} \Omega_n = \Omega \) and \( \mu(\Omega_n) < \infty \) for all \( n \). Since \( A \subset B \) for \( \mu_n(A) := \mu(\Omega_n \cap A) \) is a finite measure on \( A \subset B \) for each \( n \), by Theorem 8.44, for every \( B \in \mathcal{B} \) there exists \( C_n \in \mathcal{A}_\sigma \) such that \( B \subset C_n \) and \( \mu(\Omega_n \cap [C_n \setminus B]) = \mu_n( C_n \setminus B ) < 2^{-n} \varepsilon \). Now let \( C := \bigcup_{n=1}^{\infty} \Omega_n \cap C_n \in \mathcal{A}_\sigma \) and observe that \( B \subset C \) and

\[
\mu( C \setminus B ) = \mu( \bigcup_{n=1}^{\infty} (\Omega_n \cap C_n) \setminus B ) \leq \sum_{n=1}^{\infty} \mu( \Omega_n \cap [C_n \setminus B] ) < \varepsilon.
\]

Applying this result to \( B^c \) shows there exists \( D \in \mathcal{A}_\sigma \) such that \( B^c \subset D \) and

\[
\mu( D \setminus B^c ) = \mu( D \setminus B^c ) < \varepsilon.
\]

So if we let \( A := D^c \in \mathcal{A}_\delta \), then \( A \subset B \subset C \) and

\[
\mu( C \setminus A ) = \mu( [B \setminus A] \cup [(C \setminus B) \setminus A] ) \leq \mu( B \setminus A ) + \mu( C \setminus B ) < 2 \varepsilon
\]

and the result is proved.

**Exercise 8.11.** Suppose \( A \subset 2^\Omega \) is an algebra and \( \mu \) and \( \nu \) are two measures on \( B = \sigma(A) \).

a. Suppose that \( \mu \) and \( \nu \) are finite measures such that \( \mu = \nu \) on \( A \). Show that \( \mu = \nu \).

b. Generalize the previous assertion to the case where you only assume that \( \mu \) and \( \nu \) are \( \sigma \)-finite on \( A \).

**Corollary 8.47.** Suppose \( A \subset 2^\Omega \) is an algebra and \( \mu : B = \sigma(A) \to [0, \infty] \) is a measure which is \( \sigma \)-finite on \( A \). Then for all \( B \in \mathcal{B} \), there exists \( A \in \mathcal{A}_\delta \) and \( C \in \mathcal{A}_\sigma \) such that \( A \subset B \subset C \) and \( \mu( C \setminus A ) = 0 \).

**Proof.** By Theorem 8.44 given \( B \in \mathcal{B} \), we may choose \( A_n \in \mathcal{A}_\delta \) and \( C_n \in \mathcal{A}_\sigma \) such that \( A_n \subset B \subset C_n \) and \( \mu( C_n \setminus B ) \leq 1/n \) and \( \mu( B \setminus A_n ) \leq 1/n \). By replacing \( A_n \) by \( \bigcup_{N=1}^{\infty} A_n \) and \( C_n \) by \( \bigcap_{n=1}^{\infty} C_n \), we may assume that \( A_n \uparrow \) and \( C_n \downarrow \) as \( n \) increases. Let \( A := \bigcup A_n \in \mathcal{A}_\delta \) and \( C := \bigcap C_n \in \mathcal{A}_\sigma \), then \( A \subset B \subset C \) and

\[
\mu( C \setminus A ) = \mu( C \setminus A ) + \mu( B \setminus A ) \leq \mu( C_n \setminus B ) + \mu( B \setminus A_n ) \leq 2/n \to 0 \text{ as } n \to \infty.
\]
Exercise 8.12. Let $\mathcal{B} = \mathcal{B}_{\mathbb{R}^n} = \sigma(\{\text{open subsets of } \mathbb{R}^n\})$ be the Borel $\sigma$-algebra on $\mathbb{R}^n$ and $\mu$ be a probability measure on $\mathcal{B}$. Further, let $\mathcal{B}_0$ denote those sets $B \in \mathcal{B}$ such that for every $\varepsilon > 0$ there exists $F \subset B \subset V$ such that $F$ is closed, $V$ is open, and $\mu(V \setminus F) < \varepsilon$. Show:

1. $\mathcal{B}_0$ contains all closed subsets of $\mathcal{B}$. Hint: given a closed subset, $F \subset \mathbb{R}^n$ and $k \in \mathbb{N}$, let $V_k := \cup_{x \in F} B(x, 1/k)$, where $B(x, \delta) := \{y \in \mathbb{R}^n : |y - x| < \delta\}$. Show, $V_k \downarrow F$ as $k \to \infty$.

2. Show $\mathcal{B}_0$ is a $\sigma$-algebra and use this along with the first part of this exercise to conclude $\mathcal{B} = \mathcal{B}_0$. Hint: follow closely the method used in the first step of the proof of Theorem 8.44.

3. Show for every $\varepsilon > 0$ and $B \in \mathcal{B}$, there exist a compact subset, $K \subset \mathbb{R}^n$, such that $K \subset B$ and $\mu(B \setminus K) < \varepsilon$. Hint: take $K := F \cap \{x \in \mathbb{R}^n : |x| \leq n\}$ for some sufficiently large $n$.

8.7 Appendix: Completions of Measure Spaces*

Definition 8.48. A set $E \subset \Omega$ is a null set if $E \in \mathcal{B}$ and $\mu(E) = 0$. If $P$ is some "property" which is either true or false for each $x \in \Omega$, we will use the terminology $P$ a.e. (to be read $P$ almost everywhere) to mean

$$E := \{x \in \Omega : P \text{ is false for } x\}$$

is a null set. For example if $f$ and $g$ are two measurable functions on $(\Omega, \mathcal{B}, \mu)$, $f = g$ a.e. means that $\mu(f \neq g) = 0$.

Definition 8.49. A measure space $(\Omega, \mathcal{B}, \mu)$ is complete if every subset of a null set is in $\mathcal{B}$, i.e. for all $F \subset \Omega$ such that $F \subset E \subset \mathcal{B}$ with $\mu(E) = 0$ implies that $F \in \mathcal{B}$.

Proposition 8.50 (Completion of a Measure). Let $(\Omega, \mathcal{B}, \mu)$ be a measure space. Set

$$\mathcal{N} = \mathcal{N}^\mu := \{N \subset \Omega : \exists F \in \mathcal{B} \text{ such that } N \subset F \text{ and } \mu(F) = 0\},$$

$$\mathcal{B} = \overline{\mathcal{B}}^\mu := \{A \cup N : A \in \mathcal{B} \text{ and } N \in \mathcal{N}\} \text{ and }$$

$$\bar{\mu}(A \cup N) := \mu(A) \text{ for } A \in \mathcal{B} \text{ and } N \in \mathcal{N},$$

see Fig. 8.2. Then $\mathcal{B}$ is a $\sigma$-algebra, $\bar{\mu}$ is a well defined measure on $\mathcal{B}$, $\bar{\mu}$ is the unique measure on $\mathcal{B}$ which extends $\mu$ on $\mathcal{B}$, and $(\Omega, \mathcal{B}, \bar{\mu})$ is complete measure space. The $\sigma$-algebra, $\mathcal{B}$, is called the completion of $\mathcal{B}$ relative to $\mu$ and $\bar{\mu}$, is called the completion of $\mu$.

8.8 Appendix Monotone Class Theorems*

This appendix may be safely skipped!

Definition 8.51 (Montone Class). $\mathcal{C} \subset 2^\Omega$ is a monotone class if it is closed under countable increasing unions and countable decreasing intersections.

Lemma 8.52 (Monotone Class Theorem*). Suppose $A \subset 2^\Omega$ is an algebra and $\mathcal{C}$ is the smallest monotone class containing $A$. Then $\mathcal{C} = \sigma(A)$.

Proof. For $C \in \mathcal{C}$ let

$$\mathcal{C}(C) = \{B \in \mathcal{C} : C \cap B, C \cap B^c, B \cap C^c \in \mathcal{C}\},$$

where $A^c$ denotes the complement of $A$. Clearly, $\mathcal{C}(C)$ is a $\sigma$-algebra. If $\mathcal{C}(C) = \Omega$, then $C \in \sigma(A)$. Conversely, if $C \in \sigma(A)$, let

$$\mathcal{C}_0(C) := \{B \in \mathcal{C} : B \cap C, B \cap C^c \in \mathcal{C}\}.$$
then $\mathcal{C}(\mathcal{C})$ is a monotone class. Indeed, if $B_n \in \mathcal{C}(\mathcal{C})$ and $B_n \uparrow B$, then $B_n' \downarrow B'$ and so

$$
\mathcal{C} \ni C \cap B_n \uparrow C \cap B \\
\mathcal{C} \ni C \cap B_n' \downarrow C \cap B' \text{ and}
$$

$$
\mathcal{C} \ni B_n \cap C' \uparrow B \cap C'.
$$

Since $\mathcal{C}$ is a monotone class, it follows that $C \cap B, C \cap B', B \cap C' \in \mathcal{C}$, i.e. $B \in \mathcal{C}(\mathcal{C})$. This shows that $\mathcal{C}(\mathcal{C})$ is closed under increasing limits and a similar argument shows that $\mathcal{C}(\mathcal{C})$ is closed under decreasing limits. Thus we have shown that $\mathcal{C}(\mathcal{C})$ is a monotone class for all $C \in \mathcal{C}$. If $A, A \cap B, A \cap B', B \cap A' \in \mathcal{C}$ for all $B \in \mathcal{A}$ and hence it follows that $A \in \mathcal{C}(A) \subset \mathcal{C}$. Since $\mathcal{C}$ is the smallest monotone class containing $\mathcal{A}$ and $\mathcal{C}(A)$ is a monotone class containing $\mathcal{A}$, we conclude that $\mathcal{C}(A) = \mathcal{C}$ for any $A \in \mathcal{A}$. Let $B \in \mathcal{C}$ and notice that $A \in \mathcal{C}(B)$ happens iff $B \in \mathcal{C}(A)$. This observation and the fact that $\mathcal{C}(A) = \mathcal{C}$ for all $A \in \mathcal{A}$ implies $A \in \mathcal{C}(B) \subset \mathcal{C}$ for all $B \in \mathcal{C}$. Again since $\mathcal{C}$ is the smallest monotone class containing $\mathcal{A}$ and $\mathcal{C}(B)$ is a monotone class we conclude that $\mathcal{C}(B) = \mathcal{C}$ for all $B \in \mathcal{C}$. That is to say, if $A, B \in \mathcal{C}$ then $A \in \mathcal{C} = \mathcal{C}(B)$ and hence $A \cap B, A \cap B', A' \cap B \in \mathcal{C}$. So $\mathcal{C}$ is closed under complements (since $\Omega \in \mathcal{A} \subset \mathcal{C}$) and finite intersections and increasing unions from which it easily follows that $\mathcal{C}$ is a $\sigma$–algebra.
Measurable Functions (Random Variables)

Notation 9.1 If \( f : X \to Y \) is a function and \( \mathcal{E} \subset 2^Y \) let
\[
f^{-1}\mathcal{E} := f^{-1}(\mathcal{E}) := \{f^{-1}(E) | E \in \mathcal{E}\}.
\]
If \( \mathcal{G} \subset 2^X \), let
\[
f_*\mathcal{G} := \{A \in 2^Y | f^{-1}(A) \in \mathcal{G}\}.
\]

Definition 9.2. Let \( \mathcal{E} \subset 2^X \) be a collection of sets, \( A \subset X \), \( i_A : A \to X \) be the inclusion map \((i_A(x) = x \text{ for all } x \in A)\) and
\[
\mathcal{E}_A = i_A^{-1}(\mathcal{E}) = \{A \cap E : E \in \mathcal{E}\}.
\]

The following results will be used frequently (often without further reference) in the sequel.

Lemma 9.3 (A key measurability lemma). If \( f : X \to Y \) is a function and \( \mathcal{E} \subset 2^Y \), then
\[
\sigma(f^{-1}(\mathcal{E})) = f^{-1}(\sigma(\mathcal{E})).
\]
In particular, if \( A \subset Y \) then
\[
(\sigma(\mathcal{E}))_A = \sigma(\mathcal{E}_A), \tag{9.2}
\]

(Similar assertion hold with \( \sigma(\cdot) \) being replaced by \( \mathcal{A}(\cdot) \).

Proof. Since \( \mathcal{E} \subset \sigma(\mathcal{E}) \), it follows that \( f^{-1}(\mathcal{E}) \subset f^{-1}(\sigma(\mathcal{E})) \). Moreover, by Exercise 9.1 below, \( f^{-1}(\sigma(\mathcal{E})) \) is a \( \sigma \) – algebra and therefore,
\[
\sigma(f^{-1}(\mathcal{E})) \subset f^{-1}(\sigma(\mathcal{E})).
\]
To finish the proof we must show \( f^{-1}(\sigma(\mathcal{E})) \subset \sigma(f^{-1}(\mathcal{E})) \), i.e. that \( f^{-1}(B) \in \sigma(f^{-1}(\mathcal{E})) \) for all \( B \in \sigma(\mathcal{E}) \). To do this we follow the usual measure theoretic mantra, namely let
\[
\mathcal{M} := \{B \subset Y : f^{-1}(B) \in \sigma(f^{-1}(\mathcal{E}))\} = f_*\sigma(f^{-1}(\mathcal{E})).
\]
We will now finish the proof by showing \( \sigma(\mathcal{E}) \subset \mathcal{M} \). This is easily achieved by observing that \( \mathcal{M} \) is a \( \sigma \) – algebra (see Exercise 9.1) which contains \( \mathcal{E} \) and therefore \( \sigma(\mathcal{E}) \subset \mathcal{M} \).

Equation (9.2) is a special case of Eq. (9.1). Indeed, \( f = i_A : A \to X \) we have
\[
(\sigma(\mathcal{E}))_A = i_A^{-1}(\sigma(\mathcal{E})) = \sigma(i_A^{-1}(\mathcal{E})) = \sigma(\mathcal{E}_A).
\]

Exercise 9.1. If \( f : X \to Y \) is a function and \( \mathcal{F} \subset 2^Y \) and \( \mathcal{B} \subset 2^X \) are \( \sigma \) – algebras (algebras), then \( f^{-1}\mathcal{F} \) and \( f_*\mathcal{B} \) are \( \sigma \) – algebras (algebras).

Example 9.4. Let \( \mathcal{E} = \{(a, b) : -\infty < a < b < \infty\} \) and \( \mathcal{B} = \sigma(\mathcal{E}) \) be the Borel \( \sigma \) – field on \( \mathbb{R} \). Then
\[
\mathcal{E}_{[0, 1]} = \{(a, b) : 0 \leq a < b \leq 1\}
\]
and we have
\[
\mathcal{B}_{[0, 1]} = \sigma(\mathcal{E}_{[0, 1]}).
\]
In particular, if \( A \in \mathcal{B} \) such that \( A \subset (0, 1) \), then \( A \in \sigma(\mathcal{E}_{[0, 1]}) \).

9.1 Measurable Functions

Definition 9.5. A measurable space is a pair \( (X, \mathcal{M}) \), where \( X \) is a set and \( \mathcal{M} \) is a \( \sigma \) – algebra on \( X \).

To motivate the notion of a measurable function, suppose \( (X, \mathcal{M}, \mu) \) is a measure space and \( f : X \to \mathbb{R}_+ \) is a function. Roughly speaking, we are going to define \( \int_X f d\mu \) as a certain limit of sums of the form,
\[
\sum_{0 < a_1 < a_2 < a_3 < \ldots} a_i \mu(f^{-1}(a_i, a_{i+1}]).
\]
For this to make sense we will need to require \( f^{-1}((a, b]) \in \mathcal{M} \) for all \( a < b \). Because of Corollary 9.11 below, this last condition is equivalent to the condition \( f^{-1}(\mathcal{B}_{[0, 1]}) \subset \mathcal{M} \).

Definition 9.6. Let \( (X, \mathcal{M}) \) and \( (Y, \mathcal{F}) \) be measurable spaces. A function \( f : X \to Y \) is measurable of more precisely, \( \mathcal{M}/\mathcal{F} \) – measurable or \( (\mathcal{M}, \mathcal{F}) \) – measurable, if \( f^{-1}(\mathcal{F}) \subset \mathcal{M} \), i.e. if \( f^{-1}(A) \in \mathcal{M} \) for all \( A \in \mathcal{F} \).
Remark 9.7. Let $f : X \to Y$ be a function. Given a $\sigma$–algebra $\mathcal{F} \subset 2^Y$, the $\sigma$–algebra $\mathcal{M} := f^{-1}(\mathcal{F})$ is the smallest $\sigma$–algebra on $X$ such that $f$ is $(\mathcal{M}, \mathcal{F})$ measurable. Similarly, if $\mathcal{M}$ is a $\sigma$–algebra on $X$ then

$$\mathcal{F} = f_* \mathcal{M} = \{ A \in 2^Y | f^{-1}(A) \in \mathcal{M} \}$$

is the largest $\sigma$–algebra on $Y$ such that $f$ is $(\mathcal{M}, \mathcal{F})$ measurable.

Example 9.8 (Indicator Functions). Let $(X, \mathcal{M})$ be a measurable space and $A \subset X$. Then $1_A \in (\mathcal{M}, \mathcal{B}_R)$ measurable iff $A \in \mathcal{M}$. Indeed, $1_{A^{-1}}(W)$ is either $\emptyset$, $X$, $A$, or $A^c$ for any $W \subset \mathbb{R}$ with $1_{A^{-1}}(\{1\}) = A$.

Example 9.9. Suppose $f : X \to Y$ with $Y$ being a finite or countable set and $\mathcal{F} = 2^Y$. Then $f$ is measurable iff $f^{-1}(\{y\}) \in \mathcal{M}$ for all $y \in Y$.

Proposition 9.10. Suppose that $(X, \mathcal{M})$ and $(Y, \mathcal{F})$ are measurable spaces and further assume $\mathcal{E} \subset \mathcal{F}$ generates $\mathcal{F}$, i.e. $\mathcal{F} = \sigma(\mathcal{E})$. Then a map, $f : X \to Y$ is measurable iff $f^{-1}(\mathcal{E}) \subset \mathcal{M}$.

Proof. If $f$ is $\mathcal{M}/\mathcal{F}$ measurable, then $f^{-1}(\mathcal{E}) \subset f^{-1}(\mathcal{F}) \subset \mathcal{M}$. Conversely if $f^{-1}(\mathcal{E}) \subset \mathcal{M}$ then $\sigma(f^{-1}(\mathcal{E})) \subset \mathcal{M}$ and so making use of Lemma 9.3,

$$f^{-1}(\mathcal{F}) = f^{-1}(\sigma(\mathcal{E})) = \sigma(f^{-1}(\mathcal{E})) \subset \mathcal{M}.$$  

Corollary 9.11. Suppose that $(X, \mathcal{M})$ is a measurable space. Then the following conditions on a function $f : X \to \mathbb{R}$ are equivalent:

1. $f$ is $(\mathcal{M}, \mathcal{B}_R)$ measurable,
2. $f^{-1}((a, \infty)) \in \mathcal{M}$ for all $a \in \mathbb{R}$,
3. $f^{-1}((a, \infty)) \in \mathcal{M}$ for all $a \in \mathbb{Q}$,
4. $f^{-1}((\infty, a)) \in \mathcal{M}$ for all $a \in \mathbb{R}$.

Exercise 9.3. If $\mathcal{M}$ is the $\sigma$–algebra generated by $\mathcal{E} \subset 2^X$, then $\mathcal{M}$ is the union of the $\sigma$–algebras generated by countable subsets $\mathcal{F} \subset \mathcal{E}$.

Exercise 9.4. Let $(X, \mathcal{M})$ be a measure space and $f_n : X \to \mathbb{R}$ be a sequence of measurable functions on $X$. Show that $\{ x : \lim_{n \to \infty} f_n(x) \text{ exists in } \mathbb{R} \} \in \mathcal{M}$. Similarly show the same holds if $\mathbb{R}$ is replaced by $\mathbb{C}$.

Exercise 9.5. Show that every monotone function $f : \mathbb{R} \to \mathbb{R}$ is $(\mathcal{B}_R, \mathcal{B}_R)$ measurable.

Definition 9.12. Given measurable spaces $(X, \mathcal{M})$ and $(Y, \mathcal{F})$ and a subset $A \subset X$. We say a function $f : A \to Y$ is measurable iff $f$ is $\mathcal{M}_A/\mathcal{F}$ measurable.

Proposition 9.13 (Localizing Measurability). Let $(X, \mathcal{M})$ and $(Y, \mathcal{F})$ be measurable spaces and $f : X \to Y$ be a function.

1. If $f$ is measurable and $A \subset X$ then $f|_A : A \to Y$ is $\mathcal{M}_A/\mathcal{F}$ measurable.
2. Suppose there exist $A_n \in \mathcal{M}$ such that $X = \bigcup_{n=1}^{\infty} A_n$ and $f|A_n$ is $\mathcal{M}_{A_n}/\mathcal{F}$ measurable for all $n$, then $f$ is $\mathcal{M}$ measurable.

Proof. 1. If $f : X \to Y$ is measurable, $f^{-1}(B) \in \mathcal{M}$ for all $B \in \mathcal{F}$ and therefore $f|_A^{-1}(B) = A \cap f^{-1}(B) \in \mathcal{M}_A$ for all $B \in \mathcal{F}$.

2. If $B \in \mathcal{F}$, then

$$f^{-1}(B) = \bigcup_{n=1}^{\infty} (f^{-1}(B) \cap A_n) = \bigcup_{n=1}^{\infty} f|_{A_n}^{-1}(B).$$

Since each $A_n \in \mathcal{M}$, $\mathcal{M}_{A_n} \subset \mathcal{M}$ and so the previous displayed equation shows $f^{-1}(B) \in \mathcal{M}$.

Lemma 9.14 (Composing Measurable Functions). Suppose that $(X, \mathcal{M}), (Y, \mathcal{F})$ and $(Z, \mathcal{G})$ are measurable spaces. If $f : (X, \mathcal{M}) \to (Y, \mathcal{F})$ and $g : (Y, \mathcal{F}) \to (Z, \mathcal{G})$ are measurable functions then $g \circ f : (X, \mathcal{M}) \to (Z, \mathcal{G})$ is measurable as well.

Proof. By assumption $g^{-1}(\mathcal{G}) \subset \mathcal{F}$ and $f^{-1}(\mathcal{F}) \subset \mathcal{M}$ so that

$$(g \circ f)^{-1}(\mathcal{G}) = f^{-1}(g^{-1}(\mathcal{G})) \subset f^{-1}(\mathcal{F}) \subset \mathcal{M}.$$

Definition 9.15 ($\sigma$–Algebras Generated by Functions). Let $X$ be a set and suppose there is a collection of measurable spaces $\{ (Y_\alpha, \mathcal{F}_\alpha) : \alpha \in I \}$ and functions $f_\alpha : X \to Y_\alpha$ for all $\alpha \in I$. Let $\sigma(f_\alpha : \alpha \in I)$ denote the smallest $\sigma$–algebra on $X$ such that each $f_\alpha$ is measurable, i.e.

$$\sigma(f_\alpha : \alpha \in I) = \sigma(\bigcup_{\alpha \in I} f_\alpha^{-1}(\mathcal{F}_\alpha)).$$

Example 9.16. Suppose that $Y$ is a finite set, $\mathcal{F} = 2^Y$, and $X = Y^N$ for some $N \in \mathbb{N}$. Let $\pi_i : Y^N \to Y$ be the projection maps, $\pi_i(y_1, \ldots, y_N) = y_i$. Then, as the reader should check,

$$\sigma(\pi_1, \ldots, \pi_n) = \{ A \times A^{N-n} : A \subset A^n \}.$$
Proposition 9.17. Assuming the notation in Definition 9.19 (so \( f_\alpha : X \to Y_\alpha \) for all \( \alpha \in I \)) and additionally let \((Z, \mathcal{M})\) be a measurable space. Then \( g : Z \to X \) is \((M, \sigma(f_\alpha : \alpha \in I))\) measurable iff \( f_\alpha \circ g : Z \to Y_\alpha \) is \((M, \mathcal{F}_\alpha)\)-measurable for all \( \alpha \in I \).

Proof. \((\Rightarrow)\) If \( g \) is \((M, \sigma(f_\alpha : \alpha \in I))\) measurable, then the composition \( f_\alpha \circ g \) is \((M, \mathcal{F}_\alpha)\) measurable by Lemma 9.14. \((\Leftarrow)\) Since \( \sigma(f_\alpha : \alpha \in I) = \sigma(\mathcal{E}) \) where \( \mathcal{E} := \bigcup_{\alpha} f_\alpha^{-1}(\mathcal{F}_\alpha) \), according to Proposition 9.10 it suffices to show \( g^{-1}(A) \in \mathcal{M} \) for \( A \in f_\alpha^{-1}(\mathcal{F}_\alpha) \). But this is true since if \( A = f_\alpha^{-1}(B) \) for some \( B \in \mathcal{F}_\alpha \), then \( g^{-1}(A) = (f_\alpha \circ g)^{-1}(B) \in \mathcal{M} \) because \( f_\alpha \circ g : Z \to Y_\alpha \) is assumed to be measurable.

Definition 9.18. If \( \{(Y_\alpha, \mathcal{F}_\alpha) : \alpha \in I\} \) is a collection of measurable spaces, then the product measure space, \((Y, \mathcal{F})\), is \( Y := \prod_{\alpha \in I} Y_\alpha, \mathcal{F} := \sigma(\pi_\alpha : \alpha \in I) \) where \( \pi_\alpha : Y \to Y_\alpha \) is the \( \alpha \)-component projection. We call \( \mathcal{F} \) the product \( \sigma \)-algebra and denote it by \( \mathcal{F} = \otimes_{\alpha \in I} \mathcal{F}_\alpha \).

Let us record an important special case of Proposition 9.17.

Corollary 9.19. If \((Z, \mathcal{M})\) is a measure space, then \( g : Z \to Y = \prod_{\alpha \in I} Y_\alpha \) is \((M, \mathcal{F} := \otimes_{\alpha \in I} \mathcal{F}_\alpha)\) measurable iff \( \pi_\alpha \circ g : Z \to Y_\alpha \) is \((M, \mathcal{F}_\alpha)\) measurable for all \( \alpha \in I \).

As a special case of the above corollary, if \( A = \{1, 2, \ldots, n\} \), then \( Y = Y_1 \times \cdots \times Y_n \) and \( g = (g_1, \ldots, g_n) : Z \to Y \) is measurable iff each component, \( g_i : Z \to Y_i \), is measurable. Here is another closely related result.

Proposition 9.20. Suppose \( X \) is a set, \( \{(Y_\alpha, \mathcal{F}_\alpha) : \alpha \in I\} \) is a collection of measurable spaces, and we are given maps, \( f_\alpha : X \to Y_\alpha \), for all \( \alpha \in I \). If \( f : X \to Y := \prod_{\alpha \in I} Y_\alpha \) is the unique map, such that \( \pi_\alpha \circ f = f_\alpha \), then
\[
\sigma(f_\alpha : \alpha \in I) = \sigma(f) = f^{-1}(\mathcal{F})
\]
where \( \mathcal{F} := \otimes_{\alpha \in I} \mathcal{F}_\alpha \).

Proof. Since \( \pi_\alpha \circ f = f_\alpha \) is \( \sigma(f_\alpha : \alpha \in I) / \mathcal{F}_\alpha \) measurable for all \( \alpha \in I \) it follows from Corollary 9.19 that \( f : X \to Y \) is \( \sigma(f_\alpha : \alpha \in I) / \mathcal{F} \) measurable. Since \( \sigma(f) \) is the smallest \( \sigma \)-algebra on \( X \) such that \( f \) is measurable we may conclude that \( \sigma(f) \subset \sigma(f_\alpha : \alpha \in I) \).

Conversely, for each \( \alpha \in I \), \( f_\alpha = \pi_\alpha \circ f = \sigma(f) / \mathcal{F}_\alpha \) measurable for all \( \alpha \in I \) and being the composition of two measurable functions. Since \( \sigma(f_\alpha : \alpha \in I) \) is the smallest \( \sigma \)-algebra on \( X \) such that each \( f_\alpha : X \to Y_\alpha \) is measurable, we learn that \( \sigma(f_\alpha : \alpha \in I) \subset \sigma(f) \).

Exercise 9.6. Suppose that \( (Y_1, \mathcal{F}_1) \) and \( (Y_2, \mathcal{F}_2) \) are measurable spaces and \( \mathcal{E}_i \) is a subset of \( \mathcal{F}_i \) such that \( Y_1 \in \mathcal{E}_i \) and \( \mathcal{F}_i = \sigma(\mathcal{E}_i) \) for \( i = 1, 2 \). Show \( \mathcal{F}_1 \otimes \mathcal{F}_2 = \sigma(\mathcal{E}) \) where \( \mathcal{E} := \{A_1 \times A_2 : A_1 \in \mathcal{E}_1 \text{ for } i = 1, 2\} \).

Hints:

1. First show that if \( Y \) is a set and \( S_1 \) and \( S_2 \) are two non-empty subsets of \( 2^Y \), then \( \sigma(\sigma(S_1) \cup \sigma(S_2)) = \sigma(S_1 \cup S_2) \). (In fact, one has that \( \sigma(\bigcup_{\alpha \in I} \sigma(S_\alpha)) = \sigma(\bigcup_{\alpha \in I} S_\alpha) \) for any collection of non-empty subsets, \( \{S_\alpha\}_{\alpha \in I} \subset 2^Y \).

2. After this you might start your proof as follows:
\[
\mathcal{F}_1 \otimes \mathcal{F}_2 := \sigma(\pi_1^{-1}(\mathcal{F}_1) \cup \pi_2^{-1}(\mathcal{F}_2)) = \sigma(\pi_1^{-1}(\sigma(\mathcal{E}_2)) \cup \pi_2^{-1}(\sigma(\mathcal{E}_2))) = \ldots
\]

Remark 9.21. The reader should convince himself that Exercise 9.6 admits the following extension. If \( I \) is any finite or countable index set, \( \{(Y_i, \mathcal{F}_i)\}_{i \in I} \) are measurable spaces and \( \mathcal{E}_i \subset \mathcal{F}_i \) are such that \( Y_i \in \mathcal{E}_i \) and \( \mathcal{F}_i = \sigma(\mathcal{E}_i) \) for all \( i \in I \), then
\[
\otimes_{i \in I} \mathcal{F}_i = \sigma\left(\left\{\prod_{i \in I} A_i : A_j \in \mathcal{E}_j \text{ for all } j \in I\right\}\right)
\]
and in particular,
\[
\otimes_{i \in I} \mathcal{F}_i = \sigma\left(\left\{\prod_{i \in I} A_i : A_j \in \mathcal{F}_j \text{ for all } j \in I\right\}\right).
\]

The last fact is easily verified directly without the aid of Exercise 9.6.

Exercise 9.7. Suppose that \( (Y_1, \mathcal{F}_1) \) and \( (Y_2, \mathcal{F}_2) \) are measurable spaces and \( \emptyset \neq B_i \subset Y_i \) for \( i = 1, 2 \). Show
\[
[\mathcal{F}_1 \otimes \mathcal{F}_2]_{B_1 \times B_2} = [\mathcal{F}_1]_{B_1} \otimes [\mathcal{F}_2]_{B_2}.
\]

Hint: you may find it useful to use the result of Exercise 9.6 with
\[
\mathcal{E} := \{A_1 \times A_2 : A_i \in \mathcal{F}_i \text{ for } i = 1, 2\}.
\]

Definition 9.22. A function \( f : X \to Y \) between two topological spaces is Borel measurable if \( f^{-1}(\mathcal{B}_Y) \subset \mathcal{B}_X \).

Proposition 9.23. Let \( X \) and \( Y \) be two topological spaces and \( f : X \to Y \) be a continuous function. Then \( f \) is Borel measurable.

Proof. Using Lemma 9.3 and \( \mathcal{B}_Y = \sigma(\tau_Y) \),
\[
f^{-1}(\mathcal{B}_Y) = f^{-1}(\sigma(\tau_Y)) = \sigma(f^{-1}(\tau_Y)) \subset \sigma(\tau_X) = \mathcal{B}_X.
\]
Example 9.24. For $i=1,2,\ldots,n$, let $\pi_i : \mathbb{R}^n \to \mathbb{R}$ be defined by $\pi_i (x) = x_i$. Then each $\pi_i$ is continuous and therefore $B_{\mathbb{R}^n}/B_{\mathbb{R}}$ measurable.

**Lemma 9.25.** Let $E$ denote the collection of open rectangle in $\mathbb{R}^n$, then $B_{\mathbb{R}^n} = \sigma (E)$. We also have that $B_{\mathbb{R}^n} = \sigma (\pi_1, \ldots, \pi_n) = B_{\mathbb{R}} \otimes \cdots \otimes B_{\mathbb{R}}$ and in particular, $A_1 \times \cdots \times A_n \in B_{\mathbb{R}^n}$ whenever $A_i \in B_{\mathbb{R}}$ for $i=1,2,\ldots,n$. Therefore $B_{\mathbb{R}^n}$ may be described as the $\sigma$ algebra generated by $\{ A_1 \times \cdots \times A_n : A_i \in B_{\mathbb{R}} \}$. (Also see Remark 9.24).

**Proof.** Assertion 1. Since $E \subset B_{\mathbb{R}^n}$, it follows that $\sigma (E) \subset B_{\mathbb{R}^n}$. Let

$$E_0 := \{(a,b) : a, b \in \mathbb{Q}^n, a < b \},$$

where, for $a, b \in \mathbb{R}^n$, we write $a < b$ iff $a_i < b_i$ for $i=1,2,\ldots,n$ and let

$$(a,b) = (a_1,b_1) \times \cdots \times (a_n,b_n). \quad (9.3)$$

Since every open set, $V \subset \mathbb{R}^n$, may be written as a (necessarily) countable union of elements from $E_0$, we have

$$V \in \sigma (E_0) \subset \sigma (E),$$

i.e. $\sigma (E_0)$ and hence $\sigma (E)$ contains all open subsets of $\mathbb{R}^n$. Hence we may conclude that

$$B_{\mathbb{R}^n} = \sigma (\text{open sets}) \subset \sigma (E_0) \subset \sigma (E) \subset B_{\mathbb{R}^n}.$$

**Assertion 2.** Since each $\pi_i : \mathbb{R}^n \to \mathbb{R}$ is continuous, it is $B_{\mathbb{R}^n}/B_{\mathbb{R}}$ measurable and therefore, $\sigma (\pi_1, \ldots, \pi_n) \subset B_{\mathbb{R}^n}$. Moreover, if $(a,b)$ is as in Eq. (9.3), then

$$(a,b) = \cap_{i=1}^n \pi_i^{-1} (\{(a_i,b_i)\}) \in \sigma (\pi_1, \ldots, \pi_n).$$

Therefore, $E \subset \sigma (\pi_1, \ldots, \pi_n)$ and $B_{\mathbb{R}^n} = \sigma (E) \subset \sigma (\pi_1, \ldots, \pi_n)$.

**Assertion 3.** If $A_i \in B_{\mathbb{R}}$ for $i=1,2,\ldots,n$, then

$$A_1 \times \cdots \times A_n = \cap_{i=1}^n \pi_i^{-1} (A_i) \in \sigma (\pi_1, \ldots, \pi_n) = B_{\mathbb{R}^n}.$$

**Corollary 9.26.** If $(X, \mathcal{M})$ is a measurable space, then

$$f = (f_1, f_2, \ldots, f_n) : X \to \mathbb{R}^n$$

is $(\mathcal{M}, B_{\mathbb{R}^n})$ measurable iff $f_i : X \to \mathbb{R}$ is $(\mathcal{M}, B_{\mathbb{R}})$ measurable for each $i$.

In particular, a function $f : X \to \mathbb{C}$ is $(\mathcal{M}, B_{\mathbb{C}})$ measurable iff $\Re f$ and $\Im f$ are $(\mathcal{M}, B_{\mathbb{R}})$ measurable.

**Proof.** This is an application of Lemma 9.25 and Corollary 9.19 with $Y_i = \mathbb{R}$ for each $i$.

**Corollary 9.27.** Let $(X, \mathcal{M})$ be a measurable space and $f,g : X \to \mathbb{C}$ be $(\mathcal{M}, B_{\mathbb{C}})$ measurable functions. Then $f \pm g$ and $f \cdot g$ are also $(\mathcal{M}, B_{\mathbb{C}})$ measurable.

**Proof.** Define $F : X \to \mathbb{C} \times \mathbb{C}$, $A_{\pm} : \mathbb{C} \times \mathbb{C} \to \mathbb{C}$ and $M : \mathbb{C} \times \mathbb{C} \to \mathbb{C}$ by $F(x) = (f(x), g(x))$, $A_{\pm}(w,z) = w \pm z$ and $M(w,z) = wz$. Then $A_{\pm}$ and $M$ are continuous and hence $(B_{\mathbb{C}^2}, B_{\mathbb{C}})$ measurable. Also $F$ is $(\mathcal{M}, B_{\mathbb{C}^2})$ measurable since $\pi_1 \circ F = f$ and $\pi_2 \circ F = g$ are $(\mathcal{M}, B_{\mathbb{C}})$ measurable. Therefore $A_{\pm} \circ F = f \pm g$ and $M \circ F = f \cdot g$, being the composition of measurable functions, are also measurable.

**Lemma 9.28.** Let $\alpha \in \mathbb{R}, (X, \mathcal{M})$ be a measurable space and $f : X \to \mathbb{C}$ be a $(\mathcal{M}, B_{\mathbb{C}})$ measurable function. Then

$$F(x) := \begin{cases} \frac{1}{\alpha} & \text{if } f(x) \neq 0 \\ 0 & \text{if } f(x) = 0 \end{cases}$$

is measurable.

**Proof.** Define $i : \mathbb{C} \to \mathbb{C}$ by

$$i(z) = \begin{cases} \frac{1}{z} & \text{if } z \neq 0 \\ 0 & \text{if } z = 0. \end{cases}$$

For any open set $V \subset \mathbb{C}$ we have

$$i^{-1}(V) = i^{-1}(V \setminus \{0\}) \cup i^{-1}(V \cap \{0\})$$

Because $i$ is continuous except at $z = 0$, $i^{-1}(V \setminus \{0\})$ is an open set and hence in $B_{\mathbb{C}}$. Moreover, $i^{-1}(V \cap \{0\}) \in B_{\mathbb{C}}$ since $i^{-1}(V \cap \{0\})$ is either the empty set or the one point set $\{0\}$. Therefore $i^{-1}(\mathbb{T}) \subset B_{\mathbb{C}}$ and hence $i^{-1}(B_{\mathbb{C}}) = i^{-1}(\sigma(\mathbb{T})) = \sigma(i^{-1}(\mathbb{T})) \subset B_{\mathbb{C}}$ which shows that $i$ is Borel measurable. Since $F = i \circ f$ is the composition of measurable functions, $F$ is also measurable.

**Remark 9.29.** For the real case of Lemma 9.28 define $i$ as above but now take $z$ to real. From the plot of $i$, Figure 9.29, the reader may easily verify that $i^{-1}((\infty,a])$ is an infinite half interval for all $a$ and therefore $i$ is measurable. See Example 9.34 for another proof of this fact.
We will often deal with functions $f : X \to \mathbb{R} = \mathbb{R} \cup \{\pm \infty\}$. When talking about measurability in this context we will refer to the $\sigma$-algebra on $\mathbb{R}$ defined by
\[ B_{\mathbb{R}} := \sigma(\{[a, \infty) : a \in \mathbb{R}\}). \]

**Proposition 9.30 (The Structure of $B_{\mathbb{R}}$).** Let $B_{\mathbb{R}}$ and $B_{\mathbb{R}}$ be as above, then
\[ B_{\mathbb{R}} = \{A \subset \mathbb{R} : A \cap \mathbb{R} \in B_{\mathbb{R}}\}. \] (9.5)

In particular $\{\infty\}, \{-\infty\} \in B_{\mathbb{R}}$ and $B_{\mathbb{R}} \subset B_{\mathbb{R}}$.

**Proof.** Let us first observe that
\[
\{-\infty\} = \bigcap_{n=1}^{\infty} [-\infty, -n) \cap \bigcap_{n=1}^{\infty} [-n, \infty] \in B_{\mathbb{R}},
\]
\[
\{\infty\} = \bigcap_{n=1}^{\infty} [n, \infty] \in B_{\mathbb{R}} \text{ and } \mathbb{R} = \mathbb{R} \setminus \{\pm \infty\} \in B_{\mathbb{R}}.
\]

Letting $i : \mathbb{R} \to \bar{\mathbb{R}}$ be the inclusion map,
\[
i^{-1}(B_{\mathbb{R}}) = \sigma(i^{-1}(\{[a, \infty) : a \in \mathbb{R}\})) = \sigma(\{i^{-1}([a, \infty)) : a \in \bar{\mathbb{R}}\})
\]
\[
= \sigma(\{[a, \infty) \cap \mathbb{R} : a \in \bar{\mathbb{R}}\}) = \sigma(\{[a, \infty) : a \in \mathbb{R}\}) = B_{\mathbb{R}}.
\]

Thus we have shown
\[ B_{\mathbb{R}} = i^{-1}(B_{\mathbb{R}}) = \{A \cap \mathbb{R} : A \in B_{\mathbb{R}}\}. \]

This implies:
1. $A \in B_{\mathbb{R}} \implies A \cap \mathbb{R} \in B_{\mathbb{R}}$ and
2. if $A \subset \mathbb{R}$ is such that $A \cap \mathbb{R} \in B_{\mathbb{R}}$ there exists $B \in B_{\mathbb{R}}$ such that $A \cap \mathbb{R} = B \cap \mathbb{R}$.

Because $A \Delta B \subset \{\pm \infty\}$ and $\{\infty\}, \{-\infty\} \in B_{\mathbb{R}}$ we may conclude that $A \in B_{\mathbb{R}}$ as well.

This proves Eq. (9.5).

The proofs of the next two corollaries are left to the reader, see Exercises 9.8 and 9.9.

---

**Corollary 9.31.** Let $(X, \mathcal{M})$ be a measurable space and $f : X \to \bar{\mathbb{R}}$ be a function. Then the following are equivalent
1. $f$ is $(\mathcal{M}, B_{\mathbb{R}})$-measurable,
2. $f^{-1}((a, \infty]) \in \mathcal{M}$ for all $a \in \mathbb{R}$,
3. $f^{-1}((-\infty, a]) \in \mathcal{M}$ for all $a \in \mathbb{R}$,
4. $f^{-1}((-\infty)) \in \mathcal{M}$, $f^{-1}((\{\infty\}) \in \mathcal{M}$ and $f^0 : X \to \mathbb{R}$ defined by
\[
f^0(x) := \begin{cases} f(x) & \text{if } f(x) \in \mathbb{R} \\ 0 & \text{if } f(x) \in \{\pm \infty\} \end{cases}
\]
is measurable.

**Corollary 9.32.** Let $(X, \mathcal{M})$ be a measurable space, $f, g : X \to \bar{\mathbb{R}}$ be functions and define $f \cdot g : X \to \bar{\mathbb{R}}$ and $(f + g) : X \to \bar{\mathbb{R}}$ using the conventions, $0 \cdot \infty = 0$ and $(f + g)(x) = 0$ if $f(x) = \infty$ and $g(x) = -\infty$ or $f(x) = -\infty$ and $g(x) = \infty$. Then $f \cdot g$ and $f + g$ are measurable functions on $X$ if both $f$ and $g$ are measurable.

**Exercise 9.8.** Prove Corollary 9.31 noting that the equivalence of items 1. – 3. is a direct analogue of Corollary 9.11. Use Proposition 9.30 to handle item 4.

**Exercise 9.9.** Prove Corollary 9.32.

**Proposition 9.33 (Closure under sups, infs and limits).** Suppose that $(X, \mathcal{M})$ is a measurable space and $f_j : (X, \mathcal{M}) \to \bar{\mathbb{R}}$ for $j \in \mathbb{N}$ is a sequence of $\mathcal{M}/B_{\mathbb{R}}$-measurable functions. Then
\[
\sup_{j \to \infty} f_j, \quad \inf_{j \to \infty} f_j, \quad \limsup_{j \to \infty} f_j \text{ and } \liminf_{j \to \infty} f_j
\]
are all $\mathcal{M}/B_{\mathbb{R}}$-measurable functions. (Note that this result is in generally false when $(X, \mathcal{M})$ is a topological space and measurable is replaced by continuous in the statement.)

**Proof.** Define $g_+(x) := \sup_j f_j(x)$, then
\[
\{x : g_+(x) \leq a\} = \bigcap_j \{x : f_j(x) \leq a \forall j\}
\]
\[= \cap_j \{x : f_j(x) \leq a\} \in \mathcal{M}
\]
so that $g_+$ is measurable. Similarly if $g_-(x) = \inf_j f_j(x)$ then
\[
\{x : g_-(x) \geq a\} = \cap_j \{x : f_j(x) \geq a\} \in \mathcal{M}.
\]

Since
\[
\limsup_{j \to \infty} f_j = \inf_{n} \sup_{j \geq n} f_j \text{ and } \liminf_{j \to \infty} f_j = \sup_{n} \inf_{j \geq n} f_j
\]
we are done by what we have already proved.
Example 9.34. As we saw in Remark 9.29, \( i : \mathbb{R} \to \mathbb{R} \) defined by
\[
i(z) = \begin{cases} 
\frac{1}{z} & \text{if } z \neq 0 \\
0 & \text{if } z = 0.
\end{cases}
\]
is measurable by a simple direct argument. For an alternative argument, let
\[
i_n(z) := \frac{z}{z^2 + 1} \quad \text{for all } n \in \mathbb{N}.
\]
Then \( i_n \) is continuous and \( \lim_{n \to \infty} i_n(z) = i(z) \) for all \( z \in \mathbb{R} \) from which it follows that \( i \) is Borel measurable.

Example 9.35. Let \( \{ r_n \}_{n=1}^{\infty} \) be an enumeration of the points in \( \mathbb{Q} \cap [0,1] \) and define
\[
f(x) = \sum_{n=1}^{\infty} 2^{-n} \frac{1}{\sqrt{|x-r_n|}}
\]
with the convention that
\[
\frac{1}{\sqrt{|x-r_n|}} = 5 \text{ if } x = r_n.
\]
Then \( f : \mathbb{R} \to \mathbb{R} \) is measurable. Indeed, if
\[
g_n(x) = \begin{cases} 
\frac{1}{\sqrt{|x-r_n|}} & \text{if } x \neq r_n \\
0 & \text{if } x = r_n
\end{cases}
\]
then \( g_n(x) = \sqrt{|r(x-r_n)|} \) is measurable as the composition of measurable is measurable. Therefore \( g_n + 5 \cdot 1_{\{r_n\}} \) is measurable as well. Finally,
\[
f(x) = \lim_{N \to \infty} \sum_{n=1}^{N} 2^{-n} \frac{1}{\sqrt{|x-r_n|}}
\]
is measurable since sums of measurable functions are measurable and limits of measurable functions are measurable. **Moral:** if you can explicitly write a function \( f : \mathbb{R} \to \mathbb{R} \) down then it is going to be measurable.

**Definition 9.36.** Given a function \( f : X \to \mathbb{R} \) let \( f_+(x) := \max \{ f(x), 0 \} \) and \( f_-(x) := \max \{ -f(x), 0 \} \). Notice that \( f = f_+ - f_- \).

**Corollary 9.37.** Suppose \((X, \mathcal{M})\) is a measurable space and \( f : X \to \mathbb{R} \) is a function. Then \( f \) is measurable if \( f_\pm \) are measurable.

**Proof.** If \( f \) is measurable, then Proposition 9.33 implies \( f_\pm \) are measurable. Conversely if \( f_\pm \) are measurable then so is \( f = f_+ - f_- \).

**Definition 9.38.** Let \((X, \mathcal{M})\) be a measurable space. A function \( \varphi : X \to \mathbb{F} \) (\( \mathbb{F} \) denotes either \( \mathbb{R}, \mathbb{C} \) or \([0, \infty] \subset \mathbb{R} \)) is a **simple function** if \( \varphi \) is \( \mathcal{M} \subseteq \mathbb{F} \) measurable and \( \varphi(X) \) contains only finitely many elements.

Any such simple functions can be written as
\[
\varphi = \sum_{i=1}^{n} \lambda_i 1_{A_i} \quad \text{with } A_i \in \mathcal{M} \text{ and } \lambda_i \in \mathbb{F}.
\]

Indeed, take \( \lambda_1, \lambda_2, \ldots, \lambda_n \) to be an enumeration of the range of \( \varphi \) and \( A_i = \varphi^{-1}(\{\lambda_i\}) \). Note that this argument shows that any simple function may be written intrinsically as
\[
\varphi = \sum_{y \in \mathbb{F}} y 1_{\varphi^{-1}(\{y\})}.
\]

The next theorem shows that simple functions are “pointwise dense” in the space of measurable functions.

**Theorem 9.39 (Approximation Theorem).** Let \( f : X \to [0, \infty] \) be measurable and define, see Figure 9.1,
\[
\varphi_n(x) := \sum_{k=0}^{2^n-1} \frac{k}{2^n} 1_{(\frac{k}{2^n}, \frac{k+1}{2^n})}(x) + 2^n 1_{(2^n, \infty)}(x)
\]
then \( \varphi_n \leq f \) for all \( n \), \( \varphi_n(x) \uparrow f(x) \) for all \( x \in X \) and \( \varphi_n \uparrow f \) uniformly on the sets \( X_M := \{ x \in X : f(x) \leq M \} \) with \( M < \infty \).

Moreover, if \( f : X \to \mathbb{C} \) is a measurable function, then there exists simple functions \( \varphi_n \) such that \( \lim_{n \to \infty} \varphi_n(x) = f(x) \) for all \( x \in X \) and \( |\varphi_n| \uparrow |f| \) as \( n \to \infty \).

**Proof.** Since \( f^{-1}(\left[ \frac{k}{2^n}, \frac{k+1}{2^n} \right]) \) and \( f^{-1}\left( (2^n, \infty) \right) \) are in \( \mathcal{M} \) as \( f \) is measurable, \( \varphi_n \) is a measurable simple function for each \( n \). Because
\[
\left( \frac{k}{2^n}, \frac{k+1}{2^n} \right] = \left( \frac{2k}{2^{n+1}}, \frac{2k+1}{2^{n+1}} \right] \cup \left( \frac{2k+1}{2^{n+1}}, \frac{2k+2}{2^{n+1}} \right],
\]
if \( x \in f^{-1}(\left( \frac{2k}{2^n}, \frac{2k+1}{2^n} \right]) \) then \( \varphi_n(x) = \varphi_{n+1}(x) = \frac{2k}{2^n} \) and if \( x \in f^{-1}(\left( \frac{2k+1}{2^n}, \frac{2k+2}{2^n} \right]) \) then \( \varphi_n(x) = \frac{2k+2}{2^n} \). Similarly
\[
(2^n, \infty) = (2^n, 2^{n+1}] \cup (2^{n+1}, \infty],
\]
and so for \( x \in f^{-1}(\left( 2^n+1, \infty \right)) \), \( \varphi_n(x) = 2^n < 2^{n+1} = \varphi_{n+1}(x) \) and for \( x \in f^{-1}(\left( 2^n, 2^{n+1} \right]) \), \( \varphi_{n+1}(x) \geq 2^n = \varphi_n(x) \). Therefore \( \varphi_n \leq \varphi_{n+1} \) for all \( n \). It is
clear by construction that $0 \leq \varphi_n(x) \leq f(x)$ for all $x$ and that $0 \leq f(x) - \varphi_n(x) \leq 2^{-n}$ if $x \in X_{2^n} = \{f \leq 2^n\}$. Hence we have shown that $\varphi_n(x) \uparrow f(x)$ for all $x \in X$ and $\varphi_n \uparrow f$ uniformly on bounded sets.

For the second assertion, first assume that $f : X \to \mathbb{R}$ is a measurable function and choose $\varphi_{n \pm}$ to be non-negative simple functions such that $\varphi_{n \pm} \uparrow f_{\pm}$ as $n \to \infty$ and define $\varphi_n = \varphi_{n +} - \varphi_{n -}$. Then (using $\varphi_{n \pm} \cdot \varphi_{n \mp} \leq f_{\pm} \cdot f_{\mp} = 0$)

$$|\varphi_n| = \varphi_{n +} + \varphi_{n -} \leq \varphi_{n +1} + \varphi_{n -1} = |\varphi_{n+1}|$$

and clearly $|\varphi_n| = \varphi_{n +} + \varphi_{n -} \uparrow f_{+} + f_{-} = |f|$ and $\varphi_n = \varphi_{n +} - \varphi_{n -} \to f_{+} - f_{-} = f$ as $n \to \infty$. Now suppose that $f : X \to \mathbb{C}$ is measurable. We may now choose simple functions $u_n$ and $v_n$ such that $|u_n| \uparrow |\Re f|$, $|v_n| \uparrow |\Im f|$, $u_n \to \Re f$ and $v_n \to \Im f$ as $n \to \infty$. Let $\varphi_n = u_n + iv_n$, then

$$|\varphi_n|^2 = u_n^2 + v_n^2 \uparrow |\Re f|^2 + |\Im f|^2 = |f|^2$$

and $\varphi_n = u_n + iv_n \to \Re f + i \Im f = f$ as $n \to \infty$. $\blacksquare$

### 9.2 Factoring Random Variables

**Lemma 9.40.** Suppose that $(\mathcal{Y}, \mathcal{F})$ is a measurable space and $Y : \Omega \to \mathcal{Y}$ is a map. Then to every $(\sigma(Y), \mathcal{B}\mathcal{R})$ - measurable function $h : \Omega \to \mathbb{R}$, there is a $(\mathcal{F}, \mathcal{B}\mathcal{R})$ - measurable function $H : \mathcal{Y} \to \mathbb{R}$ such that $h = H \circ Y$. More generally, $\mathbb{R}$ may be replaced by any "standard Borel space," i.e. a space $(S, \mathcal{B}_S)$ which is measure theoretic isomorphic to a Borel subset of $\mathbb{R}$.

$$\begin{align*}
\left(\Omega, \sigma(Y)\right) & \xrightarrow{Y} (\mathcal{Y}, \mathcal{F}) \\
\left(S, \mathcal{B}_S\right) & \xrightarrow{h} \left(\bar{\mathbb{R}}, \mathcal{B}\mathcal{R}\right)
\end{align*}$$

**Proof.** First suppose that $h = 1_A$ where $A \in \sigma(Y) = Y^{-1}(\mathcal{F})$. Let $B \in \mathcal{F}$ such that $A = Y^{-1}(B)$ then $1_A = 1_{Y^{-1}(B)} = 1_B \circ Y$ and hence the lemma is valid in this case with $H = 1_B$. More generally if $h = \sum a_i 1_{A_i}$ is a simple function, then there exists $B_i \in \mathcal{F}$ such that $1_{A_i} = 1_{B_i} \circ Y$ and hence $h = H \circ Y$ with $H := \sum a_i 1_{B_i}$ - a simple function on $\bar{\mathbb{R}}$.

For a general $(\mathcal{F}, \mathcal{B}\mathcal{R})$ - measurable function, $h$, from $\Omega \to \mathbb{R}$, choose simple functions $h_n$ converging to $h$. Let $H_n : \mathcal{Y} \to \bar{\mathbb{R}}$ be simple functions such that $h_n = H_n \circ Y$. Then it follows that

$$h = \lim_{n \to \infty} h_n = \limsup_{n \to \infty} h_n = \limsup_{n \to \infty} H_n \circ Y = H \circ Y$$

where $H := \limsup_{n \to \infty} H_n$ - a measurable function from $\mathcal{Y}$ to $\mathbb{R}$.

For the last assertion we may assume that $S \in \mathcal{B}\mathcal{R}$ and $\mathcal{B}_S = (\mathcal{B}\mathcal{R})_S = \{A \cap S : A \in \mathcal{B}\mathcal{R}\}$. Since $i_S : S \to \mathbb{R}$ is measurable, what we have just proved shows there exists, $H : \mathcal{Y} \to \mathbb{R}$ which is $(\mathcal{F}, \mathcal{B}\mathcal{R})$ - measurable such that $h = i_S \circ h = H \circ Y$. The only problems with $H$ is that $H(\mathcal{Y})$ may not be contained in $S$. To fix this, let

$$H_S = \begin{cases} 
H|_{H^{-1}(S)} & \text{on } H^{-1}(S) \\
* & \text{on } \mathcal{Y} \setminus H^{-1}(S)
\end{cases}$$

where * is some fixed arbitrary point in $S$. It follows from Proposition 9.13 that $H_S : \mathcal{Y} \to S$ is $(\mathcal{F}, \mathcal{B}_S)$ - measurable and we still have $h = H_S \circ Y$ as the range of $Y$ must necessarily be in $H^{-1}(S)$.

Here is how this lemma will often be used in these notes.

**Corollary 9.41.** Suppose that $(\Omega, \mathcal{B})$ is a measurable space, $X_n : \Omega \to \mathbb{R}$ are $\mathcal{B}/\mathcal{B}\mathcal{R}$ - measurable functions, and $\mathcal{B}_n := \sigma(X_1, \ldots, X_n) \subset \mathcal{B}$ for each $n \in \mathbb{N}$. Then $h : \Omega \to \mathbb{R}$ is $\mathcal{B}_n$ - measurable iff there exists $H : \mathcal{B}_n \to \mathbb{R}$ which is $\mathcal{B}_n/\mathcal{B}_\mathcal{R}$ - measurable such that $h = H(X_1, \ldots, X_n)$.

---

1 Standard Borel spaces include almost any measurable space that we will consider in these notes. For example they include all complete separable metric spaces equipped with the Borel $\sigma$ - algebra, see Section ??.
9.3 Summary of Measurability Statements

It may be worthwhile to gather the statements of the main measurability results of Sections 9.1 and 9.2 in one place. To do this let \((\Omega, B)\), \((X, \mathcal{M})\), and \(\{Y_\alpha, \mathcal{F}_\alpha\}_{\alpha \in I}\) be measurable spaces and \(f_\alpha : \Omega \to Y_\alpha\) be given maps for all \(\alpha \in I\). Also let \(\pi_\alpha : Y \to Y_\alpha\) be the \(\alpha\)-projection map,

\[
F := \bigotimes_{\alpha \in I} \mathcal{F}_\alpha := \sigma (\pi_\alpha : \alpha \in I)
\]

be the product \(\sigma\)-algebra on \(Y\), and \(f : \Omega \to Y\) be the unique map determined by \(\pi_\alpha \circ f = f_\alpha\) for all \(\alpha \in I\). Then the following measurability results hold;

1. For \(A \subset \Omega\), the indicator function, \(1_A\), is \((B, \mathcal{B}_R)\) - measurable iff \(A \in B\). (Example 9.8)
2. If \(\mathcal{E} \subset \mathcal{M}\) generates \(\mathcal{M}\) (i.e. \(\mathcal{M} = \sigma (\mathcal{E})\)), then a map, \(g : \Omega \to X\) is \((B, \mathcal{M})\) - measurable iff \(g^{-1} (\mathcal{E}) \subset B\) (Lemma 9.3 and Proposition 9.10).
3. The notion of measurability may be localized (Proposition 9.13).
4. Composition of measurable functions are measurable (Lemma 9.14).
5. Continuous functions between two topological spaces are also Borel measurable (Proposition 9.23).
6. \(\sigma (f) = \sigma (f_\alpha : \alpha \in I)\) (Proposition 9.20).
7. A map, \(h : X \to \Omega\) is \((\mathcal{M}, \sigma (f) = \sigma (f_\alpha : \alpha \in I))\) - measurable iff \(f_\alpha \circ h\) is \((\mathcal{M}, \mathcal{F}_\alpha)\) - measurable for all \(\alpha \in I\) (Proposition 9.17).
8. A map, \(h : X \to Y\) is \((\mathcal{M}, F)\) - measurable iff \(\pi_\alpha \circ h\) is \((\mathcal{M}, \mathcal{F}_\alpha)\) - measurable for all \(\alpha \in I\) (Corollary 9.19).
9. If \(I = \{1, 2, \ldots, n\}\), then

\[
\bigotimes_{\alpha \in I} \mathcal{F}_\alpha = \mathcal{F}_1 \otimes \cdots \otimes \mathcal{F}_n = \sigma (\{A_1 \times A_2 \times \cdots \times A_n : A_i \in \mathcal{F}_i\text{ for } i \in I\})
\]

this is a special case of Remark 9.21.
10. \(\mathcal{B}_{R^n} = \mathcal{B}_R \otimes \cdots \otimes \mathcal{B}_R\) (\(n\) - times) for all \(n \in \mathbb{N}\), i.e. the Borel \(\sigma\)-algebra on \(\mathbb{R}^n\) is the same as the product \(\sigma\)-algebra. (Lemma 9.25).
11. The collection of measurable functions from \((\Omega, B)\) to \((\mathbb{R}, \mathcal{B}_R)\) is closed under the usual pointwise algebraic operations (Corollary 9.32). They are also closed under the countable supremaums, infimums, and limits (Proposition 9.33).
12. The collection of measurable functions from \((\Omega, B)\) to \((\mathbb{C}, \mathcal{B}_C)\) is closed under the usual pointwise algebraic operations and countable limits. (Corollary 9.27 and Proposition 9.33). The limiting assertion follows by considering the real and imaginary parts of all functions involved.
13. The class of measurable functions from \((\Omega, B)\) to \((\mathbb{R}, \mathcal{B}_R)\) and from \((\Omega, B)\) to \((\mathbb{C}, \mathcal{B}_C)\) may be well approximated by measurable simple functions (Theorem 9.39).
14. If $X_i : \Omega \to \mathbb{R}$ are $\mathcal{B}/\mathcal{B}_\mathbb{R}$–measurable maps and $\mathcal{B}_n := \sigma(X_1, \ldots, X_n)$, then $h : \Omega \to \mathbb{R}$ is $\mathcal{B}_n$–measurable iff $h = H(X_1, \ldots, X_n)$ for some $\mathcal{B}_\mathbb{R}^n/\mathcal{B}_\mathbb{R}$–measurable map, $H : \mathbb{R}^n \to \mathbb{R}$ (Corollary 9.41).

15. We also have the more general factorization Lemma 9.40.

For the most part most of our future measurability issues can be resolved by one or more of the items on this list.

9.4 Distributions / Laws of Random Vectors

The proof of the following proposition is routine and will be left to the reader.

**Proposition 9.42.** Let $(X, \mathcal{M}, \mu)$ be a measure space, $(Y, \mathcal{F})$ be a measurable space and $f : X \to Y$ be a measurable map. Define a function $\nu : \mathcal{F} \to [0, \infty]$ by $\nu(A) := \mu(f^{-1}(A))$ for all $A \in \mathcal{F}$. Then $\nu$ is a measure on $(Y, \mathcal{F})$. (In the future we will denote $\nu$ by $f_* \mu$ or $\mu \circ f^{-1}$ or Law$_\mu(f)$ and call $f_* \mu$ the push-forward of $\mu$ by $f$ or the law of $f$ under $\mu$).

**Definition 9.43.** Suppose that $\{X_i\}_{i=1}^n$ is a sequence of random variables on a probability space, $(\Omega, \mathcal{B}, P)$. The probability measure, $\mu = (X_1, \ldots, X_n)_* P = P \circ (X_1, \ldots, X_n)^{-1}$ on $\mathcal{B}_\mathbb{R}$ (see Proposition 9.42) is called the joint distribution (or law) of $(X_1, \ldots, X_n)$. To be more explicit, $\mu(B) := P((X_1, \ldots, X_n) \in B) := P(\{\omega \in \Omega : (X_1(\omega), \ldots, X_n(\omega)) \in B\})$ for all $B \in \mathcal{B}_\mathbb{R}^n$.

**Corollary 9.44.** The joint distribution, $\mu$ is uniquely determined from the knowledge of $P((X_1, \ldots, X_n) \in A_1 \times \cdots \times A_n)$ for all $A_i \in \mathcal{B}_\mathbb{R}$ or from the knowledge of $P(X_1 \leq x_1, \ldots, X_n \leq x_n)$ for all $A_i \in \mathcal{B}_\mathbb{R}$ for all $x = (x_1, \ldots, x_n) \in \mathbb{R}^n$.

**Proof.** Apply Proposition 8.15 with $\mathcal{P}$ being the $\pi$–systems defined by $\mathcal{P} := \{A_1 \times \cdots \times A_n : A_i \in \mathcal{B}_\mathbb{R}\}$ for the first case and $\mathcal{P} := \{(-\infty, x_1] \times \cdots \times (-\infty, x_n] : x_i \in \mathbb{R}\}$ for the second case.

**Definition 9.45.** Suppose that $\{X_i\}_{i=1}^n$ and $\{Y_i\}_{i=1}^n$ are two finite sequences of random variables on two probability spaces, $(\Omega, \mathcal{B}, P)$ and $(\Omega', \mathcal{B}', P')$ respectively. We write $(X_1, \ldots, X_n) \overset{d}{=} (Y_1, \ldots, Y_n)$ if $(X_1, \ldots, X_n)$ and $(Y_1, \ldots, Y_n)$ have the same distribution / law, i.e. if...
Let us continue using the notation in Definition 9.45. Further let

\[ X = (X_1, X_2, \ldots) : \Omega \to \mathbb{R}^n \text{ and } Y := (Y_1, Y_2, \ldots) : \Omega' \to \mathbb{R}^n \]

and let \( \mathcal{F} := \otimes_{n \in \mathbb{N}} \mathcal{B}_R \) be the product \( \sigma \)-algebra on \( \mathbb{R}^n \). Then \( \{X_i\}_{i=1}^\infty \) \( \overset{d}{=} \) \( \{Y_i\}_{i=1}^\infty \) iff \( X, P = Y, P' \) as measures on \( (\mathbb{R}^n, \mathcal{F}) \).

**Proof.** Let

\[ \mathcal{P} := \bigcup_{n=1}^\infty \{A_1 \times A_2 \times \cdots \times A_n \times \mathbb{R}^n : A_i \in \mathcal{B}_R \text{ for } 1 \leq i \leq n\} \]

Notice that \( \mathcal{P} \) is a \( \pi \)-system and it is easy to show \( \sigma(\mathcal{P}) = \mathcal{F} \) (see Exercise 9.6). Therefore by Proposition 8.15, \( X, P = Y, P' \) iff \( X, P = Y, P' \) on \( \mathcal{P} \). Now for \( A_1 \times A_2 \times \cdots \times A_n \times \mathbb{R}^n \in \mathcal{P} \) we have,

\[ X, P \left( A_1 \times A_2 \times \cdots \times A_n \times \mathbb{R}^n \right) = P \left( (X_1, \ldots, X_n) \in A_1 \times A_2 \times \cdots \times A_n \right) \]

and hence the condition becomes,

\[ P \left( (X_1, \ldots, X_n) \in A_1 \times A_2 \times \cdots \times A_n \right) = P' \left( (Y_1, \ldots, Y_n) \in A_1 \times A_2 \times \cdots \times A_n \right) \]

for all \( n \in \mathbb{N} \) and \( A_i \in \mathcal{B}_R \). Another application of Proposition 8.15 or using Corollary 9.44 allows us to conclude that shows that \( X, P = Y, P' \) iff \( (X_1, \ldots, X_n) \overset{d}{=} (Y_1, \ldots, Y_n) \) for all \( n \in \mathbb{N} \). \( \square \)

**Corollary 9.47.** Continue the notation above and assume that \( \{X_i\}_{i=1}^\infty \overset{d}{=} \{Y_i\}_{i=1}^\infty \). Further let

\[ X_\pm = \begin{cases} \limsup_{n \to \infty} X_n & \text{if } + \\ \liminf_{n \to \infty} X_n & \text{if } - \end{cases} \]

and define \( Y_\pm \) similarly. Then \( (X_-, X_+) \overset{d}{=} (Y_-, Y_+) \) as random variables into \( \left( \mathbb{R}^2, \mathcal{B}_R \otimes \mathcal{B}_R \right) \). In particular,

\[ P \left( \lim_{n \to \infty} X_n \text{ exists in } \mathbb{R} \right) = P' \left( \lim_{n \to \infty} Y \text{ exists in } \mathbb{R} \right). \quad (9.8) \]

**Proof.** First suppose that \( (\Omega', \mathcal{B}', P') = (\mathbb{R}^n, \mathcal{F}, P' := X, P) \) where \( Y_i(a_1, a_2, \ldots) := a_i = \pi_i(a_1, a_2, \ldots) \). Then for \( C \in \mathcal{B}_R \otimes \mathcal{B}_R \) we have,

\[ X^{-1} \left( \{(Y_-, Y_+) \in C\} \right) = \{(Y_- \circ X, Y_+ \circ X) \in C\} = \{(X_-, X_+) \in C\}, \]

since, for example,

\[ Y_- \circ X = \liminf_{n \to \infty} Y_n \circ X = \liminf_{n \to \infty} X_n = X_. \]

Therefore it follows that

\[ P \left( (X_-, X_+) \in C \right) = P \circ X^{-1} \left( \{(Y_-, Y_+) \in C\} \right) = P' \left( \{(Y_-, Y_+) \in C\} \right). \quad (9.9) \]

The general result now follows by two applications of this special case.

For the last assertion, take

\[ C = \{(x, x) : x \in \mathbb{R}\} \in \mathcal{B}_R^2 = \mathcal{B}_R \otimes \mathcal{B}_R \subset \mathcal{B}_R \otimes \mathcal{B}_R. \]

Then \( (X_-, X_+) \in C \) iff \( X_- = X_+ \in \mathbb{R} \) which happens iff \( \lim_{n \to \infty} X_n \) exists in \( \mathbb{R} \). Similarly, \( (Y_- , Y_+) \in C \) iff \( \lim_{n \to \infty} Y_n \) exists in \( \mathbb{R} \) and therefore Eq. (9.8) holds as a consequence of Eq. (9.9). \( \square \)

**Exercise 9.10.** Let \( \{X_i\}_{i=1}^\infty \) and \( \{Y_i\}_{i=1}^\infty \) be two sequences of random variables such that \( \{X_i\}_{i=1}^\infty \overset{d}{=} \{Y_i\}_{i=1}^\infty \). Let \( \{S_n\}_{n=1}^\infty \) and \( \{T_n\}_{n=1}^\infty \) be defined by, \( S_n := X_1 + \cdots + X_n \) and \( T_n := Y_1 + \cdots + Y_n \). Prove the following assertions.

1. Suppose that \( f : \mathbb{R}^n \to \mathbb{R}^k \) is a \( \mathcal{B}_R^n / \mathcal{B}_R^k \) \(-\)measurable function, then \( f(X_1, \ldots, X_n) \overset{d}{=} f(Y_1, \ldots, Y_n) \).

2. Use your result in item 1. to show \( \{S_n\}_{n=1}^\infty \overset{d}{=} \{T_n\}_{n=1}^\infty \).

**Hint:** Apply item 1. with \( k = n \) after making a judicious choice for \( f : \mathbb{R}^n \to \mathbb{R}^n \).

9.5 Generating All Distributions from the Uniform Distribution

**Theorem 9.48.** Given a distribution function, \( F : \mathbb{R} \to [0, 1] \) let \( G : (0, 1) \to \mathbb{R} \) be defined (see Figure 9.2) by,

\[ G(y) := \inf \{x : F(x) \geq y\}. \]

Then \( G : (0, 1) \to \mathbb{R} \) is Borel measurable and \( G_* \mu_F = \mu_F \) where \( \mu_F \) is the unique measure on \( (\mathbb{R}, \mathcal{B}_R) \) such that \( \mu_F \left( (a, b) \right) = F(b) - F(a) \) for all \( -\infty < a < b < \infty \).
Generating All Distributions from the Uniform Distribution

Fig. 9.2. A pictorial definition of \( G \).

Fig. 9.3. As can be seen from this picture, \( G(y) \leq x_0 \) iff \( y \leq F(x_0) \) and similarly, \( G(y) \leq x_1 \) iff \( y \leq x_1 \).

Proof. Since \( G : (0,1) \to \mathbb{R} \) is a non-decreasing function, \( G \) is measurable. We also claim that, for all \( x_0 \in \mathbb{R} \), that

\[
G^{-1}((0,x_0]) = \{y : G(y) \leq x_0\} = (0,F(x_0)] \cap \mathbb{R},
\]

see Figure 9.3.

To give a formal proof of Eq. (9.10), \( G(y) = \inf \{x : F(x) \geq y\} \leq x_0 \), there exists \( x_n \geq x_0 \) with \( x_n \downarrow x_0 \) such that \( F(x_n) \geq y \). By the right continuity of \( F \), it follows that \( F(x_0) \geq y \). Thus we have shown

\[
\{y \leq x_0\} \subset (0,F(x_0)] \cap (0,1).
\]

For the converse, if \( y \leq F(x_0) \) then \( G(y) = \inf \{x : F(x) \geq y\} \leq x_0 \), i.e. \( y \in \{G \leq x_0\} \). Indeed, \( y \in G^{-1}((-\infty,x_0]) \) iff \( G(y) \leq x_0 \). Observe that

\[
G(F(x_0)) = \inf \{x : F(x) \geq F(x_0)\} \leq x_0
\]

and hence \( G(y) \leq x_0 \) whenever \( y \leq F(x_0) \). This shows that

\[
(0,F(x_0)] \cap (0,1) \subset G^{-1}((0,x_0]).
\]

As a consequence we have \( G \ast m = \mu_F \). Indeed,

\[
(G \ast m)((-\infty,x]) = m(G^{-1}((-\infty,x])) = m(\{y \in (0,1) : G(y) \leq x\})
\]

\[
= m((0,F(x)] \cap (0,1)) = F(x).
\]

Theorem 9.49 (Durrett’s Version). Given a distribution function, \( F : \mathbb{R} \to [0,1] \) let \( Y : (0,1) \to \mathbb{R} \) be defined (see Figure 9.4) by,

\[
Y(x) := \sup \{y : F(y) < x\}.
\]

Then \( Y : (0,1) \to \mathbb{R} \) is Borel measurable and \( Y \ast m = \mu_F \) where \( \mu_F \) is the unique measure on \((\mathbb{R}, \mathcal{B}_\mathbb{R})\) such that \( \mu_F((a,b]) = F(b) - F(a) \) for all \(-\infty < a < b < \infty\).

Proof. Since \( Y : (0,1) \to \mathbb{R} \) is a non-decreasing function, \( Y \) is measurable. Also observe, if \( y < Y(x) \), then \( F(y) < x \) and hence,

\[
F(Y(x) -) = \lim_{y \uparrow Y(x)} F(y) \leq x.
\]
For \( y > Y(x) \), we have \( F(y) \geq x \) and therefore,

\[
F(Y(x)) = F(Y(x) +) = \lim_{y \downarrow Y(x)} F(y) \geq x
\]

and so we have shown

\[
F(Y(x)^-) \leq x \leq F(Y(x))
\]

We will now show

\[
\{ x \in (0,1) : Y(x) \leq y_0 \} = (0, F(y_0)] \cap (0,1) \tag{9.11}
\]

For the inclusion “\( \subset \)”, if \( x \in (0,1) \) and \( Y(x) \leq y_0 \), then \( x \leq F(Y(x)) \leq F(y_0) \), i.e. \( x \in (0, F(y_0)] \cap (0,1) \). Conversely if \( x \in (0,1) \) and \( x \leq F(y_0) \) then (by definition of \( Y(x) \)) \( y_0 \geq Y(x) \).

From the identity in Eq. (9.11), it follows that \( Y \) is measurable and

\[
(Y^* m)((-\infty, y_0)) = m(Y^{-1}((-\infty, y_0))) = m((0, F(y_0)] \cap (0,1)) = F(y_0).
\]

Therefore, \( \text{Law}(Y) = \mu_F \) as desired.
Integration Theory

In this chapter, we will greatly extend the “simple” integral or expectation which was developed in Section 7.3 above. Recall there that if \((\Omega, \mathcal{B}, \mu)\) was measurable space and \(\phi : \Omega \to [0, \infty)\) was a measurable simple function, then we let
\[
\mathbb{E}_\mu \phi := \sum_{\lambda \in [0, \infty)} \lambda \mu(\phi = \lambda)
\]
The conventions being used here is that \(0 \cdot \mu(\varphi = 0) = 0\) even when \(\mu(\varphi = 0) = \infty\). This convention is necessary in order to make the integral linear – at a minimum we will want \(\mathbb{E}_\mu [0] = 0\). Please be careful not blindly apply the \(0 \cdot \infty = 0\) convention in other circumstances.

10.1 Integrals of positive functions

**Definition 10.1.** Let \(L^+ = L^+(\mathcal{B}) = \{f : \Omega \to [0, \infty] : f \text{ is measurable}\}.

Define
\[
\int_{\Omega} f(\omega) d\mu(\omega) = \int_{\Omega} f d\mu := \sup \{\mathbb{E}_\mu \varphi : \varphi \text{ is simple and } \varphi \leq f\}.
\]
We say the \(f \in L^+\) is **integrable** if \(\int_{\Omega} f d\mu < \infty\). If \(A \in \mathcal{B}\), let
\[
\int_{A} f(\omega) d\mu(\omega) = \int_{A} f d\mu := \int_{\Omega} 1_{A} f d\mu.
\]
We also use the notation,
\[
\mathbb{E}f = \int_{\Omega} f d\mu \text{ and } \mathbb{E}[f : A] := \int_{A} f d\mu.
\]

**Remark 10.2.** Because of item 3. of Proposition 7.19 if \(\varphi\) is a non-negative simple function, \(\int_{\Omega} \varphi d\mu = \mathbb{E}_\mu \varphi\) so that \(\int_{\Omega}\) is an extension of \(\mathbb{E}_\mu\).

**Lemma 10.3.** Let \(f, g \in L^+(\mathcal{B})\). Then:

1. if \(\lambda \geq 0\), then
\[
\int_{\Omega} \lambda f d\mu = \lambda \int_{\Omega} f d\mu
\]
wherein \(\lambda \int_{\Omega} f d\mu \equiv 0\) if \(\lambda = 0\), even if \(\int_{\Omega} f d\mu = \infty\).

2. if \(0 \leq f \leq g\), then
\[
\int_{\Omega} f d\mu \leq \int_{\Omega} g d\mu.
\]

3. For all \(\varepsilon > 0\) and \(p > 0\),
\[
\mu(f \geq \varepsilon) \leq \frac{1}{\varepsilon^p} \int_{\Omega} f^p 1_{\{f \geq \varepsilon\}} d\mu \leq \frac{1}{\varepsilon^p} \int_{\Omega} f^p d\mu.
\]

The inequality in Eq. \((10.2)\) is called Chebyshev’s Inequality for \(p = 1\) and Markov’s inequality for \(p = 2\).

4. If \(\int_{\Omega} f d\mu < \infty\) then \(\mu(f = \infty) = 0\) (i.e. \(f < \infty\) a.e.) and the set \(\{f > 0\}\) is \(\sigma\)-finite.

**Proof.** 1. We may assume \(\lambda > 0\) in which case,
\[
\int_{\Omega} \lambda f d\mu = \sup \{\mathbb{E}_\mu \varphi : \varphi \text{ is simple and } \varphi \leq \lambda f\}
\]
\[
= \sup \{\mathbb{E}_\mu \varphi : \varphi \text{ is simple and } \lambda^{-1} \varphi \leq f\}
\]
\[
= \sup \{\mathbb{E}_\mu [\lambda \psi] : \psi \text{ is simple and } \psi \leq f\}
\]
\[
= \sup \{\lambda \mathbb{E}_\mu [\psi] : \psi \text{ is simple and } \psi \leq f\}
\]
\[
= \lambda \int_{\Omega} f d\mu.
\]

2. Since
\[
\{\varphi \text{ is simple and } \varphi \leq f\} \subset \{\varphi \text{ is simple and } \varphi \leq g\},
\]
Eq. \((10.1)\) follows from the definition of the integral.

3. Since \(1_{\{f \geq \varepsilon\}} \leq \frac{1}{\varepsilon} \frac{1}{\varepsilon} f \leq \frac{1}{\varepsilon} f\) we have
\[
1_{\{f \geq \varepsilon\}} \leq \frac{1}{\varepsilon^p} \int_{\Omega} f^p 1_{\{f \geq \varepsilon\}} d\mu \leq \frac{1}{\varepsilon^p} \int_{\Omega} f^p d\mu.
\]

and by monotonicity and the multiplicative property of the integral,
\[
\mu(f \geq \varepsilon) = \int_{\Omega} 1_{\{f \geq \varepsilon\}} d\mu \leq \left(\frac{1}{\varepsilon^p}\right) \int_{\Omega} 1_{\{f \geq \varepsilon\}} f^p d\mu \leq \left(\frac{1}{\varepsilon^p}\right) \int_{\Omega} f^p d\mu.
\]
4. If \( \mu(f = \infty) > 0 \), then \( \varphi_n := n1_{\{f = \infty\}} \) is a simple function such that \( \varphi_n \leq f \) for all \( n \) and hence

\[
n\mu(f = \infty) = E_\mu(\varphi_n) \leq \int f d\mu
\]

for all \( n \). Letting \( n \rightarrow \infty \) shows \( \int f d\mu = \infty \). Thus if \( \int f d\mu \leq \infty \) then \( \mu(f = \infty) = 0 \).

Moreover,

\[
\{f > 0\} = \bigcup_{n=1}^{\infty} \{f > 1/n\}
\]

with \( \mu(f > 1/n) \leq n \int \varphi d\mu < \infty \) for each \( n \).

Theorem 10.4 (Monotone Convergence Theorem). Suppose \( f_n \in L^+ \) is a sequence of functions such that \( f_n \uparrow f \) (\( f \) is necessarily in \( L^+ \)) then

\[
\int f_n \uparrow \int f \text{ as } n \rightarrow \infty.
\]

Proof. Since \( f_n \leq f_m \leq f \), for all \( n \leq m < \infty \),

\[
\int f_n \leq \int f_m \leq \int f
\]

from which if follows \( \int f_n \) is increasing in \( n \) and

\[
\lim_{n \rightarrow \infty} \int f_n \leq \int f.
\]

For the opposite inequality, let \( \varphi : \Omega \rightarrow [0, \infty] \) be a simple function such that \( 0 \leq \varphi \leq f \), \( \alpha \in (0, 1) \) and \( \Omega_\alpha := \{f \geq \alpha \varphi\} \). Notice that \( \Omega_n \uparrow \Omega \) and \( f_n \geq \alpha_1 \Omega_n \varphi \) and so by definition of \( \int f_n \),

\[
\int f_n \geq E_\mu[\alpha_1 \Omega_n \varphi] = \alpha E_\mu[\varphi].
\]

Then using the identity

\[
1_{\Omega_n \varphi} = 1_{\Omega_n} \sum_{y > 0} y1_{\{\varphi = y\}} = \sum_{y > 0} y1_{\{\varphi = y\} \cap \Omega_n},
\]

and the linearity of \( E_\mu \), we have,

\[
\lim_{n \rightarrow \infty} E_\mu[1_{\Omega_n \varphi}] = \lim_{n \rightarrow \infty} \sum_{y > 0} y \cdot \mu(\Omega_n \cap \{\varphi = y\})
\]

\[
= \sum_{y > 0} \lim_{n \rightarrow \infty} \mu(\Omega_n \cap \{\varphi = y\}) \text{ (finite sum)}
\]

\[
= \sum_{y > 0} y \mu(\{\varphi = y\}) = E_\mu[\varphi],
\]

wherein we have used the continuity of \( \mu \) under increasing unions for the third equality. This identity allows us to let \( n \rightarrow \infty \) in Eq. (10.4) to conclude

\[
\lim_{n \rightarrow \infty} \int f_n \geq \alpha E_\mu[\varphi]
\]

and since \( \alpha \in (0, 1) \) was arbitrary we may further conclude, \( E_\mu[\varphi] \leq \lim_{n \rightarrow \infty} \int f_n \). The latter inequality being true for all simple functions \( \varphi \) with \( \varphi \leq f \) then implies that

\[
\int f = \sup_{0 \leq \varphi \leq f} E_\mu[\varphi] \leq \lim_{n \rightarrow \infty} \int f_n,
\]

which combined with Eq. (10.3) proves the theorem.

Remark 10.5 (“Explicit” Integral Formula). Given \( f : \Omega \rightarrow [0, \infty] \) measurable, we know from the approximation Theorem 9.39 \( \varphi_n \uparrow f \) where

\[
\varphi_n := \sum_{k=0}^{2^n-1} \frac{k}{2^n} \mathbb{1}_{\{\frac{k}{2^n} < f \leq \frac{k+1}{2^n}\}} + 2^n \mathbb{1}_{f > 2^n}.
\]

Therefore by the monotone convergence theorem,

\[
\int f d\mu = \lim_{n \rightarrow \infty} \int f_n d\mu
\]

\[
= \lim_{n \rightarrow \infty} \left[ \sum_{k=0}^{2^n-1} \frac{k}{2^n} \mu(\mathbb{1}_{\{\frac{k}{2^n} < f \leq \frac{k+1}{2^n}\}}) + 2^n \mu(f > 2^n) \right].
\]

Corollary 10.6. If \( f_n \in L^+ \) is a sequence of functions then

\[
\int \sum_{n=1}^{\infty} f_n = \sum_{n=1}^{\infty} \int f_n.
\]

In particular, if \( \sum_{n=1}^{\infty} \int f_n < \infty \) then \( \sum_{n=1}^{\infty} f_n < \infty \) a.e.

Proof. First off we show that

\[
\int(f_1 + f_2) = \int f_1 + \int f_2
\]

by choosing non-negative simple function \( \varphi_n \) and \( \psi_n \) such that \( \varphi_n \uparrow f_1 \) and \( \psi_n \uparrow f_2 \). Then \( (\varphi_n + \psi_n) \) is simple as well and \( (\varphi_n + \psi_n) \uparrow (f_1 + f_2) \) so by the monotone convergence theorem,

\[
\int(f_1 + f_2) = \lim_{n \rightarrow \infty} \int(\varphi_n + \psi_n) = \lim_{n \rightarrow \infty} \left( \int \varphi_n + \int \psi_n \right)
\]

\[
= \lim_{n \rightarrow \infty} \int \varphi_n + \lim_{n \rightarrow \infty} \int \psi_n = \int f_1 + \int f_2.
\]
Now to the general case. Let $g_N := \sum_{n=1}^{N} f_n$ and $g = \sum_{n=1}^{\infty} f_n$, then $g_N \uparrow g$ and so again by monotone convergence theorem and the additivity just proved,
\[
\sum_{n=1}^{\infty} f_n := \lim_{N \to \infty} \sum_{n=1}^{N} f_n = \lim_{N \to \infty} \int_{\Omega} f_N = \lim_{N \to \infty} \int_{\Omega} f_N = \frac{1}{N} \int_{\Omega} g_N = \frac{1}{N} \int_{\Omega} g =: \sum_{n=1}^{\infty} f_n.
\]

Remark 10.7. It is in the proof of Corollary 10.6 (i.e. the linearity of the integral) that we really make use of the assumption that all of our functions are measurable. In fact the definition $\int fd\mu$ makes sense for all functions $f : \Omega \to [0, \infty]$ not just measurable functions. Moreover the monotone convergence theorem holds in this generality with no change in the proof. However, in the proof of Corollary 10.6, we use the approximation Theorem 9.39 which relies heavily on the measurability of the functions to be approximated.

Example 10.8 (Sums as Integrals I). Suppose, $\Omega = \mathbb{N}$, $B := 2^{\mathbb{N}}$, $\mu (A) = \# (A)$ for $A \subset \Omega$ is the counting measure on $B$, and $f : \mathbb{N} \to [0, \infty]$ is a function. Since
\[
f = \sum_{n=1}^{\infty} f (n) 1_{\{n\}},
\]
it follows from Corollary 10.6 that
\[
\int_{\mathbb{N}} f d\mu = \sum_{n=1}^{\infty} \int_{\mathbb{N}} f (n) 1_{\{n\}} d\mu = \sum_{n=1}^{\infty} f (n) \mu (\{n\}) = \sum_{n=1}^{\infty} f (n).
\]
Thus the integral relative to counting measure is simply the infinite sum.

Lemma 10.9 (Sums as Integrals II*). Let $\Omega$ be a set and $\rho : \Omega \to [0, \infty]$ be a function, let $\mu = \sum_{\omega \in \Omega} \rho (\omega) \delta_\omega$ on $B = 2^\Omega$, i.e.
\[
\mu (A) = \sum_{\omega \in A} \rho (\omega).
\]
If $f : \Omega \to [0, \infty]$ is a function (which is necessarily measurable), then
\[
\int_{\Omega} f d\mu = \sum_{\Omega} f \rho.
\]

Proof. Suppose that $\varphi : \Omega \to [0, \infty)$ is a simple function, then $\varphi = \sum_{z \in [0, \infty]} z 1_{\{\varphi = z\}}$ and
\[
\sum_{\Omega} \varphi \rho = \sum_{\omega \in \Omega} \rho (\omega) \sum_{z \in [0, \infty]} z 1_{\{\varphi = z\}} (\omega) = \sum_{z \in [0, \infty]} z \sum_{\omega \in \Omega} \rho (\omega) 1_{\{\varphi = z\}} (\omega)
\]
\[
= \sum_{z \in [0, \infty]} z \mu (\{\varphi = z\}) = \int_{\Omega} \varphi d\mu.
\]
So if $\varphi : \Omega \to [0, \infty)$ is a simple function such that $\varphi \leq f$, then
\[
\int_{\Omega} \varphi d\mu \leq \sum_{\Omega} f \rho.
\]
Taking the sup over $\varphi$ in this last equation then shows that
\[
\int_{\Omega} f d\mu \leq \sum_{\Omega} f \rho.
\]
For the reverse inequality, let $A \subset \subset \Omega$ be a finite set and $N \in (0, \infty)$. Set $f^N (\omega) = \min \{N, f (\omega)\}$ and let $\varphi_{N, A}$ be the simple function given by $\varphi_{N, A} (\omega) := 1_A (\omega) f^N (\omega)$. Because $\varphi_{N, A} \leq f (\omega)$,
\[
\sum_A f^N \rho = \sum_A \varphi_{N, A} \rho = \int_{\Omega} \varphi_{N, A} d\mu \leq \int_{\Omega} f d\mu.
\]
Since $f^N \uparrow f$ as $N \to \infty$, we may let $N \to \infty$ in this last equation to concluded
\[
\sum_A f \rho \leq \int_{\Omega} f d\mu.
\]
Since $A$ is arbitrary, this implies
\[
\sum_{\Omega} f \rho \leq \int_{\Omega} f d\mu.
\]

Exercise 10.1. Suppose that $\mu_n : B \to [0, \infty]$ are measures on $B$ for $n \in \mathbb{N}$. Also suppose that $\mu_n (A)$ is increasing in $n$ for all $A \in B$. Prove that $\mu : B \to [0, \infty]$ defined by $\mu (A) := \lim_{n \to \infty} \mu_n (A)$ is also a measure.

Proposition 10.10. Suppose that $f \geq 0$ is a measurable function. Then $\int_{\Omega} f d\mu = 0$ iff $f = 0$ a.e. Also if $f, g \geq 0$ are measurable functions such that $f \leq g$ a.e. then $\int_{\Omega} f d\mu \leq \int_{\Omega} g d\mu$. In particular if $f = g$ a.e. then $\int_{\Omega} f d\mu = \int_{\Omega} g d\mu$. 

Proof. If \( f = 0 \) a.e. and \( \varphi \leq f \) is a simple function then \( \varphi = 0 \) a.e. This implies that \( \mu(\varphi^{-1}(\{y\})) = 0 \) for all \( y > 0 \) and hence \( \int_{\varphi} \varphi d\mu = 0 \) and therefore \( \int_{\Omega} f d\mu = 0 \). Conversely, if \( \int f d\mu = 0 \), then by (Lemma 10.3),

\[
\mu(f \geq 1/n) \leq n \int f d\mu = 0 \text{ for all } n.
\]

Therefore, \( \mu(f > 0) \leq \sum_{n=1}^{\infty} \mu(f \geq 1/n) = 0 \), i.e. \( f = 0 \) a.e.

For the second assertion let \( E \) be the exceptional set where \( f > g \), i.e.

\[
E := \{ \omega \in \Omega : f(\omega) > g(\omega) \}.
\]

By assumption \( E \) is a null set and \( 1_{E^c} f \leq 1_{E^c} g \) everywhere. Because \( g = 1_{E^c} g + 1_{E} g \) and \( 1_{E} g = 0 \) a.e.,

\[
\int g d\mu = \int 1_{E^c} g d\mu + \int 1_{E} g d\mu = \int 1_{E} g d\mu
\]

and similarly \( \int f d\mu = \int 1_{E^c} f d\mu + \int 1_{E} f d\mu \). Since \( 1_{E^c} f \leq 1_{E^c} g \) everywhere,

\[
\int f d\mu = \int 1_{E^c} f d\mu \leq \int 1_{E^c} g d\mu = \int g d\mu.
\]

Corollary 10.11. Suppose that \( \{f_n\} \) is a sequence of non-negative measurable functions and \( f \) is a measurable function such that \( f_n \uparrow f \) off a null set, then

\[
\int f_n \uparrow \int f \text{ as } n \to \infty.
\]

Proof. Let \( E \subset \Omega \) be a null set such that \( f_n 1_{E^c} \uparrow f 1_{E^c} \) as \( n \to \infty \). Then by the monotone convergence theorem and Proposition \[10.10\],

\[
\int f_n = \int f_n 1_{E^c} \uparrow \int f 1_{E^c} = \int f \text{ as } n \to \infty.
\]

Lemma 10.12 (Fatou’s Lemma). If \( f_n : \Omega \to [0, \infty] \) is a sequence of measurable functions then

\[
\int \liminf_{n \to \infty} f_n \leq \liminf_{n \to \infty} \int f_n.
\]

Proof. Define \( g_k := \inf_{n \geq k} f_n \) so that \( g_k \uparrow \liminf_{n \to \infty} f_n \) as \( k \to \infty \). Since \( g_k \leq f_n \) for all \( k \leq n \),

\[
\int g_k \leq \int f_n \text{ for all } n \geq k
\]

and therefore

\[
\int g_k \leq \liminf_{n \to \infty} \int f_n \text{ for all } k.
\]

We may now use the monotone convergence theorem to let \( k \to \infty \) to find

\[
\int \liminf_{n \to \infty} f_n = \int \liminf_{k \to \infty} g_k = \lim_{k \to \infty} \int g_k \leq \liminf_{n \to \infty} \int f_n.
\]

The following Corollary and the next lemma are simple applications of Corollary \[10.6\].

Corollary 10.13. Suppose that \( (\Omega,\mathcal{B},\mu) \) is a measure space and \( \{A_n\}_{n=1}^{\infty} \subset \mathcal{B} \) is a collection of sets such that \( \mu(A_i \cap A_j) = 0 \) for all \( i \neq j \), then

\[
\mu(\bigcup_{n=1}^{\infty} A_n) = \sum_{n=1}^{\infty} \mu(A_n).
\]

Proof. Since

\[
\mu(\bigcup_{n=1}^{\infty} A_n) = \int_{\Omega} 1_{\bigcup_{n=1}^{\infty} A_n} d\mu
\]

\[
\sum_{n=1}^{\infty} \mu(A_n) = \int_{\Omega} \sum_{n=1}^{\infty} 1_{A_n} d\mu
\]

it suffices to show

\[
\sum_{n=1}^{\infty} 1_{A_n} = 1_{\bigcup_{n=1}^{\infty} A_n} \mu - \text{a.e. (10.5)}
\]

Now \( \sum_{n=1}^{\infty} 1_{A_n} \geq 1_{\bigcup_{n=1}^{\infty} A_n} \) and \( \sum_{n=1}^{\infty} 1_{A_n}(\omega) \neq 1_{\bigcup_{n=1}^{\infty} A_n}(\omega) \) iff \( \omega \in A_i \cap A_j \) for some \( i \neq j \), that is

\[
\left\{ \omega : \sum_{n=1}^{\infty} 1_{A_n}(\omega) \neq 1_{\bigcup_{n=1}^{\infty} A_n}(\omega) \right\} = \bigcup_{i<j} A_i \cap A_j
\]

and the latter set has measure 0 being the countable union of sets of measure zero. This proves Eq. (10.5) and hence the corollary.

}\]
Lemma 10.14 (The First Borel–Cantelli Lemma). Let \((\Omega, \mathcal{B}, \mu)\) be a measure space, \(A_n \in \mathcal{B}\), and set

\[
\{A_n \text{ i.o.}\} = \{\omega \in \Omega : \omega \in A_n \text{ for infinitely many n’s}\} = \bigcap_{N=1}^{\infty} \bigcup_{n \geq N} A_n.
\]

If \(\sum_{n=1}^{\infty} \mu(A_n) < \infty\) then \(\mu(\{A_n \text{ i.o.}\}) = 0\).

**Proof.** (First Proof.) Let us first observe that

\[
\{A_n \text{ i.o.}\} = \left\{ \omega : \sum_{n=1}^{\infty} 1_{A_n}(\omega) = \infty \right\}.
\]

Hence if \(\sum_{n=1}^{\infty} \mu(A_n) < \infty\) then

\[
\infty > \sum_{n=1}^{\infty} \mu(A_n) = \sum_{n=1}^{\infty} \int_{\Omega} 1_{A_n} \, d\mu = \int_{\Omega} \sum_{n=1}^{\infty} 1_{A_n} \, d\mu
\]

implies that \(\sum_{n=1}^{\infty} 1_{A_n}(\omega) < \infty\) for \(\mu\) a.e. \(\omega\). That is to say \(\mu(\{A_n \text{ i.o.}\}) = 0\).

(Second Proof.) Of course we may give a strictly measure theoretic proof of this fact:

\[
\mu(\{A_n \text{ i.o.}\}) = \lim_{N \to \infty} \mu \left( \bigcup_{n \geq N} A_n \right) \\
\leq \lim_{N \to \infty} \sum_{n \geq N} \mu(A_n)
\]

and the last limit is zero since \(\sum_{n=1}^{\infty} \mu(A_n) < \infty\). \(\blacksquare\)

Example 10.15. Suppose that \((\Omega, \mathcal{B}, P)\) is a probability space (i.e. \(P(\Omega) = 1\)) and \(X_n : \Omega \to [0, 1]\) are Bernoulli random variables with \(P(X_n = 1) = p_n\) and \(P(X_n = 0) = 1 - p_n\). If \(\sum_{n=1}^{\infty} p_n < \infty\), then \(P(X_n = 1 \text{ i.o.}) = 0\) and hence \(P(X_n = 0 \text{ a.a.}) = 1\). In particular, \(P(\lim_{n \to \infty} X_n = 0) = 1\).

10.2 Integrals of Complex Valued Functions

Definition 10.16. A measurable function \(f : \Omega \to \overline{\mathbb{R}}\) is **integrable** if \(f_+ := f \mathbb{I}_{\{f \geq 0\}}\) and \(f_- := -f \mathbb{I}_{\{f \leq 0\}}\) are integrable. We write \(L^1(\mu; \overline{\mathbb{R}})\) for the space of real valued integrable functions. For \(f \in L^1(\mu; \mathbb{R})\), let

\[
\int_{\Omega} f \, d\mu = \int_{\Omega} f_+ \, d\mu - \int_{\Omega} f_- \, d\mu.
\]

To shorten notation in this chapter we may simply write \(\int f \, d\mu\) or even \(\int f\) for \(\int_{\Omega} f \, d\mu\).

**Convention:** If \(f, g : \Omega \to \overline{\mathbb{R}}\) are two measurable functions, let \(f + g\) denote the collection of measurable functions \(h : \Omega \to \overline{\mathbb{R}}\) such that \(h(\omega) = f(\omega) + g(\omega)\) whenever \(f(\omega) + g(\omega)\) is well defined, i.e. is not of the form \(-\infty - \infty\) or \(-\infty + \infty\). We use a similar convention for \(f - g\). Notice that if \(f, g \in L^1(\mu; \mathbb{R})\) and \(h_1, h_2 \in f + g\), then \(h_1 = h_2\) a.e. because \(|f| < \infty\) and \(|g| < \infty\) a.e.

Notation 10.17 (Abuse of notation) We will sometimes denote the integral \(\int_{\Omega} f \, d\mu\) by \(\mu(f)\). With this notation we have \(\mu(A) = \mu(1_A)\) for all \(A \in \mathcal{B}\).

Remark 10.18. Since

\[
|f| = f_+ + f_-,
\]

a measurable function \(f\) is **integrable** if \(|f| \, d\mu < \infty\). Hence

\[
L^1(\mu; \mathbb{R}) := \left\{ f : \Omega \to \overline{\mathbb{R}} : f \text{ is measurable and } \int_{\Omega} |f| \, d\mu < \infty \right\}.
\]

If \(f, g \in L^1(\mu; \mathbb{R})\) and \(f = g\) a.e. then \(f_\pm = g_\pm\) a.e. and so it follows from Proposition 10.10 that \(\int f \, d\mu = \int g \, d\mu\). In particular if \(f, g \in L^1(\mu; \mathbb{R})\) we may define

\[
\int_{\Omega} (f + g) \, d\mu = \int_{\Omega} h \, d\mu
\]

where \(h\) is any element of \(f + g\).

Proposition 10.19. The map

\[
f \in L^1(\mu; \mathbb{R}) \rightarrow \int_{\Omega} f \, d\mu \in \mathbb{R}
\]

is linear and has the monotonicity property: \(\int f \, d\mu \leq \int g \, d\mu\) for all \(f, g \in L^1(\mu; \mathbb{R})\) such that \(f \leq g\) a.e.

**Proof.** Let \(f, g \in L^1(\mu; \mathbb{R})\) and \(a, b \in \mathbb{R}\). By modifying \(f\) and \(g\) on a null set, we may assume that \(f, g\) are real valued functions. We have \(af + bg \in L^1(\mu; \mathbb{R})\) because

\[
|af + bg| \leq |a| |f| + |b| |g| \in L^1(\mu; \mathbb{R})\) .
\]

If \(a < 0\), then

\[
(af)_+ = -af_- \text{ and } (af)_- = -af_+
\]

so that
\[ \int af = -a \int f_- + a \int f_+ = a(\int f_+ - \int f_-) = a \int f. \]

A similar calculation works for \( a > 0 \) and the case \( a = 0 \) is trivial so we have shown that
\[ \int af = a \int f. \]

Now set \( h = f + g \). Since \( h = h_+ - h_- \),
\[ h_+ - h_- = f_+ - f_- + g_+ - g_- \]
or
\[ h_+ + f_- + g_- = h_- + f_+ + g_+. \]

Therefore,
\[ \int h_+ + \int f_- + \int g_- = \int h_- + \int f_+ + \int g_+ \]
and hence
\[ \int h = \int h_+ - \int h_- = \int f_+ + \int g_- - \int f_- - \int g_- = \int f + \int g. \]

Finally if \( f_+ - f_- = f \leq g = g_+ - g_- \) then \( f_+ + g_- \leq g_+ + f_- \) which implies that
\[ \int f_+ + \int g_- \leq \int g_+ + \int f_- \]
or equivalently that
\[ \int f = \int f_+ - \int f_- \leq \int g_+ - \int g_- = \int g. \]

The monotonicity property is also a consequence of the linearity of the integral, the fact that \( f \leq g \) a.e. implies \( 0 \leq g - f \) a.e. and Proposition 10.10.

**Definition 10.20.** A measurable function \( f : \Omega \to \mathbb{C} \) is **integrable** if \( \int_{\Omega} |f| \, d\mu < \infty \). Analogously to the real case, let
\[ L^1(\mu; \mathbb{C}) := \left\{ f : \Omega \to \mathbb{C} : f \text{ is measurable and } \int_{\Omega} |f| \, d\mu < \infty \right\}. \]
denote the complex valued integrable functions. Because, \( \max(|\text{Re} f|, |\text{Im} f|) \leq |f| \leq \sqrt{2} \max(|\text{Re} f|, |\text{Im} f|) \), \( \int |f| \, d\mu < \infty \) iff
\[ \int |\text{Re} f| \, d\mu + \int |\text{Im} f| \, d\mu < \infty. \]

For \( f \in L^1(\mu; \mathbb{C}) \) define
\[ \int f \, d\mu = \int \text{Re} f \, d\mu + i \int \text{Im} f \, d\mu. \]

It is routine to show the integral is still linear on \( L^1(\mu; \mathbb{C}) \) (prove!). In the remainder of this section, let \( L^1(\mu) \) be either \( L^1(\mu; \mathbb{C}) \) or \( L^1(\mu; \mathbb{R}) \). If \( A \in \mathcal{B} \) and \( f \in L^1(\mu; \mathbb{C}) \) or \( f : \Omega \to [0, \infty] \) is a measurable function, let
\[ \int_A f \, d\mu := \int_{\Omega} 1_A f \, d\mu. \]

**Proposition 10.21.** Suppose that \( f \in L^1(\mu; \mathbb{C}) \), then
\[ \left| \int_{\Omega} f \, d\mu \right| \leq \int_{\Omega} |f| \, d\mu. \quad (10.6) \]

*Proof.* Start by writing \( \int_{\Omega} f \, d\mu = \text{Re} \int_{\Omega} e^{i\theta} f \, d\mu \) with \( R \geq 0 \). We may assume that \( R = \left| \int_{\Omega} f \, d\mu \right| > 0 \) since otherwise there is nothing to prove. Since
\[ R = e^{-i\theta} \int_{\Omega} f \, d\mu = \int_{\Omega} e^{-i\theta} f \, d\mu = \int_{\Omega} \text{Re} (e^{-i\theta} f) \, d\mu + i \int_{\Omega} \text{Im} (e^{-i\theta} f) \, d\mu, \]

it must be that \( \int_{\Omega} \text{Im} [e^{-i\theta} f] \, d\mu = 0 \). Using the monotonicity in Proposition 10.10
\[ \left| \int_{\Omega} f \, d\mu \right| = \int_{\Omega} \text{Re} (e^{-i\theta} f) \, d\mu \leq \int_{\Omega} |\text{Re} (e^{-i\theta} f)| \, d\mu \leq \int_{\Omega} |f| \, d\mu. \]

**Proposition 10.22.** Let \( f, g \in L^1(\mu) \), then

1. The set \( \{ f \neq 0 \} \) is \( \sigma \)-finite, in fact \( \{ |f| \geq \frac{1}{n} \} \) \( \uparrow \{ f \neq 0 \} \) and \( \mu(|f| \geq \frac{1}{n}) < \infty \) for all \( n \).

2. The following are equivalent
   a) \( \int f = \int g \) for all \( E \in \mathcal{B} \)
   b) \( \int f = \int g = 0 \)
   c) \( f = g \) a.e.

*Proof.* 1. By Chebyshev’s inequality, Lemma 10.3
\[ \mu(|f| \geq \frac{1}{n}) \leq n \int_{\Omega} |f| \, d\mu < \infty \]
for all \( n \).

2. (a) \( \implies \) (c) Notice that
\[ \int f = \int g \iff \int f - g = 0 \]
for all $E \in \mathcal{B}$. Taking $E = \{\text{Re}(f - g) > 0\}$ and using $1_E \text{Re}(f - g) \geq 0$, we learn that

$$0 = \text{Re} \int_E (f - g) d\mu = \int 1_E \text{Re}(f - g) \implies 1_E \text{Re}(f - g) = 0 \text{ a.e.}$$

This implies that $1_E = 0 \text{ a.e.}$ which happens iff

$$\mu(\{\text{Re}(f - g) > 0\}) = \mu(E) = 0.$$  

Similar $\mu(\text{Re}(f - g) < 0) = 0$ so that $\text{Re}(f - g) = 0 \text{ a.e.}$ Similarly, $\text{Im}(f - g) = 0 \text{ a.e.}$ and hence $f - g = 0 \text{ a.e.}$, i.e. $f = g \text{ a.e.}$

(c) $\implies$ (b) is clear and so is (b) $\implies$ (a) since

$$\left| \int_E f - \int_E g \right| \leq \int |f - g| = 0.$$  

\textbf{Lemma 10.23 (Integral Comparison I).} Suppose that $h \in L^1(\mu)$ satisfies

$$\int_A h d\mu \geq 0 \text{ for all } A \in \mathcal{B},$$

then $h \geq 0 \text{ a.e.}$

\textbf{Proof.} Since by assumption,

$$0 = \text{Im} \int_A h d\mu = \int_A \text{Im} h d\mu \text{ for all } A \in \mathcal{B},$$

we may apply Proposition 10.23 to conclude that $\text{Im} h = 0 \text{ a.e.}$ Thus we may now assume that $h$ is real valued. Taking $A = \{h < 0\}$ in Eq. (10.7) implies

$$\int_A 1_A |h| d\mu = \int_A -1_A h d\mu = -\int_A h d\mu \leq 0.$$  

However $1_A |h| \geq 0$ and therefore it follows that $\int_A 1_A |h| d\mu = 0$ and so Proposition 10.23 implies $1_A |h| = 0 \text{ a.e.}$ which then implies $0 = \mu(A) = \mu(h < 0) = 0$.

\textbf{Lemma 10.24 (Integral Comparison II).} Suppose $(\Omega, \mathcal{B}, \mu)$ is a $\sigma$–finite measure space (i.e. there exists $\Omega_n \in \mathcal{B}$ such that $\Omega_n \uparrow \Omega$ and $\mu(\Omega_n) < \infty$ for all $n$) and $f, g : \Omega \to [0, \infty]$ are $\mathcal{B}$–measurable functions. Then $f \geq g \text{ a.e.}$ iff

$$\int_A f d\mu \geq \int_A g d\mu \text{ for all } A \in \mathcal{B}.$$  

(10.8)

In particular $f = g \text{ a.e.}$ iff equality holds in Eq. (10.8).

\textbf{Proof.} It was already shown in Proposition 10.10 that $f \geq g \text{ a.e.}$ implies Eq. (10.8). For the converse assertion, let $B_n := \{f \leq n1_{\Omega_n}\}$. Then from Eq. (10.8),

$$\infty > n\mu(\Omega_n) \geq \int f 1_{B_n} d\mu \geq \int g 1_{B_n} d\mu$$

from which it follows that both $f 1_{B_n}$ and $g 1_{B_n}$ are in $L^1(\mu)$ and hence $h := f 1_{B_n} - g 1_{B_n} \in L^1(\mu)$. Using Eq. (10.8) again we know that

$$\int_A h = \int f 1_{B_n \cap A} - \int g 1_{B_n \cap A} \geq 0 \text{ for all } A \in \mathcal{B}.$$  

An application of Lemma 10.23 implies $h \geq 0 \text{ a.e.}$, i.e. $f 1_{B_n} \geq g 1_{B_n} \text{ a.e.}$ Since $B_n \uparrow \{f < \infty\}$, we may conclude that

$$f 1_{\{f < \infty\}} = \lim_{n \to \infty} f 1_{B_n} \geq \lim_{n \to \infty} g 1_{B_n} = g 1_{\{f < \infty\}} \text{ a.e.}$$

Since $f \geq g$ whenever $f = \infty$, we have shown $f \geq g \text{ a.e.}$

If equality holds in Eq. (10.8), then we know that $g \leq f$ and $f \leq g \text{ a.e.}$, i.e. $f = g \text{ a.e.}$

Notice that we cannot drop the $\sigma$–finiteness assumption in Lemma 10.24.

For example, let $\mu$ be the measure on $\mathcal{B}$ such that $\mu(A) = \infty$ when $A \neq \emptyset$, $g = 3$, and $f = 2$. Then equality holds (both sides are infinite unless $A = \emptyset$ when they are both zero) in Eq. (10.8).

\textbf{Definition 10.25.} Let $(\Omega, \mathcal{B}, \mu)$ be a measure space and $L^1(\mu) = L^1(\Omega, \mathcal{B}, \mu)$ denote the set of $L^1(\mu)$ functions modulo the equivalence relation; $f \sim g$ iff $f = g \text{ a.e.}$ We make this into a normed space using the norm

$$\|f - g\|_{L^1} = \int |f - g| d\mu$$

and into a metric space using $\rho_1(f, g) = \|f - g\|_{L^1}$.

\textbf{Warning:} in the future we will often not make much of a distinction between $L^1(\mu)$ and $L^1(\mu)$. On occasion this can be dangerous and this danger will be pointed out when necessary.

\textbf{Remark 10.26.} More generally we may define $L^p(\mu) = L^p(\Omega, \mathcal{B}, \mu)$ for $p \in [1, \infty)$ as the set of measurable functions $f$ such that

$$\int \|f\|^p \, d\mu < \infty$$

modulo the equivalence relation; $f \sim g$ iff $f = g \text{ a.e.}$
We will see in later that
\[ \|f\|_{L^p} = \left( \int |f|^p \, d\mu \right)^{1/p} \]
for \( f \in L^p(\mu) \), is a norm and \( (L^p(\mu), \|\cdot\|_{L^p}) \) is a Banach space in this norm and in particular,
\[ \|f + g\|_p \leq \|f\|_p + \|g\|_p \]
for all \( f, g \in L^p(\mu) \).

**Theorem 10.27 (Dominated Convergence Theorem).** Suppose \( f_n, g_n, g \in L^1(\mu) \), \( f_n \to f \) a.e. and \( |f_n| \leq g_n \in L^1(\mu) \), \( g_n \to g \) a.e. and \( \int \Omega g_n \, d\mu \to \int \Omega g \, d\mu \). Then \( f \in L^1(\mu) \) and
\[ \int \Omega f \, d\mu = \lim_{h \to \infty} \int \Omega f_n \, d\mu. \]
(In most typical applications of this theorem \( g_n = g \in L^1(\mu) \) for all \( n \).)

**Proof.** Notice that \( |f| = \lim_{n \to \infty} |f_n| \leq \lim_{n \to \infty} |g_n| \leq g \) a.e. so that \( f \in L^1(\mu) \). By considering the real and imaginary parts of \( f \) separately, it suffices to prove the theorem in the case where \( f \) is real. By Fatou’s Lemma,
\[ \int \Omega (g + f) \, d\mu = \int \Omega \liminf_{n \to \infty} (g_n + f_n) \, d\mu \leq \liminf_{n \to \infty} \int \Omega (g_n + f_n) \, d\mu \]
\[ = \lim_{n \to \infty} \int \Omega g_n \, d\mu + \liminf_{n \to \infty} \left( \pm \int \Omega f_n \, d\mu \right) \]
\[ = \int \Omega g \, d\mu + \liminf_{n \to \infty} \left( \pm \int \Omega f_n \, d\mu \right) \]
Since \( \liminf_{n \to \infty} (-a_n) = -\limsup_{n \to \infty} a_n \), we have shown,
\[ \int \Omega g \, d\mu \pm \int \Omega f \, d\mu \leq \int \Omega g \, d\mu + \left\{ \liminf_{n \to \infty} \int \Omega f_n \, d\mu \right\} - \limsup_{n \to \infty} \int \Omega f_n \, d\mu \]
and therefore
\[ \limsup_{n \to \infty} \int \Omega f_n \, d\mu \leq \int \Omega f \, d\mu \leq \liminf_{n \to \infty} \int \Omega f_n \, d\mu. \]
This shows that \( \lim_{n \to \infty} \int \Omega f_n \, d\mu \) exists and is equal to \( \int \Omega f \, d\mu \).

**Exercise 10.2.** Give another proof of Proposition 10.21 by first proving Eq. 10.6 with \( f \) being a simple function in which case the triangle inequality for complex numbers will do the work. Then use the approximation Theorem 9.39 along with the dominated convergence Theorem 10.27 to handle the general case.

**Corollary 10.28.** Let \( \{f_n\}_{n=1}^{\infty} \subset L^1(\mu) \) be a sequence such that \( \sum_{n=1}^{\infty} \|f_n\|_{L^1(\mu)} < \infty \), then \( \sum_{n=1}^{\infty} f_n \) is convergent a.e. and
\[ \int \Omega \left( \sum_{n=1}^{\infty} f_n \right) \, d\mu = \sum_{n=1}^{\infty} \int \Omega f_n \, d\mu. \]

**Proof.** The condition \( \sum_{n=1}^{\infty} \|f_n\|_{L^1(\mu)} < \infty \) is equivalent to \( \sum_{n=1}^{\infty} |f_n| \in L^1(\mu) \). Hence \( \sum_{n=1}^{\infty} f_n \) is almost everywhere convergent and if \( S_N := \sum_{n=1}^{N} f_n \), then
\[ |S_N| \leq \sum_{n=1}^{N} |f_n| \leq \sum_{n=1}^{\infty} |f_n| \in L^1(\mu). \]

So by the dominated convergence theorem,
\[ \int \Omega \left( \sum_{n=1}^{\infty} f_n \right) \, d\mu = \sum_{n=1}^{\infty} \int \Omega \lim_{N \to \infty} S_N \, d\mu = \lim_{N \to \infty} \int \Omega S_N \, d\mu \]
\[ = \lim_{N \to \infty} \sum_{n=1}^{N} \int \Omega f_n \, d\mu = \sum_{n=1}^{\infty} \int \Omega f_n \, d\mu. \]

**Example 10.29 (Sums as integrals).** Suppose, \( \Omega = \mathbb{N}, B := 2^\mathbb{N}, \mu \) is counting measure on \( B \) (see Example 10.8), and \( f : \mathbb{N} \to \mathbb{C} \) is a function. From Example 10.8 we have \( f \in L^1(\mu) \) iff \( \sum_{n=1}^{\infty} |f(n)| < \infty \), i.e. iff the sum, \( \sum_{n=1}^{\infty} f(n) \) is absolutely convergent. Moreover, if \( f \in L^1(\mu) \) we may again write
\[ f = \sum_{n=1}^{\infty} f(n) 1_{\{n\}} \]
and then use Corollary 10.28 to conclude that
\[ \int_{\mathbb{N}} f \, d\mu = \sum_{n=1}^{\infty} \int_{\{n\}} f(n) \, d\mu \]
\[ = \sum_{n=1}^{\infty} \sum_{m=1}^{\infty} f(m) \mu(\{m\}) = \sum_{n=1}^{\infty} f(n). \]

So again the integral relative to counting measure is simply the infinite sum provided the sum is absolutely convergent.

However if \( f(n) = (-1)^n \frac{1}{n} \), then
\[ \sum_{n=1}^{\infty} f(n) := \lim_{N \to \infty} \sum_{n=1}^{N} f(n) \]
is perfectly well defined while \( \int_{\mathbb{N}} f \, d\mu \) is not. In fact in this case we have,
\[
\int_{\mathbb{N}} f \, d\mu = \infty.
\]

The point is that when we write \(\sum_{n=1}^{\infty} f(n)\) the ordering of the terms in the sum may matter. On the other hand, \(\int_{\mathbb{N}} f \, d\mu\) knows nothing about the integer ordering.

The following corollary will be routinely be used in the sequel – often without explicit mention.

**Corollary 10.30 (Differentiation Under the Integral).** Suppose that \(J \subset \mathbb{R}\) is an open interval and \(f : J \times \Omega \to \mathbb{C}\) is a function such that

1. \(\omega \mapsto f(t, \omega)\) is measurable for each \(t \in J\).
2. \(f(t, \cdot) \in L^1(\mu)\) for some \(t_0 \in J\).
3. \(\frac{\partial f}{\partial t}(t, \omega)\) exists for all \((t, \omega)\).
4. There is a function \(g \in L^1(\mu)\) such that \(|\frac{\partial f}{\partial t}(t, \cdot)| \leq g\) for each \(t \in J\).

Then \(f(t, \cdot) \in L^1(\mu)\) for all \(t \in J\) (i.e. \(\int_{\Omega} |f(t, \omega)| \, d\mu(\omega) < \infty\), \(t \to \int_{\Omega} f(t, \omega) \, d\mu(\omega)\) is a differentiable function on \(J\), and

\[
\frac{d}{dt} \int_{\Omega} f(t, \omega) \, d\mu(\omega) = \int_{\Omega} \frac{\partial f}{\partial t}(t, \omega) \, d\mu(\omega).
\]

**Proof.** By considering the real and imaginary parts of \(f\) separately, we may assume that \(f\) is real. Also notice that

\[
\frac{\partial f}{\partial t}(t, \omega) = \lim_{n \to \infty} n(f(t + n^{-1}, \omega) - f(t, \omega))
\]

and therefore, for \(\omega \to \frac{\partial f}{\partial t}(t, \omega)\) is a sequential limit of measurable functions and hence is measurable for all \(t \in J\). By the mean value theorem,

\[
|f(t, \omega) - f(t_0, \omega)| \leq g(\omega) |t - t_0| \quad \text{for all } t \in J
\]

and hence

\[
|f(t, \omega)| \leq |f(t, \omega) - f(t_0, \omega)| + |f(t_0, \omega)| \leq g(\omega) |t - t_0| + |f(t_0, \omega)|.
\]

This shows \(f(t, \cdot) \in L^1(\mu)\) for all \(t \in J\). Let \(G(t) := \int_{\Omega} f(t, \omega) \, d\mu(\omega)\), then

\[
\frac{G(t) - G(t_0)}{t - t_0} = \int_{\Omega} \frac{f(t, \omega) - f(t_0, \omega)}{t - t_0} \, d\mu(\omega).
\]

By assumption,

\[
\lim_{t \to t_0} \frac{f(t, \omega) - f(t_0, \omega)}{t - t_0} = \frac{\partial f}{\partial t}(t, \omega)
\]

for all \(\omega \in \Omega\) and by Eq. (10.9),

\[
\left|\frac{f(t, \omega) - f(t_0, \omega)}{t - t_0}\right| \leq g(\omega) \quad \text{for all } t \in J \text{ and } \omega \in \Omega.
\]

Therefore, we may apply the dominated convergence theorem to conclude

\[
\lim_{n \to \infty} \frac{G(t_n) - G(t_0)}{t_n - t_0} = \lim_{n \to \infty} \int_{\Omega} \frac{f(t_n, \omega) - f(t_0, \omega)}{t_n - t_0} \, d\mu(\omega)
\]

\[
= \int_{\Omega} \lim_{n \to \infty} \frac{f(t_n, \omega) - f(t_0, \omega)}{t_n - t_0} \, d\mu(\omega)
\]

\[
= \int_{\Omega} \frac{\partial f}{\partial t}(t_0, \omega) \, d\mu(\omega)
\]

for all sequences \(t_n \in J \setminus \{t_0\}\) such that \(t_n \to t_0\). Therefore, \(\dot{G}(t_0) = \lim_{t \to t_0} \frac{G(t) - G(t_0)}{t - t_0}\) exists and

\[
\dot{G}(t_0) = \int_{\Omega} \frac{\partial f}{\partial t}(t_0, \omega) \, d\mu(\omega).
\]

**Corollary 10.31.** Suppose that \(\{a_n\}_{n=0}^{\infty} \subset \mathbb{C}\) is a sequence of complex numbers such that series

\[
f(z) := \sum_{n=0}^{\infty} a_n (z - z_0)^n
\]

is convergent for \(|z - z_0| < R\), where \(R\) is some positive number. Then \(f : D(z_0, R) \to \mathbb{C}\) is complex differentiable on \(D(z_0, R)\) and

\[
f'(z) = \sum_{n=0}^{\infty} na_n (z - z_0)^{n-1} = \sum_{n=1}^{\infty} na_n (z - z_0)^{n-1}.
\]

By induction it follows that \(f^{(k)}\) exists for all \(k\) and that

\[
f^{(k)}(z) = \sum_{n=0}^{\infty} n(n-1) \ldots (n - k + 1) a_n (z - z_0)^{n-1}.
\]

**Proof.** Let \(\rho < R\) be given and choose \(r \in (\rho, R)\). Since \(z = z_0 + r \in D(z_0, R)\), by assumption the series \(\sum_{n=0}^{\infty} a_n r^n\) is convergent and in particular
In particular,

\[ |g'(z, n)| = |an(z - z_0)|^{n-1} \leq n |an| \rho^{n-1} \]

and the function \( G(n) := \frac{\lambda}{r} \left( \frac{s}{r} \right)^{n-1} \) is summable (by the Ratio test for example), we may use \( G \) as our dominating function. It then follows from Corollary \[ \ref{10.30} \] that

\[ f(z) = \int_X g(z, n) \mu(n) = \sum_{n=0}^{\infty} a_n(z - z_0)^n \]

is complex differentiable with the differential given as in Eq. \[ \ref{10.10} \].

**Definition 10.32 (Moment Generating Function).** Let \((\Omega, B, P)\) be a probability space and \( X : \Omega \rightarrow \mathbb{R} \) a random variable. The moment generating function of \( X \) is \( M_X : [0, \infty) \) defined by

\[ M_X(t) := \mathbb{E}[e^{tX}]. \]

**Proposition 10.33.** Suppose there exists \( \varepsilon > 0 \) such that \( \mathbb{E}[e^{\varepsilon|X|}] < \infty \), then \( M_X(t) \) is a smooth function of \( t \in (-\varepsilon, \varepsilon) \) and

\[ M_X(t) = \sum_{n=0}^{\infty} \frac{t^n}{n!} \mathbb{E}X^n \text{ if } |t| \leq \varepsilon. \]  
(10.11)

In particular,

\[ \mathbb{E}X^n = \left( \frac{d}{dt} \right)^n |t=0| M_X(t) \text{ for all } n \in \mathbb{N}_0. \]  
(10.12)

**Proof.** If \( |t| \leq \varepsilon \), then

\[ \mathbb{E}\left[ \sum_{n=0}^{\infty} \frac{|t|^n}{n!} |X|^n \right] \leq \mathbb{E}\left[ \sum_{n=0}^{\infty} \frac{\varepsilon^n}{n!} |X|^n \right] = \mathbb{E}[e^{\varepsilon|X|}] < \infty. \]

It follows from Corollary \[ \ref{10.28} \] that, for \( |t| \leq \varepsilon \),

\[ M_X(t) = \mathbb{E}[e^{tX}] = \sum_{n=0}^{\infty} \frac{t^n}{n!} \mathbb{E}X^n. \]

Equation \[ \ref{10.12} \] now is a consequence of Corollary \[ \ref{10.31} \].

**Exercise 10.3.** Let \( d \in \mathbb{N}, \Omega = \mathbb{N}^d, B = 2^\Omega, \mu : B \rightarrow \mathbb{N}_0 \{ \infty \} \) be a counting measure on \( \Omega \) and for \( x \in \mathbb{R}^d \) and \( \omega \in \Omega \), let \( x^\omega := x_1^\omega \ldots x_n^\omega \). Further suppose that \( f : \Omega \rightarrow \mathbb{C} \) is a function and \( r_i > 0 \) for \( 1 \leq i \leq d \) such that

\[ \sum_{\omega \in \Omega} |f(\omega)| r^\omega = \int_\Omega |f(\omega)| r^\omega d\mu(\omega) < \infty, \]

where \( r := (r_1, \ldots, r_d) \). Show;

1. There is a constant, \( C < \infty \) such that \( |f(\omega)| \leq C \) for all \( \omega \in \Omega \).
2. Let \( U := \{ x \in \mathbb{R}^d : |x| < r_1 \forall i \} \) and \( \bar{U} \) be a \( C \)-continuous function on \( U \).

Show \( \sum_{\omega \in \Omega} |f(\omega)| x^\omega < \infty \) for all \( x \in \bar{U} \) and the function, \( F : U \rightarrow \mathbb{R} \) defined by

\[ F(x) = \sum_{\omega \in \Omega} f(\omega) x^\omega \]

is \( C \)-continuous on \( U \).

3. Show, for all \( x \in U \) and \( 1 \leq i \leq d \), that

\[ \frac{\partial}{\partial x_i} F(x) = \sum_{\omega \in \Omega} \omega_i f(\omega) x^{\omega-e_i} \]

where \( e_i = (0, \ldots, 0, 1, \ldots, 0) \) is the \( i^{th} \) standard basis vector on \( \mathbb{R}^d \).

4. For any \( \alpha \in \mathbb{R} \), let \( \mathcal{P}^n := \left( \frac{\partial}{\partial x_1} \right)^{\alpha_1} \ldots \left( \frac{\partial}{\partial x_d} \right)^{\alpha_d} \) and \( \alpha! := \prod_{i=1}^{d} \alpha_i! \) Explain why we may now conclude that

\[ \mathcal{P}^n F(x) = \sum_{\omega \in \Omega} \alpha! f(\omega) x^{\omega-\alpha} \text{ for all } x \in U. \]  
(10.13)

5. Conclude that \( f(\alpha) = \frac{(\partial \alpha F)}{\alpha!} \) for all \( \alpha \in \Omega \).

6. If \( g : \Omega \rightarrow \mathbb{C} \) is another function such that \( \sum_{\omega \in \Omega} g(\omega) x^\omega = \sum_{\omega \in \Omega} f(\omega) x^\omega \) for \( x \) in a neighborhood of \( 0 \in \mathbb{R}^d \), then \( g(\omega) = f(\omega) \) for all \( \omega \in \Omega \).

### 10.2.1 Square Integrable Random Variables and Correlations

Suppose that \((\Omega, B, P)\) is a probability space. We say that \( X : \Omega \rightarrow \mathbb{R} \) is ** integrable if \( X \in L^1(P) \) and ** square integrable if \( X \in L^2(P) \). When \( X \) is integrable we let \( a_X := \mathbb{E}X \) be the ** mean of \( X \).

Now suppose that \( X, Y : \Omega \rightarrow \mathbb{R} \) are two square integrable random variables. Since

\[ 0 \leq |X - Y|^2 = |X|^2 + |Y|^2 - 2 |X||Y|, \]

it follows that
\[ |XY| \leq \frac{1}{2} |X|^2 + \frac{1}{2} |Y|^2 \in L^1(P). \]

In particular by taking \( Y = 1 \), we learn that \( |X| \leq \frac{1}{2} (1 + |X|^2) \) which shows that every square integrable random variable is also integrable.

**Definition 10.34.** The **covariance**, \( \text{Cov}(X,Y) \), of two square integrable random variables, \( X \) and \( Y \), is defined by

\[ \text{Cov}(X,Y) = \mathbb{E}[(X - a_X)(Y - a_Y)] = \mathbb{E}[XY] - \mathbb{E}X \cdot \mathbb{E}Y \]

where \( a_X := \mathbb{E}X \) and \( a_Y := \mathbb{E}Y \). The **variance** of \( X \),

\[ \text{Var}(X) := \text{Cov}(X,X) = \mathbb{E}[X^2] - (\mathbb{E}X)^2 \quad (10.14) \]

We say that \( X \) and \( Y \) are **uncorrelated** if \( \text{Cov}(X,Y) = 0 \), i.e. \( \mathbb{E}[XY] = \mathbb{E}X \cdot \mathbb{E}Y \). More generally we say \( \{X_k\}_{k=1}^n \subset L^2(P) \) are **uncorrelated** iff \( \text{Cov}(X_i, X_j) = 0 \) for all \( i \neq j \).

It follows from Eq. (10.14) that

\[ \text{Var}(X) \leq \mathbb{E}[X^2] \quad \text{for all } X \in L^2(P). \quad (10.15) \]

**Lemma 10.35.** The covariance function, \( \text{Cov}(X,Y) \) is bilinear in \( X \) and \( Y \) and \( \text{Cov}(X,Y) = 0 \) if either \( X \) or \( Y \) is constant. For any constant \( k \), \( \text{Var}(X+k) = \text{Var}(X) \) and \( \text{Var}(kX) = k^2 \text{Var}(X) \). If \( \{X_k\}_{k=1}^n \) are uncorrelated \( L^2(P) \) random variables, then

\[ \text{Var}(S_n) = \sum_{k=1}^n \text{Var}(X_k). \]

**Proof.** We leave most of this simple proof to the reader. As an example of the type of argument involved, let us prove \( \text{Var}(X+k) = \text{Var}(X) \);

\[ \text{Var}(X+k) = \text{Cov}(X+k, X+k) = \text{Cov}(X+k, X) + \text{Cov}(X+k, k) \]
\[ = \text{Cov}(X+k, X) = \text{Cov}(X, X) + \text{Cov}(k, k) \]
\[ = \text{Cov}(X, X) = \text{Var}(X), \]

wherein we have used the bilinearity of \( \text{Cov}(\cdot, \cdot) \) and the property that \( \text{Cov}(Y, k) = 0 \) whenever \( k \) is a constant.

**Exercise 10.4 (A Weak Law of Large Numbers).** Assume \( \{X_n\}_{n=1}^\infty \) is a sequence if uncorrelated square integrable random variables which are identically distributed, i.e. \( X_n \overset{d}{=} X_m \) for all \( m,n \in \mathbb{N} \). Let \( S_n := \sum_{k=1}^n X_k, \mu := \mathbb{E}X_k \) and \( \sigma^2 := \text{Var}(X_k) \) (these are independent of \( k \)). Show:

\[ \mathbb{E}\left[ \frac{S_n}{n} \right] = \mu, \]
\[ \mathbb{E}\left( \frac{S_n}{n} - \mu \right)^2 = \text{Var}\left( \frac{S_n}{n} \right) = \frac{\sigma^2}{n}, \text{ and} \]
\[ P\left( \left| \frac{S_n}{n} - \mu \right| > \varepsilon \right) \leq \frac{\sigma^2}{n\varepsilon^2} \]

for all \( \varepsilon > 0 \) and \( n \in \mathbb{N} \). (Compare this with Exercise 7.13.)

**10.2.2 Some Discrete Distributions**

**Definition 10.36 (Generating Function).** Suppose that \( N : \Omega \rightarrow \mathbb{N}_0 \) is an integer valued random variable on a probability space, \( (\Omega, \mathcal{B}, P) \). The generating function associated to \( N \) is defined by

\[ G_N(z) := \mathbb{E}[z^N] = \sum_{n=0}^\infty P(N = n) z^n \text{ for } |z| \leq 1. \quad (10.16) \]

By Corollary 10.31 it follows that \( P(N = n) = \frac{1}{n!} G_N^{(n)}(0) \) so that \( G_N \) can be used to completely recover the distribution of \( N \).

**Proposition 10.37 (Generating Functions).** The generating function satisfies,

\[ G_N^{(k)}(z) = \mathbb{E}[N(N-1)\ldots(N-k+1)z^{N-k}] \text{ for } |z| < 1 \]

and

\[ G_N^{(1)}(1) = \lim_{z \uparrow 1} G_N^{(k)}(z) = \mathbb{E}[N(N-1)\ldots(N-k+1)], \]

where it is possible that one or both sides of this equation are infinite. In particular, \( G'(1) := \lim_{z \uparrow 1} G'(z) = \mathbb{E}N \) and if \( \mathbb{E}N^2 < \infty \),

\[ \text{Var}(N) = G''(1) + G'(1) - [G'(1)]^2. \quad (10.17) \]

**Proof.** By Corollary 10.31 for \( |z| < 1 \),

\[ G_N^{(k)}(z) = \sum_{n=0}^\infty P(N = n) \cdot n(n-1)\ldots(n-k+1)z^{n-k} \]
\[ = \mathbb{E}[N(N-1)\ldots(N-k+1)z^{N-k}]. \quad (10.18) \]

Since, for \( z \in (0,1) \),

\[ 0 \leq N(N-1)\ldots(N-k+1)z^{N-k} \uparrow N(N-1)\ldots(N-k+1) \text{ as } z \uparrow 1, \]
we may apply the MCT to pass to the limit as \( z \uparrow 1 \) in Eq. (10.18) to find,
\[
G^{(k)}(1) = \lim_{z \uparrow 1} G^{(k)}(z) = \mathbb{E} [N(N-1) \ldots (N-k+1)].
\]

**Exercise 10.5 (Some Discrete Distributions).** Let \( p \in (0,1] \) and \( \lambda > 0 \). In the four parts below, the distribution of \( N \) will be described. You should work out the generating function, \( G_N(z) \), in each case and use it to verify the given formulas for \( \mathbb{E}N \) and \( \text{Var}(N) \).

1. Bernoulli\((p)\) : \( P(N=1) = p \) and \( P(N=0) = 1-p \). You should find \( \mathbb{E}N = p \) and \( \text{Var}(N) = p - p^2 \).
2. Binomial\((n,p)\) : \( P(N=k) = (\binom{n}{k})p^k(1-p)^{n-k} \) for \( k = 0,1,\ldots,n \). (\( P(N=k) \) is the probability of \( k \) successes in a sequence of \( n \) independent yes/no experiments with probability of success being \( p \).) You should find \( \mathbb{E}N = np \) and \( \text{Var}(N) = n(p-p^2) \).
3. Geometric\((p)\) : \( P(N=k) = p(1-p)^{k-1} \) for \( k \in \mathbb{N} \). (\( P(N=k) \) is the probability that the \( k^{th} \) trial is the first time of success out a sequence of independent trials with probability of success being \( p \).) You should find \( \mathbb{E}N = 1/p \) and \( \text{Var}(N) = 1/p^2 \).
4. Poisson\((\lambda)\) : \( P(N=k) = \frac{\lambda^k e^{-\lambda}}{k!} \) for all \( k \in \mathbb{N}_0 \). You should find \( \mathbb{E}N = \lambda = \text{Var}(N) \).

**Exercise 10.6.** Let \( S_{n,p} \) Binomial\((n,p)\), \( k \in \mathbb{N} \), \( p_n = \lambda_n/n \) where \( \lambda_n \rightarrow \lambda > 0 \) as \( n \rightarrow \infty \). Show that
\[
\lim_{n \rightarrow \infty} P(S_{n,p} = k) = \frac{\lambda^k}{k!} e^{-\lambda} = P(\text{Poisson}(\lambda) = k).
\]
Thus we see that for \( p = O(1/n) \) and \( k \) not too large relative to \( n \) that for large \( n \),
\[
P(\text{Binomial}(n,p) = k) \approx P(\text{Poisson}(pn) = k) = \frac{(pn)^k}{k!} e^{-pn}.
\]
(We will come back to the Poisson distribution and the related Poisson process later on.)

### 10.3 Integration on \( \mathbb{R} \)

**Notation 10.38** If \( m \) is Lebesgue measure on \( \mathbb{R} \), \( f \) is a non-negative Borel measurable function and \( a < b \) with \( a, b \in \mathbb{R} \), we will often write \( \int_a^b f(x) \, dx \) or \( \int_a^b f \, dm \) for \( \int_{(a,b) \cap \mathbb{R}} f \, dm \).

**Example 10.39.** Suppose \(-\infty < a < b < \infty, f \in C([a,b],\mathbb{R}) \) and \( m \) be Lebesgue measure on \( \mathbb{R} \). Given a partition,
\[
\pi = \{a = a_0 < a_1 < \cdots < a_n = b\},
\]
let
\[
\text{mesh}(\pi) := \max\{|a_j - a_{j-1}| : j = 1, \ldots, n\}
\]
and
\[
f_\pi(x) := \sum_{l=0}^{n-1} f(a_l) 1_{(a_l,a_{l+1})}(x).
\]
Then
\[
\int_a^b f_\pi \, dm = \sum_{l=0}^{n-1} f(a_l) m((a_l,a_{l+1})) = \sum_{l=0}^{n-1} f(a_l)(a_{l+1} - a_l)
\]
is a Riemann sum. Therefore if \( \{\pi_k\}_{k=1}^\infty \) is a sequence of partitions with \( \lim_{k \rightarrow \infty} \text{mesh}(\pi_k) = 0 \), we know that
\[
\lim_{k \rightarrow \infty} \int_a^b f_{\pi_k} \, dm = \int_a^b f(x) \, dx \quad (10.19)
\]
where the latter integral is the Riemann integral. Using the (uniform) continuity of \( f \) on \([a,b]\), it easily follows that \( \lim_{k \rightarrow \infty} f_{\pi_k}(x) = f(x) \) and that \( |f_{\pi_k}(x)| \leq g(x) := M1_{(a,b)}(x) \) for all \( x \in (a,b) \) where \( M := \max_{x \in [a,b]} |f(x)| < \infty \). Since \( \int_a^b g \, dm = M(b-a) < \infty \), we may apply D.C.T. to conclude,
\[
\lim_{k \rightarrow \infty} \int_a^b f_{\pi_k} \, dm = \int_a^b \lim_{k \rightarrow \infty} f_{\pi_k} \, dm = \int_a^b f \, dm.
\]
This equation with Eq. (10.19) shows
\[
\int_a^b f \, dm = \int_a^b f(x) \, dx
\]
whenever \( f \in C([a,b],\mathbb{R}) \), i.e. the Lebesgue and the Riemann integral agree on continuous functions. See Theorem 10.67 below for a more general statement along these lines.

**Theorem 10.40 (The Fundamental Theorem of Calculus).** Suppose \(-\infty < a < b < \infty, f \in C((a,b),\mathbb{R}) \cap L^1((a,b),m) \) and \( F(x) := \int_a^x f(y) \, dm(y) \). Then
1. \( F \in C((a,b),\mathbb{R}) \cap C^1((a,b),\mathbb{R}) \).
2. \( F'(x) = f(x) \) for all \( x \in (a,b) \).
If \( G \in C([a, b], \mathbb{R}) \cap C^1((a, b), \mathbb{R}) \) is an anti-derivative of \( f \) on \((a, b)\) (i.e. \( f = G'\)) then
\[
\int_a^b f(x) \, dm(x) = G(b) - G(a).
\]

**Proof.** Since \( F(x) := \int_a^x 1_{(a,x)}(y) f(y) \, dm(y) \), \( \lim_{x \to a^+} 1_{(a,x)}(y) = 1_{(a,x)}(y) \) for \( m \)-a.e. \( y \) and \( |1_{(a,x)}(y) f(y)| \leq 1_{(a,b)}(y) |f(y)| \) is an \( L^1 \)– function, it follows from the dominated convergence Theorem [10.27](#) that \( F \) is continuous on \([a, b] \). Simple manipulations show,
\[
\left| \frac{F(x + h) - F(x)}{h} - f(x) \right| = \begin{cases} 
\frac{1}{|h|} \left( \left| \frac{\int_x^{x+h} |f(y) - f(x)| \, dm(y)}{h} \right| \right) \quad & \text{if } h > 0 \\
\frac{1}{|h|} \left( \left| \frac{\int_x^{x+h} |f(y) - f(x)| \, dm(y)}{h} \right| \right) \quad & \text{if } h < 0 \\
\leq \sup \{|f(y) - f(x)| : y \in [x - |h|, x + |h|]\} \quad & \text{if } h = 0
\end{cases}
\]
and the latter expression, by the continuity of \( f \), goes to zero as \( h \to 0 \). This shows \( F' = f \) on \((a, b)\).

For the converse direction, we have by assumption that \( G'(x) = F'(x) \) for \( x \in (a, b) \). Therefore by the mean value theorem, \( F - G = C \) for some constant \( C \). Hence
\[
\int_a^b f(x) \, dm(x) = G(b) - G(a).
\]

We can use the above results to integrate some non-Riemann integrable functions:

**Example 10.41.** For all \( \lambda > 0 \),
\[
\int_0^\infty e^{-\lambda x} \, dm(x) = \frac{1}{\lambda^2} \quad \text{and} \quad \int_\mathbb{R} e^{-\lambda x} \, dx = \pi.
\]

The proof of these identities are similar. By the monotone convergence theorem, Example [10.39](#) and the fundamental theorem of calculus for Riemann integrals (or Theorem [10.40](#) below),
\[
\int_0^\infty e^{-\lambda x} \, dm(x) = \lim_{N \to \infty} \int_0^N e^{-\lambda x} \, dm(x) = \lim_{N \to \infty} \int_0^N e^{-\lambda x} \, dx = \frac{1}{\lambda^2}.
\]

and
\[
\int_\mathbb{R} e^{-x^2} \, dx = \lim_{N \to \infty} \int_{-N}^N \frac{1}{1 + x^2} \, dx = \lim_{N \to \infty} \int_{-N}^N \frac{1}{1 + x^2} \, dx = \lim_{N \to \infty} \left[ \tan^{-1}(N) - \tan^{-1}(-N) \right] = \pi.
\]

Let us also consider the functions \( x^{-p} \). Using the MCT and the fundamental theorem of calculus,
\[
\int_{(0,1]} \frac{1}{x^p} \, dm(x) = \lim_{n \to \infty} \int_0^1 \frac{1}{x^p} \, dx = \lim_{n \to \infty} \int_0^1 \frac{1}{x^p} \, dx = \lim_{n \to \infty} \frac{1}{1 - p} \ln(1/n) = \infty.
\]

**Exercise 10.7.** Show
\[
\int_1^\infty \frac{1}{x^p} \, dx = \begin{cases} 
\infty & \text{if } p \leq 1 \\
\frac{1}{p-1} & \text{if } p > 1
\end{cases}
\]

**Example 10.42 (Integration of Power Series).** Suppose \( R > 0 \) and \( \{a_n\}_{n=0}^\infty \) is a sequence of complex numbers such that \( \sum_{n=0}^\infty |a_n| r^n < \infty \) for all \( r \in (0, R) \). Then
\[
\int_\alpha^\beta \left( \sum_{n=0}^\infty a_n \, x^n \right) \, dm(x) = \sum_{n=0}^\infty a_n \int_\alpha^\beta x^n \, dm(x) = \sum_{n=0}^\infty a_n \, \frac{\beta^{n+1} - \alpha^{n+1}}{n+1}
\]
for all \( -R < \alpha < \beta < R \). Indeed this follows from Corollary [10.28](#) since
\[
\sum_{n=0}^\infty \int_\alpha^\beta |a_n| |x|^n \, dm(x) \leq \sum_{n=0}^\infty \left( \int_0^|\beta| |a_n| |x|^n \, dm(x) + \int_0^|\alpha| |a_n| |x|^n \, dm(x) \right) \leq 2r \sum_{n=0}^\infty |a_n| r^n < \infty
\]
where \( r = \max(|\beta|, |\alpha|) \).
Example 10.43. Let \( \{r_n\}_{n=1}^{\infty} \) be an enumeration of the points in \( \mathbb{Q} \cap [0,1] \) and define
\[
 f(x) = \sum_{n=1}^{\infty} 2^{-n} \frac{1}{\sqrt{|x-r_n|}}
\]
with the convention that
\[
 \frac{1}{\sqrt{|x-r_n|}} = 5 \text{ if } x = r_n.
\]

Since, By Theorem 10.40, we find
\[
 \int_0^1 \frac{1}{\sqrt{|x-r_n|}} \, dx = \int_0^1 \frac{1}{\sqrt{x-r_n}} \, dx + \int_r^x \frac{1}{\sqrt{r_n-x}} \, dx
\]
\[
 = 2\sqrt{x-r_n} - 2\sqrt{r_n-x} + 2(\sqrt{r_n-r} - \sqrt{r_n})
\]
\[
 \leq 4,
\]
we find
\[
 \int_{[0,1]} f(x) \, dm(x) = \sum_{n=1}^{\infty} 2^{-n} \int_{[0,1]} \frac{1}{\sqrt{|x-r_n|}} \, dx \leq \sum_{n=1}^{\infty} 2^{-n} 4 = 4 < \infty.
\]

In particular, \( m(f = \infty) = 0 \), i.e. that \( f < \infty \) for almost every \( x \in [0,1] \) and this implies that
\[
 \sum_{n=1}^{\infty} 2^{-n} \frac{1}{\sqrt{|x-r_n|}} < \infty \text{ for a.e. } x \in [0,1].
\]

This result is somewhat surprising since the singularities of the summands form a dense subset of \([0,1]\).

Example 10.44. The following limit holds,
\[
 \lim_{n \to \infty} \int_0^n \left(1 - \frac{x}{n}\right)^n \, dm(x) = 1. \tag{10.20}
\]

**DCT Proof.** To verify this, let \( f_n(x) := \left(1 - \frac{x}{n}\right)^n \chi_{[0,n]}(x) \). Then
\[
 \lim_{n \to \infty} f_n(x) = e^{-x} \text{ for all } x \geq 0.
\]
Moreover by simple calculus\footnote{Since \( y = 1 - x \) is the tangent line to \( y = e^{-x} \) at \( x = 0 \) and \( e^{-x} \) is convex up, it follows that \( 1 - x \leq e^{-x} \) for all \( x \in \mathbb{R} \).},
\[
 1 - x \leq e^{-x} \text{ for all } x \in \mathbb{R}.
\]
Therefore, for \( x < n \), we have
\[
 0 \leq 1 - \frac{x}{n} \leq e^{-x/n} \implies \left(1 - \frac{x}{n}\right)^n \leq e^{-x/n}
\]
from which it follows that
\[
 0 \leq f_n(x) \leq e^{-x} \text{ for all } x \geq 0.
\]

From Example 10.41 we know
\[
 \int_0^\infty e^{-x} \, dm(x) = 1 < \infty,
\]
so that \( e^{-x} \) is an integrable function on \([0,\infty)\). Hence by the dominated convergence theorem,
\[
 \lim_{n \to \infty} \int_0^n \left(1 - \frac{x}{n}\right)^n \, dm(x) = \lim_{n \to \infty} \int_0^\infty f_n(x) \, dm(x)
\]
\[
 = \int_0^\infty \lim_{n \to \infty} f_n(x) \, dm(x) = \int_0^\infty e^{-x} \, dm(x) = 1.
\]

**MCT Proof.** The limit in Eq. (10.20) may also be computed using the monotone convergence theorem. To do this we must show that \( n \to f_n(x) \) is increasing in \( n \) for each \( x \) and for this it suffices to consider \( n > x \). But for \( n > x \),
\[
 \frac{d}{dn} \ln f_n(x) = \frac{d}{dn} \left[ n \ln \left(1 - \frac{x}{n}\right)\right] = \ln \left(1 - \frac{x}{n}\right) + \frac{n}{1 - \frac{x}{n}} \cdot \frac{x}{n}
\]
\[
 = \ln \left(1 - \frac{x}{n}\right) + \frac{x}{1 - \frac{x}{n}} = h \left(\frac{x}{n}\right)
\]
where, for \( 0 \leq y < 1 \),
\[
 h(y) := \ln(1-y) + \frac{y}{1-y}.
\]

Since \( h(0) = 0 \) and
\[
 h'(y) = -\frac{1}{1-y} + \frac{1}{1-y} + \frac{y}{(1-y)^2} > 0
\]
it follows that \( h \geq 0 \). Thus we have shown, \( f_n(x) \uparrow e^{-x} \) as \( n \to \infty \) as claimed.

Example 10.45. Suppose that \( f_n(x) := n \chi_{[0,1]}(x) \) for \( n \in \mathbb{N} \). Then
\[
 \lim_{n \to \infty} f_n(x) = 0 \text{ for all } x \in \mathbb{R}
\]
while
\[
 \lim_{n \to \infty} \int_{\mathbb{R}} f_n(x) \, dx = \lim_{n \to \infty} 1 = 1 \neq 0 = \int_{\mathbb{R}} \lim_{n \to \infty} f_n(x) \, dx.
\]
The problem is that the best dominating function we can take is 
\[ g(x) = \sup_n f_n(x) = \sum_{n=1}^{\infty} n \cdot 1_{\left( \frac{1}{n+1}, \frac{1}{n} \right]}(x). \]
Notice that 
\[ \int g(x) \, dx = \sum_{n=1}^{\infty} n \cdot \left( \frac{1}{n} - \frac{1}{n+1} \right) = \sum_{n=1}^{\infty} \frac{1}{n+1} = \infty. \]

**Example 10.46 (Jordan’s Lemma).** In this example, let us consider the limit; 
\[ \lim_{n \to \infty} \int_0^\pi \cos \left( \frac{\theta}{n} \right) e^{-n \sin(\theta)} \, d\theta. \]
Let 
\[ f_n(\theta) := 1_{(0, \pi)}(\theta) \cos \left( \frac{\theta}{n} \right) e^{-n \sin(\theta)}. \]
Then 
\[ |f_n| \leq 1_{(0, \pi)} \in L^1(m) \]
and 
\[ \lim_{n \to \infty} f_n(\theta) = 1_{(0, \pi)}(\theta) \, 1_{\{\pi\}}(\theta) = 1_{\{\pi\}}(\theta). \]
Therefore by the D.C.T., 
\[ \lim_{n \to \infty} \int_0^\pi \cos \left( \frac{\theta}{n} \right) e^{-n \sin(\theta)} \, d\theta = \int_\mathbb{R} 1_{\{\pi\}}(\theta) \, dm(\theta) = m(\{\pi\}) = 0. \]

**Example 10.47.** Recall from Example 10.41 that 
\[ \lambda^{-1} = \int_{[0, \infty)} e^{-\lambda x} dm(x) \]
for all \( \lambda > 0. \)
Let \( \varepsilon > 0. \) For \( \lambda \geq 2\varepsilon > 0 \) and \( n \in \mathbb{N} \) there exists \( C_n(\varepsilon) < \infty \) such that 
\[ 0 \leq \left( -\frac{d}{d\lambda} \right)^n e^{-\lambda x} = x^n e^{-\lambda x} \leq C_n(\varepsilon) e^{-\varepsilon x}. \]
Using this fact, Corollary 10.30 and induction gives 
\[ n! \lambda^{-n+1} = \left( -\frac{d}{d\lambda} \right)^n \lambda^{-1} = \int_{[0, \infty)} \left( -\frac{d}{d\lambda} \right)^n e^{-\lambda x} dm(x) \]
\[ = \int_{[0, \infty)} x^n e^{-\lambda x} dm(x). \]
That is 
\[ n! = \lambda^n \int_{[0, \infty)} x^n e^{-\lambda x} dm(x). \]

**Remark 10.48.** Corollary 10.30 may be generalized by allowing the hypothesis to hold for \( x \in X \setminus E \) where \( E \in \mathcal{B} \) is a fixed null set, i.e. \( E \) must be independent of \( t. \) Consider what happens if we formally apply Corollary 10.30 to \( g(t) := \int_0^\infty 1_{x \leq t} dm(x), \)
\[ \dot{g}(t) = \frac{d}{dt} \int_0^\infty 1_{x \leq t} dm(x) \geq \int_0^\infty \frac{d}{dt} 1_{x \leq t} dm(x). \]
The last integral is zero since \( \frac{d}{dt} 1_{x \leq t} = 0 \) unless \( t = x \) in which case it is not defined. On the other hand \( g(t) = t \) so that \( \dot{g}(t) = 1. \) (The reader should decide which hypothesis of Corollary 10.30 has been violated in this example.)

**Exercise 10.8 (Folland 2.28 on p. 60.).** Compute the following limits and justify your calculations:
1. \( \lim_{n \to \infty} \int_0^\infty \frac{\sin(\varepsilon x)}{(1+x^2)^n} \, dx. \)
2. \( \lim_{n \to \infty} \int_0^1 \frac{1+n^2 x}{(1+x^2)^n} \, dx. \)
3. \( \lim_{n \to \infty} \int_0^\infty \frac{n \sin(x/n)}{x(1+x^2)} \, dx. \)
4. For all \( a \in \mathbb{R} \) compute, 
\[ f(a) := \lim_{n \to \infty} \int_a^\infty n(1+n^2 x^2)^{-1} \, dx. \]

**Exercise 10.9 (Integration by Parts).** Suppose that \( f, g : \mathbb{R} \to \mathbb{R} \) are two continuously differentiable functions such that \( f', g, fg \) and \( fg' \) are all Lebesgue integrable functions on \( \mathbb{R}. \) Prove the following integration by parts formula;
\[ \int_\mathbb{R} f'(x) \cdot g(x) \, dx = -\int_\mathbb{R} f(x) \cdot g'(x) \, dx. \]
Similarly show that; if \( f, g : [0, \infty) \to [0, \infty) \) are continuously differentiable functions such that \( f', f'' \) and \( f'g, f'g' \) are all Lebesgue integrable functions on \([0, \infty), \)
then 
\[ \int_0^\infty f'(x) \cdot g(x) \, dx = -f(0) g(0) - \int_0^\infty f(x) \cdot g'(x) \, dx. \]

**Outline:** 1. First notice that Eq. (10.22) holds if \( f(x) = 0 \) for \( |x| \geq N \) for some \( N < \infty \) by undergraduate calculus.
2. Let \( \psi : [0, 1] \to [0, 1] \) be a continuously differentiable function such that \( \psi(x) = 1 \) if \( |x| \leq 1 \) and \( \psi(x) = 0 \) if \( |x| \geq 2. \) For any \( \varepsilon > 0 \) let \( \psi_\varepsilon(x) = \psi(\varepsilon x) \)
Write out the identity in Eq. (10.22) with \( f(x) \) being replaced by \( f(x) \psi_\varepsilon(x). \)
3. Now use the dominated convergence theorem to pass to the limit as \( \varepsilon \downarrow 0 \) in the identity you found in step 2.
4. A similar outline works to prove Eq. (10.23).
Definition 10.49 (Gamma Function). The Gamma function, $\Gamma : \mathbb{R}_+ \to \mathbb{R}_+$ is defined by

$$
\Gamma(x) := \int_0^\infty u^{x-1} e^{-u} \, du \quad (10.24)
$$

(The reader should check that $\Gamma(x) < \infty$ for all $x > 0$.)

Here are some of the more basic properties of this function.

Example 10.50 ($\Gamma$-function properties). Let $\Gamma$ be the gamma function, then;

1. $\Gamma(1) = 1$ as is easily verified.
2. $\Gamma(x+1) = x\Gamma(x)$ for all $x > 0$ as follows by integration by parts;

$$
\Gamma(x+1) = \int_0^\infty e^{-u} u^{x+1} \frac{du}{u} = \int_0^\infty u^x \left( -\frac{d}{du} e^{-u} \right) \, du
= \frac{d}{dx} \int_0^\infty e^{-u} u^x \, du \quad = x \int_0^\infty u^{x-1} e^{-u} \, du = x \Gamma(x).
$$

In particular, it follows from items 1. and 2. and induction that

$$
\Gamma(n+1) = n! \quad \text{for all } n \in \mathbb{N}. \quad (10.25)
$$

(Equation 10.25 was also proved in Eq. (10.21).)

3. $\Gamma(1/2) = \sqrt{\pi}$. This last assertion is a bit trickier. One proof is to make use of the fact (proved below in Lemma ??) that

$$
\int_{-\infty}^{\infty} e^{-a r^2} \, dr = \sqrt{\frac{\pi}{a}} \quad \text{for all } a > 0. \quad (10.26)
$$

Taking $a = 1$ and making the change of variables, $u = r^2$ below implies,

$$
\sqrt{\pi} = \int_{-\infty}^{\infty} e^{-r^2} \, dr = 2 \int_0^{\infty} u^{-1/2} e^{-u} \, du = \Gamma(1/2).
$$

$$
\Gamma(1/2) = 2 \int_0^{\infty} e^{-r^2} \, dr = \int_{-\infty}^{\infty} e^{-r^2} \, dr
= I_1(1) = \sqrt{\pi}.
$$

4. A simple induction argument using items 2. and 3. now shows that

$$
\Gamma \left( n+\frac{1}{2} \right) = \frac{(2n-1)!!}{2^n} \sqrt{\pi}
$$

where $(-1)!! := 1$ and $(2n-1)!! = (2n-1)(2n-3) \ldots 3 \cdot 1$ for $n \in \mathbb{N}$.

10.4 Densities and Change of Variables Theorems

Exercise 10.10 (Measures and Densities). Let $(X, \mathcal{M}, \mu)$ be a measure space and $\rho : X \to [0, \infty]$ be a measurable function. For $A \in \mathcal{M}$, set $\nu(A) := \int_A \rho \, d\mu$.

1. Show $\nu : \mathcal{M} \to [0, \infty]$ is a measure.
2. Let $f : X \to [0, \infty]$ be a measurable function, show

$$
\int_X f d\nu = \int_X f \rho \, d\mu. \quad (10.27)
$$

**Hint:** first prove the relationship for characteristic functions, then for simple functions, and then for general positive measurable functions.

3. Show that a measurable function $f : X \to \mathbb{C}$ is in $L^1(\nu)$ iff $|f| \rho \in L^1(\mu)$ and if $f \in L^1(\nu)$ then Eq. (10.27) still holds.

Notation 10.51 It is customary to informally describe $\nu$ defined in Exercise 10.10 by writing $d\nu = \rho \, d\mu$.

Exercise 10.11 (Abstract Change of Variables Formula). Let $(X, \mathcal{M}, \mu)$ be a measure space, $(Y, \mathcal{F}, \nu)$ be a measurable space and $f : X \to Y$ be a measurable map. Recall that $\nu = f_\ast \mu : \mathcal{F} \to [0, \infty]$ defined by $\nu(A) = \mu(f^{-1}(A))$ for all $A \in \mathcal{F}$ is a measure on $\mathcal{F}$.

1. Show

$$
\int_Y g d\nu = \int_X (g \circ f) \, d\mu \quad (10.28)
$$

for all measurable functions $g : Y \to [0, \infty]$. **Hint:** see the hint from Exercise 10.10.

2. Show a measurable function $g : Y \to \mathbb{C}$ is in $L^1(\nu)$ iff $g \circ f \in L^1(\mu)$ and that Eq. (10.28) holds for all $g \in L^1(\nu)$.

Example 10.52. Suppose $(\Omega, \mathcal{B}, P)$ is a probability space and $\{X_i\}_{i=1}^n$ are random variables on $\Omega$ with $\nu := \text{Law}_P(X_1, \ldots, X_n)$, then

$$
\mathbb{E}[g(X_1, \ldots, X_n)] = \int_{\mathbb{R}^n} g \, d\nu
$$

for all $g : \mathbb{R}^n \to \mathbb{R}$ which are Borel measurable and either bounded or non-negative. This follows directly from Exercise 10.11 with $f := (X_1, \ldots, X_n) : \Omega \to \mathbb{R}^n$ and $\mu = P$. 

Remark 10.53. As a special case of Example 10.52, suppose that $X$ is a random variable on a probability space, $(\Omega, B, P)$, and $F(x) := P(X \leq x)$. Then

$$E[f(X)] = \int_{\mathbb{R}} f(x) dF(x) \quad (10.29)$$

where $dF(x)$ is shorthand for $d\mu_F(x)$ and $\mu_F$ is the unique probability measure on $(\mathbb{R}, B_\mathbb{R})$ such that $\mu_F((−\infty, x]) = F(x)$ for all $x \in \mathbb{R}$. Moreover if $F : \mathbb{R} \to [0, 1]$ happens to be $C^1$-function, then

$$d\mu_F(x) = F'(x) \, dm(x) \quad (10.30)$$

and Eq. (10.29) may be written as

$$E[f(X)] = \int_{\mathbb{R}} f(x) F'(x) \, dm(x). \quad (10.31)$$

To verify Eq. (10.30), it suffices to observe, by the fundamental theorem of calculus, that

$$\mu_F((a, b]) = F(b) - F(a) = \int_a^b F'(x) \, dx = \int_{[a, b]} F' \, dm.$$ 

From this equation we may deduce that $\mu_F(A) = \int_A F' \, dm$ for all $A \in B_\mathbb{R}$. Equation (10.31) now follows from Exercise 10.10.

**Exercise 10.12.** Let $F : \mathbb{R} \to \mathbb{R}$ be a $C^1$-function such that $F'(x) > 0$ for all $x \in \mathbb{R}$ and $\lim_{x \to \pm\infty} F(x) = \pm\infty$. (Notice that $F$ is strictly increasing so that $F^{-1} : \mathbb{R} \to \mathbb{R}$ exists and moreover, by the inverse function theorem that $F^{-1}$ is a $C^1$ – function.) Let $m$ be Lebesgue measure on $B_\mathbb{R}$ and

$$\nu(A) = m(F(A)) = m((F^{-1})^{-1}(A)) = (F_*^{-1}m)(A)$$

for all $A \in B_\mathbb{R}$. Show $d\nu = F' \, dm$. Use this result to prove the change of variable formula,

$$\int_{\mathbb{R}} h \circ F \cdot F' \, dm = \int_{\mathbb{R}} h \, dm \quad (10.32)$$

which is valid for all Borel measurable functions $h : \mathbb{R} \to [0, \infty]$.

**Hint:** Start by showing $d\nu = F' \, dm$ on sets of the form $A = (a, b]$ with $a, b \in \mathbb{R}$ and $a < b$. Then use the uniqueness assertions in Exercise 8.11 to conclude $d\nu = F' \, dm$ on all of $B_\mathbb{R}$. To prove Eq. (10.32) apply Exercise 10.11 with $g = h \circ F$ and $f = F^{-1}$.

### 10.5 Normal (Gaussian) Random Variables

**Definition 10.54 (Normal / Gaussian Random Variables).** A random variable, $Y$, is normal with mean $\mu$ standard deviation $\sigma^2$ iff

$$P(Y \in B) = \frac{1}{\sqrt{2\pi\sigma^2}} \int_B e^{-\frac{1}{2\sigma^2}(y-\mu)^2} \, dy \text{ for all } B \in B_\mathbb{R}. \quad (10.33)$$

We will abbreviate this by writing $Y \overset{d}{=} N(\mu, \sigma^2)$. When $\mu = 0$ and $\sigma^2 = 1$ we will simply write $N$ for $N(0, 1)$ and if $Y \overset{d}{=} N$, we will say $Y$ is a standard normal random variable.

Observe that Eq. (10.33) is equivalent to writing

$$E[f(Y)] = \frac{1}{\sqrt{2\pi\sigma^2}} \int_{\mathbb{R}} f(y) e^{-\frac{1}{2\sigma^2}(y-\mu)^2} \, dy$$

for all bounded measurable functions, $f : \mathbb{R} \to \mathbb{R}$. Also observe that $Y \overset{d}{=} N(\mu, \sigma^2)$ is equivalent to $Y \overset{d}{=} \sigma N + \mu$. Indeed, by making the change of variable, $y = \sigma x + \mu$, we find

$$E[f(\sigma N + \mu)] = \frac{1}{\sqrt{2\pi\sigma^2}} \int_{\mathbb{R}} f(\sigma x + \mu) e^{-\frac{1}{2\sigma^2}x^2} \, dx$$

$$= \frac{1}{\sqrt{2\pi}} \int_{\mathbb{R}} f(y) e^{-\frac{1}{2\sigma^2}(y-\mu)^2} \, dy = \frac{1}{\sqrt{2\pi\sigma^2}} \int_{\mathbb{R}} f(y) e^{-\frac{1}{2\sigma^2}(y-\mu)^2} \, dy.$$

Lastly the constant, $(2\pi\sigma^2)^{-1/2}$ is chosen so that

$$\frac{1}{\sqrt{2\pi\sigma^2}} \int_{\mathbb{R}} e^{-\frac{1}{2\sigma^2}(y-\mu)^2} \, dy = \frac{1}{\sqrt{2\pi}} \int_{\mathbb{R}} e^{-\frac{1}{2\sigma^2}y^2} \, dy = 1,$$

see Example 10.50 and Lemma 77.

**Exercise 10.13.** Suppose that $X \overset{d}{=} N(0, 1)$ and $f : \mathbb{R} \to \mathbb{R}$ is a $C^1$ – function such that $Xf(X)$, $f'(X)$ and $f(X)$ are all integrable random variables. Show

$$E[Xf(X)] = -\frac{1}{\sqrt{2\pi}} \int_{\mathbb{R}} f(x) \frac{d}{dx} e^{-\frac{1}{2}x^2} \, dx$$

$$= \frac{1}{\sqrt{2\pi}} \int_{\mathbb{R}} f'(x) e^{-\frac{1}{2}x^2} \, dx = E[f'(X)].$$

**Example 10.55.** Suppose that $X \overset{d}{=} N(0, 1)$ and define $\alpha_k := E[X^{2k}]$ for all $k \in \mathbb{N}_0$. By Exercise 10.13.
Exercise 10.15. Suppose that $\alpha_k = (2k + 1) \alpha_k$ with $\alpha_0 = 1$.

Hence it follows that
\[
\alpha_1 = \alpha_0 = 1, \quad \alpha_2 = 3 \alpha_1 = 3, \quad \alpha_3 = 5 \cdot 3
\]
and by a simple induction argument,
\[
\mathbb{E}X^{2k} = \alpha_k = (2k - 1)!!, \quad (10.34)
\]
where $(-1)!! := 0$. Actually we can use the $\Gamma$ – function to say more. Namely for any $\beta > -1$,
\[
\mathbb{E}|X|^\beta = \frac{1}{\sqrt{2\pi}} \int_0^\infty x^\beta e^{-\frac{1}{2} x^2} dx = \sqrt{\frac{\pi}{2}} \int_0^\infty x^\beta e^{-\frac{1}{2} x^2} dx.
\]
Now make the change of variables, $y = x^2/2$ (i.e. $x = \sqrt{2y}$ and $dx = \frac{1}{\sqrt{2y}} y^{-1/2} dy$) to learn,
\[
\mathbb{E}|X|^\beta = \frac{1}{\sqrt{\pi}} \int_0^\infty (2y)^{\beta/2} e^{-y} y^{-1/2} dy
\]
\[
= \frac{1}{\sqrt{\pi}} 2^{\beta/2} \int_0^\infty y^{(\beta+1)/2} e^{-y} y^{-1/2} dy = \frac{1}{\sqrt{\pi}} 2^{\beta/2} \Gamma \left( \frac{\beta + 1}{2} \right). \quad (10.35)
\]

Exercise 10.14. Suppose that $X \overset{d}{=} N(0, 1)$ and $\lambda \in \mathbb{R}$. Show
\[
f(\lambda) := \mathbb{E} [e^{i\lambda X}] = \exp \left( -\lambda^2/2 \right). \quad (10.36)
\]

Hint: Use Corollary 10.30 to show, $f'(\lambda) = i \mathbb{E} [X e^{i\lambda X}]$ and then use Exercise 10.13 to see that $f''(\lambda)$ satisfies a simple ordinary differential equation.

Exercise 10.15. Suppose that $X \overset{d}{=} N(0, 1)$ and $t \in \mathbb{R}$. Show $\mathbb{E} [e^{t X}] = \exp (t^2/2)$. (You could follow the hint in Exercise 10.14 or you could use a completion of the squares argument along with the translation invariance of Lebesgue measure.)

Exercise 10.16. Use Exercise 10.15 and Proposition 10.33 to give another proof that $\mathbb{E}X^{2k} = (2k - 1)!!$ when $X \overset{d}{=} N(0, 1)$.

Exercise 10.17. Let $X \overset{d}{=} N(0, 1)$ and $\alpha \in \mathbb{R}$, find $\rho : \mathbb{R}^+ \to \mathbb{R}^+ := (0, \infty)$ such that
\[
\mathbb{E} \left[ f(\alpha |X|) \right] = \int_{\mathbb{R}^+} f(x) \rho(x) dx
\]
for all continuous functions, $f : \mathbb{R}^+ \to \mathbb{R}$ with compact support in $\mathbb{R}^+$.

Lemma 10.56 (Gaussian tail estimates). Suppose that $X$ is a standard normal random variable, i.e.
\[
P(X \in A) = \frac{1}{\sqrt{2\pi}} \int_A e^{-x^2/2} dx \text{ for all } A \in \mathcal{B}_{\mathbb{R}},
\]
then for all $x \geq 0$,
\[
P(X \geq x) \leq \min \left( \frac{1}{2} - \frac{x}{\sqrt{2\pi}} e^{-x^2/2}, \frac{1}{2} \frac{x}{\sqrt{2\pi}} e^{-x^2/2} \right) \leq \frac{1}{2} e^{-x^2/2}. \quad (10.37)
\]
Moreover (see [20, Lemma 2.5]),
\[
P(X \geq x) \geq \max \left( 1 - \frac{x}{\sqrt{2\pi}} e^{-x^2/2}, \frac{1}{\sqrt{2\pi}} x e^{-x^2/2} \right) \quad (10.38)
\]
which combined with Eq. (10.37) proves Mill’s ratio (see [7]);
\[
\lim_{x \to \infty} \frac{P(X \geq x)}{\frac{1}{\sqrt{2\pi}} e^{-x^2/2}} = 1. \quad (10.39)
\]

Proof. See Figure 10.1 where; the red is the plot of $P(X \geq x)$, the black is the plot of
\[
\min \left( \frac{1}{2} - \frac{x}{\sqrt{2\pi}} e^{-x^2/2}, \frac{1}{2} \frac{x}{\sqrt{2\pi}} e^{-x^2/2} \right),
\]
the red is the plot of $\frac{1}{2} e^{-x^2/2}$, and the blue is the plot of
\[
\max \left( 1 - \frac{x}{\sqrt{2\pi}} e^{-x^2/2}, \frac{1}{\sqrt{2\pi}} x e^{-x^2/2} \right).
\]
The formal proof of these estimates for the reader who is not convinced by Figure 10.1 is given below.

We begin by observing that
\[
P(X \geq x) = \frac{1}{\sqrt{2\pi}} \int_x^\infty e^{-y^2/2} dy \leq \frac{1}{\sqrt{2\pi}} \int_x^\infty \frac{y}{x} e^{-y^2/2} dy
\]
\[
\leq - \frac{1}{\sqrt{2\pi}} \frac{1}{x} e^{-x^2/2}, \quad (10.40)
\]
If we only want to prove Mill’s ratio (10.39), we could proceed as follows. Let $\alpha > 1$, then for $x > 0$,
Prove the second equality. Observe that

This equation along with Eq. (10.40) gives the first equality in Eq. (10.37). To

show \( \limsup \)

from which it follows,

\[
P(x) = \frac{1}{\sqrt{2\pi}} \int_{x}^{\infty} e^{-y^2/2} dy
\]

from which it follows,

\[
\liminf_{x \to \infty} \left[ x^{x/2} P(X \geq x) \right] \geq 1/\alpha \uparrow 1 \text{ as } \alpha \downarrow 1.
\]

The estimate in Eq. (10.40) shows \( \limsup_{x \to \infty} \left[ x^{x/2} P(X \geq x) \right] \leq 1. \)

To get more precise estimates, we begin by observing,

\[
P(x) = \frac{1}{\sqrt{2\pi}} \int_{x}^{\infty} e^{-y^2/2} dy \tag{10.41}
\]

\[
\leq \frac{1}{2} - \frac{1}{\sqrt{2\pi}} \int_{0}^{x} e^{-y^2/2} dy \leq \frac{1}{2} - \frac{1}{\sqrt{2\pi}} e^{-x^2/2} x.
\]

This equation along with Eq. (10.40) gives the first equality in Eq. (10.37). To

prove the second equality observe that \( \sqrt{2\pi} > 2, \)

so

\[
\frac{1}{\sqrt{2\pi}} x e^{-x^2/2} \leq \frac{1}{2} e^{-x^2/2} \text{ if } x \geq 1.
\]

For \( x \leq 1 \) we must show,

\[
\frac{1}{2} - \frac{x}{\sqrt{2\pi}} e^{-x^2/2} \leq \frac{1}{2} e^{-x^2/2}
\]

or equivalently that \( f(x) := e^{x^2/2} - \sqrt{\frac{2}{\pi}} x \leq 1 \) for \( 0 \leq x \leq 1. \) Since \( f \) is convex

\( \left( f''(x) = (x^2 + 1) e^{x^2/2} > 0 \right) \), \( f(0) = 1 \) and \( f(1) \equiv 0.85 < 1, \) it follows that

\( f \leq 1 \) on \([0, 1] \). This proves the second inequality in Eq. (10.37).

It follows from Eq. (10.41) that

\[
P(x) = \frac{1}{2} - \frac{1}{\sqrt{2\pi}} \int_{0}^{x} e^{-y^2/2} dy
\]

\[
\geq \frac{1}{2} - \frac{1}{\sqrt{2\pi}} \int_{0}^{x} 1 dy = \frac{1}{2} - \frac{1}{\sqrt{2\pi}} x \text{ for all } x \geq 0.
\]

So to finish the proof of Eq. (10.38) we must show,

\[
f(x) := \frac{1}{\sqrt{2\pi}} x e^{-x^2/2} - (1 + x^2) P(X \geq x)
\]

\[
= \frac{1}{\sqrt{2\pi}} \left[ x e^{-x^2/2} - (1 + x^2) \int_{x}^{\infty} e^{-y^2/2} dy \right] \leq 0 \text{ for all } 0 \leq x < \infty.
\]

This follows by observing that \( f(0) = -1/2 < 0, \lim_{x \to \infty} f(x) = 0 \) and

\[
f'(x) = \frac{1}{\sqrt{2\pi}} \left[ e^{-x^2/2} (1 - x^2) - 2x P(X \geq x) + (1 + x^2) e^{-x^2/2} \right]
\]

\[
= 2 \left( \frac{1}{\sqrt{2\pi}} e^{-x^2/2} - x P(X \geq y) \right) \geq 0,
\]

where the last inequality is a consequence Eq. (10.37).

\[ \blacksquare \]

10.6 Stirling’s Formula

On occasion one is faced with estimating an integral of the form, \( \int f(x) e^{-\frac{1}{2}x^2} dx \),

where \( J = (a, b) \subset \mathbb{R} \) and \( G(t) \) is a \( C^1 \) function with a unique (for simplicity)

global minimum at some point \( t_0 \in J. \) The idea is that the majority contribution

of the integral will often come from some neighborhood, \((t_0 - \alpha, t_0 + \alpha), \)

of \( t_0. \) Moreover, it may happen that \( G(t) \) can be well approximated on this

neighborhood by its Taylor expansion to order 2;

\[
G(t) \approx G(t_0) + \frac{1}{2} \dot{G}(t_0) (t - t_0)^2.
\]

Notice that the linear term is zero since \( t_0 \) is a minimum and therefore \( \dot{G}(t_0) = 0. \) We will further assume that \( \dot{G}(t_0) \neq 0 \) and hence \( \ddot{G}(t_0) > 0. \) Under these hypothesis we will have,
In particular, if \( \alpha \), satisfies Stirling’s formula, The Gamma function (see Definition Theorem 10.57 (Stirling’s formula). The proof of the next theorem (Stirling’s formula for the Gamma function) will give Stirling’s formula. The rest of the proof will be spent on rigorously justifying the approximations involved.

Proof. (The following proof is an elaboration of the proof found on page 236-237 in Krantz’s Real Analysis and Foundations.) We begin with the formula

\[
\Gamma (x + 1) := \int_0^{\infty} e^{-t} t^x dt = \int_0^{\infty} e^{-\frac{1}{2} G_0 (t) (t - t_0)^2} dt.
\]

Making the change of variables, \( s = \sqrt{G_0} (t - t_0) \), in the above integral then gives,

\[
\int_f e^{-G(t)} dt \equiv e^{-G(t_0)} \int_{|t-t_0|<\alpha} \exp \left( \frac{1}{2} G_0 (t_0) (t - t_0)^2 \right) dt.
\]

If \( \alpha \) is sufficiently large, for example if \( \sqrt{\frac{\alpha}{G_0}} = 3 \), then the error term is about 0.0037 and we should be able to conclude that

\[
\int_f e^{-G(t)} dt \equiv \sqrt{\frac{2\pi}{G_0 (t_0)}} e^{-G(t_0)}.
\]  

The proof of the next theorem (Stirling’s formula for the Gamma function) will illustrate these ideas and what one has to do to carry them out rigorously.

**Theorem 10.57 (Stirling’s formula).** The Gamma function (see Definition 10.49), satisfies Stirling’s formula,

\[
\lim_{x \to \infty} \frac{\Gamma (x + 1)}{\sqrt{2\pi e^{-x \ln x + 1/2}}} = 1.
\]

In particular, if \( n \in \mathbb{N} \), we have

\[
n! = \Gamma (n + 1) \sim \sqrt{2\pi e^{-n \ln n + 1/2}}
\]

where we write \( a_n \sim b_n \) to mean, \( \lim_{n \to \infty} \frac{a_n}{b_n} = 1 \). (See Example 10.62 below for a slightly cruder but more elementary estimate of \( n! \))

Proof. (The following proof is an elaboration of the proof found on page 236-237 in Krantz’s Real Analysis and Foundations.) We begin with the formula for \( \Gamma (x + 1) \);

\[
\Gamma (x + 1) = \int_0^{\infty} e^{-t} t^x dt = \int_0^{\infty} e^{-G_x(t)} dt,
\]

where \( G_x(t) := t - x \ln t \).

Then \( \partial (t) = 1 - x/t, \partial (t) = x/t^2, \partial (x) \) has a global minimum (since \( \partial (x) > 0 \)) at \( t_0 = x \) where \( \partial (x) = x - x \ln x \) and \( \partial (x) = 1/x \). So if Eq. (10.42) is valid in this case we should expect,

\[
\Gamma (x + 1) \approx \sqrt{2\pi x} e^{x - x \ln x + 1/2}
\]

which would give Stirling’s formula. The rest of the proof will be spent on rigorously justifying the approximations involved.

Let us begin by making the change of variables \( s = \sqrt{\frac{\gamma}{G_0}} (t - t_0) = \frac{1}{\sqrt{\pi}} (t - x) \) as suggested above. Then

\[
\Gamma (x + 1) \approx \sqrt{2\pi x} e^{-x \ln x + 1/2}
\]

Setting \( q (0) = 1/2 \) makes \( q \) a continuous and in fact smooth function on \((-1, \infty) \). Using the power series expansion for \( \ln (1 + u) \) we find,

\[
q (u) = \frac{1}{2} + \sum_{k=3}^{\infty} \frac{(-u)^{k-2}}{k} \quad \text{for } |u| < 1.
\]  

Making the change of variables, \( t = x + \sqrt{\pi} s \) in the second integral in Eq. (10.44) yields,

\[
\Gamma (x + 1) = e^{-(x - \ln x)} \sqrt{\pi} \int_{x}^{\infty} e^{-q \left( \frac{x}{\sqrt{x}} \right)} s^2 ds = x^{x+1/2} e^{-x} \cdot I (x),
\]

where

\[
I (x) = \int_{-\sqrt{x}}^{\infty} e^{-q \left( \frac{x}{\sqrt{x}} \right)} s^2 ds = \int_{-\sqrt{x}}^{\infty} 1_{s \geq -\sqrt{x}} \cdot e^{-q \left( \frac{x}{\sqrt{x}} \right)} s^2 ds.
\]  

From Eq. (10.45) it follows that \( \lim_{u \to 0} q (u) = 1/2 \) and therefore,

\[
\int_{-\sqrt{x}}^{\infty} \lim_{x \to \infty} 1_{s \geq -\sqrt{x}} \cdot e^{-q \left( \frac{x}{\sqrt{x}} \right)} s^2 ds = \int_{-\sqrt{x}}^{\infty} e^{-s^2} ds = \sqrt{\pi}.
\]  

Then \( 
\int_{-\sqrt{x}}^{\infty} \lim_{x \to \infty} 1_{s \geq -\sqrt{x}} \cdot e^{-q \left( \frac{x}{\sqrt{x}} \right)} s^2 ds = \int_{-\sqrt{x}}^{\infty} e^{-s^2} ds = \sqrt{\pi}.
\]
So if there exists a dominating function, $F \in L^1 (\mathbb{R}, m)$, such that

$$1_{s \geq -\sqrt{x}} \cdot e^{-q(\frac{1}{\sqrt{x}})s^2} \leq F(s) \quad \text{for all } s \in \mathbb{R} \text{ and } x \geq 1,$$

we can apply the DCT to learn that $\lim_{x \to \infty} I(x) = \sqrt{2\pi}$ which will complete the proof of Stirling’s formula.

We now construct the desired function $F$. From Eq. (10.45) it follows that $q(u) \geq 1/2$ for $-1 < u \leq 0$. Since $u - \ln(1 + u) > 0$ for $u \neq 0$ ($u - \ln(1 + u)$ is convex and has a minimum of 0 at $u = 0$) we may conclude that $q(u) > 0$ for all $u > -1$ therefore by compactness (on $[0,M]$), $\min_{1 < u \leq M} q(u) = \varepsilon(M) > 0$ for all $M \in (0, \infty)$, see Remark 10.58 for more explicit estimates. Lastly, since $\frac{1}{u} \ln(1 + u) \to 0$ as $u \to \infty$, there exists $M < \infty$ ($M = 3$ would due) such that $\frac{1}{u} \ln(1 + u) \leq \frac{1}{2}$ for $u \geq M$ and hence,

$$q(u) = \frac{1}{u} \left[ 1 - \frac{1}{u} \ln(1 + u) \right] \geq \frac{1}{2u} \quad \text{for } u \geq M.$$

So there exists $\varepsilon > 0$ and $M < \infty$ such that (for all $x \geq 1$),

$$1_{s \geq -\sqrt{x}} \cdot e^{-q(\frac{1}{\sqrt{x}})s^2} \leq 1 - \sqrt{x} e^{-\varepsilon s^2} + 1_{s \geq M} e^{-\sqrt{x} s/2} \leq 1 - \sqrt{x} e^{-\varepsilon s^2} + 1_{s \geq M} e^{-\varepsilon s/2} \leq e^{-\varepsilon s^2} + e^{-|s|/2} =: F(s) \in L^1 (\mathbb{R}, ds).$$

We will sometimes use the following variant of Eq. (10.43):

$$\lim_{x \to \infty} \frac{\Gamma(x)}{\sqrt{2\pi} x^{x - 1/2} e^{-x}} = 1 \quad \text{(10.48)}$$

To prove this let $x$ go to $x - 1$ in Eq. (10.43) in order to find,

$$1 = \lim_{x \to \infty} \frac{\Gamma(x)}{\sqrt{2\pi} x^{x - 1/2} e^{-x}} = \lim_{x \to \infty} \frac{\Gamma(x)}{\sqrt{2\pi} x^{x - 1/2} e^{-x}} \cdot \frac{\sqrt{2\pi} x^{x - 1/2} e^{-x}}{e^{-1/2}}$$

which gives Eq. (10.48) since

$$\lim_{x \to \infty} \frac{x^{x} e^{-x}}{\left( x - 1 \right)^{x - 1/2} e^{-1/2}} = 1.$$

Remark 10.58 (Estimating $q(u)$ by Taylor’s Theorem). Another way to estimate $q(u)$ is to use Taylor’s theorem with integral remainder. In general if $h$ is $C^2$ – function on $[0, 1]$, then by the fundamental theorem of calculus and integration by parts,

$$h(1) - h(0) = \int_0^1 \dot{h}(t) \, dt = - \int_0^1 \ddot{h}(t) (1 - t) \, dt$$

$$= - \dot{h}(1) (1 - t) \big|_0^1 + \int_0^1 \dot{h}(t) (1 - t) \, dt$$

$$= \dot{h}(0) + \frac{1}{2} \int_0^1 \dot{h}(t)\, d\nu(t)$$

(10.49)

where $d\nu(t) := 2(1 - t) \, dt$ which is a probability measure on $[0, 1]$. Applying this to $h(t) = F(x + t (b - a))$ for a $C^2$ – function on an interval of points between $a$ and $b$ in $\mathbb{R}$ then implies,

$$F(b) - F(a) = (b - a) \dot{F}(a) + \frac{1}{2} (b - a)^2 \int_0^1 F(x + t(a - b)) \, d\nu(t).$$

(10.50)

(Similar formulas hold to any order.) Applying this result with $F(x) = x - \ln(1 + x), a = 0$, and $b = u \in (-1, \infty)$ gives,

$$u - \ln(1 + u) = \frac{1}{2} u^2 \int_0^1 \frac{1}{(1 + tu)^2} \, d\nu(t),$$

i.e.

$$q(u) = \frac{1}{2} \int_0^1 \frac{1}{(1 + tu)^2} \, d\nu(t).$$
From this expression for \( q(u) \) it now easily follows that
\[
q(u) \geq \frac{1}{2} \int_0^1 \frac{1}{(1 + u)^2} d\nu(t) = \frac{1}{2} \text{ if } -1 < u \leq 0
\]
and
\[
q(u) \geq \frac{1}{2} \int_0^1 \frac{1}{(1 + u)^2} d\nu(t) = \frac{1}{2(1 + u)^2}.
\]
So an explicit formula for \( \varepsilon(M) \) is \( \varepsilon(M) = (1 + M)^{-2}/2 \).

### 10.6.1 Two applications of Stirling’s formula

In this subsection suppose \( x \in (0, 1) \) and \( S_n \sim \text{Binomial}(n, x) \) for all \( n \in \mathbb{N} \), i.e.
\[
P_x(S_n = k) = \binom{n}{k} x^k (1 - x)^{n-k} \text{ for } 0 \leq k \leq n.
\]
(10.51)

Recall that \( \mathbb{E}S_n = nx \) and \( \text{Var}(S_n) = n\sigma^2 \) where \( \sigma^2 := x(1 - x) \). The weak law of large numbers states (Exercise 7.13) that
\[
P\left( \left| \frac{S_n}{n} - x \right| \geq \varepsilon \right) \leq \frac{1}{n\varepsilon^2 \sigma}\]
and therefore, \( \frac{S_n}{n} \) is concentrating near its mean value, \( x \), for \( n \) large, i.e. \( S_n \approx nx \) for \( n \) large. The next central limit theorem describes the fluctuations of \( S_n \) about \( nx \).

**Theorem 10.59 (De Moivre-Laplace Central Limit Theorem).** For all \(-\infty < a < b < \infty\),
\[
\lim_{n \to \infty} P(a \leq \frac{S_n - nx}{\sigma\sqrt{n}} \leq b) = \frac{1}{\sqrt{2\pi}} \int_a^b e^{-y^2/2} dy
\]
\[= P(a \leq N \leq b)
\]
where \( N \overset{d}{=} N(0, 1) \). Informally, \( \frac{S_n - nx}{\sigma\sqrt{n}} \overset{d}{=} N \) or equivalently, \( S_n \overset{d}{=} nx + \sigma\sqrt{n} \cdot N \) which if valid in a neighborhood of \( nx \) whose length is order \( \sqrt{n} \).

**Proof.** (We are not going to cover all the technical details in this proof as we will give much more general versions of this theorem later.) Starting with the definition of the Binomial distribution we have,
\[
p_n := P\left( a \leq \frac{S_n - nx}{\sigma\sqrt{n}} \leq b \right) = P\left( S_n \in [n(x + \sigma\sqrt{n}[a, b]) \right)
\]
\[= \sum_{k \in \{nx + \sigma\sqrt{n}[a, b]\}} P(S_n = k)
\]
\[= \sum_{k \in \{nx + \sigma\sqrt{n}[a, b]\}} \binom{n}{k} x^k (1 - x)^{n-k}.
\]
Letting \( k = nx + \sigma\sqrt{n}y_k \), i.e. \( y_k = (k - nx) / \sigma\sqrt{n} \) we see that \( \Delta y_k = y_{k+1} - y_k = 1 / (\sigma\sqrt{n}) \). Therefore we may write \( p_n \) as
\[
p_n = \sum_{y_k \in [a, b]} \sigma\sqrt{n} \binom{n}{k} x^k (1 - x)^{n-k} \Delta y_k.
\]
(10.52)

So to finish the proof we need to show, for \( k = O(\sqrt{n}) \) \( (y_k = O(1)) \), that
\[
\sigma\sqrt{n} \binom{n}{k} x^k (1 - x)^{n-k} \sim \frac{1}{\sqrt{2\pi}} e^{-y_k^2} \text{ as } n \to \infty
\]
(10.53)
in which case the sum in Eq. (10.52) may be well approximated by the “Riemann sum”
\[
p_n \sim \sum_{y_k \in [a, b]} \frac{1}{\sqrt{2\pi}} e^{-y_k^2} \Delta y_k \to \frac{1}{\sqrt{2\pi}} \int_a^b e^{-y^2} dy \text{ as } n \to \infty.
\]

By Stirling’s formula,
\[
\sigma\sqrt{n} \binom{n}{k} = \frac{\sigma\sqrt{n}}{k!} \frac{n^k}{(n-k)!} \sim \frac{n^{n+k+1/2}}{\sqrt{2\pi} k^{k+1/2} (n-k)^{n-k+1/2}}
\]
\[= \frac{\sigma}{\sqrt{2\pi}} \left( \frac{k}{n} \right)^{k+1/2} (1 - \frac{k}{n})^{n-k+1/2}
\]
\[= \frac{\sigma}{\sqrt{2\pi}} \left( x + \frac{\sigma}{\sqrt{n}} y_k \right)^{k+1/2} (1 - x - \frac{\sigma}{\sqrt{n}} y_k)^{n-k+1/2}
\]
\[= \frac{\sigma}{\sqrt{2\pi}} \sqrt{x (1 - x)} \left( x + \frac{\sigma}{\sqrt{n}} y_k \right)^k \left( 1 - x - \frac{\sigma}{\sqrt{n}} y_k \right)^{n-k}
\]
\[= \frac{1}{\sqrt{2\pi}} \left( x + \frac{\sigma}{\sqrt{n}} y_k \right)^k \left( 1 - x - \frac{\sigma}{\sqrt{n}} y_k \right)^{n-k}.
\]
In order to shorten the notation, let \( z_k := \frac{\sigma}{\sqrt{n}} y_k = O(n^{-1/2}) \) so that \( k = nx + nz_k = n(x + z_k) \). In this notation we have shown,
\[
\sqrt{2\pi\sigma\sqrt{n}} \binom{n}{k} x^k (1-x)^{n-k} \sim \frac{x^k (1-x)^{n-k}}{(x+z_k)^2 (1-x-z_k)^{n-k}}
\]
\[
= \frac{1}{(1 + \frac{1}{x} z_k)^k (1 - \frac{1}{1-x} z_k)^{n-k}}
\]
\[
= \frac{1}{(1 + \frac{1}{x} z_k)^{n(x+z_k)} (1 - \frac{1}{1-x} z_k)^{n(1-x-z_k)}} =: q(n,k).
\]

Taking logarithms and using Taylor’s theorem we learn
\[
n (x + z_k) \ln \left(1 + \frac{1}{x} z_k\right)
\]
\[
= n (x + z_k) \left(\frac{1}{x} z_k - \frac{1}{2x^2} z_k^2 + O \left(n^{-3/2}\right)\right)
\]
\[
= nz_k + \frac{n}{2x} z_k^2 + O \left(n^{-3/2}\right)\text{ and}
\]
\[
n (1-x-z_k) \ln \left(1 - \frac{1}{1-x} z_k\right)
\]
\[
= n (1-x-z_k) \left(-\frac{1}{1-x} z_k - \frac{1}{2 (1-x)^2} z_k^2 + O \left(n^{-3/2}\right)\right)
\]
\[
= -nz_k + \frac{n}{2 (1-x)} z_k^2 + O \left(n^{-3/2}\right).
\]

and then adding these expressions shows,
\[
-\ln q(n,k) = \frac{n}{2} z_k^2 \left(\frac{1}{x} + \frac{1}{1-x}\right) + O \left(n^{-3/2}\right)
\]
\[
= \frac{n}{2\sigma^2} z_k^2 + O \left(n^{-3/2}\right) = \frac{1}{2} \gamma_k^2 + O \left(n^{-3/2}\right).
\]

Combining this with Eq. \[10.54\] shows,
\[
\sigma\sqrt{n} \binom{n}{k} x^k (1-x)^{n-k} \sim \frac{1}{\sqrt{2\pi}} \exp \left(-\frac{1}{2} \gamma_k^2 + O \left(n^{-3/2}\right)\right)
\]

which gives the desired estimate in Eq. \[10.53\].

The previous central limit theorem has shown that
\[
\frac{S_n}{n} \xrightarrow{d} x + \frac{\sigma}{\sqrt{n}} N
\]

which implies the major fluctuations of \(S_n/n\) occur within intervals about \(x\) of length \(O \left(\frac{1}{\sqrt{n}}\right)\). The next result aims to understand the rare events where \(S_n/n\) makes a “large” deviation from its mean value, \(x\) – in this case a large deviation is something of size \(O(1)\) as \(n \to \infty\).

**Theorem 10.60 (Binomial Large Deviation Bounds).** Let us continue to use the notation in Theorem 10.59. Then for all \(y \in (0, x)\),
\[
\lim_{n \to \infty} \frac{1}{n} \ln \mathbb{P}_x \left(\frac{S_n}{n} \leq y\right) = y \ln \frac{x}{y} + (1-y) \ln \frac{1-x}{1-y},
\]

Roughly speaking,
\[
\mathbb{P}_x \left(\frac{S_n}{n} \leq y\right) \approx e^{-n I_x(y)}
\]

where \(I_x(y)\) is the “rate function,”
\[
I_x(y) := y \ln \frac{y}{x} + (1-y) \ln \frac{1-y}{1-x},
\]

see Figure 10.3 for the graph of \(I_{1/2}\).

**Fig. 10.3.** A plot of the rate function, \(I_{1/2}\).
If \( a_k \geq 0 \), then we have the following crude estimates on \( \sum_{k=0}^{m-1} a_k \),

\[
\max_{k \leq m} a_k \leq \sum_{k=0}^{m-1} a_k \leq m \cdot \max_{k < m} a_k.
\]

(10.55)

In order to apply this with \( a_k = (\frac{n}{k}) x^k (1 - x)^{n-k} \) and \( m = [ny] \), we need to find the maximum of the \( a_k \) for \( 0 \leq k \leq ny \). This is easy to do since \( a_k \) is increasing for \( 0 \leq k \leq ny \) as we now show. Consider,

\[
a_{k+1} = \frac{(\frac{n}{k+1}) x^{k+1} (1 - x)^{n-k-1}}{(\frac{n}{k}) x^k (1 - x)^{n-k}} = \frac{k! (n-k)! \cdot x}{(k+1)! (n-k-1)! \cdot (1-x)} = \frac{(n-k) \cdot x}{(k+1) \cdot (1-x)}.
\]

Therefore, where the latter expression is greater than or equal to 1 iff

\[
\frac{a_{k+1}}{a_k} \geq 1 \iff (n-k) \cdot x \geq (k+1) \cdot (1-x) \iff nx \geq k + 1 - x \iff k < (n-1) x - 1.
\]

Thus for \( k < (n-1) x - 1 \) we may conclude that \( (\frac{n}{k}) x^k (1 - x)^{n-k} \) is increasing in \( k \).

Thus the crude bound in Eq. (10.55) implies,

\[
\left( \frac{n}{[ny]} \right)^{[ny]} (1-x)^{n-[ny]} \leq P_x \left( \frac{S_n}{n} \leq y \right) \leq [ny] \left( \frac{n}{[ny]} \right)^{[ny]} (1-x)^{n-[ny]}
\]

or equivalently,

\[
\frac{1}{n} \ln \left[ \left( \frac{n}{[ny]} \right)^{[ny]} (1-x)^{n-[ny]} \right] \leq \frac{1}{n} \ln P_x \left( \frac{S_n}{n} \leq y \right) \leq \frac{1}{n} \ln \left( [ny] \left( \frac{n}{[ny]} \right)^{[ny]} (1-x)^{n-[ny]} \right).
\]

By Stirling’s formula, for \( k \) such that \( k \) and \( n - k \) is large we have,

\[
\left( \frac{n}{k} \right)^k \sim \frac{1}{\sqrt{2\pi k^{3/2}}} \cdot (n-k)^{n-k-1/2} \sim \frac{1}{\sqrt{2\pi k^{3/2}}} \cdot (1 - \frac{k}{n})^{n-k-1/2}
\]

and therefore,

\[
\frac{1}{n} \ln \left( \frac{n}{k} \right) \sim - \frac{k}{n} \ln \left( \frac{k}{n} \right) - \left( \frac{1}{k} - \frac{1}{n} \right) \ln \left( \frac{1}{k} \right).
\]

So taking \( k = [ny] \), we learn that

\[
\lim_{n \to \infty} \frac{1}{n} \ln \left( \frac{n}{[ny]} \right) = - y \ln y - (1-y) \ln (1-y)
\]

and therefore,

\[
\lim_{n \to \infty} \frac{1}{n} \ln P_x \left( \frac{S_n}{n} \leq y \right) = - y \ln y - (1-y) \ln (1-y) + y \ln x + (1-y) \ln (1-x)
\]

\[
= y \frac{x}{y} + (1-y) \ln \left( \frac{1-x}{1-y} \right).
\]

As a consistency check it is worth noting, by Jensen’s inequality described below, that

\[
-I_x (y) = y \ln \left( \frac{x}{y} \right) + (1-y) \ln \left( \frac{1-x}{1-y} \right) \leq \ln \left( \frac{x}{y} + (1-y) \frac{1-x}{1-y} \right) = \ln (1) = 0.
\]

This must be the case since

\[
-I_x (y) = \lim_{n \to \infty} \frac{1}{n} \ln P_x \left( \frac{S_n}{n} \leq y \right) \leq \lim_{n \to \infty} \frac{1}{n} \ln 1 = 0.
\]

### 10.6.2 A primitive Stirling type approximation

**Theorem 10.61.** Suppose that \( f : (0, \infty) \to \mathbb{R} \) is an increasing concave down function (like \( f(x) = \ln x \)) and let \( s_n := \sum_{k=1}^{n} f(k) \), then

\[
s_n - \frac{1}{2} (f(n) + f(1)) \leq \int_{1}^{n} f(x) \, dx
\]

\[
\leq s_n - \frac{1}{2} [f(n) + 2f(1)] + \frac{1}{2} f(2)
\]

\[
\leq s_n - \frac{1}{2} [f(n) + 2f(1)] + \frac{1}{2} f(2).
\]
Proof. On the interval, \( [k-1,k] \), we have that \( f(x) \) is larger than the straight line segment joining \( (k-1,f(k-1)) \) and \( (k,f(k)) \) and thus

\[
\frac{1}{2} (f(k) + f(k-1)) \leq \int_{k-1}^{k} f(x) \, dx.
\]

Summing this equation on \( k = 2, \ldots, n \) shows,

\[
s_n - \frac{1}{2} (f(n) + f(1)) = \sum_{k=2}^{n} \frac{1}{2} (f(k) + f(k-1))
\]

\[
\leq \sum_{k=2}^{n} \int_{k-1}^{k} f(x) \, dx = \int_{1}^{n} f(x) \, dx.
\]

For the upper bound on the integral we observe that \( f(x) \leq f(k) - f'(k) (x-k) \) for all \( x \) and therefore,

\[
\int_{k-1}^{k} f(x) \, dx \leq \int_{k-1}^{k} [f(k) - f'(k) (x-k)] \, dx = f(k) - \frac{1}{2} f'(k).
\]

Summing this equation on \( k = 2, \ldots, n \) then implies,

\[
\int_{1}^{n} f(x) \, dx \leq \sum_{k=2}^{n} f(k) - \frac{1}{2} \sum_{k=2}^{n} f'(k).
\]

Since \( f''(x) \leq 0 \), \( f'(x) \) is decreasing and therefore \( f'(x) \leq f'(k-1) \) for \( x \in [k-1,k] \) and integrating this equation over \( [k-1,k] \) gives

\[
f(k) - f(k-1) \leq f'(k-1).
\]

Summing the result on \( k = 3, \ldots, n+1 \) then shows,

\[
f(n+1) - f(2) \leq \sum_{k=2}^{n} f'(k)
\]

and thus it follows that

\[
\int_{1}^{n} f(x) \, dx \leq \sum_{k=2}^{n} f(k) - \frac{1}{2} (f(n+1) - f(2)) \leq s_n - \frac{1}{2} [f(n+1) + 2f(1)] + \frac{1}{2} f(2)
\]

Example 10.62 (Approximating \( n! \)). Let us take \( f(n) = \ln n \) and recall that

\[
\int_{1}^{n} \ln x \, dx = n \ln n - n + 1.
\]

Thus we may conclude that

\[
s_n - \frac{1}{2} \ln n \leq n \ln n - n + 1 \leq s_n - \frac{1}{2} \ln n + \frac{1}{2} \ln 2.
\]

Thus it follows that

\[
\left( n + \frac{1}{2} \right) \ln n - n + 1 - \ln \sqrt{2} \leq s_n \leq \left( n + \frac{1}{2} \right) \ln n - n + 1.
\]

Exponentiating this identity then implies,

\[
\frac{e}{\sqrt{2}} \cdot e^{-n^{n+1/2}} \leq n! \leq e \cdot e^{-n^{n+1/2}}
\]

which compares well with Stirling’s formula (Theorem 10.57) which states,

\[
n! \sim \sqrt{2\pi} e^{-n^{n+1/2}}.
\]

Observe that

\[
\frac{e}{\sqrt{2}} \cong 1.9221 \leq \sqrt{2\pi} \cong 2.506 \leq e \cong 2.7183.
\]

10.7 Comparison of the Lebesgue and the Riemann Integral*

For the rest of this chapter, let \(-\infty < a < b < \infty\) and \( f : [a,b] \rightarrow \mathbb{R} \) be a bounded function. A partition of \([a,b]\) is a finite subset \( \pi \subset [a,b] \) containing \([a,b]\). To each partition
of \([a,b]\) let

\[
\text{mesh}(\pi) := \max\{|t_j - t_{j-1}| : j = 1, \ldots, n\},
\]

\[
M_j = \sup\{f(x) : t_j \leq x \leq t_{j-1}\}, \quad m_j = \inf\{f(x) : t_j \leq x \leq t_{j-1}\}
\]

\[
G_\pi = f(a)1_{\{a\}} + \sum_{1}^{n} M_j 1_{(t_{j-1},t_j]}, \quad g_\pi = f(a)1_{\{a\}} + \sum_{1}^{n} m_j 1_{(t_{j-1},t_j]}
\]

and

\[
S_\pi f = \sum M_j (t_j - t_{j-1}) \quad \text{and} \quad s_\pi f = \sum m_j (t_j - t_{j-1}).
\]

Notice that

\[
S_\pi f = \int_a^b G_\pi dm \quad \text{and} \quad s_\pi f = \int_a^b g_\pi dm.
\]

The upper and lower Riemann integrals are defined respectively by

\[
\int_a^b f(x)dx = \inf_{\pi} S_\pi f \quad \text{and} \quad \int_a^b \sup_{\pi} f(x)dx = \sup_{\pi} S_\pi f.
\]

**Definition 10.63.** The function \(f\) is **Riemann integrable** if \(\int_a^b f = \int_a^b f \in \mathbb{R}\) and which case the Riemann integral \(\int_a^b f\) is defined to be the common value:

\[
\int_a^b f(x)dx = \int_a^b f(x)dx = \int_a^b f(x)dx.
\]

The proof of the following Lemma is left to the reader as Exercise [10.28](#).

**Lemma 10.64.** If \(\pi'\) and \(\pi\) are two partitions of \([a,b]\) and \(\pi \subset \pi'\) then

\[
G_\pi \geq G_{\pi'} \geq g \geq g_{\pi'} \geq g_\pi
\]

and

\[
S_\pi f \geq S_{\pi'} f \geq s_{\pi'} f \geq s_{\pi} f.
\]

There exists an increasing sequence of partitions \(\{\pi_k\}_{k=1}^{\infty}\) such that \(\text{mesh}(\pi_k) \downarrow 0\) and

\[
S_{\pi_k} f \downarrow \int_a^b f \quad \text{and} \quad s_{\pi_k} f \uparrow \int_a^b f \quad \text{as} \quad k \to \infty.
\]

If we let

\[
G := \lim_{k \to \infty} G_{\pi_k} \quad \text{and} \quad g := \lim_{k \to \infty} g_{\pi_k}
\]

then by the dominated convergence theorem,

\[
\int_{[a,b]} gdm = \lim_{k \to \infty} \int_{[a,b]} g_{\pi_k} = \lim_{k \to \infty} S_{\pi_k} f = \int_a^b f(x)dx
\]

and

\[
\int_{[a,b]} Gdm = \lim_{k \to \infty} \int_{[a,b]} G_{\pi_k} = \lim_{k \to \infty} S_{\pi_k} f = \int_a^b f(x)dx.
\]

**Notation 10.65** For \(x \in [a,b]\), let

\[
H(x) = \limsup_{y \to x} f(y) := \lim_{\epsilon \downarrow 0} \sup \{f(y) : |y - x| \leq \epsilon, \; y \in [a,b]\}
\]

and

\[
h(x) = \liminf_{y \to x} f(y) := \lim_{\epsilon \downarrow 0} \inf \{f(y) : |y - x| \leq \epsilon, \; y \in [a,b]\}.
\]

**Lemma 10.66.** The functions \(H, h : [a,b] \to \mathbb{R}\) satisfy:

1. \(h(x) \leq f(x) \leq H(x)\) for all \(x \in [a,b]\) and \(h(x) = H(x)\) if \(f\) is continuous at \(x\).

2. If \(\{\pi_k\}_{k=1}^{\infty}\) is any increasing sequence of partitions such that \(\text{mesh}(\pi_k) \downarrow 0\) and \(G\) and \(g\) are defined as in Eq. \((10.57)\), then

\[
G(x) = H(x) \geq f(x) \geq h(x) = g(x) \quad \forall \; x \notin \pi := \bigcup_{k=1}^{\infty} \pi_k.
\]

(Note \(\pi\) is a countable set.)

3. \(H\) and \(h\) are Borel measurable.

**Proof.** Let \(G_k := G_{\pi_k} \downarrow G\) and \(g_k := g_{\pi_k} \uparrow g\).

1. It is clear that \(h(x) \leq f(x) \leq H(x)\) for all \(x\) and \(H(x) = h(x)\) if \(\lim_{y \to x} f(y)\) exists and is equal to \(f(x)\). That is \(H(x) = h(x)\) if \(f\) is continuous at \(x\).

2. For \(x \notin \pi\),

\[
G_k(x) \geq H(x) \geq f(x) \geq h_k(x) \forall k
\]

and letting \(k \to \infty\) in this equation implies

\[
G(x) \geq H(x) \geq f(x) \geq h(x) \geq g(x) \forall \; x \notin \pi.
\]

Moreover, given \(\epsilon > 0\) and \(x \notin \pi\),

\[
\sup \{f(y) : |y - x| \leq \epsilon, \; y \in [a,b]\} \geq G_k(x)
\]

for all \(k\) large enough, since eventually \(G_k(x)\) is the supremum of \(f(y)\) over some interval contained in \([x - \epsilon, x + \epsilon]\). Again letting \(k \to \infty\) implies

\[
\sup \{f(y) \geq G(x)\}
\]

and therefore, that

\[
H(x) = \limsup_{y \to x} f(y) \geq G(x)
\]
for all $x \notin \pi$. Combining this equation with Eq. (10.61) then implies $H(x) = G(x)$ if $x \notin \pi$. A similar argument shows that $h(x) = g(x)$ if $x \notin \pi$ and hence Eq. (10.60) is proved.

3. The functions $G$ and $g$ are limits of measurable functions and hence measurable. Since $H = G$ and $h = g$ except possibly on the countable set $\pi$, both $H$ and $h$ are also Borel measurable. (You justify this statement.)

**Theorem 10.67.** Let $f : [a, b] \to \mathbb{R}$ be a bounded function. Then

$$\int_a^b f = \int_{[a,b]} H dm \quad \text{and} \quad \int_a^b f = \int_{[a,b]} h dm$$

and the following statements are equivalent:

1. $H(x) = h(x)$ for $m$-a.e. $x$.
2. the set
   $$E := \{ x \in [a, b] : f \text{ is discontinuous at } x \}$$
   is an $\bar{m}$-null set.
3. $f$ is Riemann integrable.

If $f$ is Riemann integrable then $f$ is Lebesgue measurable, i.e. $f \in \mathcal{L}/\mathcal{B}$ measurable where $\mathcal{L}$ is the Lebesgue $\sigma$-algebra and $\mathcal{B}$ is the Borel $\sigma$-algebra on $[a, b]$. Moreover if we let $\bar{m}$ denote the completion of $m$, then

$$\int_{[a,b]} H dm = \int_{a}^{b} f(x)dx = \int_{[a,b]} f d\bar{m} = \int_{[a,b]} h dm.$$  \hspace{1cm} (10.63)

**Proof.** Let $(\sigma_k)_{k=1}^{\infty}$ be an increasing sequence of partitions of $[a, b]$ as described in Lemma 10.64 and let $G$ and $g$ be defined as in Lemma 10.66. Since $m(\pi) = 0$, $H = G$ a.e., Eq. (10.62) is a consequence of Eqs. (10.58) and (10.59). From Eq. (10.62), $f$ is Riemann integrable iff

$$\int_{[a,b]} H dm = \int_{[a,b]} h dm$$

and because $h \leq f \leq H$ this happens iff $h(x) = H(x)$ for $m$-a.e. $x$. Since $E = \{ x : H(x) \neq h(x) \}$, this last condition is equivalent to $E$ being a $m$–null set. In light of these results and Eq. (10.60), the remaining assertions including Eq. (10.63) are now consequences of Lemma 10.70.

**Notation 10.68** In view of this theorem we will often write $\int_{a}^{b} f(x)dx$ for $\int_{a}^{b} f dm.$  

\footnote{f need not be Borel measurable.}

### 10.8 Measurability on Complete Measure Spaces*

In this subsection we will discuss a couple of measurability results concerning completions of measure spaces.

**Proposition 10.69.** Suppose that $(X, \mathcal{B}, \mu)$ is a complete measure space$^{3}$ and $f : X \to \mathbb{R}$ is measurable.

1. If $g : X \to \mathbb{R}$ is a function such that $f(x) = g(x)$ for $\mu$ – a.e. $x$, then $g$ is measurable.
2. If $f_n : X \to \mathbb{R}$ are measurable and $f : X \to \mathbb{R}$ is a function such that $\lim_{n \to \infty} f_n = f$, $\mu$ – a.e., then $f$ is measurable as well.

**Proof.** 1. Let $E = \{ x : f(x) \neq g(x) \}$ which is assumed to be in $\mathcal{B}$ and $\mu(E) = 0$. Then $g = 1_{E^c}f + 1_{E}g$ since $f = g$ on $E^c$. Now $1_{E^c}f$ is measurable so $g$ will be measurable if we show $1_{E}g$ is measurable. For this consider,

$$\mathcal{E}^{-1}(\mathcal{A}) = \{ \mathcal{E}(\mathcal{A}) \} \text{ if } 0 \in A \text{ if } 0 \notin A \text{ (10.64)}$$

Since $(1_{E\mathcal{G}})^{-1}(B) \subset E$ if $0 \notin B$ and $\mu(E) = 0$, it follow by completeness of $\mathcal{B}$ that $(1_{E\mathcal{G}})^{-1}(B) \in \mathcal{B}$ if $0 \notin B$. Therefore Eq. (10.64) shows that $1_{E\mathcal{G}}$ is measurable. 2. Let $E = \{ x : \lim_{n \to \infty} f_n(x) \neq f(x) \}$ by assumption $E \in \mathcal{B}$ and $\mu(E) = 0$. Since $g := 1_{E}f = \lim_{n \to \infty} 1_{E}f_n$, $g$ is measurable. Because $f = g$ on $E^c$ and $\mu(E) = 0$, $f = g$ a.e. so by part 1. $f$ is also measurable.

The above results are in general false if $(X, \mathcal{B}, \mu)$ is not complete. For example, let $X = \{0, 1, 2\}$, $\mathcal{B} = \{\{0\}, \{1, 2\}, X, \emptyset\}$ and $\mu = \delta_0$. Take $g(0) = 0$, $g(1) = 1$, $g(2) = 2$, then $g = 0$ a.e. yet $g$ is not measurable.

**Lemma 10.70.** Suppose that $(X, \mathcal{M}, \mu)$ is a measure space and $\mathcal{M}$ is the completion of $\mathcal{M}$ relative to $\mu$ and $\bar{\mu}$ is the extension of $\mu$ to $\mathcal{M}$. Then a function $f : X \to \mathbb{R}$ is $(\mathcal{M}, \mathcal{B})$ – measurable iff there exists a function $g : X \to \mathbb{R}$ that is $(\mathcal{M}, \mathcal{B})$ – measurable such that $E = \{ x : f(x) \neq g(x) \} \in \mathcal{M}$ and $\bar{\mu}(E) = 0$, i.e. $f(x) = g(x)$ for $\bar{\mu}$ – a.e. $x$. Moreover for such a pair $f$ and $g$, $f \in L^1(\mu)$ iff $g \in L^1(\mu)$ and in which case

$$\int_X f d\mu = \int_X g d\mu.$$ 

**Proof.** Suppose first that such a function $g$ exists so that $\bar{\mu}(E) = 0$. Since $g$ is also $(\mathcal{M}, \mathcal{B})$ – measurable, we see from Proposition 10.69 that $f$ is $(\mathcal{M}, \mathcal{B})$ – measurable. Conversely if $f$ is $(\mathcal{M}, \mathcal{B})$ – measurable, by considering $f_{\pm}$ we may

\footnote{Recall this means that if $N \subset X$ is a set such that $N \subset A \in \mathcal{M}$ and $\mu(A) = 0$, then $N \in \mathcal{M}$ as well.}
assume that $f \geq 0$. Choose $(\mathcal{M}, \mathcal{B})$ measurable simple function $\varphi_n \geq 0$ such that $\varphi_n \uparrow f$ as $n \to \infty$. Writing

$$\varphi_n = \sum a_k 1_{A_k}$$

with $A_k \in \mathcal{M}$, we may choose $B_k \in \mathcal{M}$ such that $B_k \subseteq A_k$ and $\tilde{\mu}(A_k \setminus B_k) = 0$. Letting

$$\tilde{\varphi}_n := \sum a_k 1_{B_k}$$

we have produced a $(\mathcal{M}, \mathcal{B})$ measurable simple function $\tilde{\varphi}_n \geq 0$ such that $E_n := \{ \varphi \neq \tilde{\varphi}_n \}$ has zero $\tilde{\mu}$ measure. Since $\mu(E_n) \leq \sum a_k \tilde{\mu}(E_n)$, there exists $F \in \mathcal{M}$ such that $\cup_n E_n \subseteq F$ and $\mu(F) = 0$. It now follows that

$$1_F \cdot \tilde{\varphi}_n = 1_F \cdot \varphi_n \uparrow g := 1_F f \text{ as } n \to \infty.$$  

This shows that $g = 1_F f$ is $(\mathcal{M}, \mathcal{B})$ measurable and that $\{ f \neq g \} \subseteq F$ has $\tilde{\mu}$ measure zero. Since $f = g + \mu$ a.e., $\int_X f d\tilde{\mu} = \int_X g d\mu$ so to prove Eq. $(10.65)$ it suffices to prove

$$\int_X g d\mu = \int_X g d\mu.$$  

(10.65)

Because $\tilde{\mu}$ is on $\mathcal{M}$, Eq. $(10.65)$ is easily verified for non-negative $\mathcal{M}$ measurable simple functions. Then by the monotone convergence theorem and the approximation Theorem 9.39 it holds for all $\mathcal{M}$ measurable functions $g : X \to [0, \infty]$. The rest of the assertions follow in the standard way by considering $(\text{Re } g)_\pm$ and $(\text{Im } g)_\pm$.

### 10.9 More Exercises

**Exercise 10.18.** Let $\mu$ be a measure on an algebra $\mathcal{A} \subseteq 2^X$, then $\mu(A) + \mu(B) = \mu(A \cup B) + \mu(A \cap B)$ for all $A, B \in \mathcal{A}$.

**Exercise 10.19 (From problem 12 on p. 27 of Folland.)** Let $(X, \mathcal{M}, \mu)$ be a finite measure space and for $A, B \in \mathcal{M}$ let $\rho(A, B) = \mu(A \Delta B)$ where $A \Delta B = (A \setminus B) \cup (B \setminus A)$. It is clear that $\rho(A, B) = \rho(B, A)$. Show:

1. $\rho$ satisfies the triangle inequality:

   $$\rho(A, C) \leq \rho(A, B) + \rho(B, C) \text{ for all } A, B, C \in \mathcal{M}.$$  

2. Define $A \sim B$ if $\rho(A \Delta B) = 0$ and notice that $\rho(A, B) = 0$ iff $A \sim B$. Show "$\sim$" is an equivalence relation.

3. Let $\mathcal{M}/\sim$ denote $\mathcal{M}$ modulo the equivalence relation, $\sim$, and let $[A] := \{ B \in \mathcal{M} : B \sim A \}$. Show that $\tilde{\rho}([A], [B]) := \rho(A, B)$ is a well defined metric on $\mathcal{M}/\sim$.

4. Similarly show $\tilde{\mu}([A]) = \mu(A)$ is a well defined function on $\mathcal{M}/\sim$ and show $\tilde{\mu} : (\mathcal{M}/\sim) \to \mathbb{R}_+$ is $\sim$ continuous.

**Exercise 10.20.** Suppose that $\mu_n : \mathcal{M} \to [0, \infty]$ are measures on $\mathcal{M}$ for $n \in \mathbb{N}$. Also suppose that $\mu_n(A)$ is increasing in $n$ for all $A \in \mathcal{M}$. Prove that $\mu : \mathcal{M} \to [0, \infty]$ defined by $\mu(A) := \lim_{n \to \infty} \mu_n(A)$ is also a measure.

**Exercise 10.21.** Now suppose that $A$ is some index set and for each $\lambda \in A$, $\mu_\lambda : \mathcal{M} \to [0, \infty]$ is a measure on $\mathcal{M}$. Define $\mu : \mathcal{M} \to [0, \infty]$ by $\mu(A) = \sum_{\lambda \in A} \mu_\lambda(A)$ for each $A \in \mathcal{M}$. Show that $\mu$ is also a measure.

**Exercise 10.22.** Let $(X, \mathcal{M}, \mu)$ be a measure space and $\{ A_n \}_{n=1}^\infty \subseteq \mathcal{M}$, show

$$\mu(\{ A_n \text{ a.a.} \}) \leq \liminf_{n \to \infty} \mu(A_n)$$

and if $\mu(\cup_{n \geq m} A_m) < \infty$ for some $n$, then

$$\mu(\{ A_n \text{ i.o.} \}) \geq \limsup_{n \to \infty} \mu(A_n).$$

**Exercise 10.23 (Folland 2.13 on p. 52.)** Suppose that $\{ f_n \}_{n=1}^\infty$ is a sequence of non-negative measurable functions such that $f_n \to f$ pointwise and

$$\lim_{n \to \infty} \int f_n = \int f < \infty.$$  

Then

$$\int_E f = \lim_{n \to \infty} \int_E f_n$$

for all measurable sets $E \in \mathcal{M}$. The conclusion need not hold if $\lim_{n \to \infty} \int f_n = \int f$. Hint: "Fatou times two."

**Exercise 10.24.** Give examples of measurable functions $\{ f_n \}$ on $\mathbb{R}$ such that $f_n$ decreases to 0 uniformly yet $\int f_n dm = \infty$ for all $n$. Also give an example of a sequence of measurable functions $\{ g_n \}$ on $[0, 1]$ such that $g_n \to 0$ while $\int g_n dm = 1$ for all $n$.

**Exercise 10.25.** Suppose $\{ a_n \}_{n=-\infty}^{\infty} \subset \mathbb{C}$ is a summable sequence (i.e. $\sum_{n=-\infty}^{\infty} |a_n| < \infty$), then $f(\theta) := \sum_{n=-\infty}^{\infty} a_n e^{in\theta}$ is a continuous function for $\theta \in \mathbb{R}$ and

$$a_n = \frac{1}{2\pi} \int_{-\pi}^{\pi} f(\theta) e^{-in\theta} d\theta.$$  

**Exercise 10.26.** For any function $f \in L^1(m)$, show $x \in \mathbb{R} \to \int_{(-\infty, x]} f(t) \, dm(t)$ is continuous in $x$. Also find a finite measure, $\mu$, on $\mathbb{R}$ such that $x \to \int_{(-\infty, x]} f(t) \, d\mu(t)$ is not continuous.
Exercise 10.27. Folland 2.31b and 2.31e on p. 60. (The answer in 2.13b is wrong by a factor of $-1$ and the sum is on $k = 1$ to $\infty$. In part (e), $s$ should be taken to be $a$. You may also freely use the Taylor series expansion

$$(1 - z)^{-1/2} = \sum_{n=0}^{\infty} \frac{(2n - 1)!!}{2^n n!} z^n = \sum_{n=0}^{\infty} \frac{(2n)!}{4^n (n!)^2} z^n \text{ for } |z| < 1.$$ 

Exercise 10.28. Prove Lemma 10.64.
Functional Forms of the \( \pi – \lambda \) Theorem

In this chapter we will develop a very useful function analogue of the \( \pi – \lambda \) theorem. The results in this section will be used often in the sequel.

11.1 Multiplicative System Theorems

Notation 11.1 Let \( \Omega \) be a set and \( \mathbb{H} \) be a subset of the bounded real valued functions on \( \Omega \). We say that \( \mathbb{H} \) is closed under bounded convergence if, for every sequence, \( \{f_n\}_{n=1}^{\infty} \subset \mathbb{H} \), satisfying:

1. there exists \( M < \infty \) such that \( |f_n(\omega)| \leq M \) for all \( \omega \in \Omega \) and \( n \in \mathbb{N} \),
2. \( f(\omega) := \lim_{n \to \infty} f_n(\omega) \) exists for all \( \omega \in \Omega \), then \( f \in \mathbb{H} \).

A subset, \( \mathcal{M} \), of \( \mathbb{H} \) is called a multiplicative system if \( \mathcal{M} \) is closed under finite products.

The following result may be found in Dellacherie [2, p. 14]. The style of proof given here may be found in Janson [10, Appendix A., p. 309].

Theorem 11.2 (Dynkin’s Multiplicative System Theorem). Suppose that \( \mathbb{H} \) is a vector subspace of bounded functions from \( \Omega \) to \( \mathbb{R} \) which contains the constant functions and is closed under bounded convergence. If \( \mathcal{M} \subset \mathbb{H} \) is a multiplicative system, then \( \mathbb{H} \) contains all bounded \( \sigma(\mathcal{M}) \) measurable functions.

Proof. In this proof, we may (and do) assume that \( \mathbb{H} \) is the smallest sub-space of bounded functions on \( \Omega \) which contains the constant functions, contains \( \mathcal{M} \), and is closed under bounded convergence. (As usual such a space exists by taking the intersection of all such spaces.) The remainder of the proof will be broken into four steps.

**Step 1.** (\( \mathbb{H} \) is an algebra of functions.) For \( f \in \mathbb{H} \), let \( \mathbb{H}^f := \{g \in \mathbb{H} : gf \in \mathbb{H}\} \). The reader will now easily verify that \( \mathbb{H}^f \) is a linear subspace of \( \mathbb{H} \), \( 1 \in \mathbb{H}^f \), and \( \mathbb{H}^f \) is closed under bounded convergence. Moreover if \( f \in \mathcal{M} \), since \( \mathcal{M} \) is a multiplicative system, \( \mathcal{M} \subset \mathbb{H}^f \). Hence by the definition of \( \mathbb{H} \), \( \mathbb{H} = \mathbb{H}^f \), i.e. \( gf \in \mathbb{H} \) for all \( f \in \mathcal{M} \) and \( g \in \mathbb{H} \). Having proved this it now follows for any \( f \in \mathbb{H} \) that \( \mathcal{M} \subset \mathbb{H}^f \) and therefore as before, \( \mathbb{H}^f = \mathbb{H} \). Thus we may conclude that \( fg \in \mathbb{H} \) whenever \( f,g \in \mathbb{H} \), i.e. \( \mathbb{H} \) is an algebra of functions.

**Step 2.** (\( \mathcal{B} := \{A \subset \Omega : 1_A \in \mathbb{H}\} \) is a \( \sigma \) – algebra.) Using the fact that \( \mathbb{H} \) is an algebra containing constants, the reader will easily verify that \( \mathcal{B} \) is closed under complementation, finite intersections, and contains \( \Omega \), i.e. \( \mathcal{B} \) is an algebra. Using the fact that \( \mathbb{H} \) is closed under bounded convergence, it follows that \( \mathcal{B} \) is closed under increasing unions and hence that \( \mathcal{B} \) is \( \sigma \) – algebra.

**Step 3.** (\( \mathbb{H} \) contains all bounded \( \mathcal{B} \) – measurable functions.) Since \( \mathbb{H} \) is a vector space and \( \mathbb{H} \) contains \( 1_A \) for all \( A \in \mathcal{B} \), \( \mathbb{H} \) contains all bounded \( \mathcal{B} \) – measurable simple functions. Since every bounded \( \mathcal{B} \) – measurable function may be written as a bounded limit of such simple functions (see Theorem 9.39), it follows that \( \mathbb{H} \) contains all bounded \( \mathcal{B} \) – measurable functions.

**Step 4.** (\( \sigma(\mathcal{M}) \subset \mathcal{B} \)) Let \( \varphi_n(x) = 0 \lor [(nx) \land 1] \) (see Figure 11.1 below) so that \( \varphi_n(x) \uparrow 1_{x>0} \). Given \( f \in \mathcal{M} \) and \( a \in \mathbb{R} \), let \( F_n := \varphi_n(f-a) \) and \( M := \sup_{\omega \in \Omega} |f(\omega) - a| \). By the Weierstrass approximation Theorem [7,36] we may find polynomial functions, \( p_1(x) \) such that \( p_1 \to \varphi_n \) uniformly on \([M,M]\). Since \( p_1 \) is a polynomial and \( \mathbb{H} \) is an algebra, \( p_1(f-a) \in \mathbb{H} \) for all \( l \). Moreover, \( p_1(f-a) \to F_n \) uniformly as \( l \to \infty \), from with it follows that \( F_n \in \mathbb{H} \) for all \( n \). Since, \( F_n \uparrow 1_{f>a} \) it follows that \( 1_{f>a} \in \mathbb{H} \), i.e. \( \{f>a\} \subset \mathcal{B} \). As the sets \( \{f>a\} \) with \( a \in \mathbb{R} \) and \( f \in \mathcal{M} \) generate \( \sigma(\mathcal{M}) \), it follows that \( \sigma(\mathcal{M}) \subset \mathcal{B} \).

![Fig. 11.1. Plots of \( \varphi_1, \varphi_2 \) and \( \varphi_3 \).](image)

**Second proof.** (This proof may safely be skipped.) This proof will make use of Dynkin’s \( \pi – \lambda \) Theorem [8,13] Let
We then have $\Omega \in \mathcal{L}$ since $1_\Omega = 1 \in H$, if $A, B \in \mathcal{L}$ with $A \subset B$ then $B \setminus A \in \mathcal{L}$ since $1_B \setminus 1_A = 1_B - 1_A \in H$, and if $A_n \in \mathcal{L}$ with $A_n \uparrow A$, then $A \in \mathcal{L}$ because $1_A_n \in H$ and $1_A \uparrow 1_A \in H$. Therefore $\mathcal{L}$ is a $\lambda$-system.

Let $\varphi_n(x) = 0 \lor \lceil nx \rceil X$ (see Figure 11.1 above) so that $\varphi_n(x) \uparrow 1_{x > 0}$. Given $f_1, f_2, \ldots, f_k \in M$ and $a_1, \ldots, a_k \in R$, let
\[
F_n := \prod_{i=1}^k \varphi_n(f_i - a_i)
\]
and let
\[M := \sup_{i=1, \ldots, k} \sup_{\omega} |f_i(\omega) - a_i|.
\]
By the Weierstrass approximation Theorem 7.36 we may find polynomial functions, $p_i(x)$ such that $p_i \rightarrow \varphi_n$ uniformly on $[-M, M]$. Since $p_i$ is a polynomial it is easily seen that $\prod_{i=1}^k p_i \circ (f_i - a_i) \in H$. Moreover,
\[
\prod_{i=1}^k p_i \circ (f_i - a_i) \rightarrow F_n \text{ uniformly as } l \rightarrow \infty,
\]
from which it follows that $F_n \in H$ for all $n$. Since,
\[
F_n \uparrow \prod_{i=1}^k 1_{(f_i > a_i)} = 1_{\cap_{i=1}^k (f_i > a_i)}
\]
it follows that $1_{\cap_{i=1}^k (f_i > a_i)} \in H$ or equivalently that $1_{\cap_{i=1}^k (f_i > a_i)} \in \mathcal{L}$. Therefore $\mathcal{L}$ contains the $\pi$-system, $\mathcal{P}$, consisting of finite intersections of sets of the form, $\{ f > a \}$ with $f \in M$ and $a \in R$.

As a consequence of the above paragraphs and the $\pi$–$\lambda$ Theorem 8.1.4, $\mathcal{L}$ contains $\sigma(\mathcal{P}) = \sigma(M)$. In particular it follows that $1_A \in H$ for all $A \in \sigma(M)$. Since any positive $\sigma(M)$-measurable function may be written as an increasing limit of simple functions (see Theorem 9.33), it follows that $H$ contains all nonnegative bounded $\sigma(M)$-measurable functions. Finally, since any bounded $\sigma(M)$-measurable functions may be written as the difference of two such non-negative simple functions, it follows that $H$ contains all bounded $\sigma(M)$-measurable functions. ■

**Corollary 11.3.** Suppose $H$ is a subspace of bounded real valued functions such that $1 \in H$ and $H$ is closed under bounded convergence. If $\mathcal{P} \subset 2^\Omega$ is a multiplicative class such that $1_A \in H$ for all $A \in \mathcal{P}$, then $H$ contains all bounded $\sigma(\mathcal{P})$-measurable functions.

**Proof.** Let $M = \{1\} \cup \{1_A : A \in \mathcal{P}\}$. Then $M \subset H$ is a multiplicative system and the proof is completed with an application of Theorem 11.2. ■

**Example 11.4.** Suppose $\mu$ and $\nu$ are two probability measure on $(\Omega, \mathcal{B})$ such that
\[
\int_\Omega f d\mu = \int_\Omega f d\nu
\]
for all $f$ in a multiplicative subset, $M$, of bounded measurable functions on $\Omega$. Then $\mu = \nu$ on $\sigma(M)$. Indeed, apply Theorem 11.2 with $H$ being the bounded measurable functions on $\Omega$ such that Eq. (11.1) holds. In particular if $M = \{1\} \cup \{1_A : A \in \mathcal{P}\}$ with $\mathcal{P}$ being a multiplicative class we learn that $\mu = \nu$ on $\sigma(M) = \sigma(\mathcal{P})$.

**Exercise 11.1.** Let $\Omega := \{1, 2, 3, 4\}$ and $M := \{1_A, 1_B\}$ where $A := \{1, 2\}$ and $B := \{2, 3\}$.

a) Show $\sigma(M) = 2^\Omega$.

b) Find two distinct probability measures, $\mu$ and $\nu$ on $2^\Omega$ such that $\mu(A) = \nu(A)$ and $\mu(B) = \nu(B)$, i.e. Eq. (11.1) holds for all $f \in M$.

**Moral:** the assumption that $M$ is multiplicative can not be dropped from Theorem 11.2.

Here is a complex version of Theorem 11.2.

**Theorem 11.5 (Complex Multiplicative System Theorem).** Suppose $H$ is a complex linear subspace of the bounded complex functions on $\Omega$, $1 \in H$, $H$ is closed under complex conjugation, and $H$ is closed under bounded convergence. If $M \subset H$ is a multiplicative system which is closed under conjugation, then $H$ contains all bounded complex valued $\sigma(M)$-measurable functions.

**Proof.** Let $M_0 = \text{span}_C\{M \cup \{1\}\}$ be the complex span of $M$. As the reader should verify, $M_0$ is an algebra, $M_0 \subset H$, $M_0$ is closed under conjugate, and $\sigma(M_0) = \sigma(M)$. Let
\[H^R := \{f \in H : f \text{ is real valued}\}
\]
and
\[M^R_0 := \{f \in M_0 : f \text{ is real valued}\}.
\]
Then $H^R$ is a real linear space of bounded real valued functions which is closed under bounded convergence and $M^R_0 \subset H^R$. Moreover, $M^R_0$ is a multiplicative system (as the reader should check) and therefore by Theorem 11.2, $H^R$ contains all bounded $\sigma(M^R_0)$-measurable real valued functions. Since $H^R$ and $M^R_0$ are complex linear spaces closed under complex conjugation, for any $f \in H$ or $f \in M_0$, the functions $\text{Re}f = \frac{1}{2}(f + \overline{f})$ and $\text{Im}f = \frac{1}{2i}(f - \overline{f})$ are in $H$ or $M_0$ respectively. Therefore $M_0 = M^R_0 + iM^R_0$, $\sigma(M^R_0) = \sigma(M_0) = \sigma(M)$, and $H = H^R + iH^R$. Hence if $f : \Omega \rightarrow C$ is a bounded $\sigma(M)$-measurable function, then $f = \text{Re}f + i\text{Im}f \in H$ since $\text{Re}f$ and $\text{Im}f$ are in $H^R$. ■
Lemma 11.6. Suppose that $-\infty < a < b < \infty$ and let $\text{Trig}(\mathbb{R}) \subset C(\mathbb{R}, \mathbb{C})$ be the complex linear span of $\{x \to e^{i\lambda x} : \lambda \in \mathbb{R}\}$. Then there exists $f_n \in C_c(\mathbb{R}, [0, 1])$ and $g_n \in \text{Trig}(\mathbb{R})$ such that $\lim_{n \to \infty} f_n(x) = 1_{(a,b]}(x) = \lim_{n \to \infty} g_n(x)$ for all $x \in \mathbb{R}$.

Proof. The assertion involving $f_n \in C_c(\mathbb{R}, [0, 1])$ was the content of one of your homework assignments. For the assertion involving $g_n \in \text{Trig}(\mathbb{R})$, it will suffice to show that any $f \in C_c(\mathbb{R})$ may be written as $f(x) = \lim_{n \to \infty} g_n(x)$ for some $\{g_n\} \subset \text{Trig}(\mathbb{R})$ where the limit is uniform for $x$ in compact subsets of $\mathbb{R}$.

So suppose that $f \in C_c(\mathbb{R})$ and $L > 0$ such that $f(x) = 0$ if $|x| \geq L/4$. Then

$$f_L(x) := \sum_{n=-\infty}^{\infty} f(x + nL)$$

is a continuous $L$–periodic function on $\mathbb{R}$, see Figure 11.2 If $\varepsilon > 0$ is given, we may apply Theorem 7.42 to find $A \subset \subset \mathbb{Z}$ such that

$$\left| f_L \left( \frac{L}{2\pi} x \right) - \sum_{\alpha \in A} a_\alpha e^{i\alpha x} \right| \leq \varepsilon \text{ for all } x \in \mathbb{R},$$

wherein we have used the fact that $x \to f_L \left( \frac{L}{2\pi} x \right)$ is a $2\pi$–periodic function of $x$. Equivalently we have,

$$\max_x \left| f_L (x) - \sum_{\alpha \in A} a_\alpha e^{i\frac{2\pi \alpha x}{L}} \right| \leq \varepsilon.$$ 

In particular it follows that $f_L(x)$ is a uniform limit of functions from $\text{Trig}(\mathbb{R})$. Since $\lim_{L \to \infty} f_L(x) = f(x)$ uniformly on compact subsets of $\mathbb{R}$, it is easy to conclude there exists $g_n \in \text{Trig}(\mathbb{R})$ such that $\lim_{n \to \infty} g_n(x) = f(x)$ uniformly on compact subsets of $\mathbb{R}$.

Corollary 11.7. Each of the following $\sigma$–algebras on $\mathbb{R}^d$ are equal to $B_{\mathbb{R}^d}$:

1. $\mathcal{M}_1 := \sigma (\cup_{n=1}^\infty \{x \to f_i(x) : f_i \in C_c(\mathbb{R})\})$,
2. $\mathcal{M}_2 := \sigma (x \to f_1(x_1) \cdots f_d(x_d) : f_i \in C_c(\mathbb{R}))$,
3. $\mathcal{M}_3 = \sigma (C_c(\mathbb{R}^d))$, and
4. $\mathcal{M}_4 := \sigma (\{x \to e^{i\lambda x} : \lambda \in \mathbb{R}^d\})$.

Proof. As the functions defining each $\mathcal{M}_i$ are continuous and hence Borel measurable, it follows that $\mathcal{M}_i \subset B_{\mathbb{R}^d}$ for each $i$. So to finish the proof it suffices to show $B_{\mathbb{R}^d} \subset M_i$ for each $i$.

$\mathcal{M}_1$ case. Let $a,b \in \mathbb{R}$ with $-\infty < a < b < \infty$. By Lemma 11.6, there exists $f_n \in C_c(\mathbb{R})$ such that $\lim_{n \to \infty} f_n = 1_{(a,b]}$. Therefore it follows that $x \to 1_{(a,b]}(x)$ is $\mathcal{M}_1$–measurable for each $i$. Moreover if $-\infty < a_i < b_i < \infty$ for each $i$, then we may conclude that

$$x \to \prod_{i=1}^d 1_{(a_i,b_i]}(x) = 1_{(a_1,b_1] \times \cdots \times (a_d,b_d]}(x)$$

is $\mathcal{M}_1$–measurable as well and hence $(a_1,b_1] \times \cdots \times (a_d,b_d] \in \mathcal{M}_1$. As such sets generate $B_{\mathbb{R}^d}$ we may conclude that $B_{\mathbb{R}^d} \subset \mathcal{M}_1$.

And therefore $\mathcal{M}_1 = B_{\mathbb{R}^d}$.

$\mathcal{M}_2$ case. As above, we may find $f_{i,n} \to 1_{(a_i,b_i]}$ as $n \to \infty$ for each $1 \leq i \leq d$ and therefore,

$$1_{(a_1,b_1] \times \cdots \times (a_d,b_d]}(x) = \lim_{n \to \infty} f_{1,n}(x_1) \cdots f_{d,n}(x_d) \text{ for all } x \in \mathbb{R}^d.$$

This shows that $1_{(a_1,b_1] \times \cdots \times (a_d,b_d]}$ is $\mathcal{M}_2$–measurable and therefore $(a_1,b_1] \times \cdots \times (a_d,b_d] \in \mathcal{M}_2$.

$\mathcal{M}_3$ case. This is easy since $B_{\mathbb{R}^d} = \mathcal{M}_2 \subset \mathcal{M}_3$.

$\mathcal{M}_4$ case. By Lemma 11.6, there exists $g_n \in \text{Trig}(\mathbb{R})$ such that $\lim_{n \to \infty} g_n = 1_{(a,b]}$. Since $x \to g_n(x)$ is in the span $\{x \to e^{i\lambda x} : \lambda \in \mathbb{R}^d\}$ for each $n$, it follows that $x \to 1_{(a,b]}(x)$ is $\mathcal{M}_4$–measurable for all $-\infty < a < b < \infty$. Therefore, just as in the proof of case 1., we may now conclude that $B_{\mathbb{R}^d} \subset \mathcal{M}_4$. 

Fig. 11.2. This is plot of $f_b(x)$ where $f(x) = (1 - x^2) 1_{|x|\leq 1}$. The center hump by itself would be the plot of $f(x)$.
Corollary 11.8. Suppose that $H$ is a subspace of complex valued functions on $\mathbb{R}^d$ which is closed under complex conjugation and bounded convergence. If $H$ contains any one of the following collection of functions:

1. $M := \{ x \rightarrow f_1(x_1) \ldots f_d(x_d) : f_i \in C_c(\mathbb{R}) \}$
2. $M := C_c(\mathbb{R}^d)$, or
3. $M := \{ x \rightarrow e^{i\lambda x} : \lambda \in \mathbb{R}^d \}$

then $H$ contains all bounded complex Borel measurable functions on $\mathbb{R}^d$.

Proof. Observe that if $f \in C_c(\mathbb{R})$ such that $f(x) = 1$ in a neighborhood of 0, then $f_n(x) := f(x/n) \rightarrow 1$ as $n \rightarrow \infty$. Therefore in cases 1 and 2, $H$ contains the constant function, 1, since

$$
1 = \lim_{n \rightarrow \infty} f_n(x_1) \ldots f_n(x_d).
$$

In case 3, $1 \in M \subset H$ as well. The result now follows from Theorem 11.5 and Corollary 11.7.

Proposition 11.9 (Change of Variables Formula). Suppose that $-\infty < a < b < \infty$ and $u : [a, b] \rightarrow \mathbb{R}$ is a continuously differentiable function. Let $[c, d] = u([a, b])$ where $c = \min u([a, b])$ and $d = \max u([a, b])$. (By the intermediate value theorem $u([a, b])$ is an interval.) Then for all bounded measurable functions, $f : [c, d] \rightarrow \mathbb{R}$ we have

$$
\int_{u(a)}^{u(b)} f(x) \, dx = \int_a^b f(u(t)) \, \dot{u}(t) \, dt. \tag{11.2}
$$

Moreover, Eq. (11.2) is also valid if $f : [c, d] \rightarrow \mathbb{R}$ is measurable and

$$
\int_a^b |f(u(t))| \, |\dot{u}(t)| \, dt < \infty. \tag{11.3}
$$

Proof. Let $H$ denote the space of bounded measurable functions such that Eq. (11.2) holds. It is easily checked that $H$ is a linear space closed under bounded convergence. Next we show that $M = C([c, d], \mathbb{R}) \subset H$ which coupled with Corollary 11.8 will show that $H$ contains all bounded measurable functions from $[c, d]$ to $\mathbb{R}$.

If $f : [c, d] \rightarrow \mathbb{R}$ is a continuous function and let $F$ be an anti-derivative of $f$. Then by the fundamental theorem of calculus,

$$
\int_a^b f(u(t)) \, \dot{u}(t) \, dt = \left[ F'(u(t)) \right]_a^b = \int_a^b \frac{d}{dt} F(u(t)) \, dt = F(u(b)) - F(u(a)) = \int_{u(a)}^{u(b)} F'(x) \, dx = \int_{u(a)}^{u(b)} f(x) \, dx.
$$

Thus $M \subset H$ and the first assertion of the proposition is proved.

Now suppose that $f : [c, d] \rightarrow \mathbb{R}$ is measurable and Eq. (11.3) holds. For $M < \infty$, let $f_M(x) = f(x) \cdot 1_{f(x) < M}$ a bounded measurable function. Therefore applying Eq. (11.2) with $f$ replaced by $|f_M|$ shows,

$$
\int_{u(a)}^{u(b)} |f_M(x)| \, dx = \int_a^b |f_M(u(t))| \, \dot{u}(t) \, dt \leq \int_a^b |f_M(u(t))| \, |\dot{u}(t)| \, dt.
$$

Using the MCT, we may let $M \uparrow \infty$ in the previous inequality to learn

$$
\int_{u(a)}^{u(b)} |f(x)| \, dx \leq \int_a^b |f(u(t))| \, |\dot{u}(t)| \, dt < \infty.
$$

Now apply Eq. (11.2) with $f$ replaced by $f_M$ to learn

$$
\int_{u(a)}^{u(b)} f_M(x) \, dx = \int_a^b f_M(u(t)) \, \dot{u}(t) \, dt.
$$

Using the DCT we may now let $M \rightarrow \infty$ in this equation to show that Eq. (11.2) remains valid.

Exercise 11.2. Suppose that $u : \mathbb{R} \rightarrow \mathbb{R}$ is a continuously differentiable function such that $\dot{u}(t) \geq 0$ for all $t$ and $\lim_{t \rightarrow \pm \infty} u(t) = \pm \infty$. Show that

$$
\int_{\mathbb{R}} f(x) \, dx = \int_{\mathbb{R}} f(u(t)) \, \dot{u}(t) \, dt \tag{11.4}
$$

for all measurable functions $f : \mathbb{R} \rightarrow [0, \infty]$. In particular applying this result to $u(t) = at + b$ where $a > 0$ implies,

$$
\int_{\mathbb{R}} f(x) \, dx = a \int_{\mathbb{R}} f(at + b) \, dt.
$$

Definition 11.10. The Fourier transform or characteristic function of a finite measure, $\mu$, on $(\mathbb{R}^d, \mathcal{B}_{\mathbb{R}^d})$, is the function, $\hat{\mu} : \mathbb{R}^d \rightarrow \mathbb{C}$ defined by

$$
\hat{\mu}(\lambda) := \int_{\mathbb{R}^d} e^{i\lambda x} \, d\mu(x) \text{ for all } \lambda \in \mathbb{R}^d
$$

Corollary 11.11. Suppose that $\mu$ and $\nu$ are two probability measures on $(\mathbb{R}^d, \mathcal{B}_{\mathbb{R}^d})$. Then any one of the next three conditions implies that $\mu = \nu$:

1. $\int_{\mathbb{R}^d} f_1(x_1) \ldots f_d(x_d) \, d\nu(x) = \int_{\mathbb{R}^d} f_1(x_1) \ldots f_d(x_d) \, d\mu(x)$ for all $f_i \in C_C(\mathbb{R})$.
2. $\int_{\mathbb{R}^d} f(x) \, d\nu(x) = \int_{\mathbb{R}^d} f(x) \, d\mu(x)$ for all $f \in C_c(\mathbb{R}^d)$. 

3. \( \hat{\nu} = \hat{\mu}. \)

Item 3. asserts that the Fourier transform is injective.

**Proof.** Let \( \mathbb{H} \) be the collection of bounded complex measurable functions from \( \mathbb{R}^d \) to \( \mathbb{C} \) such that

\[
\int_{\mathbb{R}^d} f \, d\mu = \int_{\mathbb{R}^d} f \, d\nu. \tag{11.5}
\]

It is easily seen that \( \mathbb{H} \) is a linear space closed under complex conjugation and bounded convergence (by the DCT). Since \( \mathbb{H} \) contains one of the multiplicative systems appearing in Corollary 11.12, it contains all bounded Borel measurable functions form \( \mathbb{R}^d \to \mathbb{C} \). Thus we may take \( f = 1_A \) with \( A \in \mathcal{B}_{\mathbb{R}^d} \) in Eq. (11.5) to learn, \( \mu (A) = \nu (A) \) for all \( A \in \mathcal{B}_{\mathbb{R}^d} \).

In many cases we can replace the condition in item 3. of Corollary 11.11 by:

\[
\int_{\mathbb{R}^d} e^{\lambda x} d\mu (x) = \int_{\mathbb{R}^d} e^{\lambda x} d\nu (x) \quad \text{for all } \lambda \in U, \tag{11.6}
\]

where \( U \) is a neighborhood of \( 0 \in \mathbb{R}^d \). In order to do this, one must assume at least assume that the integrals involved are finite for all \( \lambda \in U \). The idea is to show that Condition 11.6 implies \( \hat{\nu} = \hat{\mu} \). You are asked to carry out this argument in Exercise 11.13 making use of the following lemma.

**Lemma 11.12 (Analytic Continuation).** Let \( \varepsilon > 0 \) and \( S_\varepsilon := \{ x + iy \in \mathbb{C} : |x| < \varepsilon \} \) be an \( \varepsilon \) strip in \( \mathbb{C} \) about the imaginary axis. Suppose that \( h : S_\varepsilon \to \mathbb{C} \) is a function such that for each \( b \in \mathbb{R} \), there exists \( \{ c_n (b) \}_{n=0}^{\infty} \subset \mathbb{C} \) such that

\[
h (z + ib) = \sum_{n=0}^{\infty} c_n (b) z^n \quad \text{for all } |z| < \varepsilon. \tag{11.7}
\]

If \( c_n (0) = 0 \) for all \( n \in \mathbb{N}_0 \), then \( h \equiv 0 \).

**Proof.** It suffices to prove the following assertion: if for some \( b \in \mathbb{R} \) we know that \( c_n (b) = 0 \) for all \( n \), then \( c_n (y) = 0 \) for all \( n \) and \( y \in (b - \varepsilon, b + \varepsilon) \). We now prove this assertion.

Let us assume that \( b \in \mathbb{R} \) and \( c_n (b) = 0 \) for all \( n \in \mathbb{N}_0 \). It then follows from Eq. (11.7) that \( h (z + ib) = 0 \) for all \( |z| < \varepsilon \). Thus if \( |y - b| < \varepsilon \), we may conclude that \( h (x + iy) = 0 \) for \( x \) in a (possibly very small) neighborhood \((\delta, \delta)\) of \( 0 \).

Since \( \sum_{n=0}^{\infty} c_n (y) x^n = h (x + iy) = 0 \) for all \( |x| < \delta \),

it follows that

\[
0 = \frac{1}{n!} \frac{d^n}{dx^n} h (x + iy) |_{x=0} = c_n (y)
\]

and the proof is complete.

### 11.2 Exercises

**Exercise 11.3.** Suppose \( \varepsilon > 0 \) and \( X \) and \( Y \) are two random variables such that \( \mathbb{E} [e^{ixX}] = \mathbb{E} [e^{iyY}] < \infty \) for all \( |t| < \varepsilon \). Show:

1. \( \mathbb{E} [e^{ixX}] \) and \( \mathbb{E} [e^{iyY}] \) are finite.
2. \( \mathbb{E} [e^{ixX}] = \mathbb{E} [e^{iyY}] \) for all \( t \in \mathbb{R} \). \**Hint:** Consider \( h (z) := \mathbb{E} [e^{izX}] - \mathbb{E} [e^{izY}] \) for \( z \in S_\varepsilon \). Now show for \( |z| < \varepsilon \) and \( b \in \mathbb{R} \), that

\[
h (z + ib) = \mathbb{E} [e^{ibX} e^{izX}] - \mathbb{E} [e^{ibY} e^{izY}] = \sum_{n=0}^{\infty} c_n (b) z^n \tag{11.8}
\]

where

\[
c_n (b) := \frac{1}{n!} \left( \mathbb{E} [e^{ibX} e^{iX}] - \mathbb{E} [e^{ibY} e^{iY}] \right). \tag{11.9}
\]

3. Conclude from item 2. that \( X = Y \), i.e. that \( \text{Law}_P (X) = \text{Law}_P (Y) \).

**Exercise 11.4.** Let \( (\Omega, \mathcal{B}, P) \) be a probability space and \( X, Y : \Omega \to \mathbb{R} \) be a pair of random variables such that

\[
\mathbb{E} [f (X) g (Y)] = \mathbb{E} [f (X) g (X)]
\]

for every pair of bounded measurable functions, \( f, g : \mathbb{R} \to \mathbb{R} \). Show \( P (X = Y) = 1 \). \**Hint:** Let \( \mathbb{H} \) denote the bounded Borel measurable functions, \( h : \mathbb{R}^2 \to \mathbb{R} \) such that

\[
\mathbb{E} [h (X, Y)] = \mathbb{E} [h (X, X)].
\]

Use Theorem 11.2 to show \( \mathbb{H} \) is the vector space of all bounded Borel measurable functions. Then take \( h (x, y) = 1_{\{x=y\}} \).

**Exercise 11.5 (Density of \( A \) – simple functions).** Let \( (\Omega, \mathcal{B}, P) \) be a probability space and assume that \( A \) is a sub-algebra of \( \mathcal{B} \) such that \( \mathcal{B} = \sigma (A) \). Let \( \mathbb{H} \) denote the bounded measurable functions \( f : \Omega \to \mathbb{R} \) such that for every \( \varepsilon > 0 \) there exists an \( \mathcal{A} \) – simple function, \( \varphi : \Omega \to \mathbb{R} \) such that \( \mathbb{E} [|f - \varphi|] < \varepsilon \). Show \( \mathbb{H} \) consists of all bounded measurable functions, \( f : \Omega \to \mathbb{R} \). \**Hint:** let \( M \) denote the collection of \( A \) – simple functions.

**Corollary 11.13.** Suppose that \( (\Omega, \mathcal{B}, P) \) is a probability space, \( \{ X_n \}_{n=1}^{\infty} \) is a collection of random variables on \( \Omega \), and \( \mathcal{B}_\infty := \sigma (X_1, X_2, X_3, \ldots) \). Then for all \( \varepsilon > 0 \) and all bounded \( \mathcal{B}_\infty \) – measurable functions, \( f : \Omega \to \mathbb{R} \), there exists an \( n \in \mathbb{N} \) and a bounded \( \mathcal{B}_\infty \) – measurable function \( G : \mathbb{R}^n \to \mathbb{R} \) such that \( \mathbb{E} [|f - G (X_1, \ldots, X_n)|] < \varepsilon. \) Moreover we may assume that \( \sup_{x \in \mathbb{R}^n} |G (x)| \leq M := \sup_{\omega \in \Omega} |f (\omega)| \).
Proposition 11.14 (Density of \( A \) in \( B = \sigma (A) \)). Let \((\Omega, B, P)\) be a probability space and assume that \( A \) is a sub-algebra of \( B \) such that \( B = \sigma (A) \). Then to each \( B \in \mathbb{B} \) and \( \varepsilon > 0 \) there exists a \( D \in \mathcal{A} \) such that

\[
P (B \Delta D) = E |1_B - 1_D| < \varepsilon.
\]

**Proof.** Let \( f = 1_B \) and choose an \( A \) – simple function, \( \varphi : \Omega \to \mathbb{R} \) such that \( E |f - \varphi| < \varepsilon \) by Exercise 11.5. Let \( \lambda_0 = 0 \) and \( \{ \lambda_i \}_{i=1}^n \) be an enumeration of \( \varphi (\Omega) \setminus \{ 0 \} \) so that \( \varphi = \sum_{i=0}^n \lambda_i 1_{A_i} \) where \( A_i := \{ \varphi = \lambda_i \} \). Then

\[
E |1_B - \varphi| = \sum_{i=0}^n E [1_{A_i} (|1_B - \varphi|)] = \sum_{i=0}^n E [|1_B - \lambda_i|]
\]

\[
= \sum_{i=0}^n E [1_{A_i \cap B} (|1_B - \lambda_i|) + 1_{A_i \setminus B} (|1_B - \lambda_i|)] = P (A_0 \cap B) + \sum_{i=1}^n \min \{ |1 - \lambda_i|, P (B \cap A_i), P (A_i \setminus B) \} \geq P (A_0 \cap B) + \sum_{i=1}^n \min \{ |1 - \lambda_i|, \lambda_i \} \min \{ P (B \cap A_i), P (A_i \setminus B) \} \geq P (A_0 \cap B) + \sum_{i=1}^n \min \{ P (B \cap A_i), P (A_i \setminus B) \}
\]

where the last equality is a consequence of the fact that \( 1 \leq |\lambda_i| + |1 - \lambda_i| \).

Now let \( \psi = \sum_{i=0}^n \alpha_i 1_{A_i} \) where \( \alpha_i = 0 \) and for \( 1 \leq i \leq n \),

\[
\alpha_i = \begin{cases} 1 & \text{if } P (A_i \setminus B) \leq P (B \cap A_i) \\ 0 & \text{if } P (A_i \setminus B) > P (B \cap A_i) \end{cases}
\]

From Eq. (11.10) with \( \varphi \) replaced by \( \psi \) and \( \lambda_i \) by \( \alpha_i \) for all \( i \) then show that

\[
E |1_B - \psi| = P (A_0 \cap B) + \sum_{i=1}^n \min \{ P (B \cap A_i), P (A_i \setminus B) \} \leq E |1_B - \varphi|.
\]

where the last equality is a consequence of Eq. (11.11). Since \( \psi = 1_D \) where \( D = \bigcup_{i=1}^n A_i \in \mathcal{A} \) we have shown there exists a \( D \in \mathcal{A} \) such that

\[
P (B \Delta D) = E |1_B - 1_D| < \varepsilon.
\]

Proposition 11.15. Suppose that \( \{ (X_i, B_i) \}_{i=1}^n \) are measurable spaces and for each \( i, \mathbb{M}_i \) is a multiplicative system of real bounded measurable functions on \( X_i \) such that \( \sigma (\mathbb{M}_i) = B_i \) and there exist \( \chi_n \in \mathbb{M}_i \) such that \( \chi_n \to 1 \) boundedly as \( n \to \infty \). Given \( f_i : X_i \to \mathbb{R} \) let \( f_1 \otimes \cdots \otimes f_n : X_1 \times \cdots \times X_n \to \mathbb{R} \) be defined by

\[
(f_1 \otimes \cdots \otimes f_n) (x_1, \ldots, x_n) = f_1 (x_1) \cdots f_n (x_n).
\]

Show

\[
\mathbb{M}_1 \otimes \cdots \otimes \mathbb{M}_n := \{ f_1 \otimes \cdots \otimes f_n : f_i \in \mathbb{M}_i \text{ for } 1 \leq i \leq n \}
\]

is a multiplicative system of bounded measurable functions on \( (X := X_1 \times \cdots \times X_n, B := B_1 \otimes \cdots \otimes B_n) \) such that \( \sigma (\mathbb{M}_1 \otimes \cdots \otimes \mathbb{M}_n) = B \).

**Proof.** I will give the proof in case that \( n = 2 \). The generalization to higher \( n \) is straightforward. Let \( \pi_i : X \to X_i \) be the projection maps, \( \pi_1 (x_1, x_2) = x_1 \) and \( \pi_2 (x_1, x_2) = x_2 \). For \( f_1 \in \mathbb{M}_1, f_1 \otimes \pi_1 : X \to \mathbb{R} \) is the composition of measurable functions and hence measurable. Therefore \( f_1 \otimes f_2 = (f_1 \otimes \pi_1) \cdot (f_2 \circ \pi_2) \) is a bounded \( B_1 \otimes B_2 \) – measurable function and therefore \( \sigma (\mathbb{M}_1 \otimes \mathbb{M}_2) \subseteq B_1 \otimes B_2 \).

Since it is clear that \( \mathbb{M}_1 \otimes \mathbb{M}_2 \) is a multiplicative system, to finish the proof we must show \( B_1 \otimes B_2 \subset \sigma (\mathbb{M}_1 \otimes \mathbb{M}_2) \) which we now do.

Let \( g \in \mathbb{M}_2 \) and let

\[
\mathbb{H}_g := \{ f \in (B_1)_g : f \circ g \in \sigma (\mathbb{M}_1 \otimes \mathbb{M}_2) \}
\]

You may easily check that \( \mathbb{H}_g \) is closed under bounded convergence, \( \mathbb{M}_1 \subset \mathbb{H}_g \), and \( \mathbb{H}_g \) contains the constant functions. Since \( \sigma (\mathbb{M}_1) = B_1 \) it now follows by Dynkin’s multiplicative systems Theorem 11.2 that \( \mathbb{H}_g = (B_1)_g \). Thus we have shown that \( (B_1)_g \otimes \mathbb{M}_2 \) consists of \( \sigma (\mathbb{M}_1 \otimes \mathbb{M}_2) \) – measurable functions. By the same logic we may now conclude that \( (B_1)_g \otimes (B_2)_g \) consists of \( \sigma (\mathbb{M}_1 \otimes \mathbb{M}_2) \) – measurable functions as well. In particular this shows for any \( A_1 \in B_1 \) that \( 1_{A_1 \times A_2} = 1_{A_1} \otimes 1_{A_2} \in \sigma (\mathbb{M}_1 \otimes \mathbb{M}_2) \) – measurable and therefore \( A_1 \times A_2 \in \sigma (\mathbb{M}_1 \otimes \mathbb{M}_2) \) for all \( A_1 \in B_1 \). As the set \( \{ A_1 \times A_2 : A_i \in B_i \} \) generate \( B_1 \otimes B_2 \) we may conclude that \( B_1 \otimes B_2 \subset \sigma (\mathbb{M}_1 \otimes \mathbb{M}_2) \).

11.3 A Strengthening of the Multiplicative System Theorem*

**Notation 11.16** We say that \( \mathbb{H} \subset \ell^\infty (\Omega, \mathbb{R}) \) is closed under monotone convergence if: for every sequence, \( \{ f_n \}_{n=1}^\infty \subset \mathbb{H} \), satisfying:
 Clearly if $\mathbb{H}$ is closed under bounded convergence then it is also closed under monotone convergence. I learned the proof of the converse from Pat Fitzsimmons but this result appears in Sharpe [25, p. 365].

**Proposition 11.17.** Let $\Omega$ be a set. Suppose that $\mathbb{H}$ is a vector subspace of bounded real valued functions from $\Omega$ to $\mathbb{R}$ which is closed under monotone convergence. Then $\mathbb{H}$ is closed under uniform convergence as well, i.e. $\{f_n\}_{n=1}^\infty \subset \mathbb{H}$ with $\sup_{n\in \mathbb{N}} \sup_{\omega \in \Omega} |f_n(\omega)| < \infty$ and $f_n \to f$, then $f \in \mathbb{H}$.

**Proof.** Let us first assume that $\{f_n\}_{n=1}^\infty \subset \mathbb{H}$ such that $f_n$ converges uniformly to a bounded function, $f : \Omega \to \mathbb{R}$. Let $\|f\|_\infty := \sup_{\omega \in \Omega} |f(\omega)|$. Let $\varepsilon > 0$ be given. By passing to a subsequence if necessary, we may assume $\|f - f_n\|_\infty \leq \varepsilon 2^{-(n+1)}$. Let

$$g_n := f_n - \delta_n + M$$

with $\delta_n$ and $M$ constants to be determined shortly. We then have

$$g_{n+1} - g_n = f_{n+1} - f_n + \delta_n - \delta_{n+1} \geq -\varepsilon 2^{-(n+1)} + \delta_n - \delta_{n+1}.$$ 

Taking $\delta_n := \varepsilon 2^{-n}$, then $\delta_n - \delta_{n+1} = \varepsilon 2^{-n} (1 - 1/2) = \varepsilon 2^{-(n+1)}$ in which case $g_{n+1} - g_n \geq 0$ for all $n$. By choosing $M$ sufficiently large, we will also have $g_n \geq 0$ for all $n$. Since $\mathbb{H}$ is a vector space containing the constant functions, $g_n \in \mathbb{H}$ and since $g_n \uparrow f + M$, it follows that $f = f + M - M \in \mathbb{H}$. So we have shown that $\mathbb{H}$ is closed under uniform convergence.

This proposition immediately leads to the following strengthening of Theorem 11.18.

**Theorem 11.18.** Suppose that $\mathbb{H}$ is a vector subspace of bounded real valued functions on $\Omega$ which contains the constant functions and is closed under monotone convergence. If $\mathcal{M} \subset \mathbb{H}$ is multiplicative system, then $\mathbb{H}$ contains all bounded $\sigma(\mathcal{M})$ – measurable functions.

**Proof.** Proposition 11.17 reduces this theorem to Theorem 11.2.

### 11.4 The Bounded Approximation Theorem*

This section should be skipped until needed (if ever!).

**Notation 11.19** Given a collection of bounded functions, $\mathcal{M}$, from a set, $\Omega$, to $\mathbb{R}$, let $\mathcal{M}_+(\mathcal{M}_-)$ denote the the bounded monotone increasing (decreasing) limits of functions from $\mathcal{M}$. More explicitly a bounded function, $f : \Omega \to \mathbb{R}$ is in $\mathcal{M}_+$ respectively $\mathcal{M}_-$ iff there exists $f_n \in \mathcal{M}$ such that $f_n \uparrow f$ respectively $f_n \downarrow f$.

**Theorem 11.20** (Bounded Approximation Theorem*). Let $(\Omega, \mathcal{B}, \mu)$ be a finite measure space and $\mathcal{M}$ be an algebra of bounded $\mathbb{R}$ – valued measurable functions such that:

1. $\sigma(\mathcal{M}) = \mathcal{B}$,
2. $1 \in \mathcal{M}$, and
3. $|f| \in \mathcal{M}$ for all $f \in \mathcal{M}$.

Then for every bounded $\sigma(\mathcal{M})$ measurable function, $g : \Omega \to \mathbb{R}$, and every $\varepsilon > 0$, there exists $f \in \mathcal{M}_+$ and $h \in \mathcal{M}_-$ such that $f \leq g \leq h$ and $\mu (h - f) < \varepsilon$.

**Proof.** Let us begin with a few simple observations.

1. $\mathcal{M}$ is a “lattice” – if $f, g \in \mathcal{M}$ then

$$f \vee g = \frac{1}{2} (f + g + |f - g|) \in \mathcal{M}$$

and

$$f \wedge g = \frac{1}{2} (f + g - |f - g|) \in \mathcal{M}.$$

2. If $f, g \in \mathcal{M}_+$ or $f, g \in \mathcal{M}_-$ then $f + g \in \mathcal{M}_+$ or $f + g \in \mathcal{M}_-$ respectively.
3. If $\lambda \geq 0$ and $f \in \mathcal{M}_+$ ($f \in \mathcal{M}_-$), then $\lambda f \in \mathcal{M}_+$ ($\lambda f \in \mathcal{M}_-$).
4. If $f \in \mathcal{M}_+$ then $-f \in \mathcal{M}_-$ and visa versa.
5. If $f_n \in \mathcal{M}_+$ and $f_n \uparrow f$ where $f : \Omega \to \mathbb{R}$ is a bounded function, then $f \in \mathcal{M}_+$.

Indeed, by assumption there exists $f_{n, i} \in \mathcal{M}$ such that $f_{n, i} \uparrow f_n$ as $i \to \infty$. By observation (1), $g_n := \max \{f_{ij} : i, j \leq n \} \in \mathcal{M}_+$. Moreover it is clear that $g_n \leq \max \{ f_k : k \leq n \} = f_n \leq f$ and hence $g_n \uparrow g := \lim_{n \to \infty} g_n \leq f$. Since $f_{ij} \leq g$ for all $i, j$, it follows that $f_n = \lim_{j \to \infty} f_{nj} \leq g$ and consequently that $f = \lim_{n \to \infty} f_n \leq g \leq f$. So we have shown that $g_n \uparrow f \in \mathcal{M}_+$.

Now let $\mathbb{H}$ denote the collection of bounded measurable functions which satisfy the assertion of the theorem. Clearly, $\mathcal{M} \subset \mathbb{H}$ and in fact it is also easy to see that $\mathcal{M}_+ \subset \mathbb{H}$ and $\mathcal{M}_- \subset \mathbb{H}$ as well. For example, if $f \in \mathcal{M}_+$, by definition, there exists $f_n \in \mathcal{M} \subset \mathcal{M}_+$ such that $f_n \uparrow f$. Since $\mathcal{M}_+ \supset f_n \leq f \in \mathcal{M}_+$ and $\mu (f - f_n) \to 0$ by the dominated convergence theorem, it follows that $f \in \mathbb{H}$. As similar argument shows $\mathcal{M}_- \subset \mathbb{H}$. We will now show $\mathbb{H}$ is a vector sub-space of the bounded $\mathcal{B} = \sigma(\mathcal{M})$ – measurable functions.

$\mathbb{H}$ is closed under addition. If $g_i \in \mathbb{H}$ for $i = 1, 2$, and $\varepsilon > 0$ is given, we may find $f_i \in \mathcal{M}_+$ and $h_i \in \mathcal{M}_-$ such that $f_i \leq g_i \leq h_i$ and $\mu (h_i - f_i) < \varepsilon/2$ for $i = 1, 2$. Since $h = h_1 + h_2 \in \mathcal{M}_+$, $f := f_1 + f_2 \in \mathcal{M}_+$, $f \leq g_1 + g_2 \leq h$, and

$$\mu (h - f) = \mu (h_1 - f_1) + \mu (h_2 - f_2) < \varepsilon,$$

Bruce: rework the Daniel integral section in the Analysis notes to stick to lattices of bounded functions.
it follows that \( g_1 + g_2 \in \mathbb{H} \).

**\( \mathbb{H} \) is closed under scalar multiplication.** If \( g \in \mathbb{H} \) then \( \lambda g \in \mathbb{H} \) for all \( \lambda \in \mathbb{R} \). Indeed suppose that \( \varepsilon > 0 \) is given and \( f \in M_{\uparrow} \) and \( h \in M_{\uparrow} \) such that \( f \leq g \leq h \) and \( \mu (h - f) < \varepsilon \). Then for \( \lambda \geq 0 \), \( \lambda f \leq \lambda g \leq \lambda h \in M_{\uparrow} \) and

\[
\mu(\lambda h - \lambda f) = \lambda \mu(h - f) < \lambda \varepsilon.
\]

Since \( \varepsilon > 0 \) was arbitrary, if follows that \( \lambda g \in \mathbb{H} \) for \( \lambda \geq 0 \). Similarly, \( M_{\downarrow} \geq -h \leq -g \leq -f \in M_{\uparrow} \) and

\[
\mu(-f - (-h)) = \mu(h - f) < \varepsilon.
\]

which shows \(-g \in \mathbb{H}\) as well.

Because of Theorem \([\Pi.18]\) to complete this proof, it suffices to show \( \mathbb{H} \) is closed under monotone convergence. So suppose that \( g_n \in \mathbb{H} \) and \( g_n \uparrow g \), where \( g : \Omega \rightarrow \mathbb{R} \) is a bounded function. Since \( \mathbb{H} \) is a vector space, it follows that \( 0 \leq \delta_n := g_{n+1} - g_n \in \mathbb{H} \) for all \( n \in \mathbb{N} \). So if \( \varepsilon > 0 \) is given, we can find \( M_{\uparrow} \ni u_n \leq \delta_n \leq v_n \in M_{\uparrow} \) such that \( \mu(v_n - u_n) \leq 2^{-n} \varepsilon \) for all \( n \). By replacing \( u_n \) by \( u_n \vee 0 \in M_{\uparrow} \) (by observation 1.), we may further assume that \( u_n \geq 0 \). Let

\[
v := \sum_{n=1}^{\infty} v_n \uparrow \lim_{N \to \infty} \sum_{n=1}^{N} v_n \in M_{\uparrow} \quad \text{(using observations 2. and 5.)}
\]

and for \( N \in \mathbb{N} \), let

\[
u N := \sum_{n=1}^{N} u_n \in M_{\uparrow} \quad \text{(using observation 2.)}
\]

Then

\[
\sum_{n=1}^{\infty} \delta_n \leq \lim_{N \to \infty} \sum_{n=1}^{N} \delta_n = \lim_{N \to \infty} (g_{N+1} - g_1) = g - g_1
\]

and \( u_N \leq g - g_1 \leq v \). Moreover,

\[
\mu(v - u_N) = \sum_{n=1}^{N} \mu(v_n - u_n) + \sum_{n=N+1}^{\infty} \mu(v_n) \leq \sum_{n=1}^{N} \varepsilon 2^{-n} + \sum_{n=N+1}^{\infty} \mu(v_n)
\]

\[
\leq \varepsilon + \sum_{n=N+1}^{\infty} \mu(v_n).
\]

However, since

\[
\sum_{n=1}^{\infty} \mu(v_n) \leq \sum_{n=1}^{\infty} \mu(\delta_n + \varepsilon 2^{-n}) = \sum_{n=1}^{\infty} \mu(\delta_n) + \varepsilon \mu(\Omega)
\]

\[
= \sum_{n=1}^{\infty} \mu(g - g_1) + t \varepsilon \mu(\Omega) < \infty,
\]

it follows that for \( N \in \mathbb{N} \) sufficiently large that \( \sum_{n=N+1}^{\infty} \mu(v_n) < \varepsilon \). Therefore, for this \( N \), we have \( \mu(v - u_N) < 2 \varepsilon \) and since \( \varepsilon > 0 \) is arbitrary, if follows that \( g - g_1 \in \mathbb{H} \). Since \( g_1 \in \mathbb{H} \) and \( \mathbb{H} \) is a vector space, we may conclude that

\[
g = (g - g_1) + g_1 \in \mathbb{H}.
\]

### 11.5 Solutions

**Exercise 11.6 (Density of \( A \) in \( B = \sigma(A) \)).** Keeping the same notation as in Exercise 11.3 but now take \( f = 1_B \) for some \( B \in \mathcal{B} \) and given \( \varepsilon > 0 \), write \( \varphi = \sum_{i=0}^{\infty} \lambda_i 1_{A_i} \) where \( \lambda_0 = 0 \), \( \{\lambda_i\}_{i=1}^{\infty} \) is an enumeration of \( \varphi(\Omega) \setminus \{0\} \), and \( A_i := \{\varphi = \lambda_i\} \). Show: 1.

\[
\mathbb{E}[B - \varphi] = P(A_0 \cap B) + \sum_{i=1}^{\infty} \mu(|1 - \lambda_i| P(B \cap A_i) + |\lambda_i| P(A_i \setminus B))
\]

\[
\geq P(A_0 \cap B) + \sum_{i=1}^{\infty} \min\{P(B \cap A_i), P(A_i \setminus B)\}.
\]

2. Now let \( \psi = \sum_{i=0}^{\infty} \alpha_i 1_{A_i} \) with

\[
\alpha_i = \begin{cases} 1 & \text{if } P(A_i \setminus B) \leq P(B \cap A_i) \\ 0 & \text{if } P(A_i \setminus B) > P(B \cap A_i) \end{cases}
\]

Then show that

\[
\mathbb{E}[B - \psi] = P(A_0 \cap B) + \sum_{i=1}^{\infty} \min\{P(B \cap A_i), P(A_i \setminus B)\} \leq \mathbb{E}[B - \varphi].
\]

Observe that \( \psi = 1_D \) where \( D = \bigcup_{i=1}^{\infty} A_i \in \mathcal{A} \) and so you have shown; for every \( \varepsilon > 0 \) there exists a \( D \in \mathcal{A} \) such that

\[
P(\mathcal{B}(D)) = \mathbb{E}[B - 1_D] < \varepsilon.
\]

**Exercise 11.7.** Suppose that \( \{(X_i,B_i)\}_{i=1}^{n} \) are measurable spaces and for each \( i, M_i \) is a multiplicative system of real bounded measurable functions on \( X_i \) such that \( \sigma(M_i) = B_i \) and there exist \( \chi_n \in M_i \) such that \( \chi_n \rightarrow 1 \) boundedly as \( n \rightarrow \infty \). Given \( f_i : X_i \rightarrow \mathbb{R} \) let \( f_1 \otimes \cdots \otimes f_n : X_1 \times \cdots \times X_n \rightarrow \mathbb{R} \) be defined by

\[
(f_1 \otimes \cdots \otimes f_n)(x_1,\ldots,x_n) = f_1(x_1)\ldots f_n(x_n).
\]

Show

\[
M_1 \otimes \cdots \otimes M_n := \{f_1 \otimes \cdots \otimes f_n : f_i \in M_i \text{ for } 1 \leq i \leq n\}
\]

is a multiplicative system of bounded measurable functions on \( X := X_1 \times \cdots \times X_n, B := B_1 \otimes \cdots \otimes B_n \) such that \( \sigma(M_1 \otimes \cdots \otimes M_n) = B \).
we may conclude that $\sigma$ – measurable functions as well. In particular this shows for any $H$ Dynkin’s multiplicative systems Theorem 11.2, that $H$ contains the constant functions. Since $\sigma(M_1) = B_1$ it now follows by Dynkin’s multiplicative systems Theorem [11.2] that $H_g = \sigma(B_1)_b$. Thus we have shown that $(B_1)_b \otimes M_2$ consists of $\sigma(M_1 \otimes M_2)$ – measurable functions. By the same logic we may now conclude that $(B_1)_b \otimes (B_2)_b$ consists of $\sigma(M_1 \otimes M_2)$ – measurable functions as well. In particular this shows for any $A_i \in B_i$, that $1_{A_1 \times A_2} = 1_{A_1} \otimes 1_{A_2}$ is $\sigma(M_1 \otimes M_2)$ – measurable and therefore $A_1 \times A_2 \in \sigma(M_1 \otimes M_2)$ for all $A_i \in B_i$. As the set \{$A_1 \times A_2 : A_i \in B_i$\} generate $B_1 \otimes B_2$ we may conclude that $B_1 \otimes B_2 \subset \sigma(M_1 \otimes M_2)$. □

### 11.6 $\sigma$ – Function Algebras (Older Version of above notes from 280 Notes!!)

In this subsection, we are going to relate $\sigma$ – algebras of subsets of a set $X$ to certain algebras of functions on $X$.

**Example 11.21.** Suppose $M$ is a $\sigma$ – algebra on $X$, then

$$\ell^\infty(M, \mathbb{R}) := \{f \in \ell^\infty(X, \mathbb{R}) : f \text{ is } M/B_\mathbb{R} \text{ – measurable}\} \quad (11.14)$$

is a $\sigma$ – function algebra. The next theorem will show that these are the only example of $\sigma$ – function algebras. (See Exercise 43.1 above for examples of function algebras on $X$.)

The next theorem is the $\sigma$ – algebra analogue of Exercise 43.1.

**Theorem 11.22.** Let $H$ be a $\sigma$ – function algebra on a set $X$. Then

1. $M(H)$ is a $\sigma$ – algebra on $X$.
2. $H = \ell^\infty(M(H), \mathbb{R})$.
3. The map

$$M \in \{\sigma \text{ – algebras on } X\} \rightarrow \ell^\infty(M, \mathbb{R}) \in \{\sigma \text{ – function algebras on } X\} \quad (11.15)$$

is bijective with inverse given by $H \mapsto M(H)$.

**Proof.** Let $M := M(H)$.

Since $0, 1 \in H$, $\emptyset, X \in M$. If $A \in M$ then, since $H$ is a linear subspace of $\ell^\infty(X, \mathbb{R})$, $1_A = 1 - 1_{\emptyset} \in H$ which shows $A^c \in H$. If $\{A_n\}_{n=1}^\infty \subset M$, then since $H$ is an algebra,

$$1_{\bigcap_{n=1}^N A_n} = \prod_{n=1}^N 1_{A_n} : f_N \in H$$

for all $N \in \mathbb{N}$. Because $H$ is closed under bounded convergence it follows that

$$1_{\bigcap_{n=1}^\infty A_n} = \lim_{N \to \infty} f_N \in H$$

and this implies $\bigcap_{n=1}^\infty A_n \in M$. Hence we have shown $M$ is a $\sigma$ – algebra.

2. Since $H$ is an algebra, $p(f) \in H$ for any $f \in H$ and any polynomial $p$ on $\mathbb{R}$.

The Weierstrass approximation Theorem [50.33] asserts that polynomials on $\mathbb{R}$ are uniformly dense in the space of continuous functions on any compact subinterval of $\mathbb{R}$. Hence if $f \in H$ and $\varphi \in C(\mathbb{R})$, there exists polynomials $p_n$ on $\mathbb{R}$ such that $p_n \circ f(x)$ converges to $\varphi \circ f(x)$ uniformly (and hence boundedly) in $x \in X$ as $n \to \infty$. Therefore $\varphi \circ f \in H$ for all $f \in H$ and $\varphi \in C(\mathbb{R})$ and in particular $|f| \in H$ and $f_\pm := \frac{|f| + I \pm I}{2} \in H$ if $f \in H$. Fix an $\alpha \in \mathbb{R}$ and for $n \in \mathbb{N}$ let $\varphi_n(t) := (t - \alpha)_+^{1/n}$, where $(t - \alpha)_+ := \max\{t - \alpha, 0\}$. Then $\varphi_n \in C(\mathbb{R})$ and $\varphi_n(t) \to 1_{(0, \alpha]}$ as $n \to \infty$ and the convergence is bounded when $t$ is restricted to any compact subset of $\mathbb{R}$. Hence if $f \in H$ it follows that $1_{f > \alpha} = \lim_{n \to \infty} \varphi_n(f) \in H$ for all $\alpha \in \mathbb{R}$, i.e. $\{f > \alpha\} \in M$ for all $\alpha \in \mathbb{R}$. Therefore if $f \in H$ then $f \in \ell^\infty(M, \mathbb{R})$ and we have shown

$$H \subset \ell^\infty(M, \mathbb{R})$$

Conversely if $f \in \ell^\infty(M, \mathbb{R})$, then for any $\alpha < \beta$, $\{\alpha < f \leq \beta\} \in M = M(H)$ and so by assumption $1_{\{\alpha < f \leq \beta\}} \in H$. Combining this remark with the approximation Theorem [44.34] and the fact that $H$ is closed under bounded convergence shows that $f \in H$. Hence we have shown $\ell^\infty(M, \mathbb{R}) \subset H$ which combined with $M \subset \ell^\infty(M, \mathbb{R})$ already proved shows

$$H = \ell^\infty(M(H), \mathbb{R})$$

2’ (BRUCE: it suffices to use the results of Exercise 4.19 here.) Exercise 4.9 there exists polynomials $p_m(x)$ such that $\sqrt{x} = \lim_{n \to \infty} p_n(x)$ uniformly in $x \in [0, M]$ for any $m < \infty$. Therefore for any $\alpha \in \mathbb{R}$ and $M$ chosen sufficiently large we have $p_n\left((f - \alpha)^2\right) \to |f - \alpha|$ boundedly as $n \to \infty$ and hence $|f - \alpha| \in H$. Since $(f - \alpha)_+^1 = \frac{1}{2}(f - \alpha) + (f - \alpha)_+^1$, it follows that $(f - \alpha)_+^1 \in H$. Similarly, we have $(f - \alpha)_+^{1/2} = \lim_{n \to \infty} p_n\left((f - \alpha)_+^{1/2}\right) \in H$ and inductively it follows that $(f - \alpha)_+^{1/n} \in H$ for all $n$. Since $(f - \alpha)_+^{1/n} \to 1_{(f > \alpha)}$ converges boundedly to $1_{(f > \alpha)}$ it follows that $1_{(f > \alpha)} \in H$, i.e. that $\{f > \alpha\} \in M$. Hence if $f \in H$, $\{f > \alpha\} \in M$ for all $\alpha \in \mathbb{R}$. Therefore if $f \in H$ then $f \in \ell^\infty(M, \mathbb{R})$ and we have shown $H \subset \ell^\infty(M, \mathbb{R})$. 
Conversely if \( f \in L^\infty(M, \mathbb{R}) \), then for any \( \alpha < \beta \), \( \{ \alpha < f \leq \beta \} \in \mathcal{M} = \mathcal{M}(\mathcal{H}) \) and so by assumption \( 1_{\{\alpha < f \leq \beta \}} \in \mathcal{H} \). Combining this remark with the approximation Theorem 11.13 and the fact that \( \mathcal{H} \) is closed under bounded convergence shows that \( f \in \mathcal{H} \). Hence we have shown \( L^\infty(M, \mathbb{R}) \subset \mathcal{H} \) which combined with \( \mathcal{H} \subset L^\infty(M, \mathbb{R}) \) already proved shows \( \mathcal{H} = L^\infty(M, \mathcal{H}) \).

3. Items 1. and 2. shows the map in Eq. (11.15) is surjective. To see the map is injective suppose \( M \) and \( \mathcal{F} \) are two \( \sigma \) – algebras on \( X \). If \( L^\infty(M, \mathbb{R}) = L^\infty(\mathcal{F}, \mathbb{R}) \), then 

\[ M = \{ A \subset X : 1_A \in L^\infty(M, \mathbb{R}) \} = \{ A \subset X : 1_A \in L^\infty(\mathcal{F}, \mathbb{R}) \} = \mathcal{F} \]

and the proof is complete.

**Notation 11.23** Suppose \( M \) is a subset of \( L^\infty(X, \mathbb{R}) \).

1. Let \( \mathcal{H}(M) \) denote the smallest subspace of \( L^\infty(X, \mathbb{R}) \) which contains \( M \), the constant functions, and is closed under bounded convergence.

2. Let \( \mathcal{H}_\sigma(M) \) denote the smallest \( \sigma \) – function algebra containing \( M \).

**Theorem 11.24.** Suppose \( M \) is a subset of \( L^\infty(X, \mathbb{R}) \), then \( \mathcal{H}_\sigma(M) = L^\infty(\sigma(M), \mathbb{R}) \) or in other words the following diagram commutes:

\[
\begin{array}{c}
M \quad \xrightarrow{\mathcal{H}_\sigma(M)} \quad \sigma(M) \\
\{ \text{Subsets of } L^\infty(X, \mathbb{R}) \} \quad \xrightarrow{\mathcal{H}_\sigma(M)} \quad \{ \sigma - \text{algebras on } X \} \quad \supseteq M \\
\mathcal{H}_\sigma(M) \quad \subseteq \quad \{ \sigma - \text{function algebras on } X \} \quad \subset \quad L^\infty(M, \mathbb{R}).
\end{array}
\]

**Proof.** Since \( L^\infty(\sigma(M), \mathbb{R}) \) is \( \sigma \) – function algebra which contains \( M \) it follows that 

\[ \mathcal{H}_\sigma(M) \subset L^\infty(\sigma(M), \mathbb{R}). \]

For the opposite inclusion, let 

\[ M = M(\mathcal{H}_\sigma(M)) := \{ A \subset X : 1_A \in \mathcal{H}_\sigma(M) \}. \]

By Theorem 11.12 \( M \subset \mathcal{H}_\sigma(M) = L^\infty(M, \mathbb{R}) \) which implies that every \( f \in M \) is \( \mathcal{M} \) – measurable. This then implies \( \sigma(M) \subset \mathcal{M} \) and therefore 

\[ L^\infty(\sigma(M), \mathbb{R}) \subset L^\infty(M, \mathbb{R}) = \mathcal{H}_\sigma(M). \]

**Definition 11.25 (Multiplicative System).** A collection of bounded real or complex valued functions, \( M \), on a set \( X \) is called a **multiplicative system** if \( f \cdot g \in M \) whenever \( f \) and \( g \) are in \( M \).

**Theorem 11.26 (Dynkin’s Multiplicative System Theorem).** Suppose \( M \subset L^\infty(X, \mathbb{R}) \) is a multiplicative system, then 

\[ \mathcal{H}(M) = \mathcal{H}_\sigma(M) = L^\infty(\sigma(M), \mathbb{R}). \] (11.16)

This can also be stated as follows.

Suppose \( \mathcal{H} \) is a linear subspace of \( L^\infty(X, \mathbb{R}) \) such that: 1 \( \in \mathcal{H} \), \( \mathcal{H} \) is closed under bounded convergence, and \( M \subset \mathcal{H} \). Then \( \mathcal{H} \) contains all bounded real valued \( \sigma(M) \)-measurable functions, i.e. \( L^\infty(\sigma(M), \mathbb{R}) \subset \mathcal{H} \).

(In words, the smallest subspace of bounded real valued functions on \( X \) which contains \( M \) that is closed under bounded convergence is the same as the space of bounded real valued \( \sigma(M) \) – measurable functions on \( X \)).

**Proof.** The assertion that \( \mathcal{H}_\sigma(M) = L^\infty(\sigma(M), \mathbb{R}) \) has already been proved (without the assumption that \( M \) is multiplicative) in Theorem 11.24. Since any \( \sigma \) – function algebra containing \( M \) is also a subspace of \( L^\infty(X, \mathbb{R}) \) which contains the constant functions and is closed under bounded convergence (compare with Exercise 11.13), it follows that \( \mathcal{H}(M) \subset \mathcal{H}_\sigma(M) \). To complete the proof it suffices to show the inclusion, \( \mathcal{H}(M) \subset \mathcal{H}_\sigma(M) \), is an equality. We will accomplish this below by showing \( \mathcal{H}(M) \) is also a \( \sigma \) – function algebra.

For any \( f \in \mathcal{H} := \mathcal{H}(M) \) let 

\[ \mathcal{H}_f := \{ g \in \mathcal{H} : fg \in \mathcal{H} \} \subset \mathcal{H} \]

and notice that \( \mathcal{H}_f \) is a linear subspace of \( L^\infty(X, \mathbb{R}) \) which is closed under bounded convergence. Moreover if \( f \in M, M \subset \mathcal{H}_f \), since \( M \) is multiplicative. Therefore \( \mathcal{H}_f = \mathcal{H} \) and we have shown that \( fg \in \mathcal{H} \) whenever \( f \in M \) and \( g \in \mathcal{H} \). Given this it now follows that \( M \subset \mathcal{H}_f \) for any \( f \in \mathcal{H} \) and by the same reasoning just used, \( f \in \mathcal{H} \). Since \( f \in \mathcal{H} \) is arbitrary, we have shown \( fg \in \mathcal{H} \) for all \( f, g \in \mathcal{H} \), i.e. \( \mathcal{H} \) is an algebra, by which the definition of \( \mathcal{H}(M) \) in Notation 11.23 contains the constant functions, i.e. \( \mathcal{H}(M) \) is a \( \sigma \) – function algebra.

**Theorem 11.27 (Complex Multiplicative System Theorem).** Suppose \( \mathcal{H} \) is a complex linear subspace of \( L^\infty(X, \mathbb{C}) \) such that: 1 \( \in \mathcal{H} \), \( \mathcal{H} \) is closed under complex conjugation, and \( \mathcal{H} \) is closed under bounded convergence. Moreover if \( M \subset \mathcal{H} \) is multiplicative system which is closed under conjugation, then \( \mathcal{H} \) contains all bounded complex valued \( \sigma(M) \)-measurable functions, i.e. \( L^\infty(\sigma(M), \mathbb{C}) \subset \mathcal{H} \).

**Proof.** Let \( M_0 = \text{span}_\mathbb{C}(M \cup \{1\}) \) be the complex span of \( M \). As the reader should verify, \( M_0 \) is an algebra, \( M_0 \subset \mathcal{H} \), \( M_0 \) is closed under complex conjugation and that \( \sigma(M_0) = \sigma(M) \). Let \( \mathcal{H}^\mathbb{C} := \mathcal{H} \cap L^\infty(X, \mathbb{R}) \) and
$M_0^R = M \cap \ell^\infty(X,\mathbb{R})$. Then (you verify) $M_0^R$ is a multiplicative system, $M_0^R \subset H^R$ and $H^R$ is a linear space containing 1 which is closed under bounded convergence. Therefore by Theorem 11.26 $\ell^\infty(\sigma(M_0^R),\mathbb{R}) \subset H^R$. Since $H$ and $M_0$ are complex linear spaces closed under complex conjugation, for any $f \in H$ or $f \in M_0$, the functions $\text{Re} f = \frac{1}{2}(f + \overline{f})$ and $\text{Im} f = \frac{1}{2}(f - \overline{f})$ are in $H$ ($M_0$) or $M_0$ respectively. Therefore $H = H^R + iH^R$, $M_0 = M_0^R + iM_0^R$, $\sigma(M_0^R) = \sigma(M_0) = \sigma(M)$ and

$$\ell^\infty(\sigma(M),\mathbb{C}) = \ell^\infty(\sigma(M_0^R),\mathbb{R}) + i\ell^\infty(\sigma(M_0^R),\mathbb{R}) \subset H^R + iH^R = H.$$

\[ \square \]

**Definition 11.28.** A collection of subsets, $C$, of $X$ is a **multiplicative class** (or a $\pi$ – **class**) if $C$ is closed under finite intersections.

**Corollary 11.29.** Suppose $H$ is a subspace of $\ell^\infty(X,\mathbb{R})$ which is closed under bounded convergence and $1 \in H$. If $C \subset 2^X$ is a multiplicative class such that $1_A \in H$ for all $A \in C$, then $H$ contains all bounded $\sigma(C)$ – measurable functions.

**Proof.** Let $M = \{1\} \cup \{1_A : A \in C\}$. Then $M \subset H$ is a multiplicative system and the proof is completed with an application of Theorem 11.26. \[ \square \]

**Corollary 11.30.** Suppose that $(X,d)$ is a metric space and $B_X = \sigma(\tau_d)$ be the Borel $\sigma$ – algebra on $X$ and $H$ is a subspace of $\ell^\infty(X,\mathbb{R})$ such that $BC(X,\mathbb{R}) \subset H$ and $H$ is closed under bounded convergence. Then $H$ contains all bounded $B_X$ – measurable real valued functions on $X$. (This may be stated as follows: the smallest vector space of bounded functions which is closed under bounded convergence and contains $BC(X,\mathbb{R})$ is the space of bounded $B_X$ – measurable real valued functions on $X$.)

**Proof.** Let $V \in \tau_d$ be an open subset of $X$ and for $n \in \mathbb{N}$ let

$$f_n(x) := \min(n \cdot d_{V^c}(x), 1) \text{ for all } x \in X.$$ Notice that $f_n = \varphi_n \circ d_{V^c}$ where $\varphi_n(t) = \min(nt, 1)$ (see Figure 11.3) which is continuous and hence $f_n \in BC(X,\mathbb{R})$ for all $n$. Furthermore, $f_n$ converges boundedly to $1_{d_{V^c} > 0} = 1_V$ as $n \to \infty$ and therefore $1_V \in H$ for all $V \in \tau$. Since $\tau$ is a $\pi$ – class, the result now follows by an application of Corollary 11.29. \[ \square \]

Here are some more variants of Corollary 11.30.

\[ ^2 \text{Recall that } BC(X,\mathbb{R}) \text{ are the bounded continuous functions on } X. \]

**Proposition 11.31.** Let $(X,d)$ be a metric space, $B_X = \sigma(\tau_d)$ be the Borel $\sigma$ – algebra and assume there exists compact sets $K_K \subset X$ such that $K_K \uparrow X$. Suppose that $H$ is a subspace of $\ell^\infty(X,\mathbb{R})$ such that $C_c(X,\mathbb{R}) \subset H$ ($C_c(X,\mathbb{R})$ is the space of continuous functions with compact support) and $H$ is closed under bounded convergence. Then $H$ contains all bounded $B_X$ – measurable real valued functions on $X$.

**Proof.** Let $k$ and $n$ be positive integers and set $\psi_{n,k}(x) = \min(1, n \cdot d_{K^c_k}(x))$. Then $\psi_{n,k} \in C_c(X,\mathbb{R})$ and $\{\psi_{n,k} \neq 0\} \subset K^c_k$. Let $H_{n,k}$ denote those bounded $B_X$ – measurable functions, $f : X \to \mathbb{R}$, such that $\psi_{n,k} f \in H$.

It is easily seen that $H_{n,k}$ is closed under bounded convergence and that $H_{n,k}$ contains $BC(X,\mathbb{R})$ and therefore by Corollary 11.30 $\psi_{n,k} f \in H$ for all bounded measurable functions $f : X \to \mathbb{R}$. Since $\psi_{n,k} f \to 1_{K^c_k} f$ boundedly as $n \to \infty$, $1_{K^c_k} f \in H$ for all $k$ and similarly $1_{K^c_k} f \to f$ boundedly as $k \to \infty$ and therefore $f \in H$. \[ \square \]

**Lemma 11.32.** Suppose that $(X,\tau)$ is a locally compact second countable Hausdorff space

1. every open subset $U \subset X$ is a $\sigma$ – compact. In fact $U$ is still a locally compact second countable Hausdorff space.
2. If $F \subset X$ is a closed set, there exist open sets $V_n \subset X$ such that $V_n \downarrow F$ as $n \to \infty$.
3. To each open set $U \subset X$ there exists $f_n \prec U$ (i.e. $f_n \in C_c(U, [0,1])$) such that $\lim_{n \to \infty} f_n = 1_U$.
4. $B_X = \sigma(C_c(X,\mathbb{R}))$, i.e. the $\sigma$ – algebra generated by $C_c(X)$ is the Borel $\sigma$ – algebra on $X$.

\[ ^3 \text{For example any separable locally compact metric space and in particular any open subset of } \mathbb{R}^n. \]
Proof. 
1. Let $U$ be an open subset of $X$, $V$ be a countable base for $\tau$ and 
\[ V^U := \{ W \in V : W \subset U \text{ and } W \text{ is compact} \}. \]
For each $x \in U$, by Proposition 25.5 there exists an open neighborhood $V$ of $x$ such that $V \subset U, \overline{V} \subset W$ is compact. Since $V$ is a base for the topology $\tau$, there exists $W \in \mathcal{V}$ such that $x \in W \subset V$. Because $\overline{W} \subset V$, it follows that $W$ is compact and hence $W \in \mathcal{V}$. As $x \in U$ was arbitrary, $U = \bigcup \mathcal{V}$. This shows $\mathcal{V}^U$ is a countable basis for the topology on $U$ and that $U$ is still locally compact. 
2. Let $\{ K_n \}_{n=1}^\infty$ be compact subsets of $F^c$ such that $K_n \uparrow F^c$ as $n \to \infty$ and set $V_n := K_n \setminus K_n$. Then $V_n \downarrow F$ and by Proposition 25.5 $V_n$ is open for each $n$. 
3. Let $U \subset X$ be an open set and $\{ K_n \}_{n=1}^\infty$ be compact subsets of $U$ such that $K_n \uparrow U$. By Urysohn’s Lemma 25.5 there exist $f_n \times U$ such that $f_n = 1$ on $K_n$. These functions satisfy, $\lim_{n \to \infty} f_n = 1$ on $U$. 
4. By item 3., $I_U$ is measurable for each $\tau$ and hence $\tau \subset \sigma(C_c(X, \mathbb{R}))$. Therefore $\mathcal{B}_X = \sigma(\tau) \subset \sigma(C_c(X, \mathbb{R}))$. The converse inclusion holds because continuous functions are always Borel measurable. 

Here is a variant of Corollary 11.30

**Corollary 11.33.** Suppose that $(X, \tau)$ is a second countable locally compact Hausdorff space and $\mathcal{B}_X = \sigma(\tau)$ is the Borel $\sigma$-algebra on $X$. If $\mathcal{H}$ is a subspace of $C_c(X, \mathbb{R})$ which is closed under bounded convergence and contains $C_c(X, \mathbb{R})$, then $\mathcal{H}$ contains all bounded $\mathcal{B}_X$-measurable real valued functions on $X$.

Proof. By item 3. of Lemma 11.32 for every $U \in \tau$ the characteristic function, $1_U$, may be written as a bounded pointwise limit of functions from $C_c(X, \mathbb{R})$. Therefore $1_U \in \mathcal{H}$ for all $U \in \tau$. Since $\tau$ is a $\pi$-class, the proof is finished with an application of Corollary 11.29.

11.6.1 Another (Better) Multiplicativistic System Theorem

**Notation 11.34.** Let $\Omega$ be a set and $\mathbb{H}$ be a subset of the bounded real valued functions on $\Omega$. We say that $\mathbb{H}$ is **closed under bounded convergence** if, for every sequence, $\{f_n\}_{n=1}^\infty \subset \mathbb{H}$, satisfying:

1. there exists $M < \infty$ such that $|f_n(\omega)| \leq M$ for all $\omega \in \Omega$ and $n \in \mathbb{N}$,
2. $f(\omega) := \lim_{n \to \infty} f_n(\omega)$ exists for all $\omega \in \Omega$, then $f \in \mathbb{H}$.

Similarly we say that $\mathbb{H}$ is **closed under monotone convergence** if;

3. for every sequence, $\{f_n\}_{n=1}^\infty \subset \mathbb{H}$, satisfying:
4. $f_n(\omega)$ is increasing in $n$ for all $\omega \in \Omega$,

then $f := \lim_{n \to \infty} f_n \in \mathbb{H}$.

Clearly if $\mathbb{H}$ is closed under bounded convergence then it is also closed under monotone convergence. I learned the following converse result from Pat Fitzsimmons.

**Proposition 11.35.** Let $\Omega$ be a set. Suppose that $\mathbb{H}$ is a vector subspace of bounded real valued functions from $\Omega$ to $\mathbb{R}$ which is closed under monotone convergence. Then $\mathbb{H}$ is closed under uniform convergence as well, i.e. $\{f_n\}_{n=1}^\infty \subset \mathbb{H}$ with $\sup_{n \in \mathbb{N}} \sup_{\omega \in \Omega} |f_n(\omega)| < \infty$ and $f_n \to f$, then $f \in \mathbb{H}$.

**Proof.** Let us first assume that $\{f_n\}_{n=1}^\infty \subset \mathbb{H}$ such that $f_n$ converges uniformly to a bounded function, $f : \Omega \to \mathbb{R}$. Let $\|f\| := \sup_{\omega \in \Omega} |f(\omega)|$. Let $\varepsilon > 0$ be given. By passing to a subsequence if necessary, we may assume $\|f_n - f\| \leq \varepsilon 2^{-n+1}$. Let $g_n := f_n - \delta_n + M$ with $\delta_n$ and $M$ constants to be determined shortly. We then have $g_{n+1} - g_n = f_{n+1} - f_n + \delta_n - \delta_{n+1} \geq -\varepsilon 2^{-n} + \delta_n - \delta_{n+1}$. Taking $\delta_n := \varepsilon 2^{-n}$, then $\delta_n - \delta_{n+1} = \varepsilon 2^{-n} (1 - 1/2) = \varepsilon 2^{-n} - 1/2$ in which case $g_{n+1} - g_n \geq 0$ for all $n$. By choosing $M$ sufficiently large, we will also have $g_n \geq 0$ for all $n$. Since $\mathbb{H}$ is a vector space containing the constant functions, $g_n \in \mathbb{H}$ and since $g_n \uparrow f + M$, it follows that $f = f + M - M \in \mathbb{H}$. So we have shown that $\mathbb{H}$ is closed under uniform convergence.

**Theorem 11.36 (Dynkin’s Multiplicativistic System Theorem (Old Proof)).** Suppose that $\mathbb{H}$ is a vector subspace of bounded functions from $\Omega$ to $\mathbb{R}$ which contains the constant functions and is closed under monotone convergence. If $\mathbb{M}$ is **multiplicativistic system** (i.e. $\mathbb{M}$ is a subset of $\mathbb{H}$ which is closed under pointwise multiplication), then $\mathbb{H}$ contains all bounded $\sigma(\mathbb{M})$-measurable functions.

**Proof.** Let $\mathcal{L} := \{ A \subset \Omega : 1_A \in \mathbb{H} \}$.
We then have $\Omega \in \mathcal{L}$ since $1\Omega = 1 \in \mathbb{H}$, if $A, B \in \mathcal{L}$ with $A \subset B$ then $B \setminus A \in \mathcal{L}$ since $1B \setminus A = 1_B - 1_A \in \mathbb{H}$, and if $A_n \in \mathcal{L}$ with $A_n \uparrow A$, then $A \in \mathcal{L}$ because $1_{A_n} \in \mathbb{H}$ and $1_{A_n} \uparrow 1_A \in \mathbb{H}$. Therefore $\mathcal{L}$ is a $\lambda$ - system.

Let $\varphi_n (x) = 0 \lor [(nx) \land 1]$ (see Figure 11.4 below) so that $\varphi_n (x) \uparrow 1_{x>0}$. Given $f_1, f_2, \ldots, f_k \in \mathbb{M}$ and $a_1, \ldots, a_k \in \mathbb{R}$, let

$$F_n := \prod_{i=1}^{k} \varphi_n (f_i - a_i)$$

and let

$$M := \sup_{i=1,\ldots,k} \sup_{\omega} |f_i (\omega) - a_i|.$$ 

By the Weierstrass approximation Theorem ??, we may find polynomial functions, $p_i (x)$ such that $p_i \to \varphi_n$ uniformly on $[-M, M]$. Since $p_i$ is a polynomial it is easily seen that $\prod_{i=1}^{k} p_i \circ (f_i - a_i) \in \mathbb{H}$. Moreover,

$$\prod_{i=1}^{k} p_i \circ (f_i - a_i) \to F_n$$

uniformly as $l \to \infty$,

from which it follows that $F_n \in \mathbb{H}$ for all $n$. Since,

$$F_n \uparrow \prod_{i=1}^{k} 1_{(f_i > a_i)} = 1_{\cap_{i=1}^{k} (f_i > a_i)},$$

it follows that $1_{\cap_{i=1}^{k} (f_i > a_i)} \in \mathbb{H}$ or equivalently that $\cap_{i=1}^{k} \{ f_i > a_i \} \in \mathcal{L}$. Therefore $\mathcal{L}$ contains the $\pi$ - system, $\mathcal{P}$, consisting of finite intersections of sets of the form, $\{ f > a \}$ with $f \in \mathbb{M}$ and $a \in \mathbb{R}$.

11.6 $\sigma$ - Function Algebras (Older Version of above notes from 280 Notes!!)

As a consequence of the above paragraphs and the $\pi - \lambda$ Theorem 10.3 $\mathcal{L}$ contains $\sigma (\mathcal{P}) = \sigma (\mathbb{M})$. In particular it follows that $1_A \in \mathbb{H}$ for all $A \in \sigma (\mathbb{M})$. Since any positive $\sigma (\mathbb{M})$ - measurable function may be written as an increasing limit of simple functions, it follows that $\mathbb{H}$ contains all non-negative bounded $\sigma (\mathbb{M})$ - measurable functions. Finally, since any bounded $\sigma (\mathbb{M})$ - measurable functions may be written as the difference of two such non-negative simple functions, it follows that $\mathbb{H}$ contains all bounded $\sigma (\mathbb{M})$ - measurable functions.

\begin{proof}
Let $M'$ be the subspace of $\mathbb{H}$ spanned by $\mathbb{M} \cup \{ 1 \}$. As $M'$ is a vector space closed under multiplication, it is an algebra. Let $M'_+ := \{ f \in M' : f \geq 0 \}$.

Let $K$ be the smallest linear subspace of $\ell^\infty (X, \mathbb{R})$ which contains $M'$ and is closed under bounded monotone convergence. (Such an $K$ is found by intersecting all such subspace together noting that $\mathbb{H}$ is a such a subspace.) Our first goal is to show that $K$ is an algebra.

For any $f \in K$, let $K_f := \{ g \in K : fg \in K \}$. Then $K_f$ is a subspace of $K$ and if $f \geq 0$, then $K_f$ is closed under bounded monotone convergence.

If $f \in M'_+ \subset M' \subset K$, we have $M' \subset K_f$ and $K_f$ is closed under bounded monotone convergence and therefore, $K \subset K_f$, i.e. $K_f = K$. Thus we have shown $fg \in K$ if $f \in M'_+$ and $g \in K$. Moreover if $f \in M'$ and $m := \max f (\Omega)$, then $f + m \in M'_+$ and hence $fg = (f + m)g - mg \in K$. Therefore, $fg \in K$ if $f \in M'$ and $g \in K$.

Similarly, if $f \in K'_+$, then $g \in K_f$ for all $g \in M'$ and therefore $K_f \subset K$ again. Thus we have shown that $fg \in K$ whenever $f \in K$ and $g \in K$. So if $f \in K$ and $m := \max f (\Omega)$, then $f + m \in M'_+$ and hence $fg = (f + m)g - mg \in K$ for all $g \in K$. This completes the proof that $K$ is an algebra.

Next we are going to show

$$K := \{ A \subset \Omega : 1_A \in K \}$$

is a $\sigma$ - algebra. As 0 and 1 are in $K$, $\emptyset, \Omega \in \mathcal{M}$. If $A \in \mathcal{M}$, then $A^c \in \mathcal{M}$ since $1_{A^c} = 1 - 1_A \in \mathbb{H}$. If we further suppose that $B \in \mathcal{M}$, then $1_{A \cap B} = 1_A \cdot 1_B \in K$ which shows that $A \cap B \in \mathcal{M}$. Thus we have shown that $\mathcal{M}$ is an algebra. Finally if $A_n \in \mathcal{M}$ and $A_n \uparrow A \subset \Omega$, then $1_{A_n} \uparrow 1_A$ showing that $1_A \in K$, i.e.
A ∈ 𝒜. This implies that 𝒜 is a σ–algebra. STOP BRUCE – look up to see how Janson finishes the proof here.

The Weierstrass approximation Theorem 50.35 asserts that polynomials on \( \mathbb{R} \) are uniformly dense in the space of continuous functions on any compact subinterval of \( \mathbb{R} \). Hence if \( f \in \mathbb{K} \) and \( \varphi \in C(\mathbb{R}) \), there exists polynomials \( p_n \) on \( \mathbb{R} \) such that \( p_n \circ f (x) \) converges to \( \varphi \circ f (x) \) uniformly (and hence boundedly) in \( x \in X \) as \( n \to \infty \). Hence by Proposition 11.35 it follows that \( \varphi \circ f \in \mathbb{K} \) for all \( f \in \mathbb{K} \) and \( \varphi \in C(\mathbb{R}) \), i.e. \( \{ f \geq \alpha \} \in \mathbb{M} \) for all \( \alpha \in \mathbb{R} \). Therefore if \( f \in \mathbb{K} \) then \( f \in \ell^\infty(\mathbb{M}, \mathbb{R}) \) and we have shown \( \mathbb{K} \subset \ell^\infty(\mathbb{M}, \mathbb{R}) \).

Conversely if \( f \in \ell^\infty(\mathbb{M}, \mathbb{R}) \), then for any \( \alpha < \beta \), \( \{ \alpha < f \leq \beta \} \in \mathbb{M} = \mathbb{M}(\mathbb{K}) \) and so by assumption \( 1_{\{ f < \alpha \}} \in \mathbb{K} \). Combining this remark with the approximation Theorem 44.34 and the fact that \( \mathbb{K} \) is closed under bounded convergence shows that \( f \in \mathbb{K} \). Hence we have shown \( \ell^\infty(\mathbb{M}, \mathbb{R}) \subset \mathbb{K} \) which combined with \( \mathbb{K} \subset \ell^\infty(\mathbb{M}, \mathbb{R}) \) already proved shows \( \ell^\infty(\mathbb{M}(\mathbb{K}), \mathbb{R}) = \mathbb{K} \subset \mathbb{H} \).

11.7 Exercises

Exercise 11.8. Prove Corollary 44.15 Hint: See Exercise 44.1

Exercise 11.9. If \( \mathbb{M} \) is the σ–algebra generated by \( \mathcal{E} \subset 2^X \), then \( \mathbb{M} \) is the union of the σ–algebras generated by countable subsets \( \mathcal{F} \subset \mathcal{E} \).

Exercise 11.10. Let \((X, \mathbb{M})\) be a measure space and \( f_n : X \to \mathcal{F} \) be a sequence of measurable functions on \( X \). Show that \( \{ x : \lim_{n \to \infty} f_n (x) \text{ exists in } \mathcal{F} \} \in \mathbb{M} \).

Exercise 11.11. Show that every monotone function \( f : \mathbb{R} \to \mathbb{R} \) is \((\mathcal{B}_{\mathbb{R}}, \mathcal{B}_{\mathbb{R}})\)–measurable.

Exercise 11.12. Show by example that the supremum of an uncountable family of measurable functions need not be measurable. (Folland problem 2.6 on p. 48.)

Exercise 11.13. Let \( X = \{ 1, 2, 3, 4 \} \), \( A = \{ 1, 2 \} \), \( B = \{ 2, 3 \} \) and \( \mathbb{M} := \{ 1_A, 1_B \} \). Show \( \mathcal{H}(\mathbb{M}) \neq \mathcal{H}(\mathbb{M}) \) in this case.
Multiple and Iterated Integrals

12.1 Iterated Integrals

Notation 12.1 (Iterated Integrals) If \((X, \mathcal{M}, \mu)\) and \((Y, \mathcal{N}, \nu)\) are two measure spaces and \(f : X \times Y \to \mathbb{C}\) is a \(\mathcal{M} \otimes \mathcal{N}\) measurable function, the \textit{iterated integrals} of \(f\) (when they make sense) are:

\[
\int_X d\mu(x) \int_Y d\nu(y) f(x, y) = \int_X \left[ \int_Y f(x, y) d\nu(y) \right] d\mu(x)
\]

and

\[
\int_Y d\nu(y) \int_X d\mu(x) f(x, y) = \int_Y \left[ \int_X f(x, y) d\mu(x) \right] d\nu(y).
\]

Notation 12.2 Suppose that \(f : X \to \mathbb{C}\) and \(g : Y \to \mathbb{C}\) are functions, let \(f \otimes g\) denote the function on \(X \times Y\) given by

\[
f \otimes g(x, y) = f(x) g(y).
\]

Notice that if \(f, g\) are measurable, then \(f \otimes g\) is \((\mathcal{M} \otimes \mathcal{N}, \mathcal{B}_C)\) measurable. To prove this let \(F(x, y) = f(x)\) and \(G(x, y) = g(y)\) so that \(f \otimes g = F \cdot G\) will be measurable provided that \(F\) and \(G\) are measurable. Now \(F = f \circ \pi_1\) where \(\pi_1 : X \times Y \to X\) is the projection map. This shows that \(F\) is the composition of measurable functions and hence measurable. Similarly one shows that \(G\) is measurable.

12.2 Tonelli’s Theorem and Product Measure

Theorem 12.3. Suppose \((X, \mathcal{M}, \mu)\) and \((Y, \mathcal{N}, \nu)\) are \(\sigma\)-finite measure spaces and \(f\) is a nonnegative \((\mathcal{M} \otimes \mathcal{N}, \mathcal{B}_R)\) measurable function, then for each \(y \in Y\),

\[
x \to f(x, y) \text{ is } \mathcal{M} - B_{[0,\infty]} \text{ measurable}, \quad (12.1)
\]

for each \(x \in X\),

\[
y \to f(x, y) \text{ is } \mathcal{N} - B_{[0,\infty]} \text{ measurable}, \quad (12.2)
\]

\[
x \to \int_Y f(x, y) d\nu(y) \text{ is } \mathcal{M} - B_{[0,\infty]} \text{ measurable}, \quad (12.3)
\]

\[
y \to \int_X f(x, y) d\mu(x) \text{ is } \mathcal{N} - B_{[0,\infty]} \text{ measurable}, \quad (12.4)
\]

and

\[
\int_X d\mu(x) \int_Y d\nu(y) f(x, y) = \int_Y d\nu(y) \int_X d\mu(x) f(x, y). \quad (12.5)
\]

Proof. Suppose that \(E = A \times B \in \mathcal{E} := \mathcal{M} \times \mathcal{N}\) and \(f = 1_E\). Then

\[
f(x, y) = 1_{A \times B}(x, y) = 1_A(x) 1_B(y)
\]

and one sees that Eqs. (12.1) and (12.2) hold. Moreover

\[
\int_Y f(x, y) d\nu(y) = \int_Y 1_A(x) 1_B(y) d\nu(y) = 1_A(x) \nu(B),
\]

so that Eq. (12.3) holds and we have

\[
\int_X d\mu(x) \int_Y d\nu(y) f(x, y) = \nu(B) \mu(A). \quad (12.6)
\]

Similarly,

\[
\int_Y d\nu(y) \int_X d\mu(x) f(x, y) = \nu(B) \mu(A)
\]

from which it follows that Eqs. (12.4) and (12.5) hold in this case as well.

For the moment let us now further assume that \(\mu(X) < \infty\) and \(\nu(Y) < \infty\) and let \(\mathbb{H}\) be the collection of all bounded \((\mathcal{M} \otimes \mathcal{N}, \mathcal{B}_R)\) measurable functions on \(X \times Y\) such that Eqs. (12.1) – (12.5) hold. Using the fact that measurable functions are closed under pointwise limits and the dominated convergence theorem (the dominating function always being a constant), one easily shows that \(\mathbb{H}\) closed under bounded convergence. Since we have just verified that \(1_E \in \mathbb{H}\) for all \(E\) in the \(\pi\) – class, \(\mathcal{E}\), it follows by Corollary 11.3 that \(\mathbb{H}\) is the space...
of all bounded \((\mathcal{M} \otimes N, B_\mathcal{M})\) measurable functions on \(X \times Y\). Moreover, if \(f : X \times Y \to [0, \infty]\) is a \((\mathcal{M} \otimes N, B_\mathcal{M})\) measurable function, let \(f_M = M \land f\) so that \(f_M \uparrow f\) as \(M \to \infty\). Then Eqs. \([12.1] - [12.5]\) hold with \(f\) replaced by \(f_M\) for all \(M \in \mathbb{N}\). Repeated use of the monotone convergence theorem allows us to pass to the limit \(M \to \infty\) in these equations to deduce the theorem in the case \(\mu\) and \(\nu\) are finite measures.

For the \(\sigma\) finite case, choose \(X_n \in \mathcal{M}, Y_n \in \mathcal{N}\) such that \(X_n \uparrow X, Y_n \uparrow Y, \mu(X_n) < \infty\) and \(\nu(Y_n) < \infty\) for all \(n \in \mathbb{N}\). Then define \(\mu_m(A) = \mu(X_m \cap A)\) and \(\nu_n(B) = \nu(Y_n \cap B)\) for all \(A \in \mathcal{M}\) and \(B \in \mathcal{N}\) or equivalently \(d\mu_m = 1_{X_m} d\mu\) and \(d\nu_n = 1_{Y_n} d\nu\). By what we have just proved Eqs. \([12.1] - [12.5]\) with \(\mu\) replaced by \(\mu_m\) and \(\nu\) by \(\nu_n\) for all \((\mathcal{M} \otimes \mathcal{N}, B_\mathcal{M})\) measurable functions, \(f : X \times Y \to [0, \infty]\). The validity of Eqs. \([12.1] - [12.5]\) then follows by passing to the limits \(m \to \infty\) and \(n \to \infty\) making use of the monotone convergence theorem in the following context. For all \(u \in L^+(X, \mathcal{M}),\)

\[
\int_X u d\mu_m = \int_X u 1_{X_m} d\mu \uparrow \int_X u d\mu \quad \text{as} \quad m \to \infty,
\]

and for all \(v \in L^+(Y, \mathcal{N}),\)

\[
\int_Y v d\nu_m = \int_Y v 1_{Y_n} d\nu \uparrow \int_Y v d\nu \quad \text{as} \quad n \to \infty.
\]

\[\square\]

**Corollary 12.4.** Suppose \((X, \mathcal{M}, \mu)\) and \((Y, \mathcal{N}, \nu)\) are \(\sigma\) finite measure spaces. Then there exists a unique measure \(\pi\) on \(\mathcal{M} \otimes \mathcal{N}\) such that \(\pi(A \times B) = \mu(A)\nu(B)\) for all \(A \in \mathcal{M}\) and \(B \in \mathcal{N}\). Moreover \(\pi\) is given by

\[
\pi(E) = \int_X d\mu(x) \int_Y d\nu(y) 1_E(x,y) = \int_Y d\nu(y) \int_X d\mu(x) 1_E(x,y) \quad (12.7)
\]

for all \(E \in \mathcal{M} \otimes \mathcal{N}\) and \(\pi\) is \(\sigma\) finite.

\[\square\]

**Proof.** Notice that any measure \(\pi\) such that \(\pi(A \times B) = \mu(A)\nu(B)\) for all \(A \in \mathcal{M}\) and \(B \in \mathcal{N}\) is necessarily \(\sigma\) finite. Indeed, let \(X_n \in \mathcal{M}\) and \(Y_n \in \mathcal{N}\) be chosen so that \(\mu(X_n) < \infty, \nu(Y_n) < \infty, X_n \uparrow X\) and \(Y_n \uparrow Y\); then \(X_n \times Y_n \in \mathcal{M} \otimes \mathcal{N}\), \(X_n \times Y_n \uparrow X \times Y\) and \(\pi(X_n \times Y_n) < \infty\) for all \(n\). The uniqueness assertion is a consequence of the combination of Exercises \([6.10, 8.11]\) and Proposition \([6.25]\) with \(\mathcal{E} = \mathcal{M} \times \mathcal{N}\). For the existence, it suffices to observe, using the monotone convergence theorem, that \(\pi\) defined in Eq. \([12.7]\) is a measure on \(\mathcal{M} \otimes \mathcal{N}\). Moreover this measure satisfies \(\pi(A \times B) = \mu(A)\nu(B)\) for all \(A \in \mathcal{M}\) and \(B \in \mathcal{N}\) from Eq. \([12.6]\).

\[\square\]

**Notation 12.5** The measure \(\pi\) is called the product measure of \(\mu\) and \(\nu\) and will be denoted by \(\mu \otimes \nu\).

**Theorem 12.6 (Tonelli’s Theorem).** Suppose \((X, \mathcal{M}, \mu)\) and \((Y, \mathcal{N}, \nu)\) are \(\sigma\) finite measure spaces and \(\pi = \mu \otimes \nu\) is the product measure on \(\mathcal{M} \otimes \mathcal{N}\). If \(f \in L^+(X \times Y, \mathcal{M} \otimes \mathcal{N})\), then \(f \cdot (y) \in L^+(X, \mathcal{M})\) for all \(y \in Y\), \(f(x, \cdot) \in L^+(Y, \mathcal{N})\) for all \(x \in X\),

\[
\int_Y f(y) d\nu(y) \in L^+(X, \mathcal{M}), \quad \int_X f(x, \cdot) d\mu(x) \in L^+(Y, \mathcal{N})
\]

and

\[
\int_{X \times Y} f \, d\pi = \int_X d\mu(x) \int_Y d\nu(y) f(x,y) \quad (12.8)
\]

\[
= \int_Y d\nu(y) \int_X d\mu(x) f(x,y). \quad (12.9)
\]

**Proof.** By Theorem \([12.3]\) and Corollary \([12.4]\) the theorem holds when \(f = 1_E\) with \(E \in \mathcal{M} \otimes \mathcal{N}\). Using the linearity of all of the statements, the theorem is also true for non-negative simple functions. Then using the monotone convergence theorem repeatedly along with the approximation Theorem \([9.39]\), one deduces the theorem for general \(f \in L^+(X \times Y, \mathcal{M} \otimes \mathcal{N})\).}

**Example 12.7.** In this example we are going to show, \(I := \int_R e^{-x^2/2} dm(x) = \sqrt{2\pi}\). To this end we observe, using Tonelli’s theorem, that

\[
I^2 = \left[ \int_R e^{-x^2/2} dm(x) \right]^2 = \int_R e^{-y^2/2} \left[ \int_R e^{-x^2/2} dm(x) \right] dm(y)
\]

\[
= \int_R e^{-x^2+y^2}/2 dm(x) \quad (12.10)
\]

where \(m^2 = m \otimes m\) is “Lebesgue measure” on \((\mathbb{R}^2, B_{\mathbb{R}^2}) = B_{\mathbb{R}} \otimes B_{\mathbb{R}}\). From the monotone convergence theorem,

\[
I^2 = \lim_{R \to \infty} \int_{D_R} e^{-x^2+y^2}/2 dm^2(x, y)
\]

where \(D_R = \{(x, y) : x^2 + y^2 < R^2\}\). Using the change of variables theorem described in Section \([??]\) below\(^1\) we find

\[
\int_{D_R} e^{-x^2+y^2}/2 dm^2(x, y) = \int_{(0,R) \times (0,2\pi)} e^{-r^2/2} r dr d\theta
\]

\[
= 2\pi \int_0^R e^{-r^2/2} r dr = 2\pi \left( 1 - e^{-R^2/2} \right).
\]

\(^1\) Alternatively, you can easily show that the integral \(\int_{D_R} f dm^2\) agrees with the multiple integral in undergraduate analysis when \(f\) is continuous. Then use the change of variables theorem from undergraduate analysis.
From this we learn that
\[ I^2 = \lim_{R \to \infty} 2\pi \left( 1 - e^{-R^2/2} \right) = 2\pi \]
as desired.

### 12.3 Fubini’s Theorem

**Notation 12.8** If \((X, \mathcal{M}, \mu)\) is a measure space and \(f : X \to \mathbb{C}\) is any measurable function, let
\[ \int_X f \, d\mu := \begin{cases} \int_X f \, d\mu & \text{if } \int_X |f| \, d\mu < \infty \\ 0 & \text{otherwise.} \end{cases} \]

**Theorem 12.9 (Fubini’s Theorem).** Suppose \((X, \mathcal{M}, \mu)\) and \((Y, \mathcal{N}, \nu)\) are \(\sigma\)-finite measure spaces, \(\pi = \mu \otimes \nu\) is the product measure on \(\mathcal{M} \otimes \mathcal{N}\) and \(f : X \times Y \to \mathbb{C}\) is a \(\mathcal{M} \otimes \mathcal{N}\)-measurable function. Then the following three conditions are equivalent:

1. \(\int_{X \times Y} |f| \, d\pi < \infty\), i.e. \(f \in L^1(\pi)\),
2. \(\int_X \left( \int_Y |f(x,y)| \, d\nu(y) \right) \, d\mu(x) < \infty\) and
3. \(\int_Y \left( \int_X |f(x,y)| \, d\mu(x) \right) \, d\nu(y) < \infty\).

If any one (and hence all) of these condition hold, then \(f(x, \cdot) \in L^1(\nu)\) for \(\mu\)-a.e. \(x\), \(f(\cdot, y) \in L^1(\mu)\) for \(\nu\)-a.e. \(y\), \(\int_Y f(\cdot, y) \, d\nu(y) \in L^1(\mu)\), \(\int_X f(x, \cdot) \, d\mu(x) \in L^1(\nu)\) and Eqs. (12.8) and (12.9) are still valid after putting a bar over the integral symbols.

**Proof.** The equivalence of Eqs. (12.10) – (12.12) is a direct consequence of Tonelli’s Theorem [12.6]. Now suppose \(f \in L^1(\pi)\) is a real valued function and let
\[ E := \left\{ x \in X : \int_Y |f(x,y)| \, d\nu(y) = \infty \right\}. \]

Then by Tonelli’s theorem, \(x \to \int_Y |f(x,y)| \, d\nu(y)\) is measurable and hence \(E \in \mathcal{M}\). Moreover Tonelli’s theorem implies
\[ \int_X \left[ \int_Y |f(x,y)| \, d\nu(y) \right] \, d\mu(x) = \int_{X \times Y} |f| \, d\pi < \infty \]
which implies that \(\mu(E) = 0\). Let \(f_\pm\) be the positive and negative parts of \(f\), then
\[ \int_Y f(x,y) \, d\nu(y) = \int_Y 1_{E^c}(x) f(x,y) \, d\nu(y) = \int_Y 1_{E^c}(x) f_+(x,y) \, d\nu(y) - \int_Y 1_{E^c}(x) f_-(x,y) \, d\nu(y). \]

Noting that \(1_{E^c}(x) f_\pm(x,y) = (1_{E^c} \otimes 1_Y \cdot f_\pm)(x,y)\) is a positive \(\mathcal{M} \otimes \mathcal{N}\)-measurable function, it follows from another application of Tonelli’s theorem that \(x \to \int_Y f(x,y) \, d\nu(y)\) is \(\mathcal{M}\)-measurable, being the difference of two measurable functions. Moreover
\[ \int_X \left[ \int_Y f(x,y) \, d\nu(y) \right] \, d\mu(x) < \int_X \int_Y |f(x,y)| \, d\nu(y) \, d\mu(x) < \infty, \]
which shows \(\int_Y f(\cdot,y) \, d\nu(y) \in L^1(\mu)\). Integrating Eq. (12.14) on \(x\) and using Tonelli’s theorem repeatedly implies,
\[ \int_X \left[ \int_Y f(x,y) \, d\nu(y) \right] \, d\mu(x) = \int_Y d\mu(x) \int_X d\nu(y) 1_{E^c}(x) f_+(x,y) - \int_Y d\mu(x) \int_X d\nu(y) 1_{E^c}(x) f_-(x,y) \]
\[ = \int_Y d\nu(y) \int_X d\mu(x) 1_{E^c}(x) f_+(x,y) - \int_Y d\nu(y) \int_X d\mu(x) 1_{E^c}(x) f_-(x,y) \]
\[ = \int_Y d\nu(y) \int_X d\mu(x) f_+(x,y) - \int_Y d\nu(y) \int_X d\mu(x) f_-(x,y) \]
\[ = \int_X d\pi \int_{X \times Y} f_+ - f_- \, d\pi = \int_{X \times Y} f_+ - f_- \, d\pi = \int_{X \times Y} f \, d\pi \]
which proves Eq. (12.12) holds.

Now suppose that \(f = u + iv\) is complex valued and again let \(E\) be as in Eq. (12.13). Just as above we still have \(E \in \mathcal{M}\) and \(\mu(E) = 0\) and
\[ \int_Y f(x,y) \, d\nu(y) = \int_Y 1_{E^c}(x) f(x,y) \, d\nu(y) = \int_Y 1_{E^c}(x) (u(x,y) + iv(x,y)) \, d\nu(y) \]
\[ = \int_Y 1_{E^c}(x) u(x,y) \, d\nu(y) + i \int_Y 1_{E^c}(x) v(x,y) \, d\nu(y). \]
The last line is a measurable in $x$ as we have just proved. Similarly one shows \( \int y f (\cdot,y) \, dv (y) \in L^1 (\mu) \) and Eq. \((12.8)\) still holds by a computation similar to that done in Eq. \( (12.15) \). The assertions pertaining to Eq. \((12.9)\) may be proved in the same way.

The previous theorems generalize to products of any finite number of $\sigma$–finite measure spaces.

**Theorem 12.10.** Suppose \( \{ (X_i, \mathcal{M}_i, \mu_i) \}_{i=1}^n \) are $\sigma$–finite measure spaces and \( X := X_1 \times \cdots \times X_n \). Then there exists a unique measure \( (\pi) \) on \((X, \mathcal{M}_1 \otimes \cdots \otimes \mathcal{M}_n)\) such that

\[
\pi (A_1 \times \cdots \times A_n) = \mu_1 (A_1) \cdots \mu_n (A_n) \text{ for all } A_i \in \mathcal{M}_i. \tag{12.16}
\]

(This measure and its completion will be denoted by \( \mu_1 \otimes \cdots \otimes \mu_n \).) If \( f : X \to [0, \infty) \) is a \( \mathcal{M}_1 \otimes \cdots \otimes \mathcal{M}_n \)–measurable function then

\[
\int_X f \, d\pi = \int_{X_{\pi(1)}} d\mu_{\pi(1)} (x_{\pi(1)}) \cdots \int_{X_{\pi(n)}} d\mu_{\pi(n)} (x_{\pi(n)}) \, f(x_1, \ldots, x_n) \tag{12.17}
\]

where $\pi$ is any permutation of \( \{1, 2, \ldots, n\} \). In particular \( f \in L^1 (\pi) \), iff

\[
\int_{X_{\pi(i)}} d\mu_{\pi(i)} (x_{\pi(i)}) \cdots \int_{X_{\pi(n)}} d\mu_{\pi(n)} (x_{\pi(n)}) \cdot f(x_1, \ldots, x_n) < \infty
\]

for some (and hence all) permutations, $\pi$. Furthermore, if \( f \in L^1 (\pi) \), then

\[
\int_X f \, d\pi = - \int_{X_{\pi(1)}} d\mu_{\pi(1)} (x_{\pi(1)}) \cdots \int_{X_{\pi(n)}} d\mu_{\pi(n)} (x_{\pi(n)}) \, f(x_1, \ldots, x_n) \tag{12.18}
\]

for all permutations $\pi$.

**Proof.** (I would consider skipping this tedious proof.) The proof will be by induction on $n$ with the case $n = 2$ being covered in Theorems \(12.6\) and \(12.9\). So let $n \geq 3$ and assume the theorem is valid for $n - 1$ factors or less. To simplify notation, for \( 1 \leq i \leq n \), let \( X^i = \prod_{j \neq i} X_j \), \( M^i := \otimes_{j \neq i} M_j \), and \( \mu^i := \otimes_{j \neq i} \mu_j \) be the product measure on \((X^i, M^i)\) which is assumed to exist by the induction hypothesis. Also let \( M := M_1 \otimes \cdots \otimes M_n \) and for $x = (x_1, \ldots, x_i, \ldots, x_n) \in X$ let

\[ x^i := (x_1, \ldots, \hat{x}_i, \ldots, x_n) := (x_1, \ldots, x_{i-1}, x_{i+1}, \ldots, x_n). \]

Here is an outline of the argument with some details being left to the reader.

1. If $f : X \to [0, \infty]$ is $M$–measurable, then

\[
(x_1, \ldots, \hat{x}_i, \ldots, x_n) \mapsto \int_{X_i} f (x_1, \ldots, x_i, \ldots, x_n) \, d\mu_i (x_i)
\]

is $M^i$–measurable. Thus by the induction hypothesis, the right side of Eq. \( (12.17) \) is well defined.

2. If $\sigma \in S_n$ (the permutations of \( \{1, 2, \ldots, n\} \)) we may define a measure $\pi$ on \((X, M)\) by:

\[
\pi (A) := \int_{X_{\pi(n)}} \cdots \int_{X_{\pi(1)}} d\mu_{\pi(n)} (x_{\pi(n)}) \cdots d\mu_{\pi(1)} (x_{\pi(1)}) \int_{X_{\pi(n)}} \cdots \int_{X_{\pi(1)}} f (x_1, \ldots, x_n) \, d\mu (x_1, \ldots, x_n). \tag{12.19}
\]

It is easy to check that $\pi$ is a measure which satisfies Eq. \( (12.16) \). Using the $\sigma$–finiteness assumptions and the fact that

\[
\mathcal{P} := \{ A_1 \times \cdots \times A_n : A_i \in \mathcal{M}_i \text{ for } 1 \leq i \leq n \}
\]

is a $\pi$–system such that $\sigma (\mathcal{P}) = \mathcal{M}$, it follows from Exercise \(8.1\) that there is only one such measure satisfying Eq. \( (12.16) \). Thus the formula for $\pi$ in Eq. \( (12.19) \) is independent of $\sigma \in S_n$.

3. From Eq. \( (12.19) \) and the usual simple function approximation arguments we may conclude that Eq. \( (12.17) \) is valid. Now suppose that $f \in L^1 (X, M, \mu)$. Then

\[
(x_1, \ldots, \hat{x}_i, \ldots, x_n) \mapsto \int_{X_i} f (x_1, \ldots, x_i, \ldots, x_n) \, d\mu_i (x_i)
\]

is $M^i$–measurable. Indeed,

\[
(x_1, \ldots, \hat{x}_i, \ldots, x_n) \mapsto \int_{X_i} | f (x_1, \ldots, x_i, \ldots, x_n) | \, d\mu_i (x_i)
\]

is $M^i$–measurable and therefore

\[
E := \left\{ (x_1, \ldots, \hat{x}_i, \ldots, x_n) : \int_{X_i} | f (x_1, \ldots, x_i, \ldots, x_n) | \, d\mu_i (x_i) < \infty \right\} \in M^i.
\]

Now let $u := \text{Re} f$ and $v := \text{Im} f$ and $u_\pm$ and $v_\pm$ are the positive and negative parts of $u$ and $v$ respectively, then

\[
\int_{X_i} f (x) \, d\mu_i (x_i) = \int_{X_i} 1_E (x^i) f (x) \, d\mu_i (x_i)
\]

\[
= \int_{X_i} 1_E (x^i) u (x) \, d\mu_i (x_i) + i \int_{X_i} 1_E (x^i) v (x) \, d\mu_i (x_i).
\]

Both of these later terms are $M^i$–measurable since, for example,

\[
\int_{X_i} 1_E (x^i) u (x) \, d\mu_i (x_i) = \int_{X_i} 1_E (x^i) u_+ (x) \, d\mu_i (x_i) - \int_{X_i} 1_E (x^i) u_- (x) \, d\mu_i (x_i)
\]

which is $M^i$–measurable by step 1.
5. It now follows by induction that the right side of Eq. (12.18) is well defined.
6. Let \( i := \sigma n \) and \( T : X \to X_i \times X^i \) be the obvious identification;
\[
T((x_i, (x_1, \ldots, x_n)) = (x_1, \ldots, x_n).
\]

One easily verifies \( T \) is \( \mathcal{M}_i \otimes \mathcal{M}^i \) measurable (use Corollary 9.19 repeatedly) and that \( \pi \circ T^{-1} = \mu_i \otimes \mu^i \) (see Exercise 8.1).

7. Let \( f \in L^1(\pi) \). Combining step 6. with the abstract change of variables

Theorem \( (\text{Exercise 10.11}) \) implies
\[
\int_X f \, d\pi = \int_{X_i \times X^i} (f \circ T) \, d(\mu_i \otimes \mu^i).
\tag{12.20}
\]

By Theorem \( 12.9 \) we also have
\[
\int_{X_i \times X^i} (f \circ T) \, d(\mu_i \otimes \mu^i) = \int_{X^i} d\mu_i^i \left( x^i \right) \int_{X_i} d\mu_i(x_i) \, f \circ T(x_i, x^i)
\]
\[
= \int_{X_i} d\mu_i^i \left( x^i \right) \int_{X_i} d\mu_i(x_i) \, f(x_1, \ldots, x_n).
\tag{12.21}
\]

Then by the induction hypothesis,
\[
\int_{X} d\mu_i^i \left( x_i \right) \int_{X_i} d\mu_i(x_i) \, f(x_1, \ldots, x_n) = \prod_{j \neq i} \int_{X_j} d\mu_j(x_j) \int_{X_i} d\mu_i(x_i) \, f(x_1, \ldots, x_n)
\tag{12.22}
\]
where the ordering the integrals in the last product are inconsequential. Combining Eqs. (12.20) – (12.22) completes the proof.

\[\text{Convention:} \] We are now going to drop the bar above the integral sign with the understanding that \( \int_X f \, d\mu = 0 \) whenever \( f : X \to \mathbb{C} \) is a measurable function such that \( \int_X |f| \, d\mu = \infty \). However if \( f \) is a non-negative function (i.e. \( f : X \to [0, \infty) \)) non-integrable function we will interpret \( \int_X f \, d\mu \) to be infinite.

\textbf{Example 12.11.} In this example we will show
\[
\lim_{M \to \infty} \int_0^M \frac{\sin x}{x} \, dx = \frac{\pi}{2}.
\tag{12.23}
\]

To see this write \( \frac{1}{x} = \int_0^\infty e^{-tx} \, dt \) and use Fubini-Tonelli to conclude that
\[
\int_0^M \frac{\sin x}{x} \, dx = \int_0^M \left[ \int_0^\infty e^{-tx} \sin x \, dt \right] \, dx
\]
\[
= \int_0^\infty \left[ \int_0^M e^{-tx} \sin x \, dx \right] \, dt
\]
\[
= \int_0^\infty \frac{1}{1 + t^2} \left( 1 - te^{-Mt} \sin M - e^{-Mt} \cos M \right) \, dt
\]
\[
\to \int_0^\infty \frac{1}{1 + t^2} \, dt = \frac{\pi}{2} \text{ as } M \to \infty,
\]
wherein we have used the dominated convergence theorem (for instance, take \( g(t) := \frac{1}{1 + t^2} \left( 1 + te^{-t} + e^{-t} \right) \)) to pass to the limit.

The next example is a refinement of this result.

\textbf{Example 12.12.} We have
\[
\int_0^\infty \frac{\sin x}{x} e^{-Ax} \, dx = \frac{1}{2} \pi - \arctan A \text{ for all } A > 0
\tag{12.24}
\]

and for \( A, M \in [0, \infty) \),
\[
\left| \int_0^M \frac{\sin x}{x} e^{-Ax} \, dx - \frac{1}{2} \pi + \arctan A \right| \leq C \frac{e^{-MA}}{M}
\tag{12.25}
\]
where \( C = \max_{x \geq 0} \frac{1 + x}{1 + x^2} = \frac{1}{2\sqrt{2} - 2} \approx 1.2 \). In particular Eq. \( 12.23 \) is valid.

To verify these assertions, first notice that by the fundamental theorem of calculus,
\[
|\sin x| = \left| \int_0^x \cos y \, dy \right| \leq \left| \int_0^x |\cos y| \, dy \right| \leq \left| \int_0^x 1 \, dy \right| = |x|
\]
so \( \left| \frac{\sin x}{x} \right| \leq 1 \) for all \( x \neq 0 \). Making use of the identity
\[
\int_0^\infty e^{-tx} \, dt = 1/x
\]
and Fubini’s theorem,
\[
\int_0^M \frac{\sin x}{x} e^{-Ax} \, dx = \int_0^M dx \sin x e^{-Ax} \int_0^\infty e^{-tx} \, dt \\
= \int_0^\infty dt \int_0^M dx \sin x e^{-(A+t)x} \\
= \int_0^\infty \frac{1 - (\cos M + (A+t) \sin M) e^{-M(A+t)}}{(A+t)^2 + 1} \, dt \\
= \int_0^\infty \frac{1}{(A+t)^2 + 1} dt - \int_0^\infty \cos M + (A+t) \sin M e^{-M(A+t)} \, dt \\
= \frac{1}{2} \pi - \arctan \Lambda - \varepsilon(M, \Lambda) \\
\]
where
\[
\varepsilon(M, \Lambda) = \int_0^\infty \frac{\cos M + (A+t) \sin M}{(A+t)^2 + 1} e^{-M(A+t)} \, dt.
\]

Since
\[
\left| \frac{\cos M + (A+t) \sin M}{(A+t)^2 + 1} \right| \leq \frac{1 + (A+t)}{(A+t)^2 + 1} \leq C,
\]
\[
|\varepsilon(M, \Lambda)| \leq \int_0^\infty e^{-M(A+t)} \, dt = C e^{-MA/M}.
\]
This estimate along with Eq. (12.26) proves Eq. (12.25) from which Eq. (12.23) follows by taking \(A \to \infty\) and Eq. (12.24) follows (using the dominated convergence theorem again) by letting \(M \to \infty\).

**Lemma 12.13.** Suppose that \(X\) is a random variable and \(\varphi : \mathbb{R} \to \mathbb{R}\) is a \(C^1\) function such that \(\lim_{x \to -\infty} \varphi(x) = 0\) and either \(\varphi'(x) \geq 0\) for all \(x\) or \(\int_{\mathbb{R}} |\varphi'(x)| \, dx < \infty\). Then
\[
\mathbb{E}[\varphi(X)] = \int_{-\infty}^\infty \varphi'(y) P(X > y) \, dy.
\]
Similarly if \(X \geq 0\) and \(\varphi : [0, \infty) \to \mathbb{R}\) is a \(C^1\) function such that \(\varphi(0) = 0\) and either \(\varphi' \geq 0\) or \(\int_{0}^\infty |\varphi'(x)| \, dx < \infty\), then
\[
\mathbb{E}[\varphi(X)] = \int_{0}^\infty \varphi'(y) P(X > y) \, dy.
\]

**Proof.** By the fundamental theorem of calculus for all \(M < \infty\) and \(x \in \mathbb{R}\),
\[
\varphi(x) = \varphi(-M) + \int_{-M}^{x} \varphi'(y) \, dy.
\]

Under the stated assumptions on \(\varphi\), we may use either the monotone or the dominated convergence theorem to let \(M \to \infty\) in Eq. (12.27) to find,
\[
\varphi(x) = \int_{-\infty}^{x} \varphi'(y) \, dy = \int_{\mathbb{R}} 1_{y \leq x} \varphi'(y) \, dy \text{ for all } x \in \mathbb{R}.
\]

Therefore,
\[
\mathbb{E}[\varphi(X)] = \mathbb{E} \left[ \int_{\mathbb{R}} 1_{y \leq X} \varphi'(y) \, dy \right] = \int_{\mathbb{R}} \mathbb{E}[1_{y \leq X}] \varphi'(y) \, dy = \int_{-\infty}^{\infty} \varphi'(y) P(X > y) \, dy,
\]
where we applied Fubini’s theorem for the second equality. The proof of the second assertion is similar and will be left to the reader.

**Example 12.14.** Here are a couple of examples involving Lemma 12.13
1. Suppose \(X\) is a random variable, then
\[
\mathbb{E}[e^X] = \int_{-\infty}^{\infty} P(X > y) e^y \, dy = \int_{0}^{\infty} P(X > \ln u) \, du,
\]
where we made the change of variables, \(u = e^y\), to get the second equality.
2. If \(X \geq 0\) and \(p \geq 1\), then
\[
\mathbb{E}X^p = p \int_{0}^{\infty} y^{p-1} P(X > y) \, dy.
\]

### 12.4 Fubini’s Theorem and Completions*

**Notation 12.15** Given \(E \subset X \times Y\) and \(x \in X\), let
\[
_xE := \{y \in Y : (x, y) \in E\}.
\]
Similarly if \(y \in Y\) is given let
\[
_yE := \{x \in X : (x, y) \in E\}.
\]

If \(f : X \times Y \to \mathbb{C}\) is a function let \(f_x = f(x, \cdot)\) and \(f^y := f(\cdot, y)\) so that \(f_x : Y \to \mathbb{C}\) and \(f^y : X \to \mathbb{C}\).

**Theorem 12.16.** Suppose \((X, M, \mu)\) and \((Y, N, \nu)\) are complete \(\sigma\)-finite measure spaces. Let \((X \times Y, \mathcal{L}, \lambda)\) be the completion of \((X \times Y, M \otimes N, \mu \otimes \nu)\). If \(f\) is \(\mathcal{L}\)-measurable and (a) \(f \geq 0\) or (b) \(f \in L^1(\lambda)\) then \(f_x\) is \(N\)-measurable for \(\mu \text{ a.e. } x\) and \(f^y\) is \(M\)-measurable for \(\nu \text{ a.e. } y\) and in case (b) \(f_x \in L^1(\nu)\) and \(f^y \in L^1(\mu)\) for \(\mu \text{ a.e. } x\) and \(\nu \text{ a.e. } y\) respectively. Moreover,
\[ (x \to \int_Y f_x \, d\nu) \in L^1(\mu) \text{ and } (y \to \int_X f_y \, d\mu) \in L^1(\nu) \]

and
\[ \int_{X \times Y} f \, d\lambda = \int_Y \int_X f \, d\mu = \int_X \int_Y f \, d\nu. \]

**Proof.** If \( E \in \mathcal{M} \otimes \mathcal{N} \) is a \( \mu \otimes \nu \) null set (i.e. \( (\mu \otimes \nu)(E) = 0 \)), then
\[ 0 = (\mu \otimes \nu)(E) = \int_X \nu(\{x\}) \, d\mu(x) = \int_X \mu(E) \, d\nu(y). \]

This shows that
\[ \mu(\{x : \nu(x) \neq 0\}) = 0 \text{ and } \nu(\{y : \mu(y) \neq 0\}) = 0, \]
i.e. \( \nu(x) = 0 \) for \( \mu \) a.e. \( x \) and \( \mu(y) = 0 \) for \( \nu \) a.e. \( y \). If \( h \subseteq L \) measurable and 
\[ h = 0 \text{ for } \lambda \text{ a.e., then there exists } E \subseteq \mathcal{M} \otimes \mathcal{N} \text{ such that } \{(x, y) : h(x, y) \neq 0\} \subseteq E \text{ and } (\mu \otimes \nu)(E) = 0. \]
Therefore \( |h(x, y)| \leq 1_E(x, y) \) and \( (\mu \otimes \nu)(E) = 0 \).

Since
\[ \{h_x \neq 0\} = \{(y \in Y : h(x, y) \neq 0) \subseteq X \} \text{ and } \{h_y \neq 0\} = \{(x \in X : h(x, y) \neq 0) \subseteq Y \} \]
we learn that for \( \mu \) a.e. \( x \) and \( \nu \) a.e. \( y \) that \( \{h_x \neq 0\} \subseteq \mathcal{M}, \{h_y \neq 0\} \subseteq \mathcal{N}, \nu(h_x \neq 0) = 0 \) and a.e. and \( \mu(\{h_y \neq 0\}) = 0 \). This implies \( \int_X h'(x, y) \, d\nu(y) \) exists and equals 0 for \( \mu \) a.e. \( x \) and similarly that \( \int_X h(x, y) \, d\mu(x) \) exists and equals 0 for \( \nu \) a.e. \( y \). Therefore
\[ 0 = \int_{X \times Y} h \, d\lambda = \int_Y \left( \int_X h \, d\mu \right) \, d\nu = \int_X \left( \int_Y h \, d\nu \right) \, d\mu. \]

For general \( f \in L^1(\lambda) \), we may choose \( g \in L^1((\mathcal{M} \otimes \mathcal{N}), \mu \otimes \nu) \) such that \( f(x, y) = g(x, y) \) for \( \lambda \)-a.e. \( (x, y) \). Define \( h := f - g \). Then \( h = 0 \), \( \lambda \)-a.e. Hence by what we have just proved and Theorem 12.6 \( f = g + h \) has the following properties:

1. For \( \mu \) a.e. \( x \), \( y \to f(x, y) = g(x, y) + h(x, y) \) is in \( L^1(\nu) \) and
\[ \int_Y f(x, y) \, d\nu(y) = \int_Y g(x, y) \, d\nu(y). \]

2. For \( \nu \) a.e. \( y \), \( x \to f(x, y) = g(x, y) + h(x, y) \) is in \( L^1(\mu) \) and
\[ \int_X f(x, y) \, d\mu(x) = \int_X g(x, y) \, d\mu(x). \]

From these assertions and Theorem 12.6 it follows that
\[ \int_X d\mu(x) \int_Y d\nu(y) f(x, y) = \int_X d\mu(x) \int_Y d\nu(y) g(x, y) \]
\[ = \int_Y d\nu(y) \int_X d\mu(x) g(x, y) \]
\[ = \int_{X \times Y} f(x, y) \, d\lambda(x, y) \]
\[ = \int_{X \times Y} f(x, y) \, d\lambda(x, y). \]

Similarly it is shown that
\[ \int_Y d\nu(y) \int_X d\mu(x) f(x, y) = \int_{X \times Y} f(x, y) \, d\lambda(x, y). \]

**12.5 Exercises**

**Exercise 12.1.** Prove Theorem 47.21 Suggestion, to get started define
\[ \pi(A) := \int_{X_1} d\mu(x_1) \ldots \int_{X_n} d\mu(x_n) 1_A(x_1, \ldots, x_n) \]
and then show Eq. (47.20) holds. Use the case of two factors as the model of your proof.

**Exercise 12.2.** Let \( (\mathcal{X}_j, \mathcal{M}_j, \mu_j) \) for \( j = 1, 2, 3 \) be \( \sigma \)-finite measure spaces. Let \( F : (X_1 \times X_2) \times X_3 \to X_1 \times X_2 \times X_3 \) be defined by
\[ F((x_1, x_2), x_3) = (x_1, x_2, x_3). \]

1. Show \( F \) is \((\mathcal{M}_1 \otimes \mathcal{M}_2) \otimes \mathcal{M}_3, \mathcal{M}_1 \otimes \mathcal{M}_2 \otimes \mathcal{M}_3)\) measurable and \( F^{-1} \) is \((\mathcal{M}_1 \otimes \mathcal{M}_2) \otimes \mathcal{M}_3, \mathcal{M}_1 \otimes \mathcal{M}_2 \otimes \mathcal{M}_3)\) measurable. That is
\[ F : ((X_1 \times X_2) \times X_3, (\mathcal{M}_1 \otimes \mathcal{M}_2) \otimes \mathcal{M}_3) \to (X_1 \times X_2 \times X_3, \mathcal{M}_1 \otimes \mathcal{M}_2 \otimes \mathcal{M}_3) \]
is a “measure theoretic isomorphism.”

2. Let \( \pi := F \mid (\mathcal{M}_1 \otimes \mathcal{M}_2) \otimes \mathcal{M}_3 \), i.e. \( \pi(A) = [\mu_1 \otimes \mu_2] \otimes \mu_3(A) \) for all \( A \in \mathcal{M}_1 \otimes \mathcal{M}_2 \otimes \mathcal{M}_3 \). Then \( \pi \) is the unique measure on \( \mathcal{M}_1 \otimes \mathcal{M}_2 \otimes \mathcal{M}_3 \) such that
\[ \pi(A_1 \times A_2 \times A_3) = \mu_1(A_1)\mu_2(A_2)\mu_3(A_3) \]
for all \( A_j \in \mathcal{M}_j \). We will write \( \pi := \mu_1 \otimes \mu_2 \otimes \mu_3 \).
3. Let \( f : X_1 \times X_2 \times X_3 \to [0, \infty] \) be a \((\mathcal{M}_1 \otimes \mathcal{M}_2 \otimes \mathcal{M}_3, \mathcal{B}_{[0,\infty)})\)–measurable function. Verify the identity,
\[
\int_{X_1 \times X_2 \times X_3} f \, d\pi = \int_{X_3} d\mu_3(x_3) \int_{X_2} d\mu_2(x_2) \int_{X_1} d\mu_1(x_1) f(x_1, x_2, x_3),
\]
which makes sense and is correct.

4. (Optional.) Also show the above identity holds for any one of the six possible orderings of the iterated integrals.

**Exercise 12.3.** Prove the second assertion of Theorem 47.27. That is show \( m^d \) is the unique translation invariant measure on \( \mathcal{B}_{[0,\infty)^d} \) such that \( m^d([0,1]^d) = 1 \).

**Hint:** Look at the proof of Theorem 43.53.

**Exercise 12.4.** (Part of Folland Problem 2.46 on p. 69.) Let \( X = [0,1], \mathcal{M} = \mathcal{B}_{[0,1]} \) be the Borel \( \sigma \)-field on \( X \), \( m \) be Lebesgue measure on \([0,1]\) and \( \nu \) be counting measure, \( \nu(A) = \#(A) \). Finally let \( D = \{(x,x) \in X^2 : x \in X\} \) be the diagonal in \( X^2 \). Show
\[
\int_X \left[ \int_X 1_D(x,y) d\nu(y) \right] \, d\nu(x) \neq \int_X \left[ \int_X 1_D(x,y) d\nu(y) \right] \, d\nu(x)
\]
by explicitly computing both sides of this equation.

**Exercise 12.5.** Folland Problem 2.48 on p. 69. (Counter example related to Fubini Theorem involving counting measures.)

**Exercise 12.6.** Folland Problem 2.50 on p. 69 pertaining to area under a curve. (Note the \( \mathcal{M} \times \mathcal{B}_{\mathbb{R}} \) should be \( \mathcal{M} \otimes \mathcal{B}_{\mathbb{R}} \) in this problem.)

**Exercise 12.7.** Folland Problem 2.55 on p. 77. (Explicit integrations.)

**Exercise 12.8.** Folland Problem 2.56 on p. 77. Let \( f \in L^1((0,a),dm) \), \( g(x) = \int_x^a \frac{f(t)}{t} \, dt \) for \( x \in (0,a) \), show \( g \in L^1((0,a),dm) \) and
\[
\int_0^a g(x) \, dx = \int_0^a f(t) \, dt.
\]

**Exercise 12.9.** Show \( \int_0^\infty \frac{\sin x}{x} \, dm(x) = \infty \). So \( \frac{\sin x}{x} \notin L^1([0,\infty),m) \) and \( \int_0^\infty \frac{\sin x}{x} \, dm(x) \) is not defined as a Lebesgue integral.

**Exercise 12.10.** Folland Problem 2.57 on p. 77.

**Exercise 12.11.** Folland Problem 2.58 on p. 77.

**Exercise 12.12.** Folland Problem 2.60 on p. 77. Properties of the \( \Gamma \)–function.
Part III

Topological, Metric, Banach, and Hilbert Space Basics
Metric Spaces

**Definition 13.1.** A function \( d : X \times X \to [0, \infty) \) is called a metric if

1. (Symmetry) \( d(x, y) = d(y, x) \) for all \( x, y \in X \)
2. (Non-degenerate) \( d(x, x) = 0 \) if and only if \( x = 0 \in X \)
3. (Triangle inequality) \( d(x, z) \leq d(x, y) + d(y, z) \) for all \( x, y, z \in X \).

As primary examples, any normed space \((X, \| \cdot \|)\) (see Definition 4.24) is a metric space with \( d(x, y) := \| x - y \| \). Thus the space \( \ell^p(\mu) \) (as in Theorem 4.25) is a metric space for all \( p \in [1, \infty) \). Also any subset of a metric space is a metric space. For example a surface \( \Sigma \) in \( \mathbb{R}^3 \) is a metric space with the distance between two points on \( \Sigma \) being the usual distance in \( \mathbb{R}^3 \).

**Definition 13.2.** Let \((X, d)\) be a metric space. The open ball \( B(x, \delta) \subset X \) centered at \( x \in X \) with radius \( \delta > 0 \) is the set

\[
B(x, \delta) := \{ y \in X : d(x, y) < \delta \}.
\]

We will often also write \( B(x, \delta) \) as \( B_x(\delta) \). We also define the closed ball centered at \( x \in X \) with radius \( \delta > 0 \) as the set \( C_x(\delta) := \{ y \in X : d(x, y) \leq \delta \} \).

**Definition 13.3.** A sequence \( \{x_n\}_{n=1}^\infty \) in a metric space \((X, d)\) is said to be convergent if there exists a point \( x \in X \) such that \( \lim_{n \to \infty} d(x, x_n) = 0 \). In this case we write \( \lim_{n \to \infty} x_n = x \), or \( x_n \to x \) as \( n \to \infty \).

**Exercise 13.1.** Show that \( x \) in Definition 13.3 is necessarily unique.

**Definition 13.4.** A set \( E \subset X \) is bounded if \( E \subset B(x, R) \) for some \( x \in X \) and \( R < \infty \). A set \( F \subset X \) is closed if every convergent sequence \( \{x_n\}_{n=1}^\infty \) which is contained in \( F \) has its limit back in \( F \). A set \( V \subset X \) is open if \( V^c \) is closed. We will write \( F \subset X \) to indicate \( F \) is a closed subset of \( X \) and \( V \subset O_x \) to indicate the \( V \) is an open subset of \( X \). We also let \( \tau_d \) denote the collection of open subsets of \( X \) relative to the metric \( d \).

**Definition 13.5.** A subset \( A \subset X \) is a neighborhood of \( x \) if there exists an open set \( V \subset O_x X \) such that \( x \in V \subset A \). We will say that \( A \subset X \) is an open neighborhood of \( x \) if \( A \) is open and \( x \in A \).

**Exercise 13.2.** Let \( F \) be a collection of closed subsets of \( X \), show \( \cap F := \cap_{F \in F} F \) is closed. Also show that finite unions of closed sets are closed, i.e. if \( \{F_k\}_{k=1}^n \) are closed sets then \( \cup_{k=1}^n F_k \) is closed. (By taking complements, this shows that the collection of open sets, \( \tau_d \), is closed under finite intersections and arbitrary unions.)

The following “continuity” facts of the metric \( d \) will be used frequently in the remainder of this book.

**Lemma 13.6.** For any non empty subset \( A \subset X \), let \( d_A(x) := \inf \{d(x, a)|a \in A\} \), then
\[
|d_A(x) - d_A(y)| \leq d(x, y) \quad \forall x, y \in X
\]
and in particular if \( x_n \to x \) in \( X \), then \( d_A(x_n) \to d_A(x) \) as \( n \to \infty \). Moreover the set \( F_\varepsilon := \{x \in X|d_A(x) \geq \varepsilon\} \) is closed in \( X \).

**Proof.** Let \( a \in A \) and \( x, y, \varepsilon \in X \), then
\[
d_A(x) \leq d(x, a) \leq d(x, y) + d(y, a).
\]
Take the infimum over \( a \) in the above equation shows that
\[
d_A(x) \leq d(x, y) + d_A(y) \quad \forall x, y \in X.
\]
Therefore, \( d_A(x) - d_A(y) \leq d(x, y) \) and by interchanging \( x \) and \( y \) we also have that \( d_A(y) - d_A(x) \leq d(x, y) \) which implies Eq. [13.1]. If \( x_n \to x \) in \( X \), then by Eq. [13.1],
\[
|d_A(x) - d_A(x_n)| \leq d(x, x_n) \to 0 \quad \text{as} \quad n \to \infty
\]
so that \( \lim_{n \to \infty} d_A(x_n) = d_A(x) \). Now suppose that \( \{x_n\}_{n=1}^\infty \subset F_\varepsilon \) and \( x_n \to x \) in \( X \), then
\[
d_A(x) = \lim_{n \to \infty} d_A(x_n) \geq \varepsilon
\]
since \( d_A(x_n) \geq \varepsilon \) for all \( n \). This shows that \( x \in F_\varepsilon \) and hence \( F_\varepsilon \) is closed. \( \blacksquare \)

**Corollary 13.7.** The function \( d \) satisfies,
\[
|d(x, y) - d(x', y')| \leq d(y, y') + d(x, x').
\]
In particular \( d : X \times X \to [0, \infty) \) is “continuous” in the sense that \( d(x, y) \) is close to \( d(x', y') \) if \( x \) is close to \( x' \) and \( y \) is close to \( y' \). (The notion of continuity will be developed shortly.)
that is to say closure of \( X \). For example, if \( y_n \to y \in X \), then \( d(y_n, x) \leq \delta \) for all \( n \) and using Corollary 13.7 it follows \( d(y, x) \leq \delta \), i.e., \( y \in C_x(\delta) \). A similar proof shows \( B_x(\delta) \) is open, see Exercise 13.3.

**Exercise 13.3.** Show that \( V \subset X \) is open iff for every \( x \in V \) there is a \( \delta > 0 \) such that \( B_x(\delta) \subset V \). In particular show \( B_x(\delta) \) is open for all \( x \in X \) and \( \delta > 0 \).

**Hint:** by definition \( V \) is not open iff \( V^c \) is not closed.

**Lemma 13.9 (Approximating open sets from the inside by closed sets).** Let \( A \) be a closed subset of \( X \) and \( F_\varepsilon := \{ x \in X | d_A(x) \geq \varepsilon \} \subset X \) be as in Lemma 13.6. Then \( F_\varepsilon \uparrow A^c \) as \( \varepsilon \downarrow 0 \).

**Proof.** It is clear that \( d_A(x) = 0 \) for \( x \in A \) so that \( F_\varepsilon \subset A^c \) for each \( \varepsilon > 0 \) and hence \( \bigcup_{\varepsilon > 0} F_\varepsilon \subset A^c \). Now suppose that \( x \in A^c \subset o X \). By Exercise 13.3 there exists an \( \varepsilon > 0 \) such that \( B_x(\varepsilon) \subset A^c \), i.e., \( d(x, y) \geq \varepsilon \) for all \( y \in A \). Hence \( x \in F_\varepsilon \) and we have shown that \( A^c \subset \bigcup_{\varepsilon > 0} F_\varepsilon \). Finally it is clear that \( F_\varepsilon \subset F_{\varepsilon'} \) whenever \( \varepsilon' \leq \varepsilon \).

**Definition 13.10.** Given a set \( A \) contained in a metric space \( X \), let \( \bar{A} \subset X \) be the closure of \( A \) defined by

\[
\bar{A} := \{ x \in X : \exists \{ x_n \} \subset A \ni x = \lim_{n \to \infty} x_n \}.
\]

That is to say \( \bar{A} \) contains all limit points of \( A \). We say \( A \) is dense in \( X \) if \( \bar{A} = X \), i.e., every element \( x \in X \) is a limit of a sequence of elements from \( A \).

**BRUCE:** Probably should add the definition of separable here as well. See Definition 17.42.

**Exercise 13.4.** Given \( A \subset X \), show \( \bar{A} \) is a closed set and in fact

\[
\bar{A} = \bigcap \{ F : A \subset F \subset X \text{ with } F \text{ closed} \}.
\]  

(13.2)

That is to say \( \bar{A} \) is the smallest closed set containing \( A \).

### 13.1 Continuity

Suppose that \( (X, \rho) \) and \( (Y, d) \) are two metric spaces and \( f : X \to Y \) is a function.

**Definition 13.11.** A function \( f : X \to Y \) is continuous at \( x \in X \) if for all \( \varepsilon > 0 \) there is a \( \delta > 0 \) such that

\[
d(f(x), f(x')) < \varepsilon \quad \text{provided that } \rho(x, x') < \delta.
\]

(13.3)

The function \( f \) is said to be continuous if \( f \) is continuous at all points \( x \in X \).

The following lemma gives two other characterizations of continuity of a function at a point.

**Lemma 13.12 (Local Continuity Lemma).** Suppose that \( (X, \rho) \) and \( (Y, d) \) are two metric spaces and \( f : X \to Y \) is a function defined in a neighborhood of a point \( x \in X \). Then the following are equivalent:

1. \( f \) is continuous at \( x \).  
2. For all neighborhoods \( A \subset Y \) of \( f(x) \), \( f^{-1}(A) \) is a neighborhood of \( x \in X \).  
3. For all sequences \( \{ x_n \}_{n=1}^\infty \subset X \) such that \( x = \lim_{n \to \infty} x_n \), \( \{ f(x_n) \} \) is convergent in \( Y \) and

\[
\lim_{n \to \infty} f(x_n) = f \left( \lim_{n \to \infty} x_n \right).
\]

**Proof.** 1 \( \implies \) 2. If \( A \subset Y \) is a neighborhood of \( f(x) \), there exists \( \varepsilon > 0 \) such that \( B_{f(x)}(\varepsilon) \subset A \) and because \( f \) is continuous there exists a \( \delta > 0 \) such that Eq. (13.3) holds. Therefore

\[
B_x(\delta) \subset f^{-1}(B_{f(x)}(\varepsilon)) \subset f^{-1}(A)
\]

showing \( f^{-1}(A) \) is a neighborhood of \( x \).

2 \( \implies \) 3. Suppose that \( \{ x_n \}_{n=1}^\infty \subset X \) and \( x = \lim_{n \to \infty} x_n \). Then for any \( \varepsilon > 0 \), \( B_{f(x)}(\varepsilon) \) is a neighborhood of \( f(x) \) and so \( f^{-1}(B_{f(x)}(\varepsilon)) \) is a neighborhood of \( x \) which must contain \( B_x(\delta) \) for some \( \delta > 0 \). Because \( x_n \to x \), it follows that \( x_n \in B_x(\delta) \subset f^{-1}(B_{f(x)}(\varepsilon)) \) for a.a. \( n \) and this implies \( f(x_n) \in B_{f(x)}(\varepsilon) \) for a.a. \( n \), i.e., \( d(f(x), f(x_n)) < \varepsilon \) for a.a. \( n \). Since \( \varepsilon > 0 \) is arbitrary it follows that

\[
\lim_{n \to \infty} f(x_n) = f(x).
\]

3. \( \implies \) 1. We will show not 1. \( \implies \) not 3. If \( f \) is not continuous at \( x \), there exists an \( \varepsilon > 0 \) such that for all \( n \in \mathbb{N} \) there exists a point \( x_n \in X \) with \( \rho(x_n, x) < \frac{1}{n} \) yet \( d(f(x_n), f(x)) \geq \varepsilon \). Hence \( x_n \to x \) as \( n \to \infty \) yet \( f(x_n) \) does not converge to \( f(x) \).

Here is a global version of the previous lemma.
Lemma 13.13 (Global Continuity Lemma). Suppose that \((X, \rho)\) and \((Y, d)\) are two metric spaces and \(f : X \rightarrow Y\) is a function defined on all of \(X\). Then the following are equivalent:

1. \(f\) is continuous.
2. \(f^{-1}(V) \in \tau_\rho\) for all \(V \in \tau_d\), i.e. \(f^{-1}(V)\) is open in \(X\) if \(V\) is open in \(Y\).
3. \(f^{-1}(C)\) is closed in \(X\) if \(C\) is closed in \(Y\).
4. For all convergent sequences \(\{x_n\} \subset X\), \(\{f(x_n)\}\) is convergent in \(Y\) and
\[
\lim_{n \to \infty} f(x_n) = f\left(\lim_{n \to \infty} x_n\right).
\]

Proof. Since \(f^{-1}(A^c) = \left[f^{-1}(A)^c\right]^c\), it is easily seen that 2. and 3. are equivalent. So because of Lemma 13.12, it only remains to show 1. and 2. are equivalent. If \(f\) is continuous and \(V \subset Y\) is open, then for every \(x \in f^{-1}(V)\), \(V\) is a neighborhood of \(f(x)\) and so \(f^{-1}(V)\) is a neighborhood of \(x\). Hence \(f^{-1}(V)\) is a neighborhood of all of its points and from this and Exercise 13.13, it follows that \(f^{-1}(V)\) is open. Conversely, if \(x \in X\) and \(A \subset Y\) is a neighborhood of \(f(x)\), then \(V \subset Y\) such that \(f(x) \in V \subset A\). Hence \(x \in f^{-1}(V) \subset f^{-1}(A)\) and by assumption \(f^{-1}(V)\) is open showing \(f^{-1}(A)\) is a neighborhood of \(x\). Therefore \(f\) is continuous at \(x\) and since \(x \in X\) was arbitrary, \(f\) is continuous.

Example 13.14. The function \(d_A\) defined in Lemma 13.6 is continuous for each \(A \subset X\). In particular, if \(A = \{x\}\), it follows that \(y \in X \rightarrow d(y, x)\) is continuous for each \(x \in X\).

The next result shows that there are lots of continuous functions on a metric space \((X, d)\).

Lemma 13.15 (Urysohn’s Lemma for Metric Spaces). Let \((X, d)\) be a metric space and suppose that \(A\) and \(B\) are two disjoint closed subsets of \(X\). Then
\[
f(x) = \frac{d_B(x)}{d_A(x) + d_B(x)} \quad \text{for} \quad x \in X
\]
defines a continuous function, \(f : X \rightarrow [0, 1]\), such that \(f(x) = 1\) for \(x \in A\) and \(f(x) = 0\) if \(x \in B\).

Proof. By Lemma 13.6, \(d_A\) and \(d_B\) are continuous functions on \(X\). Since \(A\) and \(B\) are closed, \(d_A(x) > 0\) if \(x \notin A\) and \(d_B(x) > 0\) if \(x \notin B\). Since \(A \cap B = \emptyset\), \(d_A(x) + d_B(x) > 0\) for all \(x\) and \((d_A + d_B)^{-1}\) is continuous as well. The remaining assertions about \(f\) are all easy to verify.

Sometimes Urysohn’s lemma will be use in the following form. Suppose \(F \subset V \subset X\) with \(F\) being closed and \(V\) being open, then there exists \(f \in C(X, [0, 1])\) such that \(f = 1\) on \(F\) while \(f = 0\) on \(V^c\). This of course follows from Lemma 13.15 by taking \(A = F\) and \(B = V^c\).

13.2 Completeness in Metric Spaces

Definition 13.16 (Cauchy sequences). A sequence \(\{x_n\}_{n=1}^\infty\) in a metric space \((X, d)\) is **Cauchy** provided that
\[
\lim_{m,n \to \infty} d(x_n, x_m) = 0.
\]

Exercise 13.6. Show that convergent sequences are always Cauchy sequences. The converse is not always true. For example, let \(X = \mathbb{Q}\) be the set of rational numbers and \(d(x, y) = |x - y|\). Choose a sequence \(\{x_n\}_{n=1}^\infty\subset \mathbb{Q}\) which converges to \(\sqrt{2} \in \mathbb{R}\), then \(\{x_n\}_{n=1}^\infty\) is \((\mathbb{Q}, d)\) – Cauchy but not \((\mathbb{Q}, d)\) – convergent. The sequence does converge in \(\mathbb{R}\) however.

Definition 13.17. A metric space \((X, d)\) is **complete** if all Cauchy sequences are convergent sequences.

Exercise 13.7. Let \((X, d)\) be a complete metric space. Let \(A \subset X\) be a subset of \(X\) viewed as a metric space using \(d|_{A \times A}\). Show that \((A, d|_{A \times A})\) is complete iff \(A\) is a closed subset of \(X\).

Example 13.18. Examples 2. – 4. of complete metric spaces will be verified in Chapter 14 below.

1. \(X = \mathbb{R}\) and \(d(x, y) = |x - y|\), see Theorem 3.8 above.
2. \(X = \mathbb{R}^n\) and \(d(x, y) = \|x - y\|_2 = \left(\sum_{i=1}^n (x_i - y_i)^2\right)^{1/2}\).
3. \(X = \Theta^p(\mu)\) for \(p \in [1, \infty]\) and any weight function \(\mu : X \rightarrow (0, \infty)\).
4. \(X = C([0, 1], \mathbb{R})\) – the space of continuous functions from \([0, 1]\) to \(\mathbb{R}\) and
\[
d(f, g) := \max_{t \in [0, 1]} |f(t) - g(t)|.
\]
This is a special case of Lemma 14.3 below.

5. Let \(X = C([0, 1], \mathbb{R})\) and
\[
d(f, g) := \int_0^1 |f(t) - g(t)|\, dt.
\]
You are asked in Exercise 14.11 to verify that \((X, d)\) is a metric space which is **not** complete.
Exercise 13.8 (Completions of Metric Spaces). Suppose that $(X, d)$ is a (not necessarily complete) metric space. Using the following outline show there exists a complete metric space $(\tilde{X}, \tilde{d})$ and an isometric map $i : X \to \tilde{X}$ such that $i(X)$ is dense in $\tilde{X}$, see Definition \ref{def:comp}.

1. Let $C$ denote the collection of Cauchy sequences $a = \{a_n\}_{n=1}^\infty \subset X$. Given two element $a, b \in C$ show $d_C(a, b) := \lim_{n \to \infty} d(a_n, b_n)$ exists, $d_C(a, b) \geq 0$ for all $a, b \in C$ and $d_C$ satisfies the triangle inequality,

$$d_C(a, c) \leq d_C(a, b) + d_C(b, c) \text{ for all } a, b, c \in C.$$  

Thus $(C, d_C)$ would be a metric space if it were true that $d_C(a, b) = 0$ iff $a = b$. This however is false, for example if $a_n = b_n$ for all $n \geq 100$, then $d_C(a, b) = 0$ while $a$ need not equal $b$.

2. Define two elements $a, b \in C$ to be equivalent (write $a \sim b$ whenever $d_C(a, b) = 0$). Show “$\sim$” is an equivalence relation on $C$ and that $d_C(a', b') = d_C(a, b)$ if $a \sim a'$ and $b \sim b'$. (Hint: see Corollary \ref{cor:comp})

3. Given $a \in C$ let $\bar{a} := \{a \in C : a \sim a\}$ denote the equivalence class containing $a$ and let $\bar{X} := \{\bar{a} : a \in C\}$ denote the collection of such equivalence classes. Show that $\tilde{d}(\bar{a}, \bar{b}) := d_C(a, b)$ is well defined on $\bar{X} \times \bar{X}$ and verify $(\bar{X}, \tilde{d})$ is a metric space.

4. For $x \in X$ let $i(x) = \bar{a}$ where $a$ is the constant sequence, $a_n = x$ for all $n$. Verify that $i : X \to \bar{X}$ is an isometric map and that $i(X)$ is dense in $\bar{X}$.

5. Verify $(\bar{X}, \tilde{d})$ is complete. Hint: if $\{a(m)\}_{m=1}^\infty$ is a Cauchy sequence in $\bar{X}$ choose $b_m \in X$ such that $\tilde{d}(i(b_m), a(m)) \leq 1/m$. Then show $a(m) \to \bar{b}$ where $\bar{b} = \{b_m\}_{m=1}^\infty$.

13.3 Supplementary Remarks

13.3.1 Word of Caution

Example 13.19. Let $(X, d)$ be a metric space. It is always true that $B_x(\varepsilon) \subset C_x(\varepsilon)$ since $C_x(\varepsilon)$ is a closed set containing $B_x(\varepsilon)$. However, it is not always true that $B_x(\varepsilon) = C_x(\varepsilon)$. For example let $X = \{1, 2\}$ and $d(1, 2) = 1$, then $B_1(1) = \{1\}$, $B_1(2) = \{\}$. This subsection is not completely self contained and may safely be skipped.

In spite of the above examples, Lemmas \ref{lem:comp} \& \ref{lem:bd} below shows that for certain metric spaces of interest it is true that $B_x(\varepsilon) = C_x(\varepsilon)$.

Lemma 13.20. Suppose that $(X, |\cdot|)$ is a normed vector space and $d$ is the metric on $X$ defined by $d(x, y) = |x - y|$. Then

$$B_x(\varepsilon) = C_x(\varepsilon) \text{ and}$$

$$bd(B_x(\varepsilon)) = \{y \in X : d(x, y) = \varepsilon\}$$

where the boundary operation, $bd(\cdot)$ is defined in Definition \ref{def:bd} (BRUCE: Forward Reference.) below.

Proof. We must show that $C := C_x(\varepsilon) \subset B_x(\varepsilon) =: \tilde{B}$. For $y \in C$, let $v = y - x$, then

$$|v| = |y - x| = d(x, y) \leq \varepsilon.$$ 

Let $\alpha_n = 1 - 1/n$ so that $\alpha_n \uparrow 1$ as $n \to \infty$. Let $y_n = x + \alpha_n v$, then $d(x, y_n) = \alpha_n d(x, y) < \varepsilon$, so that $y_n \in B_x(\varepsilon)$ and $d(y, y_n) = (1 - \alpha_n) |v| \to 0$ as $n \to \infty$. This shows that $y_n \to y$ as $n \to \infty$ and hence that $y \in \tilde{B}$. ■

13.3.2 Riemannian Metrics

This subsection is not completely self contained and may safely be skipped.

Lemma 13.21. Suppose that $X$ is a Riemannian (or sub-Riemannian) manifold and $d$ is the metric on $X$ defined by

$$d(x, y) = \inf \{\ell(\sigma) : \sigma(0) = x \text{ and } \sigma(1) = y\}$$

where $\ell(\sigma)$ is the length of the curve $\sigma$. We define $\ell(\sigma) = \infty$ if $\sigma$ is not piecewise smooth. Then

$$B_x(\varepsilon) = C_x(\varepsilon) \text{ and}$$

$$bd(B_x(\varepsilon)) = \{y \in X : d(x, y) = \varepsilon\}$$

where the boundary operation, $bd(\cdot)$ is defined in Definition \ref{def:bd} (BRUCE: Forward Reference.) below.

Proof. Let $C := C_x(\varepsilon) \subset B_x(\varepsilon) =: \tilde{B}$. We will show that $C \subset \tilde{B}$ by showing $\tilde{B}^c \subset C^c$. Suppose that $y \in \tilde{B}^c$ and choose $\delta > 0$ such that $B_y(\delta) \cap \tilde{B} = \emptyset$. In particular this implies that

$$B_y(\delta) \cap B_x(\varepsilon) = \emptyset.$$ 

We will finish the proof by showing that $d(x, y) \geq \varepsilon + \delta > \varepsilon$ and hence that $y \in C^c$. This will be accomplished by showing: if $d(x, y) < \varepsilon + \delta$ then $B_y(\delta) \cap$
Remark 13.22. Suppose again that $X$ is a Riemannian (or sub-Riemannian) manifold and

$$d(x,y) := \inf \{ \ell(\sigma) : \sigma(0) = x \text{ and } \sigma(1) = y \}.$$  

Let $\sigma$ be a curve from $x$ to $y$ and let $\varepsilon = \ell(\sigma) - d(x,y)$. Then for all $0 \leq u < v \leq 1$,

$$d(x,y) + \varepsilon = \ell(\sigma) = \ell(\sigma|_{[0,u]}) + \ell(\sigma|_{[u,v]}) + \ell(\sigma|_{[v,1]})$$

$$\geq d(x,\sigma(u)) + \ell(\sigma|_{[u,v]}) + d(\sigma(v),y)$$

and therefore, using the triangle inequality,

$$\ell(\sigma|_{[u,v]}) \leq d(x,y) + \varepsilon - d(x,\sigma(u)) - d(\sigma(v),y)$$

$$\leq d(\sigma(u),\sigma(v)) + \varepsilon.$$  

This leads to the following conclusions. If $\sigma$ is within $\varepsilon$ of a length minimizing curve from $x$ to $y$ then $\sigma|_{[u,v]}$ is within $\varepsilon$ of a length minimizing curve from $\sigma(u)$ to $\sigma(v)$. In particular if $\sigma$ is a length minimizing curve from $x$ to $y$ then $\sigma|_{[u,v]}$ is a length minimizing curve from $\sigma(u)$ to $\sigma(v)$.

13.4 Exercises

Exercise 13.9. Let $(X,d)$ be a metric space. Suppose that $\{x_n\}_{n=1}^\infty \subset X$ is a sequence and set $\varepsilon_n := d(x_n, x_{n+1})$. Show that for $m > n$ that

$$d(x_n, x_m) \leq \sum_{k=n}^{m-1} \varepsilon_k \leq \sum_{k=n}^\infty \varepsilon_k.$$  

Conclude from this that if

$$\sum_{k=1}^\infty \varepsilon_k = \sum_{n=1}^\infty d(x_n, x_{n+1}) < \infty$$

then $\{x_n\}_{n=1}^\infty$ is Cauchy. Moreover, show that if $\{x_n\}_{n=1}^\infty$ is a convergent sequence and $x = \lim_{n \to \infty} x_n$ then

$$d(x,x_n) \leq \sum_{k=n}^\infty \varepsilon_k.$$  

Exercise 13.10. Show that $(X,d)$ is a complete metric space iff every sequence $\{x_n\}_{n=1}^\infty \subset X$ such that $\sum_{n=1}^\infty d(x_n, x_{n+1}) < \infty$ is a Cauchy sequence in $X$.

You may find it useful to prove the following statements in the course of the proof.

1. If $\{x_n\}$ is Cauchy sequence, then there is a subsequence $y_j := x_{n_j}$ such that $\sum_{j=1}^\infty d(y_{j+1}, y_j) < \infty$.
2. If $\{x_n\}_{n=1}^\infty$ is Cauchy and there exists a subsequence $y_j := x_{n_j}$ of $\{x_n\}$ such that $x = \lim_{j \to \infty} y_j$ exists, then $\lim_{n \to \infty} x_n$ also exists and is equal to $x$.

Exercise 13.11. Suppose that $f : [0, \infty) \to [0, \infty)$ is a $C^2$ – function such that $f(0) = 0$, $f' > 0$ and $f'' \leq 0$ and $(X,\rho)$ is a metric space. Show that $d(x,y) = f(\rho(x,y))$ is a metric on $X$. In particular show that

$$d(x,y) := \frac{\rho(x,y)}{1 + \rho(x,y)}$$

is a metric on $X$. (Hint: use calculus to verify that $f(a+b) \leq f(a) + f(b)$ for all $a,b \in [0,\infty).$)

Exercise 13.12. Let $\{(X_n,d_n)\}_{n=1}^\infty$ be a sequence of metric spaces, $X := \prod_{n=1}^\infty X_n$, and for $x = (x(n))_{n=1}^\infty$ and $y = (y(n))_{n=1}^\infty$ in $X$ let

$$d(x,y) = \sum_{n=1}^\infty 2^{-n} d_n(x(n), y(n)).$$

Show:
1. $(X, d)$ is a metric space,
2. a sequence $\{x_k\}_{k=1}^\infty \subset X$ converges to $x \in X$ iff $x_k(n) \to x(n) \in X_n$ as $k \to \infty$ for each $n \in \mathbb{N}$ and
3. $X$ is complete if $X_n$ is complete for all $n$.

**Exercise 13.13.** Suppose $(X, \rho)$ and $(Y, d)$ are metric spaces and $A$ is a dense subset of $X$.

1. Show that if $F : X \to Y$ and $G : X \to Y$ are two continuous functions such that $F = G$ on $A$ then $F = G$ on $X$. **Hint:** consider the set $C := \{x \in X : F(x) = G(x)\}$.
2. Suppose $f : A \to Y$ is a function which is uniformly continuous, i.e. for every $\varepsilon > 0$ there exists a $\delta > 0$ such that

$$d(f(a), f(b)) < \varepsilon$$

for all $a, b \in A$ with $\rho(a, b) < \delta$.

Show there is a unique continuous function $F : X \to Y$ such that $F = f$ on $A$. **Hint:** each point $x \in X$ is a limit of a sequence consisting of elements from $A$.

3. Let $X = \mathbb{R} = Y$ and $A = \mathbb{Q} \subset X$, find a function $f : \mathbb{Q} \to \mathbb{R}$ which is continuous on $\mathbb{Q}$ but does **not** extend to a continuous function on $\mathbb{R}$. 
Banach Spaces

Let \((X, \|\cdot\|)\) be a normed vector space and \(d(x, y) := \|x - y\|\) be the associated metric on \(X\). We say \(\{x_n\}_{n=1}^\infty \subset X\) converges to \(x \in X\) (and write \(\lim_{n \to \infty} x_n = x\) or \(x_n \to x\)) if

\[
0 = \lim_{n \to \infty} d(x_n, x) = \lim_{n \to \infty} \|x - x_n\|.
\]

Similarly \(\{x_n\}_{n=1}^\infty \subset X\) is said to be a Cauchy sequence if

\[
0 = \lim_{m,n \to \infty} d(x_m, x_n) = \lim_{m,n \to \infty} \|x_m - x_n\|.
\]

**Definition 14.1 (Banach space).** A normed vector space \((X, \|\cdot\|)\) is a Banach space if the associated metric space \((X, d)\) is complete, i.e. all Cauchy sequences are convergent.

**Remark 14.2.** Since \(\|x\| = d(x, 0)\), it follows from Lemma 13.9 that \(\|\cdot\|\) is a continuous function on \(X\) and that

\[
\|\|x\| - \|y\|\| \leq \|x - y\| \quad \text{for all} \quad x, y \in X.
\]

It is also easily seen that the vector addition and scalar multiplication are continuous on any normed space as the reader is asked to verify in Exercise 14.5. These facts will often be used in the sequel without further mention.

**14.1 Examples**

**Lemma 14.3.** Suppose that \(X\) is a set then the bounded functions, \(\ell^\infty(X)\), on \(X\) is a Banach space with the norm

\[
\|f\| = \|f\|_\infty = \sup_{x \in X} |f(x)|.
\]

Moreover if \(X\) is a metric space (more generally a topological space, see Chapter 17) the set \(\text{BC}(X) \subset \ell^\infty(X) = B(X)\) is closed subspace of \(\ell^\infty(X)\) and hence is also a Banach space.

**Proof.** Let \(\{f_n\}_{n=1}^\infty \subset \ell^\infty(X)\) be a Cauchy sequence. Since for any \(x \in X\), we have

\[
|f_n(x) - f_m(x)| \leq \|f_n - f_m\|_\infty
\]

which shows that \(\{f_n(x)\}_{n=1}^\infty \subset \mathbb{F}\) is a Cauchy sequence of numbers. Because \(\mathbb{F} = \mathbb{R}\) or \(\mathbb{C}\) is complete, \(f(x) := \lim_{n \to \infty} f_n(x)\) exists for all \(x \in X\). Passing to the limit \(n \to \infty\) in Eq. (14.1) implies

\[
|f(x) - f_m(x)| \leq \lim \inf_{n \to \infty} \|f_n - f_m\|_\infty
\]

and taking the supremum over \(x \in X\) of this inequality implies

\[
\|f - f_m\|_\infty \leq \lim \inf_{n \to \infty} \|f_n - f_m\|_\infty \to 0 \quad \text{as} \quad m \to \infty
\]

showing \(f_m \to f\) in \(\ell^\infty(X)\). For the second assertion, suppose that \(\{f_n\}_{n=1}^\infty \subset \text{BC}(X) \subset \ell^\infty(X)\) and \(f_n \to f \in \ell^\infty(X)\). We must show that \(f \in \text{BC}(X)\), i.e. that \(f\) is continuous. To this end let \(x, y \in X\), then

\[
|f(x) - f(y)| \leq |f(x) - f_n(x)| + |f_n(x) - f_n(y)| + |f_n(y) - f(y)|
\]

\[
\leq 2 \|f - f_n\|_\infty + |f_n(x) - f_n(y)|.
\]

Thus if \(\varepsilon > 0\), we may choose \(n\) large so that \(2 \|f - f_n\|_\infty < \varepsilon/2\) and then for this \(n\) there exists an open neighborhood \(V_x\) of \(x \in X\) such that \(|f_n(x) - f_n(y)| < \varepsilon/2\) for \(y \in V_x\). Thus \(|f(x) - f(y)| < \varepsilon\) for \(y \in V_x\) showing the limiting function \(f\) is continuous.

Here is an application of Urysonhn’s Lemma 13.15 and Lemma 14.3.

**Theorem 14.4 (Metric Space Tietze Extension Theorem).** Let \((X, d)\) be a metric space, \(D\) be a closed subset of \(X\), \(-\infty < a < b < \infty\) and \(f \in C(D, [a, b])\). (Here we are viewing \(D\) as a metric space with metric \(d_D := d|_{D \times D}\).) Then there exists \(F \in C(X, [a, b])\) such that \(F|_D = f\).

**Proof.**

1. By scaling and translation (i.e. by replacing \(f\) by \((b - a)^{-1}(f - a)\)), it suffices to prove Theorem 14.4 with \(a = 0\) and \(b = 1\).
2. Suppose $\alpha \in (0, 1]$ and $f : D \to [0, \alpha]$ is continuous function. Let $A := f^{-1}([0, \frac{2}{3}\alpha])$ and $B := f^{-1}([\frac{2}{3}\alpha, \alpha])$. By Lemma 13.15, there exists a function $\tilde{g} \in C(X, [0, \frac{2}{3}])$ such that $\tilde{g} = 0$ on $A$ and $\tilde{g} = 1$ on $B$. Letting $g := \frac{2}{3}\tilde{g}$, we have $g \in C(X, [0, \frac{2}{3}])$ such that $g = 0$ on $A$ and $g = \frac{2}{3}$ on $B$. Further notice that

$$0 \leq f(x) - g(x) \leq \frac{2}{3}\alpha$$

for all $x \in D$.

3. Now suppose $f : D \to [0, 1]$ is a continuous function as in step 1. Let $g_1 \in C(X, [0, 1/3])$ be as in step 2 with $\alpha = 1$ (see Figure ??) and let $f_1 := f - g_1|_D \in C(D, [0, 2/3])$. Now apply step 2, with $f = f_1$ and $\alpha = 2/3$ to find $g_2 \in C(X, [0, 1/3])$ such that $f_2 := f - (g_1 + g_2)|_D \in C(D, [0, (\frac{2}{3})^2])$.

Continue this way inductively to find $g_n \in C(X, [0, \frac{1}{3}])$ such that

$$f - \sum_{n=1}^N g_n|_D =: f_N \in C \left( D, \left[ 0, \left( \frac{2}{3} \right)^N \right] \right).$$

(14.2)

4. Define $F := \sum_{n=1}^\infty g_n$. Since

$$\sum_{n=1}^\infty \|g_n\|_\infty \leq \sum_{n=1}^\infty \frac{1}{3} \left( \frac{2}{3} \right)^{n-1} = \frac{1}{3} \frac{1}{1 - \frac{2}{3}} = 1,$$

the series defining $F$ is uniformly convergent so $F \in C(X, [0, 1])$ via Lemma 14.3. Passing to the limit in Eq. (14.2) shows $f = F|_D$.

\[ \square \]

**Theorem 14.5 (Completeness of $\ell^p(\mu)$).** Let $X$ be a set and $\mu : X \to (0, \infty)$ be a given function. Then for any $p \in [1, \infty]$, $(\ell^p(\mu), \|\cdot\|_p)$ is a Banach space.

**Proof.** We have already proved this for $p = \infty$ in Lemma 14.3 so we now assume that $p \in [1, \infty)$. Let $\{f_n\}_{n=1}^\infty \subset \ell^p(\mu)$ be a Cauchy sequence. Since for any $x \in X$,

$$|f_n(x) - f_m(x)| \leq \frac{1}{\mu(x)} \|f_n - f_m\|_p$$

it follows that $\{f_n(x)\}_{n=1}^\infty$ is a Cauchy sequence of numbers and $f(x) := \lim_{n \to \infty} f_n(x)$ exists for all $x \in X$. By Fatou’s Lemma,

$$\|f_n - f\|_p^p = \sum_x \mu \cdot \lim_{m \to \infty} \inf \|f_n - f_m\|_p^p \leq \lim_{m \to \infty} \inf \sum_x \mu \cdot |f_n - f_m|_p^p$$

$$= \lim_{m \to \infty} \inf \|f_n - f_m\|_p^p \to 0$$

as $n \to \infty$.

This then shows that $f = (f_n) + f_n \in \ell^p(\mu)$ (being the sum of two $\ell^p$ - functions) and that $f_n \to f$.

\[ \square \]
that provided write is a linear map. The following are equivalent:

Proposition 14.8. Suppose that $\|x\|_X$ determine the norm that is to be used by context.

Exercise 14.1. Assume the norms on $T : X \to Y$ are given by matrix multiplication by an $m \times n$ matrix. Let us identify the linear transformation to $T$ with this matrix.

Exercise 14.2. Assume the norms on $X$ and $Y$ are the $\ell_\infty$ – norms, i.e. for $x \in \mathbb{R}^n$, $\|x\| = \max_{1 \leq j \leq n} |x_j|$. Then the operator norm of $T$ is given by

$$\|T\| = \max_{1 \leq j \leq m} \sum_{i=1}^n |T_{ij}|.$$ 

Exercise 14.3. Assume the norms on $X$ and $Y$ are the $\ell_2$ – norms, i.e. for $x \in \mathbb{R}^n$, $\|x\|^2 = \sum_{j=1}^n x_j^2$. Show $\|T\|^2$ is the largest eigenvalue of the matrix $T^*T : \mathbb{R}^n \to \mathbb{R}^n$. Hint: Use the spectral theorem for orthogonal matrices.

\[\|T(x)\|_Y \leq C\|x\|_X \text{ for all } x \in X.\] We denote the best constant by $\|T\|_{op} = \|T\|_{L(X,Y)}$, i.e.

$$\|T\|_{L(X,Y)} = \sup_{x \neq 0} \frac{\|T(x)\|_Y}{\|x\|_X} = \sup \{\|T(x)\|_Y : \|x\|_X = 1\}. $$

The number $\|T\|_{L(X,Y)}$ is called the operator norm of $T$.

In the future, we will usually drop the garnishing on the norms and simply write $\|x\|_X$ as $\|x\|$, $\|T\|_{L(X,Y)}$ as $\|T\|$, etc. The reader should be able to determine the norm that is to be used by context.

Proposition 14.8. Suppose that $X$ and $Y$ are normed spaces and $T : X \to Y$ is a linear map. The following are equivalent:

1. $T$ is continuous.
2. $T$ is continuous at 0.
3. $T$ is bounded.

Proof. 1. $\Rightarrow$ 2. trivial. 2. $\Rightarrow$ 3. If $T$ continuous at 0 then there exist $\delta > 0$ such that $\|T(x)\| \leq 1$ if $\|x\| \leq \delta$. Therefore for any nonzero $x \in X$, $\|T(\delta x/\|x\|)\| \leq 1$ which implies that $\|T(x)\| \leq \frac{1}{\delta} \|x\|$ and hence $\|T\| \leq \frac{1}{\delta} < \infty$. 3. $\Rightarrow$ 1. Let $x \in X$ and $\varepsilon > 0$ be given. Then

$$\|Ty - Tx\| = \|T(y - x)\| \leq \|T\| \|y - x\| < \varepsilon$$

provided $\|y - x\| < \varepsilon/\|T\| := \delta$. $\blacksquare$

For the next three exercises, let $X = \mathbb{R}^n$ and $Y = \mathbb{R}^m$ and $T : X \to Y$ be a linear transformation so that $T$ is given by matrix multiplication by an $m \times n$ matrix. Let us identify the linear transformation $T$ with this matrix.

Exercise 14.1. Assume the norms on $X$ and $Y$ are the $\ell_1$ – norms, i.e. for $x \in \mathbb{R}^n$, $\|x\| = \sum_{j=1}^n |x_j|$. Then the operator norm of $T$ is given by

$$\|T\| = \max_{1 \leq j \leq m} \sum_{i=1}^n |T_{ij}|.$$ 

Exercise 14.2. Assume the norms on $X$ and $Y$ are the $\ell_\infty$ – norms, i.e. for $x \in \mathbb{R}^n$, $\|x\| = \max_{1 \leq j \leq n} |x_j|$. Then the operator norm of $T$ is given by

$$\|T\| = \max_{1 \leq j \leq m} \sum_{i=1}^n |T_{ij}|.$$ 

Exercise 14.3. Assume the norms on $X$ and $Y$ are the $\ell_2$ – norms, i.e. for $x \in \mathbb{R}^n$, $\|x\|^2 = \sum_{j=1}^n x_j^2$. Show $\|T\|^2$ is the largest eigenvalue of the matrix $T^*T : \mathbb{R}^n \to \mathbb{R}^n$. Hint: Use the spectral theorem for orthogonal matrices.

Notation 14.9 Let $L(X,Y)$ denote the bounded linear operators from $X$ to $Y$ and $L(X) = L(X,X)$. If $Y = \mathbb{R}$ we write $X^*$ for $L(X,\mathbb{R})$ and call $X^*$ the (continuous) dual space to $X$.

Lemma 14.10. Let $X$, $Y$ be normed spaces, then the operator norm $\|\cdot\|$ on $L(X,Y)$ is a norm. Moreover if $X$ is another normed space and $T : X \to Y$ and $S : Y \to Z$ are linear maps, then $\|ST\| \leq \|S\|\|T\|$, where $ST := S \circ T$.

Proof. As usual, the main point in checking the operator norm is a norm is to verify the triangle inequality, the other axioms being easy to check. If $A, B \in L(Y)$ then the triangle inequality is verified as follows:

$$\|A + B\| = \sup_{x \neq 0} \frac{\|Ax + Bx\|}{\|x\|} \leq \sup_{x \neq 0} \frac{\|Ax\| + \|Bx\|}{\|x\|} \leq \sup_{x \neq 0} \frac{\|Ax\|}{\|x\|} + \sup_{x \neq 0} \frac{\|Bx\|}{\|x\|} = \|A\| + \|B\|.$$ 

For the second assertion, we have for $x \in X$, that

$$\|STx\| \leq \|S\|\|Tx\| \leq \|S\|\|T\|\|x\|.$$ 

From this inequality and the definition of $\|ST\|$, it follows that $\|ST\| \leq \|S\|\|T\|$.

The reader is asked to prove the following continuity lemma in Exercise 14.9.

Lemma 14.11. Let $X$, $Y$ and $Z$ be normed spaces. Then the maps

$$(S, x) \in L(X,Y) \times X \to Sx \in Y$$

and

$$(S, T) \in L(X,Y) \times L(Y,Z) \to ST \in L(X,Z)$$

are continuous relative to the norms

$$\|(S, x)\|_{L(X,Y) \times X} := \|S\|_{L(X,Y)} + \|x\|_X$$

and

$$\|(S, T)\|_{L(X,Y) \times L(Y,Z)} := \|S\|_{L(X,Y)} + \|T\|_{L(Y,Z)}$$

on $L(X,Y) \times X$ and $L(X,Y) \times L(Y,Z)$ respectively.

Proposition 14.12. Suppose that $X$ is a normed vector space and $Y$ is a Banach space. Then $(L(X,Y), \|\cdot\|_{op})$ is a Banach space. In particular the dual space $X^*$ is always a Banach space.

Proof. Let $\{T_n\}_{n=1}^\infty$ be a Cauchy sequence in $L(X,Y)$. Then for each $x \in X$, $\|T_nx - T_mx\| \leq \|T_n - T_m\| \|x\| \to 0$ as $m, n \to \infty$.
Thus we have shown that 
\[ T \] 
The map \( T: X \to Y \) is linear map, since for \( x, x' \in X \) and \( \lambda \in \mathbb{F} \) we have 
\[ T(x + \lambda x') = \lim_{n \to \infty} T_n(x + \lambda x') = T x + \lambda T x', \]
wherein we have used the continuity of the vector space operations in the last equality. Moreover, 
\[ \|T x - T_n x\| \leq \|T x - T_m x\| + \|T_m x - T_n x\| \leq \|T x - T_m x\| + \|T_m - T_n\| \|x\| \]
and therefore
\[ \|T x - T_n x\| \leq \lim \inf_{n \to \infty} (\|T x - T_m x\| + \|T_m - T_n\| \|x\|) = \|x\| \lim \inf_{n \to \infty} \|T_m - T_n\|. \]
Hence
\[ \|T - T_n\| \leq \lim \inf_{n \to \infty} \|T_m - T_n\| \to 0 \text{ as } n \to \infty. \]
Thus we have shown that \( T_n \to T \) in \( L(X,Y) \) as desired.

The following characterization of a Banach space will sometimes be useful in the sequel.

**Theorem 14.13.** A normed space \((X, \|\cdot\|)\) is a Banach space if and only if every sequence \( \{x_n\}_{n=1}^{\infty} \subset X \) such that \( \sum_{n=1}^{\infty} \|x_n\| < \infty \) implies \( \lim_{n \to \infty} \sum_{n=1}^{N} x_n = s \) exists in \( X \) (that is to say every absolutely convergent series is a convergent series in \( X \)).
As usual we will denote \( s \) by \( \sum_{n=1}^{\infty} x_n \).

**Proof.** (This is very similar to Exercise 13.10) \( (\Rightarrow) \) If \( X \) is complete and \( \sum_{n=1}^{\infty} \|x_n\| < \infty \) then sequence \( s_N := \sum_{n=1}^{N} x_n \) for \( N \in \mathbb{N} \) is Cauchy because (for \( N > M \))
\[ \|s_N - s_M\| \leq \sum_{n=M+1}^{N} \|x_n\| \to 0 \text{ as } M, N \to \infty. \]
Therefore \( s = \sum_{n=1}^{\infty} x_n := \lim_{N \to \infty} \sum_{n=1}^{N} x_n \) exists in \( X \). \( (\Leftarrow) \) Suppose that \( \{x_n\}_{n=1}^{\infty} \) is a Cauchy sequence and let \( \{y_k = x_{n_k}\}_{k=1}^{\infty} \) be a subsequence of \( \{x_n\}_{n=1}^{\infty} \) such that \( \sum_{n=1}^{\infty} \|y_{n+1} - y_n\| < \infty \). By assumption
\[ y_{N+1} - y_1 = \sum_{n=1}^{N} (y_{n+1} - y_n) \to s = \sum_{n=1}^{\infty} (y_{n+1} - y_n) \in X \text{ as } N \to \infty. \]
This shows that \( \lim_{N \to \infty} y_N \) exists and is equal to \( x := y_1 + s \). Since \( \{x_n\}_{n=1}^{\infty} \)

is Cauchy,
\[ \|x - x_n\| \leq \|x - y_k\| + \|y_k - x_n\| \to 0 \text{ as } k, n \to \infty \]
showing that \( \lim_{n \to \infty} x_n \) exists and is equal to \( x \).

**Example 14.14.** Here is another proof of Proposition 14.12 which makes use of Theorem 14.13. Suppose that \( T_n \in L(X,Y) \) is a sequence of operators such that \( \sum_{n=1}^{\infty} \|T_n\| < \infty \). Then
\[ \sum_{n=1}^{\infty} \|T_n x\| \leq \sum_{n=1}^{\infty} \|T_n\| \|x\| < \infty \]
and therefore by the completeness of \( Y \), \( s := \sum_{n=1}^{\infty} T_n x = \lim_{N \to \infty} S_N x \) exists in \( Y \), where \( S_N := \sum_{n=1}^{N} T_n \). The reader should check that \( S: X \to Y \) so defined is linear. Since,
\[ \|S x\| = \lim_{N \to \infty} \|S_N x\| \leq \lim_{N \to \infty} \sum_{n=1}^{N} \|T_n x\| \leq \sum_{n=1}^{\infty} \|T_n\| \|x\|, \]
\( S \) is bounded and
\[ \|S\| \leq \sum_{n=1}^{\infty} \|T_n\|. \] (14.3)
Similarly,
\[ \|S x - S_M x\| = \lim_{N \to \infty} \|S_N x - S_M x\| \leq \lim_{N \to \infty} \sum_{n=M+1}^{N} \|T_n\| \|x\| = \sum_{n=M+1}^{\infty} \|T_n\| \|x\| \]
and therefore,
\[ \|S - S_M\| \leq \sum_{n=M}^{\infty} \|T_n\| \to 0 \text{ as } M \to \infty. \]
For the remainder of this section let $X$ be an infinite set, $\mu : X \to (0, \infty)$ be a given function and $p, q \in [1, \infty]$ such that $q = p/(p - 1)$. It will also be convenient to define $\delta_x : X \to \mathbb{R}$ for $x \in X$ by

$$\delta_x(y) = \begin{cases} 1 & \text{if } y = x \\ 0 & \text{if } y \neq x. \end{cases}$$

**Notation 14.15** Let $c_0(X)$ denote those functions $f \in \ell^\infty(X)$ which “vanish at infinity,” i.e. for every $\varepsilon > 0$ there exists a finite subset $\Lambda_\varepsilon \subset X$ such that $|f(x)| < \varepsilon$ whenever $x \notin \Lambda_\varepsilon$. Also let $c_f(X)$ denote those functions $f : X \to \mathbb{F}$ with finite support, i.e.

$$c_f(X) := \{ f \in \ell^\infty(X) : \#(\{ x \in X : f(x) \neq 0 \}) < \infty \}.$$ 

**Exercise 14.4.** Show $c_f(X)$ is a dense subspace of the Banach spaces $\left( \ell^p(\mu), \| \cdot \|_p \right)$ for $1 \leq p < \infty$, while the closure of $c_f(X)$ inside the Banach space, $\left( \ell^\infty(X), \| \cdot \|_\infty \right)$ is $c_0(X)$. Note from this it follows that $c_0(X)$ is a closed subspace of $\ell^\infty(X)$. (See Proposition 25.23 below where this last assertion is proved in a more general context.)

**Theorem 14.16.** Let $X$ be any set, $\mu : X \to (0, \infty)$ be a function, $p \in [1, \infty]$, $q := p/(p - 1)$ be the conjugate exponent and for $f \in \ell^q(\mu)$ define $\phi_f : \ell^p(\mu) \to \mathbb{F}$ by

$$\phi_f(g) := \sum_{x \in X} f(x) g(x) \mu(x).$$

Then

1. $\phi_f(g)$ is well defined and $\phi_f \in \ell^p(\mu)^*$.
2. The map

$$f \in \ell^q(\mu) \mapsto \phi_f \in \ell^p(\mu)^*$$

is an isometric linear map of Banach spaces.
3. If $p \in [1, \infty)$, then the map in Eq. (14.4) is also surjective and hence, $\ell^p(\mu)^*$ is isometrically isomorphic to $\ell^q(\mu)$.
4. When $p = \infty$, the map

$$f \in \ell^1(\mu) \mapsto \phi_f \in c_0(X)^*$$

is an isometric and surjective, i.e. $\ell^1(\mu)$ is isometrically isomorphic to $c_0(X)^*$.

(See Theorem 31.14 below for a continuation of this theorem.)

**Proof.**

1. By Holder’s inequality,

$$\sum_{x \in X} |f(x)||g(x)| \mu(x) \leq \|f\|_q \|g\|_p$$

which shows that $\phi_f$ is well defined. The $\phi_f : \ell^p(\mu) \to \mathbb{F}$ is linear by the linearity of sums and since

$$|\phi_f(g)| = \left| \sum_{x \in X} f(x)g(x) \mu(x) \right| \leq \sum_{x \in X} |f(x)||g(x)| \mu(x) \leq \|f\|_q \|g\|_p,$$

we learn that

$$\|\phi_f\|_{\ell^p(\mu)^*} \leq \|f\|_q.$$ 

Therefore $\phi_f \in \ell^p(\mu)^*$.
2. The map $\phi$ in Eq. (14.4) is linear in $f$ by the linearity properties of infinite sums. For $p \in (1, \infty)$, define $g(x) = \frac{\text{sgn}(f(x))}{|f(x)|^{q - 1}} |f(x)|$ where

$$\text{sgn}(z) := \begin{cases} \frac{z}{|z|} & \text{if } z \neq 0 \\ 0 & \text{if } z = 0. \end{cases}$$

Then

$$\|g\|_p^p = \sum_{x \in X} |f(x)|^{q - 1} \mu(x) = \sum_{x \in X} |f(x)|^{\left(\frac{q}{q - 1}\right) - 1} \mu(x)$$

and

$$\phi_f(g) = \sum_{x \in X} f(x) \text{sgn}(f(x)) |f(x)|^{\frac{q}{q - 1}} \mu(x) = \sum_{x \in X} |f(x)||f(x)|^{\frac{q}{q - 1}} \mu(x)$$

$$= \|f\|_q \|f\|_p^\frac{1}{q} = \|f\|_q \|f\|_p = \|f\|_q \|g\|_p.$$ Hence $\|\phi_f\|_{\ell^p(\mu)^*} \geq \|f\|_q$ which combined with Eq. (14.5) shows $\|\phi_f\|_{\ell^p(\mu)^*} = \|f\|_q$. For $p = \infty$, let $g(x) = \text{sgn}(f(x))$, then $\|g\|_\infty = 1$ and

$$|\phi_f(g)| = \sum_{x \in X} f(x) \text{sgn}(f(x)) \mu(x)$$

$$= \sum_{x \in X} |f(x)| \mu(x) = \|f\|_1 \|g\|_\infty$$

which shows $\|\phi_f\|_{\ell^\infty(\mu)^*} \geq \|f\|_{\ell^1(\mu)}$. Combining this with Eq. (14.5) shows $\|\phi_f\|_{\ell^\infty(\mu)^*} = \|f\|_{\ell^1(\mu)}$. For $p = 1$, ...
3. and 4. Suppose that
and therefore
which combined with Eq. (14.5) shows

. 4. Suppose that \( p \in [1, \infty) \) and \( \lambda \in \ell^p(\mu)^* \) or \( p = \infty \) and \( \lambda \in c_0(X)^* \).

We wish to find \( f \in \ell^p(\mu) \) such that \( \lambda = \phi_f \). If such an \( f \) exists, then \( \lambda(x) = f(x)\mu(x) \) and so we must define \( f(x) := \lambda(\delta_x)/\mu(x) \). As a preliminary estimate,

\[
|f(x)| = \frac{|\lambda(\delta_x)|}{\mu(x)} \leq \frac{\|\lambda\|_{\ell^p(\mu)^*} \cdot \|\delta_x\|_{\ell^p(\mu)}}{\mu(x)} = \frac{\|\lambda\|_{\ell^p(\mu)^*} \cdot \|\mu(x)\|^{\frac{1}{p}}}{\mu(x)} = \|\lambda\|_{\ell^p(\mu)^*} \cdot |\mu(x)|^{-\frac{1}{p}}.
\]

When \( p = 1 \) and \( q = \infty \), this implies \( \|f\|_{\infty} \leq \|\lambda\|_{\ell^p(\mu)^*} < \infty \). If \( p \in (1, \infty] \) and \( A \subset X \), then

\[
\|f\|_{\ell^q(\Lambda,\mu)} := \sum_{x \in A} |f(x)|^q \mu(x) = \sum_{x \in A} f(x) \text{sgn}(f(x)) |f(x)|^{q-1} \mu(x)
\]

\[
= \sum_{x \in A} \lambda(\delta_x) \text{sgn}(f(x)) |f(x)|^{q-1} \mu(x)
\]

\[
= \sum_{x \in A} \lambda(\delta_x) \text{sgn}(f(x)) |f(x)|^{q-1}
\]

\[
= \lambda \left( \sum_{x \in A} \text{sgn}(f(x)) |f(x)|^{q-1} \delta_x \right)
\]

\[
\leq \|\lambda\|_{\ell^p(\mu)^*} \frac{\sum_{x \in A} \text{sgn}(f(x)) |f(x)|^{q-1} \delta_x}{p}.
\]

Since

\[
\left\| \sum_{x \in A} \text{sgn}(f(x)) |f(x)|^{q-1} \delta_x \right\|_p = \left( \sum_{x \in A} |f(x)|^{(q-1)p} \mu(x) \right)^{1/p}
\]

\[
= \left( \sum_{x \in A} |f(x)|^{q} \mu(x) \right)^{1/p} = \|f\|_{\ell^q(\Lambda,\mu)}
\]

which is also valid for \( p = \infty \) provided \( \|f\|_{\ell^1(\Lambda,\mu)} := 1 \). Combining the last two displayed equations shows

\[
\|f\|_{\ell^q(\Lambda,\mu)}^q \leq \|\lambda\|_{\ell^p(\mu)^*} \cdot \|f\|_{\ell^q(\Lambda,\mu)}^{q/p}
\]

and solving this inequality for \( \|f\|_{\ell^q(\Lambda,\mu)}^q \) (using \( q - q/p = 1 \)) implies

\[
\|f\|_{\ell^q(\Lambda,\mu)} \leq \|\lambda\|_{\ell^p(\mu)^*}.
\]

Taking the supremum of this inequality on \( A \subset X \) shows \( \|f\|_{\ell^q(\mu)} \leq \|\lambda\|_{\ell^p(\mu)^*} \), i.e. \( f \in \ell^q(\mu) \). Since \( \lambda = \phi_f \) agree on \( c_f(X) \) and \( c_f(X) \) is a dense subspace of \( \ell^p(\mu) \) for \( p < \infty \) and \( c_f(X) \) is dense subspace of \( c_0(X) \) when \( p = \infty \), it follows that \( \lambda = \phi_f \).

\[ \Box \]

14.3 General Sums in Banach Spaces

Definition 14.17. Suppose \( X \) is a normed space.

1. Suppose that \( \{x_n\}_{n=1}^\infty \) is a sequence in \( X \), then we say \( \sum_{n=1}^\infty x_n \) converges in \( X \) and \( \sum_{n=1}^\infty x_n = s \) if

\[ \lim_{N \to \infty} \sum_{n=1}^{N} x_n = s \text{ in } X. \]

2. Suppose that \( \{x_\alpha : \alpha \in A\} \) is a given collection of vectors in \( X \). We say the sum \( \sum_{\alpha \in A} x_\alpha \) converges in \( X \) and write \( s = \sum_{\alpha \in A} x_\alpha \in X \) if for all \( \varepsilon > 0 \) there exists a finite set \( \Gamma \subset A \) such that \( \|s - \sum_{\alpha \in A \setminus \Gamma} x_\alpha\| < \varepsilon \) for any \( A \subset \subset A \) such that \( \Gamma \subset A \).

Warning: As usual if \( X \) is a Banach space and \( \sum_{\alpha \in A} \|x_\alpha\| < \infty \) then \( \sum_{\alpha \in A} x_\alpha \) exists in \( X \), see Exercise [14.13]. However, unlike the case of real valued sums the existence of \( \sum_{\alpha \in A} x_\alpha \) does not imply \( \sum_{\alpha \in A} \|x_\alpha\| < \infty \). See Proposition [16.19] below, from which one may manufacture counter-examples to this false premise.

Lemma 14.18. Suppose that \( \{x_\alpha : \alpha \in A\} \) is a given collection of vectors in a normed space, \( X \).

1. If \( s = \sum_{\alpha \in A} x_\alpha \in X \) exists and \( T : X \to Y \) is a bounded linear map between normed spaces, then \( \sum_{\alpha \in A} T x_\alpha \) exists in \( Y \) and

\[ Ts = T \sum_{\alpha \in A} x_\alpha = \sum_{\alpha \in A} T x_\alpha. \]

2. If \( s = \sum_{\alpha \in A} x_\alpha \) exists in \( X \) then for every \( \varepsilon > 0 \) there exists \( \Gamma \subset \subset A \) such that \( \sum_{\alpha \in A \setminus \Gamma} \|x_\alpha\| < \varepsilon \) for all \( A \subset \subset A \setminus \Gamma \).

3. If \( s = \sum_{\alpha \in A} x_\alpha \) exists in \( X \), the set \( \Gamma := \{\alpha : x_\alpha \neq 0\} \) is at most countable. Moreover if \( \Gamma \) is infinite and \( \{\alpha_n\}_{n=1}^\infty \) is an enumeration of \( \Gamma \), then

\[ s = \sum_{n=1}^\infty x_{\alpha_n} = \lim_{N \to \infty} \sum_{n=1}^{N} x_{\alpha_n}. \quad (14.6) \]
4. If we further assume that $X$ is a Banach space and suppose for all $\varepsilon > 0$ there exists $\Gamma_\varepsilon \subset \subset A$ such that $\left\| \sum_{\alpha \in A} x_\alpha \right\| < \varepsilon$ whenever $A \subset \subset A \setminus \Gamma_\varepsilon$, then $\sum_{\alpha \in A} x_\alpha$ exists in $X$.

Proof.

1. Let $\Gamma_\varepsilon$ be as in Definition 14.17 and $A \subset \subset A$ such that $\Gamma_\varepsilon \subset A$. Then

$$\left\| Ts - \sum_{\alpha \in A} Tx_\alpha \right\| \leq \|T\| \left\| s - \sum_{\alpha \in A} x_\alpha \right\| < \varepsilon,$$

which shows that $\sum_{\alpha \in A} Tx_\alpha$ exists and is equal to $Ts$.

2. Suppose that $s = \sum_{\alpha \in A} x_\alpha$ exists and $\varepsilon > 0$. Let $\Gamma_\varepsilon \subset \subset A$ be as in Definition 14.17. Then for $A \subset \subset A \setminus \Gamma_\varepsilon$,

$$\left\| \sum_{\alpha \in A} x_\alpha \right\| = \left\| \sum_{\alpha \in \Gamma_\varepsilon} x_\alpha - \sum_{\alpha \in \Gamma_\varepsilon \setminus A} x_\alpha \right\| \leq \left\| \sum_{\alpha \in \Gamma_\varepsilon} x_\alpha - s \right\| + \left\| \sum_{\alpha \in \Gamma_\varepsilon \setminus A} x_\alpha - s \right\| < 2\varepsilon.$$

3. If $s = \sum_{\alpha \in A} x_\alpha$ exists in $X$, for each $n \in \mathbb{N}$ there exists a finite subset $\Gamma_n \subset A$ such that $\left\| \sum_{\alpha \in A} x_\alpha \right\| < \frac{1}{n}$ for all $A \subset \subset A \setminus \Gamma_n$. Without loss of generality we may assume $x_\alpha \neq 0$ for all $\alpha \in \Gamma_n$. Let $\Gamma_\infty := \bigcup_{n=1}^\infty \Gamma_n$ - a countable subset of $A$. Then for any $\beta \notin \Gamma_\infty$, we have $\{\beta\} \cap \Gamma_n = \emptyset$ and therefore

$$\left\| x_\beta \right\| = \left\| \sum_{\alpha \in \{\beta\}} x_\alpha \right\| \leq \frac{1}{n} \rightarrow 0 \text{ as } n \rightarrow \infty.$$

Let $\{\alpha_n\}_{n=1}^\infty$ be an enumeration of $\Gamma$ and define $\gamma_N := \{\alpha_n : 1 \leq n \leq N\}$. Since for any $M \in \mathbb{N}$, $\gamma_N$ will eventually contain $\Gamma_M$ for $N$ sufficiently large, we have

$$\lim_{N \rightarrow \infty} \sup_{n \geq 1} \left\| s - \sum_{n=1}^N x_{\alpha_n} \right\| \leq \frac{1}{M} \rightarrow 0 \text{ as } M \rightarrow \infty.$$

Therefore Eq. (14.6) holds.

4. For $n \in \mathbb{N}$, let $\Gamma_n \subset \subset A$ such that $\left\| \sum_{\alpha \in A} x_\alpha \right\| < \frac{1}{n}$ for all $A \subset \subset A \setminus \Gamma_n$. Define $\gamma_n : = \bigcup_{k=1}^n \Gamma_k \subset \subset A$ and $s_n : = \sum_{\alpha \in \gamma_n} x_\alpha$. Then for $m > n$,

$$\left\| s_m - s_n \right\| = \left\| \sum_{\alpha \in \gamma_m \setminus \gamma_n} x_\alpha \right\| \leq \frac{1}{n} \rightarrow 0 \text{ as } m, n \rightarrow \infty.$$

Therefore $\{s_n\}_{n=1}^\infty$ is Cauchy and hence convergent in $X$, because $X$ is a Banach space. Let $s := \lim_{n \rightarrow \infty} s_n$. Then for $A \subset \subset A$ such that $\gamma_n \subset A$, we have

$$\left\| s - \sum_{\alpha \in A} x_\alpha \right\| \leq \left\| s - s_n \right\| + \left\| \sum_{\alpha \in A \setminus \gamma_n} x_\alpha \right\| \leq \left\| s - s_n \right\| + \frac{1}{n}.$$

Since the right side of this equation goes to zero as $n \rightarrow \infty$, it follows that $\sum_{\alpha \in A} x_\alpha$ exists and is equal to $s$.

\subsection*{14.4 Inverting Elements in $L(X)$}

Definition 14.19. A linear map $T : X \rightarrow Y$ is an isometry if $\|Tx\|_Y = \|x\|_X$ for all $x \in X$. $T$ is said to be invertible if $T$ is a bijection and $T^{-1}$ is bounded.

Notation 14.20 We will write $GL(X,Y)$ for those $T \in L(X,Y)$ which are invertible. If $X = Y$ we simply write $L(X)$ and $GL(X)$ for $L(X,X)$ and $GL(X,X)$ respectively.

Proposition 14.21. Suppose $X$ is a Banach space and $\Lambda \in L(X) := L(X,X)$ satisfies $\sum_{n=0}^\infty \|A^n\| < \infty$. Then $I - \Lambda$ is invertible and

$$(I - \Lambda)^{-1} = \frac{1}{1 - \Lambda} = \sum_{n=0}^\infty A^n \text{ and } \|(I - \Lambda)^{-1}\| \leq \sum_{n=0}^\infty \|A^n\|.$$

In particular if $\|A\| < 1$ then the above formula holds and

$$\|(I - \Lambda)^{-1}\| \leq \frac{1}{1 - \|A\|}.$$

\textbf{Proof.} Since $L(X)$ is a Banach space and $\sum_{n=0}^\infty \|A^n\| < \infty$, it follows from Theorem 14.13 that

$$S := \lim_{n \rightarrow \infty} S_n := \lim_{n \rightarrow \infty} \sum_{n=0}^N A^n$$

exists in $L(X)$. Moreover, by Lemma 14.11.
If we further assume \( \| \cdot \| \) is continuous. In particular the map \( S \) and similarly \( \Lambda \) are as above, then

\[
\|(I - A)^{-1}\| = \|S\| = \sum_{n=0}^{\infty} \|A^n\|.
\]

If we further assume \( \|A\| < 1 \), then \( \|A^n\| \leq \|A\|^n \) and

\[
\sum_{n=0}^{\infty} \|A^n\| \leq \sum_{n=0}^{\infty} \|A\|^n = \frac{1}{1 - \|A\|} < \infty.
\]

**Corollary 14.22.** Let \( X \) and \( Y \) be Banach spaces. Then \( GL(X, Y) \) is an open (possibly empty) subset of \( L(X, Y) \). More specifically, if \( A \in GL(X, Y) \) and \( B \in L(X, Y) \) satisfies

\[
\|B - A\| < \|A^{-1}\|^{-1}
\]

then \( B \in GL(X, Y) \)

\[
B^{-1} = \sum_{n=0}^{\infty} [I_X - A^{-1}B]^n A^{-1} \in L(Y, X),
\]

\[
\|B^{-1}\| \leq \|A^{-1}\| \frac{1}{1 - \|A^{-1}\|^2 \|A - B\|}
\]

and

\[
\|B^{-1} - A^{-1}\| \leq \|A^{-1}\|^2 \|A - B\| \frac{1}{1 - \|A^{-1}\|^2 \|A - B\|}.
\]

In particular the map

\[
A \in GL(X, Y) \rightarrow A^{-1} \in GL(Y, X)
\]

is continuous.

**Proof.** Let \( A \) and \( B \) be as above, then

\[
B = A - (A - B) = A [I_X - A^{-1}(A - B)] = A(I_X - A)
\]

where \( A : X \rightarrow X \) is given by

\[
A := A^{-1}(A - B) = I_X - A^{-1}B.
\]

Now

\[
\|A\| = \|A^{-1}(A - B)\| \leq \|A^{-1}\| \|A - B\| < \|A^{-1}\| \|A^{-1}\|^{-1} = 1.
\]

Therefore \( I - A \) is invertible and hence so is \( B \) (being the product of invertible elements) with

\[
B^{-1} = (I_X - A)^{-1}A^{-1} = (I_X - A^{-1}(A - B))^2 A^{-1}.
\]

Taking norms of the previous equation gives

\[
\|B^{-1}\| \leq \|A\|^{-1} \|A^{-1}\| \leq \|A^{-1}\| \frac{1}{1 - \|A\|}
\]

\[
\leq \|A^{-1}\| \frac{1}{1 - \|A^{-1}\|^2 \|A - B\|}
\]

which is the bound in Eq. (14.9). The bound in Eq. (14.10) holds because

\[
\|B^{-1} - A^{-1}\| \leq \|B^{-1}(A - B) A^{-1}\| \leq \|B^{-1}\| \|A^{-1}\| \|A - B\|
\]

\[
\leq \|A^{-1}\|^2 \|A - B\| \frac{1}{1 - \|A^{-1}\|^2 \|A - B\|}.
\]

For an application of these results to linear ordinary differential equations, see Section 50.3.

**14.5 Exercises**

**Exercise 14.5.** Let \( (X, \|\cdot\|) \) be a normed space over \( \mathbb{F} \) (\( \mathbb{R} \) or \( \mathbb{C} \)). Show the map

\[
(\lambda, x, y) \in \mathbb{F} \times X \times X \rightarrow x + \lambda y \in X
\]

is continuous relative to the norm on \( \mathbb{F} \times X \times X \) defined by

\[
\|(\lambda, x, y)\|_{\mathbb{F} \times X \times X} := |\lambda| + \|x\| + \|y\|.
\]

(See Exercise 17.32 for more on the metric associated to this norm.) Also show that \( \|\cdot\| : X \rightarrow [0, \infty) \) is continuous.

**Exercise 14.6.** Let \( X = \mathbb{N} \) and for \( p, q \in [1, \infty) \) let \( \|\cdot\|_p \) denote the \( \ell^p(\mathbb{N}) \) - norm. Show \( \|\cdot\|_p \) and \( \|\cdot\|_q \) are inequivalent norms for \( p \neq q \) by showing

\[
\sup_{f \neq 0} \frac{\|f\|_p}{\|f\|_q} = \infty \text{ if } p < q.
\]
Exercise 14.7. Suppose that \((X, \|\cdot\|)\) is a normed space and \(S \subset X\) is a linear subspace.

1. Show the closure \(\overline{S}\) of \(S\) is also a linear subspace.
2. Now suppose that \(X\) is a Banach space. Show that \(S\) with the inherited norm from \(X\) is a Banach space iff \(S\) is closed.

Exercise 14.8. Folland Problem 5.9. Showing \(C^k([0, 1])\) is a Banach space.

Exercise 14.9. Suppose that \(X, Y\) and \(Z\) are Banach spaces and \(Q : X \times Y \to Z\) is a bilinear form, i.e., we are assuming \(x \in X \to Q(x, y) \in Z\) is linear for each \(y \in Y\) and \(y \in Y \to Q(x, y) \in Z\) is linear for each \(x \in X\). Show \(Q\) is continuous relative to the product norm, \(\| (x, y) \|_{X \times Y} := \| x \|_X + \| y \|_Y\), on \(X \times Y\) iff there is a constant \(M < \infty\) such that

\[
\| Q(x, y) \|_Z \leq M \| x \|_X \cdot \| y \|_Y \quad \text{for all } (x, y) \in X \times Y. \tag{14.12}
\]

Then apply this result to prove Lemma 14.11

Exercise 14.10. Let \(d : C(\mathbb{R}) \times C(\mathbb{R}) \to [0, \infty)\) be defined by

\[
d(f, g) = \sum_{n=1}^{\infty} 2^{-n} \frac{\| f - g \|_n}{1 + \| f - g \|_n},
\]

where \(\| f \|_n := \sup\{|f(x)| : |x| \leq n\} = \max\{|f(x)| : |x| \leq n\} \).

1. Show that \(d\) is a metric on \(C(\mathbb{R})\).
2. Show that a sequence \(\{f_n\}_{n=1}^{\infty} \subset C(\mathbb{R})\) converges to \(f \in C(\mathbb{R})\) as \(n \to \infty\) iff \(f_n\) converges to \(f\) uniformly on bounded subsets of \(\mathbb{R}\).
3. Show that \((C(\mathbb{R}), d)\) is a complete metric space.

Exercise 14.11. Let \(X = C([0, 1], \mathbb{R})\) and for \(f \in X\), let

\[
\| f \|_1 := \int_0^1 |f(t)| \, dt.
\]

Show that \((X, \|\cdot\|_1)\) is a normed space and show by example that this space is not complete. Hint: For the last assertion find a sequence \(\{f_n\}_{n=1}^{\infty} \subset X\) which is “trying” to converge to the function \(f = 1_{[1, 1]} \notin X\).

Exercise 14.12. Let \((X, \|\cdot\|_1)\) be the normed space in Exercise 14.11. Compute the closure of \(A\) when

1. \(A = \{ f \in X : f(1/2) = 0 \} \).
2. \(A = \{ f \in X : \sup_{t \in [0, 1]} f(t) \leq 5 \} \).

Exercise 14.13. Suppose \(\{x_\alpha \in X : \alpha \in A\}\) is a given collection of vectors in a Banach space \(X\). Show \(\sum_{\alpha \in A} x_\alpha\) exists in \(X\) and

\[
\left\| \sum_{\alpha \in A} x_\alpha \right\| \leq \sum_{\alpha \in A} \| x_\alpha \|
\]

if \(\sum_{\alpha \in A} \| x_\alpha \| < \infty\). That is to say “absolute convergence” implies convergence in a Banach space.

Exercise 14.14. Suppose \(X\) is a Banach space and \(\{f_n : n \in \mathbb{N}\}\) is a sequence in \(X\) such that \(\lim_{n \to \infty} f_n = f \in X\). Show \(s_N := \frac{1}{N} \sum_{n=1}^{N} f_n\) for \(N \in \mathbb{N}\) is still a convergent sequence and

\[
\lim_{N \to \infty} \frac{1}{N} \sum_{n=1}^{N} f_n = \lim_{N \to \infty} s_N = f.
\]

Exercise 14.15 (Dominated Convergence Theorem Again). Let \(X\) be a Banach space, \(A\) be a set and suppose \(f_n : A \to X\) is a sequence of functions such that \(f(\alpha) := \lim_{n \to \infty} f_n(\alpha)\) exists for all \(\alpha \in A\). Further assume there exists a summable function \(g : A \to [0, \infty)\) such that \(\| f_n (\alpha) \| \leq g (\alpha)\) for all \(\alpha \in A\). Show \(\sum_{\alpha \in A} f(\alpha)\) exists in \(X\) and

\[
\lim_{n \to \infty} \sum_{\alpha \in A} f_n (\alpha) = \sum_{\alpha \in A} f (\alpha).
\]
Hölder Spaces as Banach Spaces

In this section, we will assume that the reader has basic knowledge of the Riemann integral and differentiability properties of functions. The results used here may be found in Part XII below. (BRUCE: there are forward references in this section.)

Notation 15.1 Let $\Omega$ be an open subset of $\mathbb{R}^d$, $BC(\Omega)$ and $BC(\bar{\Omega})$ be the bounded continuous functions on $\Omega$ and $\bar{\Omega}$ respectively. By identifying $f \in BC(\bar{\Omega})$ with $f|_\Omega \in BC(\Omega)$, we will consider $BC(\Omega)$ as a subset of $BC(\bar{\Omega})$. For $u \in BC(\bar{\Omega})$ and $0 < \beta \leq 1$ let

$$
\|u\| := \sup_{x \in \Omega} |u(x)| \quad \text{and} \quad [u]_\beta := \sup_{x,y \in \Omega} \left\{ \frac{|u(x) - u(y)|}{|x - y|^\beta} \right\}.
$$

If $[u]_\beta < \infty$, then $u$ is Hölder continuous with Hölder exponent $\beta$. The collection of $\beta$-Hölder continuous functions on $\Omega$ will be denoted by $C^{0,\beta}(\Omega) := \{u \in BC(\Omega) : [u]_\beta < \infty\}$ and for $u \in C^{0,\beta}(\Omega)$ let

$$
\|u\|_{C^{0,\beta}(\Omega)} := \|u\|_u + [u]_\beta. \quad (15.1)
$$

Remark 15.2. If $u : \Omega \to \mathbb{C}$ and $[u]_\beta < \infty$ for some $\beta > 1$, then $u$ is constant on each connected component of $\Omega$. Indeed, if $x \in \Omega$ and $h \in \mathbb{R}^d$ then

$$
\left| \frac{u(x + th) - u(x)}{t} \right| \leq [u]_\beta |h|^{-\beta} / t \to 0 \text{ as } t \to 0
$$

which shows $\partial_h u(x) = 0$ for all $x \in \Omega$. If $y \in \Omega$ is in the same connected component as $x$, then by Exercise 15.8 below there exists a smooth curve $\sigma : [0,1] \to \Omega$ such that $\sigma(0) = x$ and $\sigma(1) = y$. So by the fundamental theorem of calculus and the chain rule,

$$
u(y) - u(x) = \int_0^1 \frac{d}{dt} u(\sigma(t))dt = \int_0^1 0 \ dt = 0.
$$

This is why we do not talk about Hölder spaces with Hölder exponents larger than 1. 1 If $\beta = 1$, $u$ is is said to be Lipschitz continuous.

Lemma 15.3. Suppose $u \in C^1(\Omega) \cap BC(\Omega)$ and $\partial_i u \in BC(\Omega)$ for $i = 1,2,\ldots,d$, then $u \in C^{0,1}(\Omega)$, i.e. $[u]_1 < \infty$.

The proof of this lemma is left to the reader as Exercise 15.1.

Theorem 15.4. Let $\Omega$ be an open subset of $\mathbb{R}^d$. Then

1. Under the identification of $u \in BC(\bar{\Omega})$ with $u|_\Omega \in BC(\Omega)$, $BC(\Omega)$ is a closed subspace of $BC(\bar{\Omega})$.
2. Every element $u \in C^{0,\beta}(\bar{\Omega})$ has a unique extension to a continuous function (still denoted by $u$) on $\bar{\Omega}$. Therefore we may identify $C^{0,\beta}(\bar{\Omega})$ with $C^{0,\beta}(\Omega)$ to be the same when $\beta > 0$.
3. The function $u \in C^{0,\beta}(\bar{\Omega}) \to \|u\|_{C^{0,\beta}(\Omega)} \in [0,\infty)$ is a norm on $C^{0,\beta}(\Omega)$ which make $C^{0,\beta}(\Omega)$ into a Banach space.

Proof. 1. The first item is trivial since for $u \in BC(\bar{\Omega})$, the sup-norm of $u$ on $\Omega$ agrees with the sup-norm on $\Omega$ and $BC(\bar{\Omega})$ is complete in this norm.

2. Suppose that $[u]_\beta < \infty$ and $x_0 \in \text{bd}(\Omega)$. Let $\{x_n\}_{n=1}^\infty \subset \Omega$ be a sequence such that $x_0 = \lim_{n \to \infty} x_n$. Then

$$
|u(x_n) - u(x_m)| \leq [u]_\beta |x_n - x_m|^{\beta} \to 0 \text{ as } m,n \to \infty
$$

showing $\{u(x_n)\}_{n=1}^\infty$ is Cauchy so that $\tilde{u}(x_0) := \lim_{n \to \infty} u(x_n)$ exists. If $\{y_n\}_{n=1}^\infty \subset \Omega$ is another sequence converging to $x_0$, then

$$
|u(x_n) - u(y_n)| \leq [u]_\beta |x_n - y_n|^{\beta} \to 0 \text{ as } n \to \infty,
$$

showing $\tilde{u}(x_0)$ is well defined. In this way we define $\tilde{u}(x)$ for all $x \in \text{bd}(\Omega)$ and let $\tilde{u}(x) = u(x)$ for $x \in \Omega$. Since a similar limiting argument shows

$$
|\tilde{u}(x) - \tilde{u}(y)| \leq [u]_\beta |x - y|^{\beta}\text{ for all }x,y \in \bar{\Omega}
$$

it follows that $\tilde{u}$ is still continuous and $[\tilde{u}]_\beta = [u]_\beta$. In the sequel we will abuse notation and simply denote $\tilde{u}$ by $u$.

3. For $u,v \in C^{0,\beta}(\bar{\Omega})$,
It is enough to show that \( \bar{u} \) is continuous at all points in \( \partial \Omega \). For any \( \varepsilon > 0 \), by assumption, the set \( K_{\varepsilon} := \{ x \in \Omega : |u(x)| \geq \varepsilon \} \) is a compact subset of \( \Omega \). Since \( \partial \Omega = \Omega \setminus \Omega \), \( \partial \Omega \cap K_{\varepsilon} = \emptyset \) and therefore the distance, \( \delta := d(K_{\varepsilon}, \partial \Omega) \), between \( K_{\varepsilon} \) and \( \partial \Omega \) is positive. So if \( x \in \partial \Omega \) and \( y \in \Omega \) and \( |y - x| < \delta \), then \( |\bar{u}(x) - \bar{u}(y)| = |u(y)| < \varepsilon \) which shows \( \bar{u} : \Omega \to \mathbb{C} \) is continuous. This also shows \( \{ |u| \geq \varepsilon \} = \{ |u| \geq \varepsilon \} = K_{\varepsilon} \) is compact in \( \Omega \) and hence also in \( \Omega \). Since \( \varepsilon > 0 \) was arbitrary, this shows \( \bar{u} \in C_0(\Omega) \). Conversely if \( u \in C_0(\Omega) \) such that \( u|_{\partial \Omega} = 0 \) and \( \varepsilon > 0 \), then \( K_{\varepsilon} := \{ x \in \Omega : |u(x)| \geq \varepsilon \} \) is a compact subset of \( \Omega \) which is contained in \( \Omega \) since \( \partial \Omega \cap K_{\varepsilon} = \emptyset \). Therefore \( K_{\varepsilon} \) is a compact subset of \( \Omega \) showing \( u|_{\Omega} \in C_0(\Omega) \).

**Definition 15.7.** Let \( \Omega \) be an open subset of \( \mathbb{R}^d \), \( k \in \mathbb{N} \cup \{ 0 \} \) and \( \beta \in (0, 1) \). Let \( BC^k(\Omega) \) (\( BC^k(\Omega) \)) denote the set of \( k \) times continuously differentiable functions \( u \) on \( \Omega \) such that \( \partial^l u \in BC(\Omega) \) \( (\partial^l u \in BC(\Omega)) \) for all \( |\alpha| \leq k \). Similarly, let \( BC^{k,\beta}(\Omega) \) denote those \( u \in BC^k(\Omega) \) such that \( \| \partial^\alpha u \|_{\beta} < \infty \) for all \( |\alpha| = k \). For \( u \in BC^k(\Omega) \) let

\[
\| u \|_{C^k(\Omega)} = \sum_{|\alpha| \leq k} \| \partial^\alpha u \|_{C(\Omega)}
\]

and \( \| u \|_{C^{k,\beta}(\Omega)} = \sum_{|\alpha| \leq k} \| \partial^\alpha u \|_{C^{k,\beta}(\Omega)} \). By the Arzel\'a-Ascoli theorem, the spaces \( BC^k(\Omega) \) and \( BC^{k,\beta}(\Omega) \) equipped with \( \| \cdot \|_{C^k(\Omega)} \) and \( \| \cdot \|_{C^{k,\beta}(\Omega)} \) respectively are Banach spaces and \( BC^k(\Omega) \) is a closed subspace of \( BC^{k,\beta}(\Omega) \) and \( BC^{k,\beta}(\Omega) \) is a closed subspace of \( BC^{k,\beta}(\Omega) \).

**Proof.** Suppose that \( \{ u_n \}_{n=1}^\infty \subset BC^k(\Omega) \) is a Cauchy sequence, then \( \{ \partial^\alpha u_n \}_{n=1}^\infty \) is a Cauchy sequence in \( BC(\Omega) \) for \( |\alpha| \leq k \). Since \( BC(\Omega) \) is complete, there exists \( g_\alpha \in BC(\Omega) \) such that \( \lim_{n \to \infty} \| \partial^\alpha u_n - g_\alpha \|_{C(\Omega)} = 0 \) for all \( |\alpha| \leq k \). Letting \( u := g_0 \), we must show \( u \in C^k(\Omega) \) and \( \partial^\alpha u = g_\alpha \) for all \( |\alpha| \leq k \). This will be done by induction on \( |\alpha| \). If \( |\alpha| = 0 \) there is nothing to prove. Suppose that we have verified \( u \in C^k(\Omega) \) and \( \partial^\alpha u = g_\alpha \) for all \( |\alpha| \leq l \) for some \( l < k \). Then for \( x \in \Omega \), \( i \in \{ 1, 2, \ldots, d \} \) and \( t \in \mathbb{R} \) sufficiently small,

\[
\partial^\alpha u_n(x + te_i) = \partial^\alpha u_n(x) + \int_0^t \partial_i \partial^\alpha u_n(x + s \epsilon_i) ds.
\]
Letting $n \to \infty$ in this equation gives

$$\partial^a u(x + te_i) = \partial^a u(x) + \int_0^t g_{\alpha + e_i}(x + \tau e_i) d\tau$$

from which it follows that $\partial_i \partial^a u(x)$ exists for all $x \in \Omega$ and $\partial_i \partial^a u = g_{\alpha + e_i}$.

This completes the induction argument and also the proof that $BC^k(\Omega)$ is complete. It is easy to check that $BC^k(\Omega)$ is a closed subspace of $BC^k(\Omega)$ and by using Exercise 15.1 and Theorem 15.4 that $BC^{k,\beta}(\Omega)$ is a subspace of $BC^k(\Omega)$. The fact that $C^{k,\beta}_0(\Omega)$ is a closed subspace of $BC^{k,\beta}(\Omega)$ is a consequence of (BRUCE: forward reference.) Proposition 25.23. To prove $BC^{k,\beta}(\Omega)$ is complete, let $\{u_n\}_{n=1}^{\infty} \subset BC^{k,\beta}(\Omega)$ be a $\|\cdot\|_{C^{k,\beta}(\Omega)}$-Cauchy sequence. By the completeness of $BC^k(\Omega)$ just proved, there exists $u \in BC^k(\Omega)$ such that $\lim_{n \to \infty} \|u - u_n\|_{C^k(\Omega)} = 0$. An application of Theorem 15.4 then shows

$$\lim_{n \to \infty} \|\partial^a u_n - \partial^a u\|_{C^{0,\beta}(\Omega)} = 0$$

for $|\alpha| = k$ and therefore $\lim_{n \to \infty} \|u - u_n\|_{C^{k,\beta}(\Omega)} = 0$.

The reader is asked to supply the proof of the following lemma.

**Lemma 15.9.** The following inclusions hold. For any $\beta \in [0,1]$.

$$BC^{k+1,0}(\Omega) \subset BC^{k,1}(\Omega) \subset BC^{k,\beta}(\Omega)$$

$$BC^{k+1,0}(\bar{\Omega}) \subset BC^{k,1}(\bar{\Omega}) \subset BC^{k,\beta}(\Omega).$$

### 15.1 Exercises

**Exercise 15.1.** Prove Lemma 15.3.
Hilbert Space Basics

Definition 16.1. Let \( H \) be a complex vector space. An inner product on \( H \) is a function, \( \langle \cdot | \cdot \rangle : H \times H \to \mathbb{C} \), such that

1. \( \langle ax + by \mid z \rangle = a\langle x \mid z \rangle + b\langle y \mid z \rangle \) i.e. \( x \to \langle x \mid z \rangle \) is linear.
2. \( \langle x \mid y \rangle = \langle y \mid x \rangle \).
3. \( \|x\|^2 := \langle x \mid x \rangle \geq 0 \) with equality \( \|x\|^2 = 0 \iff x = 0 \).

Notice that combining properties (1) and (2) that \( x \to \langle z \mid x \rangle \) is conjugate linear for fixed \( z \in H \), i.e.
\[
\langle z \mid ax + by \rangle = \bar{a}\langle z \mid x \rangle + \bar{b}\langle z \mid y \rangle.
\]
The following identity will be used frequently in the sequel without further mention,
\[
\|x + y\|^2 = \langle x + y \mid x + y \rangle = \|x\|^2 + \|y\|^2 + \langle x \mid y \rangle + \langle y \mid x \rangle
\]
(16.1)

Theorem 16.2 (Schwarz Inequality). Let \( (H, \langle \cdot | \cdot \rangle) \) be an inner product space, then for all \( x, y \in H \)
\[
\|\langle x \mid y \rangle\| \leq \|x\|\|y\|
\]
and equality holds iff \( x \) and \( y \) are linearly dependent.

Proof. If \( y = 0 \), the result holds trivially. So assume that \( y \neq 0 \) and observe; if \( x = \alpha y \) for some \( \alpha \in \mathbb{C} \), then \( \langle x \mid y \rangle = \alpha\|y\|^2 \) and hence
\[
|\langle x \mid y \rangle| = |\alpha|\|y\|^2 = \|x\|\|y\|.
\]
Now suppose that \( x \in H \) is arbitrary, let \( z := x - \|y\|^{-2}\langle x \mid y \rangle y \). (So \( z \) is the “orthogonal projection” of \( x \) onto \( y \), see Figure 16.1.) Then
\[
0 \leq \|z\|^2 = \left\| x - \frac{\langle x \mid y \rangle}{\|y\|^2} y \right\|^2 = \|x\|^2 + \frac{|\langle x \mid y \rangle|^2}{\|y\|^4} \|y\|^2 - 2\Re \langle x \mid \frac{\langle x \mid y \rangle}{\|y\|^2} y \rangle
\]
\[
= \|x\|^2 - \frac{|\langle x \mid y \rangle|^2}{\|y\|^2}
\]
from which it follows that \( 0 \leq \|y\|^2\|x\|^2 - |\langle x \mid y \rangle|^2 \) with equality iff \( z = 0 \) or equivalently iff \( x = \|y\|^{-2}\langle x \mid y \rangle y \).

Corollary 16.3. Let \( (H, \langle \cdot | \cdot \rangle) \) be an inner product space and \( \|x\| := \sqrt{\langle x \mid x \rangle} \). Then the Hilbertian norm, \( \| \cdot \| \), is a norm on \( H \). Moreover \( \langle \cdot | \cdot \rangle \) is continuous on \( H \times H \), where \( H \) is viewed as the normed space \( (H, \| \cdot \|) \).

Proof. If \( x, y \in H \), then, using Schwarz’s inequality,
\[
\|x + y\|^2 = \|x\|^2 + \|y\|^2 + 2\Re \langle x \mid y \rangle
\]
\[
\leq \|x\|^2 + \|y\|^2 + 2\|x\|\|y\| = (\|x\| + \|y\|)^2.
\]
Taking the square root of this inequality shows \( \| \cdot \| \) satisfies the triangle inequality.

Checking that \( \| \cdot \| \) satisfies the remaining axioms of a norm is now routine and will be left to the reader. If \( x, x', y, y' \in H \), then
\[
|\langle x \mid y \rangle - \langle x' \mid y' \rangle| = \langle x - x' \mid y - y' \rangle
\]
\[
\leq \|x\|\|x - x'\| + \|x'\|\|y - y'\|
\]
\[
\leq \|x\|\|x - x'\| + \|x\| + \|x - x'\| \|y - y'\|
\]
\[
= \|y\|\|x - x'\| + \|x\|\|y - y'\| + \|x - x'\|\|y - y'\|
\]
from which it follows that \( \langle \cdot | \cdot \rangle \) is continuous. \( \blacksquare \)

Definition 16.4. Let \( (H, \langle \cdot | \cdot \rangle) \) be an inner product space, we say \( x, y \in H \) are orthogonal and write \( x \perp y \) iff \( \langle x \mid y \rangle = 0 \). More generally if \( A \subset H \) is a set, \( x \in H \) is orthogonal to \( A \) (write \( x \perp A \)) iff \( \langle x \mid y \rangle = 0 \) for all \( y \in A \). Let \( A^\perp = \{ x \in H : x \perp A \} \) be the set of vectors orthogonal to \( A \). A subset \( S \subset H \) is an orthogonal set if \( x \perp y \) for all distinct elements \( x, y \in S \). If \( S \) further satisfies, \( \|x\| = 1 \) for all \( x \in S \), then \( S \) is said to be an orthonormal set.

Proposition 16.5. Let \( (H, \langle \cdot | \cdot \rangle) \) be an inner product space then

1. (Parallelogram Law)
\[ ||x + y||^2 + ||x - y||^2 = 2||x||^2 + 2||y||^2 \] (16.2)

for all \( x, y \in H \).

2. **Pythagorean Theorem** If \( S \subset H \) is a finite orthogonal set, then

\[ \left\| \sum_{x \in S} x \right\|^2 = \sum_{x \in S} ||x||^2. \] (16.3)

3. If \( A \subset H \) is a set, then \( A^\perp \) is a closed linear subspace of \( H \).

**Remark 16.6.** See Proposition [16.31] for the “converse” of the parallelogram law.

**Proof.** I will assume that \( H \) is a complex Hilbert space, the real case being easier. Items 1. and 2. are proved by the following elementary computations;

\[
||x + y||^2 + ||x - y||^2 = ||x||^2 + ||y||^2 + 2Re(x|y) + ||y||^2 + ||y||^2 - 2Re(x|y) = 2||x||^2 + 2||y||^2,
\]

and

\[
\left\| \sum_{x \in S} x \right\|^2 = \sum_{x \in S} \sum_{y \in S} x|y\rangle = \sum_{x,y \in S} \langle x|y\rangle = \sum_{x \in S} \langle x|x\rangle = \sum_{x \in S} ||x||^2.
\]

Item 3. is a consequence of the continuity of \( \langle \cdot | \cdot \rangle \) and the fact that

\[ A^\perp = \cap_{x \in A} \text{Null}(\langle \cdot | x \rangle) \]

where \( \text{Null}(\langle \cdot | x \rangle) = \{ y \in H : \langle y|x\rangle = 0 \} \) – a closed subspace of \( H \).

**Definition 16.7.** A **Hilbert space** is an inner product space \( (H, \langle \cdot | \cdot \rangle) \) such that the induced Hilbertian norm is complete.

**Example 16.8.** Suppose \( X \) is a set and \( \mu : X \to (0, \infty) \), then \( H := \ell^2(\mu) \) is a Hilbert space when equipped with the inner product,

\[ \langle f | g \rangle := \sum_{x \in X} f(x) \overline{g(x)} \mu(x). \]

In Exercise [16.7] you will show every Hilbert space \( H \) is “equivalent” to a Hilbert space of this form with \( \mu \equiv 1 \).

More examples of Hilbert spaces will be given later after we develop the Lebesgue integral, see Example [30.1] below.

**Definition 16.9.** A subset \( C \) of a vector space \( X \) is said to be convex if for all \( x, y \in C \) the line segment \( [x,y] := \{tx + (1-t)y : 0 \leq t \leq 1 \} \) joining \( x \) to \( y \) is contained in \( C \) as well. (Notice that any vector subspace of \( X \) is convex.)

**Theorem 16.10 (Best Approximation Theorem).** Suppose that \( H \) is a Hilbert space and \( M \subset H \) is a closed convex subset of \( H \). Then for any \( x \in H \) there exists a unique \( y \in M \) such that

\[ ||x - y|| = d(x,M) := \inf_{z \in M} ||x - z||. \]

Moreover, if \( M \) is a vector subspace of \( H \), then the point \( y \) may also be characterized as the unique point in \( M \) such that \( (x - y) \perp M \).

**Proof.** Let \( x \in H, \delta := d(x,M), y, z \in M \), and, referring to Figure [16.2] let \( w = z + (y - x) \) and \( c = (z + y)/2 \in M \). It then follows by the parallelogram law (Eq. (?)) with \( a = (y - x) \) and \( b = (z - x) \) and the fact that \( c \in M \) that

\[ 2 ||y - x||^2 + 2 ||z - x||^2 = ||w - x||^2 + ||y - z||^2 = ||z + y - 2x||^2 + ||y - z||^2 = 4 ||x - c||^2 + ||y - z||^2 \geq 4\delta^2 + ||y - z||^2. \]

Thus we have shown for all \( y, z \in M \) that,

\[ ||y - z||^2 \leq 2 ||y - x||^2 + 2 ||z - x||^2 - 4\delta^2. \] (16.4)

**Uniqueness.** If \( y, z \in M \) minimize the distance to \( x \), then \( ||y - x|| = \delta = ||z - x|| \) and it follows from Eq. (16.4) that \( y = z \).

![Fig. 16.2. In this figure \( y, z \in M \) and by convexity, \( c = (z + y)/2 \in M \).](image-url)
**Existence.** Let \( y_n \in M \) be chosen such that \( \|y_n - x\| = \delta_n \rightarrow \delta = d(x, M) \).

Taking \( y = y_m \) and \( z = y_n \) in Eq. (16.4) shows
\[
\|y_n - y_m\|^2 \leq 2\delta_m^2 + 2\delta_n^2 - 4\delta^2 \rightarrow 0 \text{ as } m, n \rightarrow \infty.
\]

Therefore, by completeness of \( H \), \( \{y_n\}_n \) is convergent. Because \( M \) is closed,
\[
y := \lim_{n \rightarrow \infty} y_n \in M \text{ and because the norm is continuous,}
\]
\[
\|y - x\| = \lim_{n \rightarrow \infty} \|y_n - x\| = \delta = d(x, M).
\]

So \( y \) is the desired point in \( M \) which is closest to \( x \).

**Orthogonality property.** Now suppose \( M \) is a closed subspace of \( H \) and \( x \in H \). Let \( y \in M \) be the closest point in \( M \) to \( x \). Then for \( w \in M \), the function
\[
g(t) := \|x - (y + tw)\|^2 = \|x - y\|^2 - 2t\text{Re}(x - y)|w| + t^2\|w\|^2
\]
has a minimum at \( t = 0 \) and therefore \( 0 = g'(0) = -2\text{Re}(x - y)|w| \). Since \( w \in M \) is arbitrary, this implies that \( (x - y) \perp M \), see Figure 16.3 Finally

![Fig. 16.3. The orthogonality relationships of closest points.](image)

suppose \( y \in M \) is any point such that \( (x - y) \perp M \). Then for \( z \in M \), by Pythagorean’s theorem,
\[
\|x - z\|^2 = \|x - y + y - z\|^2 = \|x - y\|^2 + \|y - z\|^2 \geq \|x - y\|^2
\]
which shows \( d(x, M)^2 \geq \|x - y\|^2 \). That is to say \( y \) is the point in \( M \) closest to \( x \).

**Definition 16.11.** Suppose that \( A : H \rightarrow H \) is a bounded operator. The **adjoint** of \( A \), denoted \( A^* : H \rightarrow H \) such that \( \langle Ax | y \rangle = \langle x | Ay \rangle \). (The proof that \( A^* \) exists and is unique will be given in Proposition 16.16 below.) A bounded operator \( A : H \rightarrow H \) is **self-adjoint** or **Hermitian** if \( A = A^* \).

**Definition 16.12.** Let \( H \) be a Hilbert space and \( M \subset H \) be a closed subspace. The orthogonal projection of \( H \) onto \( M \) is the function \( P_M : H \rightarrow H \) such that for \( x \in H \), \( P_M(x) \) is the unique element in \( M \) such that \( (x - P_M(x)) \perp M \).

**Theorem 16.13 (Projection Theorem).** Let \( H \) be a Hilbert space and \( M \subset H \) be a closed subspace. The orthogonal projection \( P_M \) satisfies:

1. \( P_M \) is linear and hence we will write \( P_M x \) rather than \( P_M(x) \).
2. \( P_M^2 = P_M \) (\( P_M \) is a projection).
3. \( P_M^* = P_M \) (\( P_M \) is self-adjoint).
4. \( \text{Ran}(P_M) = M \) and \( \text{Nul}(P_M) = M^\perp \).
5. If \( N \subset M \subset H \) is another closed subspace, the \( P_N P_M = P_M P_N = P_N \).

**Proof.**

1. Let \( x_1, x_2 \in H \) and \( \alpha \in \mathbb{F} \), then \( P_M x_1 + \alpha P_M x_2 \in M \) and
\[
P_M x_1 + \alpha P_M x_2 - (x_1 + \alpha x_2) = [P_M x_1 - x_1 + \alpha (P_M x_2 - x_2)] \in M^\perp
\]
showing \( P_M x_1 + \alpha P_M x_2 = P_M(x_1 + \alpha x_2) \), i.e. \( P_M \) is linear.
2. Obviously \( \text{Ran}(P_M) = M \) and \( P_M x = x \) for all \( x \in M \). Therefore \( P_M^2 = P_M \).
3. Let \( x, y \in H \), then since \( (x - P_M x) \) and \( (y - P_M y) \) are in \( M^\perp \),
\[
\langle P_M x | y \rangle = \langle P_M x | P_M y + y - P_M y \rangle = \langle P_M x | P_M y \rangle = \langle P_M x + (x - P_M x) | P_M y \rangle = \langle x | P_M y \rangle.
\]
4. We have already seen, \( \text{Ran}(P_M) = M \) and \( P_M x = 0 \) iff \( x = 0 \in M^\perp \), i.e. \( \text{Nul}(P_M) = M^\perp \).
5. If \( N \subset M \subset H \) it is clear that \( P_M P_N = P_N \) since \( P_M = \text{Id} \) on \( N = \text{Ran}(P_N) \subset M \). Taking adjoints gives the other identity, namely that \( P_N P_M = P_N \).

**Alternative proof 1 of** \( P_N P_M = P_N \). If \( x \in H \), then \( (x - P_M x) \) \perp M and therefore \( (x - P_M x) \perp N \). We also have \( P_M x = P_N P_M x \) \perp N and therefore,
\[
x - P_N P_M x = (x - P_M x) + (P_M x - P_N P_M x) \in N^\perp
\]
which shows \( P_N P_M x = P_N x \).

**Alternative proof 2 of** \( P_N P_M = P_N \). If \( x \in H \) and \( n \in \mathbb{N} \), we have
\[
\langle P_N P_M x | n \rangle = \langle P_M x | P_N n \rangle = \langle P_M x | n \rangle = \langle x | P_M n \rangle = \langle x | n \rangle.
\]
Since this holds for all \( n \) we may conclude that \( P_N P_M x = P_N x \).
Corollary 16.14. If $M \subset H$ is a proper closed subspace of a Hilbert space $H$, then $\overline{M} \cap M^\perp = \{0\}$.

Proof. Given $x \in H$, let $y = P_M x$ so that $x - y \in M^\perp$. Then $x = y + (x - y) \in M + M^\perp$. If $x \in M \cap M^\perp$, then $x \perp x$, i.e. $\|x\|^2 = \langle x|x \rangle = 0$. So $M \cap M^\perp = \{0\}$.

Exercise 16.1. Suppose $M$ is a subset of $H$, then $M^\perp = \text{span}(M)$ where (as usual), $\text{span}(M)$ denotes all finite linear combinations of elements from $M$.

Theorem 16.15 (Riesz Theorem). Let $H^*$ be the dual space of $H$ (Notation 14.4), i.e. $f \in H^*$ iff $f : H \to \mathbb{R}$ is linear and continuous. The map

$$\begin{equation}
\tag{16.5} z \in H \mapsto \langle |z| \rangle \in H^*
\end{equation}$$

is a conjugate linear¹ isometric isomorphism, where for $f \in H^*$ we let,

$$\|f\|_{H^*} := \sup_{x \in H \setminus \{0\}} \left| \frac{f(x)}{\|x\|} \right| = \sup_{\|x\|=1} |f(x)|.
$$

Proof. Let $f \in H^*$ and $M = \text{Null}(f) \subset H$ a closed proper subspace of $H$ since $f$ is continuous. If $f \equiv 0$, then clearly $f(\cdot) = \langle |\cdot| \rangle$. If $f \not\equiv 0$ there exists $y \in H \setminus M$. Then for any $\alpha \in \mathbb{C}$ we have $e := \alpha(y - P_M y) \in M^\perp$. We now choose $\alpha$ so that $f(e) = 1$. Hence if $x \in H$,

$$f(x - f(x)e) = f(x) - f(e) = f(x) - f(x) = 0,$$

which shows $x - f(x)e \in M$. As $e \in M^\perp$ it follows that

$$0 = \langle x - f(x)e | e \rangle = \langle x | e \rangle - f(x) \|e\|^2
$$

which shows $f(\cdot) = \langle |z| \rangle = jz$ where $z := e/\|e\|^2$ and thus $j$ is surjective.

The map $j$ is conjugate linear by the axioms of the inner products. Moreover, for $x, z \in H$,

$$|\langle x | z \rangle| \leq \|x\| \|z\|$$

for all $x \in H$ with equality when $x = z$. This implies that $\|jz\|_{H^*} = \|\langle z | \rangle\|_{H^*} = \|z\|$. Therefore $j$ is isometric and this implies $j$ is injective.

¹ Recall that $j$ is conjugate linear if

$$j(z_1 + \alpha z_2) = jz_1 + \bar{\alpha} jz_2$$

for all $z_1, z_2 \in H$ and $\alpha \in \mathbb{C}$.

Proposition 16.16 (Adjoint). Let $H$ and $K$ be Hilbert spaces and $A : H \to K$ be a bounded operator. Then there exists a unique bounded operator $A^* : K \to H$ such that

$$\langle Ax | y \rangle_K = \langle x | A^* y \rangle_H$$

for all $x \in H$ and $y \in K$.

Moreover, for all $A, B \in L(H, K)$ and $\lambda \in \mathbb{C}$,

1. $(A + \lambda B)^* = A^* + \lambda B^*$,
2. $A^{**} := (A^*)^* = A$,
3. $\|A^*\| = \|A\|$ and
4. $\|A^* A\| = \|A\|^2$.

If $K = H$, then $(AB)^* = B^* A^*$. In particular $A \in L(H)$ has a bounded inverse iff $A^*$ has a bounded inverse and $(A^*)^{-1} = (A^{-1})^*$.

Proof. For each $y \in K$, the map $x \mapsto \langle Ax | y \rangle_K$ is in $H^*$ and therefore there exists, by Theorem 16.15, a unique vector $z \in H$ (we will denote this $z$ by $A^*(y)$) such that

$$\langle Ax | y \rangle_K = \langle x | z \rangle_H$$

for all $x \in H$.

This shows there is a unique map $A^* : K \to H$ such that $\langle Ax | y \rangle_K = \langle x | A^*(y) \rangle_H$ for all $x \in H$ and $y \in K$.

To see $A^*$ is linear, let $y_1, y_2 \in K$ and $\lambda \in \mathbb{C}$, then for any $x \in H$,

$$\langle Ax | y_1 + \lambda y_2 \rangle_K = \langle Ax | y_1 \rangle_K + \lambda \langle Ax | y_2 \rangle_K$$

$$= \langle x | A^*(y_1) \rangle_K + \lambda \langle x | A^*(y_2) \rangle_K$$

$$= \langle x | A^*(y_1) + \lambda A^*(y_2) \rangle_H$$

and by the uniqueness of $A^*(y_1 + \lambda y_2)$ we find

$$A^*(y_1 + \lambda y_2) = A^*(y_1) + \lambda A^*(y_2).$$

This shows $A^*$ is linear and so we will now write $A^* y$ instead of $A^*(y)$.

Since

$$\langle A^* y | x \rangle_H = \langle x | A^* y \rangle_H = \langle Ax | y \rangle_K = \langle y | Ax \rangle_K$$

it follows that $A^{**} = A$. The assertion that $(A + \lambda B)^* = A^* + \lambda B^*$ is Exercise 16.2.

Items 3. and 4. Making use of Schwarz’s inequality (Theorem 16.2), we have

$$\|A^*\| = \sup_{k \in K : \|k\| = 1} \|A^* k\|$$

$$= \sup_{k \in K : \|k\| = 1} \sup_{h \in H : \|h\| = 1} |\langle A^* k | h \rangle|$$

$$= \sup_{h \in H : \|h\| = 1} \sup_{k \in K : \|k\| = 1} |\langle k | Ah \rangle| = \sup_{h \in H : \|h\| = 1} \|Ah\| = \|A\|.$$
Lemma 16.17. Let $A \in B(H,K)$ be a bounded linear operator. Then:

1. $\text{Nul}(A^*) = \text{Ran}(A)^\perp$.
2. $\text{Ran}(A) = \text{Nul}(A^*)^\perp$.
3. If $K = H$ and $V \subset H$ is an $A$-invariant subspace (i.e. $A(V) \subset V$), then $V^\perp$ is $A^*$-invariant.

Proof. An element $y \in K$ is in $\text{Nul}(A^*)$ if and only if $\langle A^*y|x \rangle = \langle y|Ax \rangle = 0$ for all $x \in H$. This happens if and only if $y \in \text{Ran}(A)^\perp$. Therefore, by Exercise 16.1, $\text{Ran}(A) = \text{Ran}(A)^\perp$. Now suppose $V \subset H$ is an $A$-invariant subspace. Then $A(V) \subset V$, and so $\text{Nul}(A^*)^\perp \supset V^\perp$. We will show that $\text{Nul}(A^*)^\perp = V^\perp$.

Let $v \in V^\perp$. Then $A^*v \in \text{Nul}(A)$, and hence $A^*v \in \text{Nul}(A^*)^\perp$. Therefore, $v \in \text{Nul}(A^*)^\perp$. Conversely, let $v \in \text{Nul}(A^*)^\perp$. Then $A^*v = 0$, and hence $v = 0$. Therefore, $V^\perp = \text{Nul}(A^*)^\perp$. This completes the proof.

16.1 Hilbert Space Basis

Proposition 16.18 (Bessel’s Inequality). Let $T$ be an orthonormal set, then for any $x \in H$,
\[ \sum_{v \in T} |\langle x|v \rangle|^2 \leq \|x\|^2 \text{ for all } x \in H. \] (16.9)

In particular the set $T_x := \{ v \in T : \langle x|v \rangle \neq 0 \}$ is at most countable for all $x \in H$.

Proof. Let $\Gamma \subset T$ be any finite set. Then
\[ 0 \leq |\langle x - \sum_{v \in \Gamma} \langle x|v \rangle v \rangle|^2 = \|x\|^2 - 2\text{Re} \sum_{v \in \Gamma} \langle x|v \rangle \langle v|x \rangle + \sum_{v \in \Gamma} |\langle x|v \rangle|^2 \]
\[ = \|x\|^2 - \sum_{v \in \Gamma} |\langle x|v \rangle|^2 \]
showing that $\sum_{v \in \Gamma} |\langle x|v \rangle|^2 \leq \|x\|^2$. Taking the supremum of this inequality over $\Gamma \subset T$ then proves Eq. (16.9). ■

Proposition 16.19. Suppose $T \subset H$ is an orthogonal set. Then $s = \sum_{v \in T} v$ exists in $H$ (see Definition 14.17) iff $\sum_{v \in T} \|v\|^2 < \infty$. (In particular $T$ must be at most a countable set.) Moreover, if $\sum_{v \in T} \|v\|^2 < \infty$, then

1. $\|s\|^2 = \sum_{v \in T} \|v\|^2$ and
2. $\langle s|x \rangle = \sum_{v \in T} \langle v|x \rangle$ for all $x \in H$.

Similarly if $\{v_n\}_{n=1}^\infty$ is an orthogonal set, then $s = \sum_{n=1}^\infty v_n$ exists in $H$ iff $\sum_{n=1}^\infty \|v_n\|^2 < \infty$. In particular if $\sum_{n=1}^\infty v_n$ exists, then it is independent of rearrangements of $\{v_n\}_{n=1}^\infty$. 

Exercise 16.2. Let $H, K, M$ be Hilbert spaces, $A, B \in L(H,K)$, $C \in L(K,M)$ and $\lambda \in \mathbb{C}$. Show $(A + \lambda B)^* = A^* + \lambda B^*$ and $(CA)^* = A^*C^* = C^*A^* \in L(M,H)$.

Exercise 16.3. Let $H = \mathbb{C}^n$ and $K = \mathbb{C}^m$ equipped with the usual inner products, i.e. $(z|w)_H = \bar{z} \cdot w$ for $z, w \in H$. Let $A$ be an $m \times n$ matrix thought of as a linear operator from $H$ to $K$. Show the matrix associated to $A^* : K \to H$ is the conjugate transpose of $A$.
Proof. Suppose \( s = \sum_{v \in T} v \) exists. Then there exists \( T' \subset \subset T \) such that
\[
\sum_{v \in A} \|v\|^2 = \left\| \sum_{v \in A} v \right\|^2 \leq 1
\]
for all \( A \subset \subset T' \setminus T' \), wherein the first inequality we have used Pythagorean's theorem. Taking the supremum over such \( A \) shows that \( \sum_{v \in T' \setminus T} \|v\|^2 \leq 1 \) and therefore
\[
\sum_{v \in T} \|v\|^2 \leq 1 + \sum_{v \in T'} \|v\|^2 < \infty.
\]

Conversely, suppose that \( \sum_{v \in T} \|v\|^2 < \infty \). Then for all \( \varepsilon > 0 \) there exists \( T' \subset \subset T \) such that if \( A \subset \subset T \setminus T' \),
\[
\left\| \sum_{v \in A} v \right\|^2 = \sum_{v \in A} \|v\|^2 < \varepsilon^2.
\]
Hence by Lemma 14.18, \( \sum_{v \in T} v \) exists.

For item 1, let \( T' \) be as above and set \( s_\varepsilon := \sum_{v \in T'} v \). Then
\[
\|s - s_\varepsilon\| \leq \|s - s_\varepsilon\| < \varepsilon
\]
and by Eq. (16.10),
\[
0 \leq \sum_{v \in T} \|v\|^2 - \|s_\varepsilon\|^2 = \sum_{v \in T'} \|v\|^2 \leq \varepsilon^2.
\]
Letting \( \varepsilon \downarrow 0 \) we deduce from the previous two equations that \( \|s_\varepsilon\| \to \|s\| \) and \( \|s_\varepsilon\|^2 \to \sum_{v \in T} \|v\|^2 \) as \( \varepsilon \downarrow 0 \) and therefore \( \|s\|^2 = \sum_{v \in T} \|v\|^2 \).

Item 2. is a special case of Lemma 14.18. For the final assertion, let \( s_N := \sum_{n=1}^N v_n \) and suppose that \( \lim_{N \to \infty} s_N = s \) exists in \( H \) and in particular \( \{s_N\}_{N=1}^\infty \) is Cauchy. So for \( N > M \),
\[
\sum_{n=M+1}^N \|v_n\|^2 = \|s_N - s_M\|^2 \to 0 \text{ as } N \to \infty
\]
which shows that \( \sum_{n=1}^\infty \|v_n\|^2 \) is convergent, i.e. \( \sum_{n=1}^\infty \|v_n\|^2 < \infty \).

Alternative proof of item 1. We could use the last result to prove Item 1. Indeed, if \( \sum_{v \in T} \|v\|^2 < \infty \), then \( T \) is countable and so we may write \( T = \{v_n\}_{n=1}^\infty \). Then \( s = \lim_{N \to \infty} s_N \) with \( s_N \) as above. Since the norm, \( \|v\| \), is continuous on \( H \),
\[
\|s\|^2 = \lim_{N \to \infty} \|s_N\|^2 = \lim_{N \to \infty} \sum_{n=1}^N \|v_n\|^2 = \lim_{N \to \infty} \sum_{n=1}^N \|v_n\|^2
\]
\[
= \sum_{n=1}^\infty \|v_n\|^2 = \sum_{v \in T} \|v\|^2.
\]

**Corollary 16.20.** Suppose \( H \) is a Hilbert space, \( \beta \subset H \) is an orthonormal set and \( M = \text{span} \beta \). Then
\[
P_M x = \sum_{u \in \beta} (x|u) u,
\]
\[
\sum_{u \in \beta} |(x|u)|^2 = \|P_M x\|^2 \text{ and }
\]
\[
\sum_{u \in \beta} (x|u)(u|y) = (P_M x|y)
\]
for all \( x, y \in H \).

**Proof.** By Bessel's inequality, \( \sum_{u \in \beta} |(x|u)|^2 \leq \|x\|^2 \) for all \( x \in H \) and hence by Proposition 16.18 \( Px := \sum_{u \in \beta} (x|u) u \) exists in \( H \) and for all \( x, y \in H \),
\[
(Px|y) = \sum_{u \in \beta} ((x|u)u|y) = \sum_{u \in \beta} (x|u)(u|y).
\]
Taking \( y \in \beta \) in Eq. (16.14) gives \( (Px|y) = (x|y) \), i.e. that \( (x - Px) \perp \text{span} \beta \) and by continuity we also have \( (x - Px) \perp \text{span} \beta \). Since \( Px \) is also in \( M \), it follows from the definition of \( P_M \) that \( P_M x = Px \) proving Eq. (16.11). Equations (16.12) and (16.13) now follow from (16.14), Proposition 16.19 and the fact that \( (P_M x|y) = (P_M x|P_M y) \) for all \( x, y \in H \).

**Exercise 16.4.** Let \( (H, \langle \cdot | \cdot \rangle) \) be a Hilbert space and suppose that \( \{P_n\}_{n=1}^\infty \) is a sequence of orthogonal projection operators on \( H \) such that \( P_n(H) \subset P_{n+1}(H) \) for all \( n \). Let \( M := \bigcup_{n=1}^\infty P_n(H) \) (a subspace of \( H \)) and let \( P \) denote orthonormal projection onto \( M \). Show \( \lim_{n \to \infty} P_n x = Px \) for all \( x \in H \). **Hint:** first prove the result for \( x \in M^+ \), then for \( x \in M \) and then for \( x \in M \).

**Definition 16.21 (Basis).** Let \( H \) be a Hilbert space. A **basis** \( \beta \) of \( H \) is a maximal orthonormal subset \( \beta \subset H \).

**Proposition 16.22.** Every Hilbert space has an orthonormal basis.
Proof. Let $F$ be the collection of all orthonormal subsets of $H$ ordered by inclusion. If $Φ \subseteq F$ is linearly ordered then $∪Φ$ is an upper bound. By Zorn’s Lemma (see Theorem ??) there exists a maximal element $β \in F$.

An orthonormal set $β \subseteq H$ is said to be complete if $β^⊥ = \{0\}$. That is to say if $⟨x|u⟩ = 0$ for all $u \in β$ then $x = 0$.

Lemma 16.23. Let $β$ be an orthonormal subset of $H$ then the following are equivalent:

1. $β$ is a basis,
2. $β$ is complete and $β^⊥ = H$.

Proof. (1. $⇔$ 2.) If $β$ is not complete, then there exists a unit vector $x ∈ β^⊥ \setminus \{0\}$. The set $β \cup \{x\}$ is an orthonormal set properly containing $β$, so $β$ is not maximal. Conversely, if $β$ is not maximal, there exists an orthonormal set $β_1 \subseteq H$ such that $β ⊊ β_1$. Then if $x ∈ β_1 \setminus β$, we have $⟨x|u⟩ = 0$ for all $u \in β$ showing $β$ is not complete. ($\Rightarrow$)

(2. $⇔$ 3.) If $β$ is not complete and $x ∈ β^⊥ \setminus \{0\}$, then $span β \subseteq x^⊥$ which is a proper subspace of $H$. Conversely if $span β$ is a proper subspace of $H$, $β^⊥ = span β^⊥$ is a non-trivial subspace by Corollary 16.14 and $β$ is not complete. ($\Leftarrow$)

Theorem 16.24. Let $β \subseteq H$ be an orthonormal set. Then the following are equivalent:

1. $β$ is complete, i.e. $β$ is an orthonormal basis for $H$.
2. $x = ∑_{u∈β} ⟨x|u⟩ u$ for all $x \in H$.
3. $⟨x|y⟩ = ∑_{u∈β} ⟨x|u⟩ ⟨u|y⟩$ for all $x, y \in H$.
4. $||x||^2 = ∑_{u∈β} ||⟨x|u⟩||^2$ for all $x \in H$.

Proof. Let $M = span β$ and $P = P_M$.

(1) ⇒ (2) By Corollary 16.20 $∑_{u∈β} ⟨x|u⟩ u = P_M x$. Therefore

$$x − ∑_{u∈β} ⟨x|u⟩ u = x − P_M x ∈ M^⊥ = β^⊥ = \{0\} .$$

(2) ⇒ (3) is a consequence of Proposition 16.19.

(3) ⇒ (4) is obvious, just take $y = x$.

(4) ⇒ (1) If $x ∈ β^⊥$, then by 4), $||x|| = 0$, i.e. $x = 0$. This shows that $β$ is complete.

Suppose $Γ := \{u_n\}_{n=1}^{∞}$ is a collection of vectors in an inner product space $(H, ⟨⋅|⋅⟩)$. The standard Gram-Schmidt process produces from $Γ$ an orthonormal subset, $β = \{v_n\}_{n=1}^{∞}$, such that every element $u_n ∈ Γ$ is a finite linear combination of elements from $β$. Recall the procedure is to define $v_n$ inductively by setting

$$v_{n+1} := v_{n+1} − ∑_{j=1}^{n} ⟨v_{n+1}|v_j⟩ v_j = v_{n+1} − P_n v_{n+1}$$

where $P_n$ is orthogonal projection onto $M_n := span\{v_k\}_{k=1}^{n}$. If $v_{n+1} := 0$, let $v_{n+1} = 0$, otherwise set $v_{n+1} := ∥v_{n+1}∥^−1 v_{n+1}$. Finally re-index the resulting sequence so as to throw out those $v_n$ with $v_n = 0$. The result is an orthonormal subset, $β \subseteq H$, with the desired properties.

Definition 16.25. A subset, $Γ$, of a normed space $X$ is said to be total if span($Γ$) is dense in $X$.

Remark 16.26. Suppose that $\{u_n\}_{n=1}^{∞}$ is a total subset of $H$. Let $\{v_n\}_{n=1}^{∞}$ be the vectors found by performing Gram-Schmidt on the set $\{u_n\}_{n=1}^{∞}$. Then $β := \{v_n\}_{n=1}^{∞}$ is an orthonormal basis for $H$. Indeed, if $h ∈ H$ is orthogonal to $β$ then $h$ is orthogonal to $\{v_n\}_{n=1}^{∞}$ and hence also span $\{u_n\}_{n=1}^{∞} = H$. In particular $h$ is orthogonal to itself and so $h = 0$. This generalizes the corresponding results for finite dimensional inner product spaces.

Proposition 16.27. A Hilbert space $H$ is separable (BRUCE: has separable been defined yet? No, see Definition 17.13) iff $H$ has a countable orthonormal basis $β ⊆ H$. Moreover, if $H$ is separable, all orthonormal bases of $H$ are countable. (See Prop 4.14 in Conway’s, “A Course in Functional Analysis,” for a more general version of this proposition.)

Proof. Let $D ⊆ H$ be a countable dense set $D = \{u_n\}_{n=1}^{∞}$. By Gram-Schmidt process there exists $β = \{v_n\}_{n=1}^{∞}$ an orthonormal set such that span$\{v_n : n = 1, 2, \ldots, N\} ⊇$ span$\{u_n : n = 1, 2, \ldots, N\}$. So if $⟨x|v_n⟩ = 0$ for all $n$ then $⟨x|u_n⟩ = 0$ for all $n$. Since $D ⊆ H$ is dense we may choose $w_k ∈ D$ such that $x = lim_k→∞ w_k$ and therefore $⟨x|x⟩ = lim_k→∞ ⟨x|w_k⟩ = 0$. That is to say $x = 0$ and $β$ is complete. Conversely if $β ⊆ H$ is a countable orthonormal basis, then the countable set

$$D = \left\{ ∑_{u∈β} a_u u : a_u ∈ Q + iQ : \#\{u : a_u ≠ 0\} < ∞ \right\}$$

is dense in $H$. Finally let $β = \{u_n\}_{n=1}^{∞}$ be an orthonormal basis and $β_1 ⊆ H$ be another orthonormal basis. Then the sets

$$B_n = \{v ∈ β_1 : ⟨v|u_n⟩ ≠ 0\}$$
are countable for each \( n \in \mathbb{N} \) and hence \( B := \bigcup_{n=1}^{\infty} B_n \) is a countable subset of \( \beta_1 \).
Suppose there exists \( v \in \beta_1 \setminus B \), then \( \langle v | u_n \rangle = 0 \) for all \( n \) and since \( \beta = \{ u_n \}_{n=1}^{\infty} \) is an orthonormal basis, this implies \( v = 0 \) which is impossible since \( \|v\| = 1 \). Therefore \( \beta_1 \setminus B = \emptyset \) and hence \( \beta_1 = B \) is countable.

**Notation 16.28** If \( f : X \to \mathbb{C} \) and \( g : Y \to \mathbb{C} \) are two functions, let \( f \otimes g : X \times Y \to \mathbb{C} \) be defined by \( f \otimes g (x, y) := f(x) g(y) \).

**Proposition 16.29.** Suppose \( X \) and \( Y \) are sets and \( \mu : X \to (0, \infty) \) and \( \nu : Y \to (0, \infty) \) are given weight functions. If \( \beta \subset \ell^2 (\mu) \) and \( \gamma \subset \ell^2 (\nu) \) are orthonormal bases, then

\[
\beta \otimes \gamma := \{ f \otimes g : f \in \beta \text{ and } g \in \gamma \}
\]

is an orthonormal basis for \( \ell^2 (\mu \otimes \nu) \).

**Proof.** Let \( f, f' \in \ell^2 (\mu) \) and \( g, g' \in \ell^2 (\nu) \), then by the Tonelli’s Theorem for sums and Hölder’s inequality,

\[
\sum_{x \in X} \sum_{y \in Y} |f(x) f'(x) \otimes g(y) g'(y)| \mu \otimes \nu = \sum_{x \in X} |f(x)|^2 \mu \cdot \sum_{y \in Y} |g(y)|^2 \nu \\
\leq \|f\|_{\ell^2(\mu)} \|f'\|_{\ell^2(\mu)} \|g\|_{\ell^2(\nu)} \|g'\|_{\ell^2(\nu)} = 1 < \infty.
\]

So by Fubini’s Theorem for \( f \otimes g \) for sums,

\[
\langle f \otimes g | f' \otimes g' \rangle_{\ell^2(\mu \otimes \nu)} = \sum_{x \in X} \sum_{y \in Y} f(x) f'(x) g(y) g'(y) | \mu \otimes \nu = \delta_{f, f'} \delta_{g, g'}.
\]

Therefore, \( \beta \otimes \gamma \) is an orthonormal subset of \( \ell^2 (\mu \otimes \nu) \). So it only remains to show \( \beta \otimes \gamma \) is complete. We will give two proofs of this fact. Let \( F \in \ell^2 (\mu \otimes \nu) \). In the first proof we will verify item 4. of Theorem 16.24 while in the second we will verify item 1 of Theorem 16.24.

**First Proof.** By Tonelli’s Theorem,

\[
\sum_{x \in X} \mu(x) \sum_{y \in Y} \nu(y) |F(x, y)|^2 = \|F\|_{\ell^2(\mu \otimes \nu)}^2 < \infty
\]

and since \( \mu > 0 \), it follows that

\[
\sum_{x \in X} |F(x, y)|^2 \nu(y) < \infty \text{ for all } x \in X,
\]

i.e. \( F(x, \cdot) \in \ell^2 (\nu) \) for all \( x \in X \). By the completeness of \( \gamma \),

\[
\sum_{y \in Y} |F(x, y)|^2 \nu(y) = \langle F(x, \cdot) | F(x, \cdot) \rangle_{\ell^2(\nu)} = \sum_{g \in \gamma} |\langle F(x, \cdot) | g \rangle_{\ell^2(\nu)}|^2
\]

and therefore,

\[
\|F\|_{\ell^2(\mu \otimes \nu)}^2 = \sum_{x \in X} \mu(x) \sum_{y \in Y} \nu(y) |F(x, y)|^2
\]

\[
= \sum_{x \in X} \sum_{y \in Y} |\langle F(x, \cdot) | g \rangle_{\ell^2(\nu)}|^2 \mu(x).
\]

(16.15)

and in particular, \( x \to \langle F(x, \cdot) | g \rangle_{\ell^2(\nu)} \) is in \( \ell^2 (\mu) \). So by the completeness of \( \beta \) and the Fubini and Tonelli theorems, we find

\[
\sum_{x \in X} |\langle F(x, \cdot) | g \rangle_{\ell^2(\nu)}|^2 \mu(x) = \sum_{f \in \beta} \left( \sum_{x \in X} \sum_{y \in Y} \nu(y) |F(x, y)|^2 \right) \mu(x)
\]

\[
\sum_{f \in \beta} \left( \sum_{x \in X} \sum_{y \in Y} \nu(y) |F(x, y)|^2 \right) \mu(x)
\]

\[
= \sum_{f \in \beta} \left( \sum_{x \in X} \sum_{y \in Y} \nu(y) |F(x, y)|^2 \right) \mu(x).
\]

(16.15)

Combining this result with Eq. (16.15) shows

\[
\|F\|_{\ell^2(\mu \otimes \nu)}^2 = \sum_{f \in \beta} \sum_{g \in \gamma} |\langle F(f \otimes g) | F(f \otimes g) \rangle_{\ell^2(\mu \otimes \nu)}|^2
\]

as desired.

**Second Proof.** Suppose, for all \( f \in \beta \) and \( g \in \gamma \) that \( \langle F | f \otimes g \rangle = 0 \), i.e.

\[
0 = \langle F | f \otimes g \rangle_{\ell^2(\mu \otimes \nu)} = \sum_{x \in X} \mu(x) \sum_{y \in Y} \nu(y) F(x, y) \bar{f}(x) g(y)
\]

\[
= \sum_{x \in X} \mu(x) \langle F(x, \cdot) \rangle_{\ell^2(\nu)} \bar{f}(x).
\]

(16.16)

Since

\[
\sum_{x \in X} |\langle F(x, \cdot) | g \rangle_{\ell^2(\nu)}|^2 \mu(x) \leq \sum_{x \in X} \mu(x) \sum_{y \in Y} |F(x, y)|^2 \nu(y) < \infty,
\]

(16.17)

it follows from Eq. (16.16) and the completeness of \( \beta \) that \( \langle F(x, \cdot) | g \rangle_{\ell^2(\nu)} = 0 \) for all \( x \in X \). By the completeness of \( \gamma \) we conclude that \( F(x, y) = 0 \) for all \( (x, y) \in X \times Y \).
Definition 16.30. A linear map $U : H \to K$ is an isometry if $\|Ux\|_K = \|x\|_H$ for all $x \in H$ and $U$ is unitary if $U$ is also surjective.

Exercise 16.5. Let $U : H \to K$ be a unitary map, show the following are equivalent:
1. $U : H \to K$ is an isometry,
2. $\langle Ux | Ux' \rangle_K = \langle x | x' \rangle_H$ for all $x, x' \in H$, (see Eq. (16.18) below)
3. $U^*U = \text{id}_H$.

Exercise 16.6. Let $U : H \to K$ be a linear map, show the following are equivalent:
1. $U : H \to K$ is unitary,
2. $U^*U = \text{id}_H$ and $UU^* = \text{id}_K$.
3. $U$ is invertible and $U^{-1} = U^*$.

Exercise 16.7. Let $H$ be a Hilbert space. Use Theorem 16.24 to show there exists a set $X$ and a unitary map $U : H \to \ell^2(X)$. Moreover, if $H$ is separable and dim$(H) = \infty$, then $X$ can be taken to be $\mathbb{N}$ so that $H$ is unitarily equivalent to $\ell^2 = \ell^2(\mathbb{N})$.

16.2 Supplement 1: Converse of the Parallelogram Law

Proposition 16.31 (Parallelogram Law Converse). If $(X, \|\cdot\|)$ is a normed space such that Eq. (16.2) holds for all $x, y \in X$, then there exists a unique inner product on $\langle \cdot | \cdot \rangle$ such that $\|x\| = \sqrt{\langle x | x \rangle}$ for all $x \in X$. In this case we say that $\langle \cdot | \cdot \rangle$ is a Hilbertian norm.

Proof. If $\|\cdot\|$ is going to come from an inner product $\langle \cdot | \cdot \rangle$, it follows from Eq. (16.1) that

\[ 2 \text{Re} \langle x | y \rangle = \|x + y\|^2 - \|x\|^2 - \|y\|^2 \]
and

\[ -2 \text{Re} \langle x | y \rangle = \|x - y\|^2 - \|x\|^2 - \|y\|^2. \]

Subtracting these two equations gives the “polarization identity,”

\[ 4 \text{Re} \langle x | y \rangle = \|x + y\|^2 - \|x - y\|^2. \]

Replacing $y$ by $iy$ in this equation then implies that

\[ 4 \text{Im} \langle x | y \rangle = \|x + iy\|^2 - \|x - iy\|^2 \]
from which we find

\[ \langle x | y \rangle = \frac{1}{4} \sum_{\varepsilon \in G} \varepsilon \|x + \varepsilon y\|^2 \] (16.18)

where $G = \{ \pm 1, \pm i \}$ – a cyclic subgroup of $S^1 \subset \mathbb{C}$. Hence, if $\langle \cdot | \cdot \rangle$ is going to exist we must define it by Eq. (16.18) and the uniqueness has been proved.

For existence, define $\langle x | y \rangle$ by Eq. (16.18) in which case,

\[ \langle x | y \rangle = \frac{1}{4} \sum_{\varepsilon \in G} \varepsilon \|x + \varepsilon y\|^2 = \frac{1}{4} \left( \|x\|^2 + i\|x + iy\|^2 - i\|x - iy\|^2 \right) \]

\[ = \|x\|^2 + \frac{i}{4} \left( 1 + i^2 \right) \|x\|^2 - \frac{i}{4} \left( 1 - i^2 \right) \|x\|^2 = \|x\|^2. \]

So to finish the proof, it only remains to show that $\langle x | y \rangle$ defined by Eq. (16.18) is an inner product.

Since

\[ 4 \langle x | x \rangle = \sum_{\varepsilon \in G} \varepsilon \|x + \varepsilon x\|^2 = \sum_{\varepsilon \in G} \varepsilon \|x + \varepsilon x\|^2 
\]

\[ = \sum_{\varepsilon \in G} \varepsilon \|x + \varepsilon^2 x\|^2 
\]

\[ = \|y + x\|^2 - \|y - x\|^2 + i\|iy - x\|^2 - i\|iy - x\|^2 = \|y + x\|^2 - \|y - x\|^2 + i\|x - iy\|^2 - i\|x + iy\|^2 
\]

\[ = 4 \langle x | y \rangle 
\]

it suffices to show $x \to \langle x | y \rangle$ is linear for all $y \in H$. (The rest of this proof may safely be skipped by the reader.) For this we will need to derive an identity from Eq. (16.2). To do this we make use of Eq. (16.2) three times to find

\[ \|x + y + z\|^2 = -\|x + y - z\|^2 + 2\|x + y\|^2 + 2\|z\|^2 \]

\[ = \|x - y - z\|^2 - 2\|x - z\|^2 - 2\|y\|^2 + 2\|x + y\|^2 + 2\|z\|^2 \]

\[ = \|y + z - x\|^2 - 2\|y - z\|^2 - 2\|y\|^2 + 2\|x + y\|^2 + 2\|z\|^2 \]

\[ = -\|y + z + x\|^2 + 2\|y + z\|^2 + 2\|x\|^2 
\]

\[ - 2\|x - z\|^2 - 2\|y\|^2 + 2\|x + y\|^2 + 2\|z\|^2. \]

Solving this equation for $\|x + y + z\|^2$ gives

\[ \|x + y + z\|^2 = \|y + z\|^2 + \|x + y\|^2 - \|x - z\|^2 + \|x\|^2 + \|z\|^2 - \|y\|^2. \] (16.19)

Using Eq. (16.19), for $x, y, z \in H$,
4 Re\langle x + z | y \rangle = \| x + z + y \|^2 - \| x + z - y \|^2 \\
= \| y + z \|^2 + \| x + y \|^2 - \| x - z \|^2 + \| x \|^2 + \| z \|^2 - \| y \|^2 \\
- \left( \| y - z \|^2 + \| x - y \|^2 - \| x - z \|^2 + \| x \|^2 + \| z \|^2 - \| y \|^2 \right) \\
= \| y + z \|^2 - \| y - z \|^2 + \| x + y \|^2 - \| x - y \|^2 \\
= 4 \text{Re}\langle x | y \rangle + 4 \text{Re}\langle z | y \rangle. \quad (16.20)

Now suppose that \( \delta \in G \), then since \( |\delta| = 1 \),

\[
4 \langle \delta x | y \rangle = \frac{1}{4} \sum_{\varepsilon \in G} \varepsilon \| \delta x + \varepsilon y \|^2 = \frac{1}{4} \sum_{\varepsilon \in G} \varepsilon \| x + \delta^{-1} \varepsilon y \|^2 \\
= \frac{1}{4} \sum_{\varepsilon \in G} \varepsilon \| x + \delta \varepsilon y \|^2 = 4 \text{Re}\langle x | y \rangle \tag{16.21}
\]

where in the third inequality, the substitution \( \varepsilon \to \varepsilon \delta \) was made in the sum. So Eq. \( (16.21) \) says \( \langle \pm i x | y \rangle = \pm i \langle x | y \rangle \) and \( \langle - x | y \rangle = - \langle x | y \rangle \). Therefore

\[
\text{Im}\langle x | y \rangle = \text{Re}\langle -i \langle x | y \rangle \rangle = \text{Re}\langle -iz | y \rangle \nonumber
\]

which combined with Eq. \( (16.20) \) shows

\[
\text{Im}\langle x + z | y \rangle = \text{Re}\langle -ix - iz | y \rangle = \text{Re}\langle -ix | y \rangle + \text{Re}\langle -iz | y \rangle \\
= \text{Im}\langle x | y \rangle + \text{Im}\langle z | y \rangle
\]

and therefore (again in combination with Eq. \( (16.20) \)),

\[
\langle x + z | y \rangle = \langle x | y \rangle + \langle z | y \rangle \quad \text{for all } x, y \in H.
\]

Because of this equation and Eq. \((16.21)\) to finish the proof that \( x \to \langle x | y \rangle \) is linear, it suffices to show \( \langle \lambda x | y \rangle = \lambda \langle x | y \rangle \) for all \( \lambda > 0 \). Now if \( \lambda = m \in \mathbb{N} \), then

\[
\langle mx | y \rangle = \langle x + (m - 1)x | y \rangle = \langle x | y \rangle + \langle (m - 1)x | y \rangle
\]

so that by induction \( \langle mx | y \rangle = m \langle x | y \rangle \). Replacing \( x \) by \( x / m \) then shows that \( \langle x/y \rangle = m \langle x/y \rangle \). So that \( m^{-1} \langle x | y \rangle = m^{-1} \langle x | y \rangle \) and so if \( m, n \in \mathbb{N} \), we find

\[
\langle nx | y \rangle = n \langle x | y \rangle = \frac{n}{m} \langle x | y \rangle
\]

so that \( \langle \lambda x | y \rangle = \lambda \langle x | y \rangle \) for all \( \lambda > 0 \) and \( \lambda \in \mathbb{Q} \). By continuity, it now follows that \( \langle \lambda x | y \rangle = \lambda \langle x | y \rangle \) for all \( \lambda > 0 \).

\section*{16.3 Supplement 2. Non-complete inner product spaces}

Part of Theorem \( (16.24) \) goes through when \( H \) is a not necessarily complete inner product space. We have the following proposition.

\textbf{Proposition 16.32.} Let \((H, \langle \cdot | \cdot \rangle)\) be a not necessarily complete inner product space and \( \beta \subset H \) be an orthonormal set. Then the following two conditions are equivalent:

1. \( x = \sum_{u \in \beta} \langle x | u \rangle u \) for all \( x \in H \).
2. \( \| x \|^2 = \sum_{u \in \beta} |\langle x | u \rangle|^2 \) for all \( x \in H \).

Moreover, either of these two conditions implies that \( \beta \subset H \) is a maximal orthonormal set. However \( \beta \subset H \) being a maximal orthonormal set is not sufficient (without completeness of \( H \)) to show that items 1. and 2. hold!

\textbf{Proof.} As in the proof of Theorem \( (16.24) \) implies 2). For 2) implies 1) let \( A \subset \beta \) and consider

\[
\left\| \sum_{u \in A} \langle x | u \rangle u - \sum_{u \in \beta} \langle x | u \rangle u \right\|^2 = \| x \|^2 - 2 \sum_{u \in \beta} |\langle x | u \rangle|^2 + \sum_{u \in A} |\langle x | u \rangle|^2 \\
= \| x \|^2 - \sum_{u \in A} |\langle x | u \rangle|^2.
\]

Since \( \| x \|^2 = \sum_{u \in \beta} |\langle x | u \rangle|^2 \), it follows that for every \( \varepsilon > 0 \) there exists \( A \subset \beta \) such that for all \( A \subset \beta \) such that \( A \subset A \),

\[
\left\| \sum_{u \in A} \langle x | u \rangle u - \sum_{u \in \beta} \langle x | u \rangle u \right\|^2 < \varepsilon
\]

showing that \( x = \sum_{u \in \beta} \langle x | u \rangle u \). Suppose \( x = (x_1, x_2, \ldots, x_n, \ldots) \in \beta^1 \). If 2) is valid then \( \| x \|^2 = 0 \), i.e. \( x = 0 \). So \( \beta \) is maximal. Let us now construct a counterexample to prove the last assertion. Take \( H = \text{Span}\{e_i\}_{i=1}^\infty \subset l^2 \) and let \( \bar{u}_n = e_1 - (n + 1)^{-1} e_{n+1} \) for \( n = 1, 2, \ldots \). Applying Gram-Schmidt to \( \{\bar{u}_n\}_{n=1}^\infty \), we construct an orthonormal set \( \beta = \{\bar{u}_n\}_{n=1}^\infty \subset H \). I now claim that \( \beta \subset H \) is maximal. Indeed if \( x = (x_1, x_2, \ldots, x_n, \ldots) \in \beta^1 \) then \( x \perp u_n \) for all \( n \), i.e.

\[
0 = \langle x | \bar{u}_n \rangle = x_1 - (n + 1) x_{n+1}.
\]

Therefore \( x_{n+1} = (n + 1)^{-1} x_1 \) for all \( n \). Since \( x \in \text{Span}\{e_i\}_{i=1}^\infty \), \( x_N = 0 \) for some \( N \) sufficiently large and therefore \( x_1 = 0 \) which in turn implies that \( x_n = 0 \) for all \( n \). So \( x = 0 \) and hence \( \beta \) is maximal in \( H \). On the other hand, \( \beta \) is not maximal in \( l^2 \). In fact the above argument shows that \( \beta^1 \) in \( l^2 \) is given by the span of \( v = (1, \frac{1}{2}, \frac{1}{3}, \frac{1}{4}, \frac{1}{5}, \ldots) \). Let \( P \) be the orthogonal projection of \( l^2 \) onto the Span\((\beta) = v^\perp \). Then
Suppose that Exercise 16.8. Show \( x \) weakly to \( H \).

Definition 16.33. We say a sequence \( \{x_n\}_{n=1}^{\infty} \) converges weakly to \( x \in H \) (and denote this by writing \( x_n \rightharpoonup x \in H \) as \( n \to \infty \)) iff

\[
\lim_{n \to \infty} \langle x_n, y \rangle = \langle x, y \rangle \quad \text{for all } y \in H.
\]

Exercise 16.9. Suppose that \( \{x_n\}_{n=1}^{\infty} \subset H \) and \( x_n \rightharpoonup x \in H \) as \( n \to \infty \). Show \( x_n \rightarrow x \) as \( n \to \infty \) (i.e. \( \lim_{n \to \infty} \|x - x_n\| = 0 \)) iff \( \lim_{n \to \infty} \|x_n\| = \|x\| \).

Exercise 16.10 (Banach-Saks). Suppose that \( \{x_n\}_{n=1}^{\infty} \subset H \), \( x_n \rightharpoonup x \in H \) as \( n \to \infty \), and \( c := \sup_n \|x_n\| < \infty \). Show there exists a subsequence, \( y_k = x_{n_k} \) such that

\[
\lim_{N \to \infty} \left\| x - \frac{1}{N} \sum_{k=1}^{N} y_k \right\| = 0,
\]

i.e. \( \frac{1}{N} \sum_{k=1}^{N} y_k \to x \) as \( N \to \infty \). \textbf{Hints:} 1. Show it suffices to assume \( x = 0 \) and then choose \( \{y_k\}_{k=1}^{\infty} \) so that \( |\langle y_k, y_l \rangle| \leq l^{-1} \) (or even smaller if you like) for all \( k \leq l \).

Exercise 16.11 (The Mean Ergodic Theorem). Let \( U : H \to H \) be a unitary operator on a Hilbert space \( H \), \( M = \text{Nul}(U - I) \), \( P = P_M \) be orthogonal projection onto \( M \), and \( S_n = \frac{1}{n} \sum_{k=0}^{n-1} U^k \). Show \( S_n \to P_M \) \textbf{strongly} by which we mean \( \lim_{n \to \infty} S_n x = P_M x \) for all \( x \in H \). 

\[\text{Hint:} \text{ first showing Nul}(U^* - I) = \text{Nul}(U - I) \text{ and then using Lemma 16.17. 2. Verify the result for } x \in \text{Nul}(U - I) \text{ and } x \in \text{Ran}(U - I). \text{ 3. Use a limiting argument to verify the result for } x \in \text{Ran}(U - I).\]

See Definition 24.18 and the exercises in Section 31.4 for more on the notion of weak and strong convergence.
Topological Space Basics

Using the metric space results above as motivation we will axiomatize the notion of being an open set to more general settings. See [12,13] and many more references on point-set topology.

**Definition 17.1.** A collection of subsets $\tau$ of $X$ is a topology if

1. $\emptyset, X \in \tau$.
2. $\tau$ is closed under arbitrary unions, i.e. if $V_\alpha \in \tau$, for $\alpha \in I$ then $\bigcup_{\alpha \in I} V_\alpha \in \tau$.
3. $\tau$ is closed under finite intersections, i.e. if $V_1, \ldots, V_n \in \tau$ then $V_1 \cap \cdots \cap V_n \in \tau$.
4. A pair $(X, \tau)$ where $\tau$ is a topology on $X$ will be called a topological space.

**Notation 17.2** Let $(X, \tau)$ be a topological space.

1. The elements, $V \in \tau$, are called open sets. We will often write $V \subset_o X$ to indicate $V$ is an open subset of $X$.
2. A subset $F \subset X$ is closed if $F^c$ is open and we will write $F \subset X$ if $F$ is a closed subset of $X$.
3. An open neighborhood of a point $x \in X$ is an open set $V \subset X$ such that $x \in V$. Let $\tau_x = \{V \in \tau : x \in V\}$ denote the collection of open neighborhoods of $x$.
4. A subset $W \subset X$ is a neighborhood of $x$ if there exists $V \in \tau_x$ such that $V \subset W$.
5. A collection $\eta \subset \tau_x$ is called a neighborhood base at $x \in X$ if for all $V \in \tau_x$ there exists $W \in \eta$ such that $W \subset V$.

The notation $\tau_x$ should not be confused with $\tau_x := \{ \{ x \} \cap V : V \in \tau \} = \{ \emptyset, \{ x \} \}$.

**Example 17.3.** 1. Let $(X, d)$ be a metric space, we write $\tau_d$ for the collection of $d$ - open sets in $X$. We have already seen that $\tau_d$ is a topology, see Exercise [13.2]. The collection of sets $\eta = \{ B_x(\varepsilon) : \varepsilon \in \mathbb{D}\}$ where $\mathbb{D}$ is any dense subset of $(0, 1]$ is a neighborhood base at $x$.

2. Let $X$ be any set, then $\tau = 2^X$ is the discrete topology on $X$. In this topology all subsets of $X$ are both open and closed. At the opposite extreme we have the trivial topology, $\tau = \{ \emptyset, X \}$. In this topology only the empty set and $X$ are open (closed).

3. Let $X = \{1, 2, 3\}$, then $\tau = \{ \emptyset, X, \{2, 3\}\}$ is a topology on $X$ which does not come from a metric.
4. Again let $X = \{1, 2, 3\}$. Then $\tau = \{ \{1\}, \{2, 3\}, \emptyset, X\}$ is a topology, and the sets $X, \{1\}, \{2, 3\}, \emptyset$ are open and closed. The sets $\{1, 2\}$ and $\{1, 3\}$ are neither open nor closed.

![Fig. 17.1. A topology.](image)

**Definition 17.4.** Let $(X, \tau_X)$ and $(Y, \tau_Y)$ be topological spaces. A function $f : X \to Y$ is continuous if

$$f^{-1}(\tau_Y) := \{ f^{-1}(V) : V \in \tau_Y \} \subset \tau_X.$$  

We will also say that $f$ is $\tau_X/\tau_Y$ - continuous or $(\tau_X, \tau_Y)$ - continuous. Let $C(X, Y)$ denote the set of continuous functions from $X$ to $Y$.

**Exercise 17.1.** Show $f : X \to Y$ is continuous iff $f^{-1}(C)$ is closed in $X$ for all closed subsets $C$ of $Y$.

**Definition 17.5.** A map $f : X \to Y$ between topological spaces is called a homeomorphism provided that $f$ is bijective, $f$ is continuous and $f^{-1} : Y \to X$ is continuous. If there exists $f : X \to Y$ which is a homeomorphism, we say...
that $X$ and $Y$ are homeomorphic. (As topological spaces $X$ and $Y$ are essentially the same.)

### 17.1 Constructing Topologies and Checking Continuity

**Proposition 17.6.** Let $\mathcal{E}$ be any collection of subsets of $X$. Then there exists a unique smallest topology $\tau(\mathcal{E})$ which contains $\mathcal{E}$.

**Proof.** Since $2^X$ is a topology and $\mathcal{E} \subset 2^X$, $\mathcal{E}$ is always a subset of a topology. It is now easily seen that

$$\tau(\mathcal{E}) := \bigcap \{\tau : \tau \text{ is a topology and } \mathcal{E} \subset \tau\}$$

is a topology which is clearly the smallest possible topology containing $\mathcal{E}$. 

The following proposition gives an explicit descriptions of $\tau(\mathcal{E})$.

**Proposition 17.7.** Let $X$ be a set and $\mathcal{E} \subset 2^X$. For simplicity of notation, assume that $X, \emptyset \in \mathcal{E}$. (If this is not the case simply replace $\mathcal{E}$ by $\mathcal{E} \cup \{X, \emptyset\}$.) Then

$$\tau(\mathcal{E}) := \{\text{arbitrary unions of finite intersections of elements from } \mathcal{E}\}. \quad (17.1)$$

**Proof.** Let $\tau$ be given as in the right side of Eq. (17.1). From the definition of a topology any topology containing $X$ must contain $\tau$ and hence $\mathcal{E} \subset \tau \subset \tau(\mathcal{E})$. The proof will be completed by showing $\tau$ is a topology. The validation of $\tau$ being a topology is routine except for showing that $\tau$ is closed under taking finite intersections. Let $V, W \in \tau$ which by definition may be expressed as

$$V = \bigcup_{\alpha \in A} V_\alpha \quad \text{and} \quad W = \bigcup_{\beta \in B} W_\beta,$$

where $V_\alpha$ and $W_\beta$ are sets which are finite intersections of elements from $\mathcal{E}$. Then

$$V \cap W = (\bigcup_{\alpha \in A} V_\alpha) \cap (\bigcup_{\beta \in B} W_\beta) = \bigcup_{(\alpha, \beta) \in A \times B} V_\alpha \cap W_\beta.$$

Since for each $(\alpha, \beta) \in A \times B$, $V_\alpha \cap W_\beta$ is still a finite intersection of elements from $\mathcal{E}$, $V \cap W \in \tau$ showing $\tau$ is closed under taking finite intersections.

**Definition 17.8.** Let $(X, \tau)$ be a topological space. We say that $\mathcal{S} \subset \tau$ is a sub-base for the topology $\tau$ iff $\tau = \tau(\mathcal{S})$ and $X = \bigcup \mathcal{S} := \bigcup_{\mathcal{V} \in \mathcal{S}} V$. We say $\mathcal{V} \subset \tau$ is a base for the topology $\tau$ iff $\mathcal{V}$ is a sub-base with the property that every element $V \in \mathcal{V}$ may be written as

$$V = \bigcup \{B \in \mathcal{V} : B \subset V\}.$$

**Exercise 17.2.** Suppose that $\mathcal{S}$ is a sub-base for a topology $\tau$ on a set $X$.

1. Show $\mathcal{V} := \mathcal{S}_f$ ($\mathcal{S}_f$ is the collection of finite intersections of elements from $\mathcal{S}$) is a base for $\tau$.
2. Show $\mathcal{S}$ is itself a base for $\tau$ iff

$$V_1 \cap V_2 = \bigcup \{S \in \mathcal{S} : S \subset V_1 \cap V_2\}.$$ for every pair of sets $V_1, V_2 \in \mathcal{S}$.

**Remark 17.9.** Let $(X, \mathcal{S})$ be a metric space, then $\mathcal{E} = \{B_x(\delta) : x \in X \text{ and } \delta > 0\}$ is a base for $\tau(d)$ – the topology associated to the metric $d$. This is the content of Exercise [17.3]

Let us check directly that $\mathcal{E}$ is a base for a topology. Suppose that $x, y \in X$ and $\varepsilon, \delta > 0$. If $z \in B(x, \delta) \cap B(y, \varepsilon)$, then

$$B(z, \alpha) \subset B(x, \delta) \cap B(y, \varepsilon) \quad (17.2)$$

where $\alpha = \min\{\delta - d(x, z), \varepsilon - d(y, z)\}$, see Figure [17.2]. This is a formal consequence of the triangle inequality. For example let us show that $B(z, \alpha) \subset B(x, \delta)$. By the definition of $\alpha$, we have that $\alpha \leq \delta - d(x, z)$ or that $d(x, z) \leq \delta - \alpha$. Hence if $w \in B(z, \alpha)$, then

$$d(x, w) \leq d(x, z) + d(z, w) \leq \delta - \alpha + d(z, w) < \delta - \alpha + \alpha = \delta$$

which shows that $w \in B(x, \delta)$. Similarly we show that $w \in B(y, \varepsilon)$ as well.

Owing to Exercise [17.2] this shows $\mathcal{E}$ is a base for a topology. We do not need to use Exercise [17.2] here since in fact Equation (17.2) may be generalized to finite intersection of balls. Namely if $x_i \in X, \delta_i > 0$ and $z \in \bigcap_{i=1}^n B(x_i, \delta_i)$, then
$B(z, \alpha) \subset \cap_{i=1}^{n} B(x_i, \delta_i)$  \hspace{1cm} (17.3)

where now $\alpha := \min \{\delta_i - d(x_i, z) : i = 1, 2, \ldots, n\}$. By Eq. (17.3) it follows that any finite intersection of open balls may be written as a union of open balls.

**Exercise 17.3.** Suppose $f : X \to Y$ is a function and $\tau_X$ and $\tau_Y$ are topologies on $X$ and $Y$ respectively. Show

$$f^{-1}\tau_Y := \{f^{-1}(V) : X : V \in \tau_Y\} \text{ and } f_*\tau_X := \{V \subset Y : f^{-1}(V) \in \tau_X\}$$

(\text{as in Notation 2.7}) are also topologies on $X$ and $Y$ respectively.

**Remark 17.10.** Let $f : X \to Y$ be a function. Given a topology $\tau_Y \subset 2^Y$, the topology $\tau_X := f^{-1}(\tau_Y)$ is the smallest topology on $X$ such that $f$ is $(\tau_X, \tau_Y)$ continuous. Similarly, if $\tau_X$ is a topology on $X$ then $\tau_Y = f_*\tau_X$ is the largest topology on $Y$ such that $f$ is $(\tau_X, \tau_Y)$ continuous.

**Definition 17.11.** Let $(X, \tau)$ be a topological space and $A$ a subset of $X$. The \textit{relative topology} or \textit{induced topology} on $A$ is the collection of sets

$$\tau_A = i_A^{-1}(\tau) = \{A \cap V : V \in \tau\},$$

where $i_A : A \to X$ is the inclusion map as in Definition 2.8.

**Lemma 17.12.** The relative topology, $\tau_A$, is a topology on $A$. Moreover a subset $B \subset A$ is $\tau_A$-closed if and only if $B = C \cap A$ for some $C$ in $\tau$.

**Proof.** (1) The first assertion is a consequence of Exercise 17.3. For the second, $B \subset A$ is $\tau_A$-closed if and only if $A \setminus B = A \cap V$ for some $V \in \tau$ which is equivalent to $B = A \setminus (A \cap V) = A \cap V^c$ for some $V \in \tau$.

**Exercise 17.4.** Show that $(X, d)$ is a metric space and $\tau = d$ is the topology coming from $d$, then $(\tau_d)_A$ is the topology induced by making $A$ into a metric space using the metric $d_{AX,A}$.

**Lemma 17.13.** Suppose that $(X, \tau_X), (Y, \tau_Y)$ and $(Z, \tau_Z)$ are topological spaces. If $f : (X, \tau_X) \to (Y, \tau_Y)$ and $g : (Y, \tau_Y) \to (Z, \tau_Z)$ are continuous functions then $g \circ f : (X, \tau_X) \to (Z, \tau_Z)$ is continuous as well.

**Proof.** This is easy since by assumption $g^{-1}(\tau_Z) \subset \tau_Y$ and $f^{-1}(\tau_Y) \subset \tau_X$ so that

$$(g \circ f)^{-1}(\tau_Z) = f^{-1}(g^{-1}(\tau_Z)) \subset f^{-1}(\tau_Y) \subset \tau_X.$$  

The following elementary lemma turns out to be extremely useful because it may be used to greatly simplify the verification that a given function is continuous.

**Lemma 17.14.** Suppose that $f : X \to Y$ is a function, $\mathcal{E} \subset 2^Y$ and $A \subset Y$, then

$$\tau(f^{-1}(\mathcal{E})) = f^{-1}(\tau(\mathcal{E})) \text{ and } \tau(\mathcal{E}_A) = (\tau(\mathcal{E}))_A.$$  

Moreover, if $\tau_Y = \tau(\mathcal{E})$ and $\tau_X$ is a topology on $X$, then $f$ is $(\tau_X, \tau_Y)$-continuous if and only if $f^{-1}(\mathcal{E}) \subset \tau_X$.

**Proof.** We will give two proofs of Eq. (17.4). The first proof is more constructive than the second, but the second proof will work in the context of $\sigma$-algebras to be developed later.

**First Proof.** There is no harm (as the reader should verify) in replacing $\mathcal{E}$ by $\mathcal{E} \cup \{\emptyset, Y\}$ if necessary so that we may assume that $\emptyset, Y \in \mathcal{E}$. By Proposition 17.7 the general element $V$ of $\tau(\mathcal{E})$ is an arbitrary union of finite intersections of elements from $\mathcal{E}$. Since $f^{-1}$ preserves all of the set operations, it follows that $f^{-1}(\mathcal{E})$ consists of sets which are arbitrary unions of finite intersections of elements from $f^{-1}\mathcal{E}$, which is precisely $\tau(f^{-1}(\mathcal{E}))$ by another application of Proposition 17.7.

**Second Proof.** By Exercise 17.3 $f^{-1}(\tau(\mathcal{E}))$ is a topology and since $\mathcal{E} \subset \tau(\mathcal{E}), f^{-1}(\mathcal{E}) \subset f^{-1}(\tau(\mathcal{E}))$. It now follows that $\tau(f^{-1}(\mathcal{E})) \subset f^{-1}(\tau(\mathcal{E}))$. For the reverse inclusion notice that

$$f_*\tau(f^{-1}(\mathcal{E})) = \{B \subset Y : f^{-1}(B) \in \tau(f^{-1}(\mathcal{E}))\}$$

is a topology which contains $\mathcal{E}$ and thus $\tau(\mathcal{E}) \subset f_*\tau(f^{-1}(\mathcal{E}))$. Hence if $B \in \tau(\mathcal{E})$ we know that $f^{-1}(B) \in \tau(f^{-1}(\mathcal{E}))$, i.e. $f^{-1}(\tau(\mathcal{E})) \subset \tau(f^{-1}(\mathcal{E}))$ and Eq. (17.4) has been proved. Applying Eq. (17.4) with $X = A$ and $f = i_A$ being the inclusion map implies

$$\tau(\mathcal{E})_A = i_A^{-1}(\tau(\mathcal{E})) = \tau(i_A^{-1}(\mathcal{E})) = \tau(\mathcal{E}_A).$$

Last if $f^{-1}\mathcal{E} \subset \tau_X$, then $f^{-1}\tau(\mathcal{E}) = \tau(f^{-1}\mathcal{E}) \subset \tau_X$ which shows $f$ is $(\tau_X, \tau_Y)$-continuous.

**Corollary 17.15.** If $(X, \tau)$ is a topological space and $f : X \to \mathbb{R}$ is a function then the following are equivalent:

1. $f$ is $(\tau, \tau_{\mathbb{R}})$-continuous,
2. $f^{-1}((a,b)) \in \tau$ for all $-\infty < a < b < \infty$,
3. $f^{-1}((a,\infty)) \in \tau$ and $f^{-1}((\infty,b)) \in \tau$ for all $a, b \in \mathbb{Q}$.

(We are using $\tau_{\mathbb{R}}$ to denote the standard topology on $\mathbb{R}$ induced by the metric $d(x,y) = |x - y|$.)
Proof. Apply Lemma 17.14 with appropriate choices of \( \mathcal{E} \).

Definition 17.16. Let \((X, \tau_X)\) and \((Y, \tau_Y)\) be topological spaces. A function \( f : X \to Y \) is continuous at a point \( x \in X \) if for every open neighborhood \( V \) of \( f(x) \) there is an open neighborhood \( U \) of \( x \) such that \( U \subseteq f^{-1}(V) \). See Figure 17.3.

Exercise 17.5. Show \( f : X \to Y \) is continuous (Definition 17.16) iff \( f \) is continuous at all points \( x \in X \).

Definition 17.17. Given topological spaces \((X, \tau)\) and \((Y, \tau')\) and a subset \( A \subseteq X \). We say a function \( f : A \to Y \) is continuous iff \( f \) is \( \tau_A/\tau' \) - continuous.

Definition 17.18. Let \((X, \tau)\) be a topological space and \( A \subseteq X \). A collection of subsets \( \mathcal{U} \subseteq \tau \) is an open cover of \( A \) if \( A \subseteq \bigcup \mathcal{U} := \bigcup_{U \in \mathcal{U}} U \).

Proposition 17.19 (Localizing Continuity). Let \((X, \tau)\) and \((Y, \tau')\) be topological spaces and \( f : X \to Y \) be a function.

1. If \( f \) is continuous and \( A \subseteq X \) then \( f|_A : A \to Y \) is continuous.
2. Suppose there exists an open cover, \( \mathcal{U} \subseteq \tau \), of \( X \) such that \( f|_A \) is continuous for all \( A \in \mathcal{U} \), then \( f \) is continuous.

Proof. 1. If \( f : X \to Y \) is continuous, \( f^{-1}(V) \in \tau \) for all \( V \in \tau' \) and therefore
\[
f|_A^{-1}(V) = A \cap f^{-1}(V) \in \tau_A \quad \text{for all} \quad V \in \tau'.
\]
2. Let \( V \in \tau' \), then
\[
f^{-1}(V) = \bigcup_{A \in \mathcal{U}} (f^{-1}(V) \cap A) = \bigcup_{A \in \mathcal{U}} f|_A^{-1}(V).
\]
Since each \( A \in \mathcal{U} \) is open, \( \tau_A \subseteq \tau \) and by assumption, \( f|_A^{-1}(V) \in \tau_A \subseteq \tau \). Hence Eq. (17.6) shows \( f^{-1}(V) \) is a union of \( \tau - \) open sets and hence is also \( \tau - \) open.

Exercise 17.6 (A Baby Extension Theorem). Suppose \( V \in \tau \) and \( f : V \to C \) is a continuous function. Further assume there is a closed subset \( C \) such that \( \{x \in V : f(x) \neq 0\} \subseteq C \subset V \). Then \( f : X \to C \) defined by
\[
F(x) = \begin{cases} f(x) & \text{if} \ x \in V \\ 0 & \text{if} \ x \notin V \end{cases}
\]
is continuous.

Exercise 17.7 (Building Continuous Functions). Prove the following variant of item 2. of Proposition 17.19. Namely, suppose there exists a finite collection \( \mathcal{F} \) of closed subsets of \( X \) such that \( X = \bigcup_{A \in \mathcal{F}} A \) and \( f|_A \) is continuous for all \( A \in \mathcal{F} \), then \( f \) is continuous. Given an example showing that the assumption that \( \mathcal{F} \) is finite cannot be eliminated. Hint: consider \( f^{-1}(C) \) where \( C \) is a closed subset of \( Y \).

17.2 Product Spaces I

Definition 17.20. Let \( X \) be a set and suppose there is a collection of topological spaces \( \{ (Y_\alpha, \tau_\alpha) : \alpha \in A \} \) and functions \( f_\alpha : X \to Y_\alpha \) for all \( \alpha \in A \). Let \( \tau(f_\alpha : \alpha \in A) \) denote the smallest topology on \( X \) such that each \( f_\alpha \) is continuous, i.e.
\[
\tau(f_\alpha : \alpha \in A) = \tau(\bigcup_{\alpha \in A} f_\alpha^{-1}(\tau_\alpha)).
\]

Proposition 17.21 (Topologies Generated by Functions). Assuming the notation in Definition 17.20 and additionally let \((Z, \tau_Z)\) be a topological space and \( g : Z \to X \) be a function. Then \( g \) is \( (\tau_Z, \tau(f_\alpha : \alpha \in A)) \) - continuous iff \( f_\alpha \circ g \) is \( (\tau_Z, \tau_\alpha) \) - continuous for all \( \alpha \in A \).

Proof. \((\Rightarrow)\) If \( g \) is \( (\tau_Z, \tau(f_\alpha : \alpha \in A)) \) - continuous, then the composition \( f_\alpha \circ g \) is \( (\tau_Z, \tau_\alpha) \) - continuous by Lemma 17.13 \((\Leftarrow)\) Let
\[
\tau_X = \tau(f_\alpha : \alpha \in A) = \tau(\bigcup_{\alpha \in A} f_\alpha^{-1}(\tau_\alpha)).
\]
If \( f_\alpha \circ g \) is \( (\tau_Z, \tau_\alpha) \) - continuous for all \( \alpha \), then
\[
g^{-1} f_\alpha^{-1}(\tau_\alpha) \subseteq \tau_Z \ \forall \ \alpha \in A
\]
and therefore
\[
g^{-1}(\bigcup_{\alpha \in A} f_\alpha^{-1}(\tau_\alpha)) = \bigcup_{\alpha \in A} g^{-1} f_\alpha^{-1}(\tau_\alpha) \subseteq \tau_Z
\]
Hence
\[ g^{-1}(\tau_X) = g^{-1}\left(\tau\left(\bigcup_{\alpha \in A} f_A^{-1}(\tau_\alpha)\right)\right) = \tau\left(\bigcup_{\alpha \in A} f_A^{-1}(\tau_\alpha)\right) \subset \tau_Z \]
which shows that \(g\) is \((\tau_Z, \tau_X)\) - continuous.

Let \(\{X_\alpha, \tau_\alpha\}\) be a collection of topological spaces, \(X = X_A = \prod_{\alpha \in A} X_\alpha\) and \(\pi_\alpha : X_A \to X_\alpha\) be the canonical projection map as in Notation 2.2.

**Definition 17.22.** The product topology \(\tau = \bigotimes_{\alpha \in A} \tau_\alpha\) is the smallest topology on \(X_A\) such that each projection \(\pi_\alpha\) is continuous. Explicitly, \(\tau\) is the topology generated by the collection of sets,
\[ \mathcal{E} = \{\pi_\alpha^{-1}(V_\alpha) : \alpha \in A, V_\alpha \in \tau_\alpha\} = \bigcup_{\alpha \in A} \pi_\alpha^{-1}(\tau_\alpha). \quad (17.7) \]

Applying Proposition 17.21 in this setting implies the following proposition.

**Proposition 17.23.** Suppose \(Y\) is a topological space and \(f : Y \to X_A\) is a map. Then \(f\) is continuous if \(\pi_\alpha \circ f : Y \to X_\alpha\) is continuous for all \(\alpha \in A\). In particular if \(A = \{1, 2, \ldots, n\}\) so that \(X_A = X_1 \times X_2 \times \cdots \times X_n\) and \(f(y) = (f_1(y), f_2(y), \ldots, f_n(y)) \in X_1 \times X_2 \times \cdots \times X_n\), then \(f : Y \to X_A\) is continuous if \(f_\alpha : Y \to X_\alpha\) is continuous for all \(\alpha \).

**Proof.** Since \(\pi_\alpha\) is continuous, if \(f_\alpha \to f_\alpha\) then \(f_\alpha(\alpha) = \pi_\alpha(f_\alpha) \to \pi_\alpha(f) = f(\alpha)\) for all \(\alpha \in A\). Conversely, \(f_\alpha(\alpha) \to f(\alpha)\) for all \(\alpha \in A\) iff \(\pi_\alpha(f_\alpha) \to \pi_\alpha(f)\) for all \(\alpha \). Therefore if \(V = \pi_\alpha^{-1}(V_\alpha) \in \mathcal{E}\) (with \(\mathcal{E}\) as in Eq. (17.7)) and \(f \in V\), then \(\pi_\alpha(f) \in V_\alpha\) and \(\pi_\alpha(f_\alpha) \in V_\alpha\) for a.a. \(n\) and hence \(f_\alpha \in V\) for a.a. \(n\). This shows that \(f_\alpha \to f\) as \(n \to \infty\).

**Proposition 17.24.** Suppose that \((X_\alpha, \tau_\alpha)_{\alpha \in A}\) is a collection of topological spaces and \(\bigotimes_{\alpha \in A} \tau_\alpha\) is the product topology on \(X := \prod_{\alpha \in A} X_\alpha\).

1. If \(\mathcal{E}_\alpha \subset \tau_\alpha\) generates \(\tau_\alpha\) for each \(\alpha \in A\), then
\[ \bigotimes_{\alpha \in A} \tau_\alpha = \tau\left(\bigcup_{\alpha \in A} \pi_\alpha^{-1}(\mathcal{E}_\alpha)\right) \quad (17.8) \]
2. If \(\mathcal{B}_\alpha \subset \tau_\alpha\) is a base for \(\tau_\alpha\) for each \(\alpha\), then the collection of sets, \(\mathcal{V}\), of the form
\[ V = \cap_{\alpha \in A} \pi_\alpha^{-1}(V_\alpha) = \prod_{\alpha \in A} V_\alpha \times \prod_{\alpha \notin A} X_\alpha, =: V_\alpha \times X_{A \setminus \alpha}, \quad (17.9) \]
where \(A \subset A\) and \(V_\alpha \in \mathcal{B}_\alpha\) for all \(\alpha \in A\) is base for \(\bigotimes_{\alpha \in A} \tau_\alpha\).

**Proof.** 1. Since
\[ \bigcup_{\alpha \in A} \pi_\alpha^{-1}(\mathcal{E}_\alpha) \subset \bigcup_{\alpha \in A} \pi_\alpha^{-1}(\tau_\alpha) = \bigcup_{\alpha \in A} \pi_\alpha^{-1}(\tau(\mathcal{E}_\alpha)) \]
\[ = \bigcup_{\alpha \in A} \tau(\pi_\alpha^{-1}(\mathcal{E}_\alpha)) \subset \tau(\bigcup_{\alpha \in A} \pi_\alpha^{-1}(\mathcal{E}_\alpha)), \]
it follows that
\[ \tau\left(\bigcup_{\alpha \in A} \pi_\alpha^{-1}(\mathcal{E}_\alpha)\right) \subset \bigotimes_{\alpha \in A} \tau_\alpha \subset \tau(\bigcup_{\alpha \in A} \pi_\alpha^{-1}(\mathcal{E}_\alpha)). \]

2. Now let \(U = \left[\bigcup_{\alpha \in A} \pi_\alpha^{-1}(\mathcal{E}_\alpha)\right]_{f}\) denote the collection of sets consisting of finite intersections of elements from \(\bigcup_{\alpha \in A} \pi_\alpha^{-1}(\mathcal{E}_\alpha)\). Notice that \(U\) may be described as those sets in Eq. (17.9) where \(V_\alpha \in \tau_\alpha\) for all \(\alpha \in A\). By Exercise 17.22 \(U\) is a base for the product topology, \(\bigotimes_{\alpha \in A} \tau_\alpha\). Hence for \(W \in \bigotimes_{\alpha \in A} \tau_\alpha\) and \(x \in W\), there exists a \(V \in U\) of the form in Eq. (17.9) such that \(x \in V \subset W\). Since \(\mathcal{B}_\alpha\) is a base for \(\tau_\alpha\), there exists \(U_\alpha \in \mathcal{B}_\alpha\) such that \(x_\alpha \in U_\alpha \subset \tau_\alpha\) for each \(\alpha \in A\). With this notation, the set \(U_A \times X_{A \setminus \alpha} \subset V \in U\) and \(x \in U_A \times X_{A \setminus \alpha} \subset \bigotimes_{\alpha \in A} \tau_\alpha \subset W\) in the case that every open set in \(X\) may be written as a union of elements from \(V\), i.e. \(V\) is a base for the product topology.

**Notation 17.26** Let \(\mathcal{E}_i \subset 2^{X_i}\) be a collection of subsets of a set \(X_i\) for each \(i = 1, 2, \ldots, n\). We will write, by abuse of notation, \(\mathcal{E}_1 \times \mathcal{E}_2 \times \cdots \times \mathcal{E}_n\) for the collection of subsets of \(X_1 \times \cdots \times X_n\), of the form \(A_1 \times A_2 \times \cdots \times A_n\) with \(A_i \in \mathcal{E}_i\) for all \(i\). That is we are identifying \((A_1, A_2, \ldots, A_n)\) with \(A_1 \times A_2 \times \cdots \times A_n\).

**Corollary 17.27.** Suppose \(A = \{1, 2, \ldots, n\}\) so that \(X = X_1 \times X_2 \times \cdots \times X_n\).

1. If \(\mathcal{E}_i \subset 2^{X_i}\), \(\tau_i = (\mathcal{E}_i)\) and \(X_i \in \mathcal{E}_i\) for each \(i\), then
\[ \tau_1 \otimes \tau_2 \otimes \cdots \otimes \tau_n = \tau(\mathcal{E}_1 \times \mathcal{E}_2 \times \cdots \times \mathcal{E}_n) \quad (17.10) \]
and in particular
\[ \tau_1 \otimes \tau_2 \otimes \cdots \otimes \tau_n = \tau(\mathcal{E}_1 \times \cdots \times \mathcal{E}_n). \quad (17.11) \]
2. Furthermore if \(\mathcal{B}_i \subset \tau_i\) is a base for the topology \(\tau_i\) for each \(i\), then \(\mathcal{B}_1 \times \cdots \times \mathcal{B}_n\) is a base for the product topology, \(\tau_1 \otimes \tau_2 \otimes \cdots \otimes \tau_n\).

**Proof.** (The proof is a minor variation on the proof of Proposition 17.25.) 1. Let \(\bigcup_{\mathcal{E}_i \in A} \pi_i^{-1}(\mathcal{E}_i)\) denotes the collection of sets which are finite intersections from \(\bigcup_{\mathcal{E}_i \in A} \pi_i^{-1}(\mathcal{E}_i)\), then, using \(X_i \in \mathcal{E}_i\) for all \(i\),
\[ \bigcup_{\mathcal{E}_i \in A} \pi_i^{-1}(\mathcal{E}_i) \subset \mathcal{E}_1 \times \mathcal{E}_2 \times \cdots \times \mathcal{E}_n \subset \left[\bigcup_{\mathcal{E}_i \in A} \pi_i^{-1}(\mathcal{E}_i)\right]_f. \]
Therefore
\[ \tau = \tau(\bigcup_{\mathcal{E}_i \in A} \pi_i^{-1}(\mathcal{E}_i)) \subset \tau(\mathcal{E}_1 \times \mathcal{E}_2 \times \cdots \times \mathcal{E}_n) \subset \tau\left(\left[\bigcup_{\mathcal{E}_i \in A} \pi_i^{-1}(\mathcal{E}_i)\right]_f\right) = \tau. \]
2. Observe that \( \tau_1 \times \cdots \times \tau_n \) is closed under finite intersections and generates \( \tau_1 \otimes \tau_2 \otimes \cdots \otimes \tau_n \), therefore \( \tau_1 \times \cdots \times \tau_n \) is a base for the product topology. The proof that \( B_1 \times \cdots \times B_n \) is also a base for \( \tau_1 \otimes \tau_2 \otimes \cdots \otimes \tau_n \) follows the same method used to prove item 2. in Proposition 17.25.

Lemma 17.28. Let \( (X_i, d_i) \) for \( i = 1, \ldots, n \) be metric spaces, \( X := X_1 \times \cdots \times X_n \) and for \( x = (x_1, x_2, \ldots, x_n) \) and \( y = (y_1, y_2, \ldots, y_n) \) in \( X \) let

\[
d(x, y) = \sum_{i=1}^{n} d_i(x_i, y_i).
\]

Then the topology, \( \tau_d \), associated to the metric \( d \) is the product topology on \( X \), i.e.

\[
\tau_d = \tau_{d_1} \otimes \tau_{d_2} \otimes \cdots \otimes \tau_{d_n}.
\]

Proof. Let \( \rho(x, y) = \max\{d_i(x_i, y_i) : i = 1, 2, \ldots, n\} \). Then \( \rho \) is equivalent to \( d \) and hence \( \tau_{\rho} = \tau_d \). Moreover if \( \varepsilon > 0 \) and \( x = (x_1, x_2, \ldots, x_n) \) in \( X \), then

\[
B^\rho_x(\varepsilon) = B^d_{x_1}(\varepsilon) \times \cdots \times B^d_{x_n}(\varepsilon).
\]

By Remark 17.9,

\[
\mathcal{E} := \{B^\rho_x(\varepsilon) : x \in X \text{ and } \varepsilon > 0\}
\]

is a base for \( \tau_{\rho} \) and by Proposition 17.25 \( \mathcal{E} \) is also a base for \( \tau_{d_1} \otimes \tau_{d_2} \otimes \cdots \otimes \tau_{d_n} \). Therefore,

\[
\tau_{d_1} \otimes \tau_{d_2} \otimes \cdots \otimes \tau_{d_n} = \tau(\mathcal{E}) = \tau_{\rho} = \tau_d.
\]

17.3 Closure operations

Definition 17.29. Let \( (X, \tau) \) be a topological space and \( A \) be a subset of \( X \).

1. The closure of \( A \) is the smallest closed set \( \bar{A} \) containing \( A \), i.e.

\[
\bar{A} := \cap \{F : A \subset F \subset X\}.
\]

(Because of Exercise 13.4 this is consistent with Definition 13.10 for the closure of a set in a metric space.)

2. The interior of \( A \) is the largest open set \( A^o \) contained in \( A \), i.e.

\[
A^o = \cup \{V \in \tau : V \subset A\}.
\]

(With this notation the definition of a neighborhood of \( x \in X \) may be stated as: \( A \subset X \) is a neighborhood of a point \( x \in X \) if \( x \in A^o \).)

3. The accumulation points of \( A \) is the set

\[
\text{acc}(A) = \{x \in X : V \cap A \setminus \{x\} \neq \emptyset \text{ for all } V \in \tau_x\}.
\]

4. The boundary of \( A \) is the set \( \text{bd}(A) := \bar{A} \setminus A^o \).

Remark 17.30. The relationships between the interior and the closure of a set are:

\[
(A^o)^c = \bigcap \{V^c : V \in \tau \text{ and } V \subset A\} = \bigcap \{C : C \text{ is closed } C \supseteq A^c\} = \overline{A^c}
\]

and similarly, \((\bar{A})^c = (A^o)^c\). Hence the boundary of \( A \) may be written as

\[
\text{bd}(A) := \bar{A} \setminus A^o = \bar{A} \cap (\bar{A}^c)^c = \bar{A} \cap \overline{A^c},
\]

which is to say \( \text{bd}(A) \) consists of the points in both the closures of \( A \) and \( A^c \).

Proposition 17.31. Let \( A \subset X \) and \( x \in X \).

1. If \( V \subset_0 X \) and \( A \cap V = \emptyset \) then \( \bar{A} \cap V = \emptyset \).
2. \( x \in A \iff V \cap A \neq \emptyset \text{ for all } V \in \tau_x \).
3. \( x \in \text{bd}(A) \iff V \cap A \neq \emptyset \text{ and } V \cap A^c \neq \emptyset \text{ for all } V \in \tau_x \).
4. \( \bar{A} = A \cup \text{acc}(A) \).

Proof. 1. Since \( A \cap V = \emptyset \), \( A \subset V^c \) and since \( V^c \) is closed, \( \bar{A} \subset V^c \). That is to say \( \bar{A} \cap V = \emptyset \). By Remark 17.30 \( \bar{A} = ((A^o)^c)^c \) so \( x \in \bar{A} \) iff \( x \notin (A^o)^c \) which happens iff \( V \not\subseteq A^c \) for all \( V \in \tau_x \), i.e. iff \( V \cap A = \emptyset \) for all \( V \in \tau_x \). This assertion easily follows from the Item 2. and Eq. (17.13). Item 4. is an easy consequence of the definition of acc(\( A \)) and item 2.

Lemma 17.32. Let \( A \subset Y \subset X \). \( (X, \tau_X) \) denote the closure of \( A \) in \( Y \) with its relative topology and \( \bar{A} = \bar{A}^X \cap Y \) be the closure of \( A \) in \( X \), then \( \bar{A}^Y = \bar{A}^X \cap Y \).

Proof. Using Lemma 17.12

\[
\bar{A}^Y = \cap \{B \subset Y : A \subset B\} = \cap \{C \cap Y : A \subset C \subset X\} = Y \cap \overline{A^X}.
\]

Alternative proof. Let \( x \in Y \) then \( x \in \bar{A}^Y \) iff \( V \cap A \neq \emptyset \) for all \( V \in \tau_Y \) such that \( x \in V \). This happens iff for all \( U \in \tau_x \), \( U \cap Y \cap A = U \cap A = \emptyset \) which happens iff \( x \in \bar{A}^X \). That is to say \( \bar{A}^Y = \bar{A}^X \cap Y \).

The support of a function may now be defined as in Definition 50.26 above.

\[
\text{acc}(A) = \{x \in X : V \cap A \setminus \{x\} \neq \emptyset \text{ for all } V \in \tau_x\}.
\]
Definition 17.33 (Support). Let \( f : X \to Y \) be a function from a topological space \((X, \tau_X)\) to a vector space \(Y\). Then we define the support of \( f \) by
\[
\text{supp}(f) := \{x \in X : f(x) \neq 0\},
\]
a closed subset of \(X\).

The next result is included for completeness but will not be used in the sequel so may be omitted.

Lemma 17.34. Suppose that \( f : X \to Y \) is a map between topological spaces. Then the following are equivalent:

1. \( f \) is continuous.
2. \( f(\overline{A}) \subseteq \overline{f(A)} \) for all \( A \subseteq X \).
3. \( f^{-1}(B) \subseteq f^{-1}(\overline{B}) \) for all \( B \subseteq Y \).

Proof. If \( f \) is continuous, then \( f^{-1}(\overline{f(A)}) \) is closed and since \( A \subseteq f^{-1}(f(A)) \subseteq f^{-1}(\overline{f(A)}) \) it follows that \( \overline{A} \subseteq f^{-1}(\overline{f(A)}) \). From this equation we learn that \( f(\overline{A}) \subseteq \overline{f(A)} \) so that 1. implies 2. Now assume 2., then for \( B \subseteq Y \) (taking \( A = f^{-1}(B) \)) we have
\[
f(\overline{f^{-1}(B)}) \subseteq f(\overline{f^{-1}(B)}) \subseteq \overline{f(f^{-1}(B))} \subseteq \overline{B},
\]
and therefore
\[
\overline{f^{-1}(B)} \subseteq f^{-1}(\overline{B}). \tag{17.14}
\]
This shows that 2. implies 3. Finally if Eq. (17.14) holds for all \( B \), then when \( B \) is closed this shows that
\[
f^{-1}(B) \subseteq f^{-1}(\overline{B}) = f^{-1}(B) \subseteq \overline{f^{-1}(B)},
\]
which shows that
\[
f^{-1}(B) = \overline{f^{-1}(B)}.
\]
Therefore \( f^{-1}(B) \) is closed whenever \( B \) is closed which implies that \( f \) is continuous.

17.4 Countability Axioms

Definition 17.35. Let \((X, \tau)\) be a topological space. A sequence \( \{x_n\}_{n=1}^{\infty} \subseteq X \) converges to a point \( x \in X \) if for all \( V \in \tau_x \), \( x_n \in V \) almost always (abbreviated a.a.), i.e. \( \# \{n : x_n \notin V\} < \infty \). We will write \( x_n \to x \) as \( n \to \infty \) or \( \lim_{n \to \infty} x_n = x \) when \( x_n \) converges to \( x \).

Example 17.36. Let \( X = \{1, 2, 3\} \) and \( \tau = \{\emptyset, \{1, 2\}, \{2, 3\}, \{2\}\} \) and \( x_n = 2 \) for all \( n \). Then \( x_n \to x \) for every \( x \in X \). So limits need not be unique!

Definition 17.37 (First Countable). A topological space, \((X, \tau)\), is first countable iff every point \( x \in X \) has a countable neighborhood base as defined in Notation 17.2.

Example 17.38. All metric spaces, \((X,d)\), are first countable. Indeed, if \( x \in X \) then \( \{B(x, 1/n) : n \in \mathbb{N}\} \) is a countable neighborhood base at \( x \in X \).

Exercise 17.8. Suppose \( X \) is an uncountable set and define \( \tau \subseteq 2^X \) so that \( V \in \tau \) iff \( V^c \) is finite or countable or \( V = \emptyset \). Show \( \tau \) is a topology on \( X \) which is closed under countable intersections and that \((X, \tau)\) is not first countable.

Exercise 17.9. Let \( \{0,1\} \) be equipped with the discrete topology and \( X = \{0,1\}^\mathbb{R} \) be equipped with the product topology, \( \tau \). Show \((X, \tau)\) is not first countable.

The spaces described in Exercises [17.8] and [17.9] are examples of topological spaces which are not metrizable, i.e. the topology is not induced by any metric on \( X \). Like for metric spaces, when \( \tau \) is first countable, we may formulate many topological notions in terms of sequences.

Proposition 17.39. If \( f : X \to Y \) is continuous at \( x \in X \) and \( \lim_{n \to \infty} x_n = x \in X \), then \( \lim_{n \to \infty} f(x_n) = f(x) \in Y \). Moreover, if there exists a countable neighborhood base \( \eta \) of \( x \in X \), then \( f \) is continuous at \( x \) iff \( \lim_{n \to \infty} f(x_n) = f(x) \) for all sequences \( \{x_n\}_{n=1}^{\infty} \subseteq X \) such that \( x_n \to x \) as \( n \to \infty \).

Proof. If \( f : X \to Y \) is continuous and \( W \in \tau_x \) is a neighborhood of \( f(x) \in Y \), then there exists a neighborhood \( V \) of \( x \) such that \( f(V) \subseteq W \). Since \( x_n \to x \), \( x_n \in V \) a.a. and therefore \( f(x_n) \in f(V) \subseteq W \) a.a., i.e. \( f(x_n) \to f(x) \) as \( n \to \infty \). Conversely suppose that \( \eta := \{W_n\}_{n=1}^{\infty} \) is a countable neighborhood base at \( x \) and \( \lim_{n \to \infty} f(x_n) = f(x) \) for all sequences \( \{x_n\}_{n=1}^{\infty} \subseteq X \) such that \( x_n \to x \). By replacing \( W_n \) by \( W_1 \cap \cdots \cap W_n \) if necessary, we may assume that \( \{W_n\}_{n=1}^{\infty} \) is a decreasing sequence of sets. If \( f \) were not continuous at \( x \) then there exists \( V \in \tau_x \) such that \( x \notin f^{-1}(V) \). Therefore, \( W_n \) is not a subset of \( f^{-1}(V) \) for all \( n \). Hence for each \( n \), we may choose \( x_n \in W_n \setminus f^{-1}(V) \). This sequence then has the property that \( x_n \to x \) as \( n \to \infty \) while \( f(x_n) \notin V \) for all \( n \) and hence \( \lim_{n \to \infty} f(x_n) \neq f(x) \).

Lemma 17.40. Suppose there exists \( \{x_n\}_{n=1}^{\infty} \subseteq A \) such that \( x_n \to x \), then \( x \in A \). Conversely if \((X, \tau)\) is a first countable space (like a metric space) then if \( x \in A \) there exists \( \{x_n\}_{n=1}^{\infty} \subseteq A \) such that \( x_n \to x \).
Proof. Suppose \( \{x_n\}_{n=1}^{\infty} \subset A \) and \( x_n \to x \in X \). Since \( \overline{A} \) is an open set, if \( x \in \overline{A} \) then \( x_n \in \overline{A} \subset \overline{A} \) a.a. contradicting the assumption that \( \{x_n\}_{n=1}^{\infty} \subset A \). Hence \( x \in \overline{A} \). For the converse we now assume that \( (X, \tau) \) is first countable and that \( \{V_n\}_{n=1}^{\infty} \) is a countable neighborhood base at \( x \) such that \( V_1 \supset V_2 \supset V_3 \ldots \). By Proposition \( 17.31 \) \( x \in \overline{A} \) iff \( V \cap A \neq \emptyset \) for all \( V \in \tau_x \). Hence \( x \in A \implies \) there exists \( x_n \in V_n \cap A \) for all \( n \). It is now easily seen that \( x_n \to x \) as \( n \to \infty \).

Definition 17.41. A topological space, \( (X, \tau) \), is second countable if there exists a countable base \( \mathcal{V} \) for \( \tau \), i.e., \( \mathcal{V} \subset \tau \) is a countable set such that for every \( W \in \tau \),

\[
W = \bigcup \{ V : V \in \mathcal{V} \text{ such that } V \subset W \}.
\]

Definition 17.42. A subset \( D \) of a topological space \( X \) is dense if \( \overline{D} = X \). A topological space is said to be separable if it contains a countable dense subset, \( D \).

Example 17.43. The following are examples of countable dense sets.

1. The rational numbers, \( \mathbb{Q} \), are dense in \( \mathbb{R} \) equipped with the usual topology.
2. More generally, \( \mathbb{Q}^d \) is a countable dense subset of \( \mathbb{R}^d \) for any \( d \in \mathbb{N} \).
3. Even more generally, for any function \( \mu : \mathbb{N} \to (0, \infty) \), \( \ell^p(\mu) \) is separable for all \( 1 \leq p < \infty \). For example, let \( \Gamma \subset \mathbb{R} \) be a countable dense set, then

\[
D := \{ x \in \ell^p(\mu) : x_i \in \Gamma \text{ for all } i \text{ and } \# \{ j : x_j \neq 0 \} < \infty \}.
\]

The set \( \Gamma \) can be taken to be \( \mathbb{Q} \) if \( \mathbb{F} = \mathbb{R} \) or \( \mathbb{Q} + i\mathbb{Q} \) if \( \mathbb{F} = \mathbb{C} \).

4. If \( (X, d) \) is a metric space which is separable then every subset \( Y \subset X \) is also separable in the induced topology.

To prove 4 above, let \( A = \{x_n\}_{n=1}^{\infty} \subset X \) be a countable dense subset of \( X \). Let \( d_Y(x) = \inf \{d(x, y) : y \in Y \} \) be the distance from \( x \) to \( Y \) and recall that \( d_Y : X \to [0, \infty) \) is continuous. Let \( \varepsilon_n = \max \{d_Y(x_n), \frac{1}{n} \} \geq 0 \) and for each \( n \) let \( y_n \in B_{x_n}(\varepsilon_n) \). Then if \( y \in Y \) and \( \varepsilon > 0 \) we may choose \( n \in \mathbb{N} \) such that \( d(y, x_n) \leq \varepsilon_n < \varepsilon/3 \). Then \( d(y_n, x_n) \leq 2\varepsilon_n < 2\varepsilon/3 \) and therefore

\[
d(y_n, y) \leq d(y_n, x_n) + d(x_n, y_n) < \varepsilon.
\]

This shows that \( B := \{y_n\}_{n=1}^{\infty} \) is a countable dense subset of \( Y \).

Exercise 17.10. Show \( \ell^\infty(\mathbb{N}) \) is not separable.

Exercise 17.11. Show every second countable topological space \( (X, \tau) \) is separable. Show the converse is not true by showing \( X := \mathbb{R} \) with \( \tau = \{\emptyset\} \cup \{V \subset \mathbb{R} : 0 \in V \} \) is a separable, first countable but not a second countable topological space.

Exercise 17.12. Every separable metric space, \((X, d)\) is second countable.

Exercise 17.13. Suppose \( E \subset 2^X \) is a countable collection of subsets of \( X \), then \( \tau = \tau(E) \) is a second countable topology on \( X \).

17.5 Connectedness

Definition 17.44. \((X, \tau)\) is disconnected if there exist non-empty open sets \( U \) and \( V \) of \( X \) such that \( U \cap V = \emptyset \) and \( X = U \cup V \). We say \( \{U, V\} \) is a disconnection of \( X \). The topological space \((X, \tau)\) is called connected if it is not disconnected, i.e. if there is no disconnection of \( X \). If \( A \subset X \) we say \( A \) is connected if \((A, \tau_A)\) is connected where \( \tau_A \) is the relative topology on \( A \). Explicitly, \( A \) is disconnected in \((X, \tau)\) if there is no disconnection of \( X \).

The reader should check that the following statement is an equivalent definition of connectivity. A topological space \((X, \tau)\) is connected ifff the only sets \( A \subset X \) which are both open and closed are the sets \( X \) and \( \emptyset \). This version of the definition is often used in practice.

Remark 17.45. Let \( A \subset Y \subset X \). Then \( A \) is connected in \( Y \) iff \( A \) is connected in \( X \).

Proof. Since \( \tau_A := \{V \cap A : V \subset X\} = \{V \cap A \cap Y : V \subset X\} = \{U \cap A : U \subset Y\} \), the relative topology on \( A \) inherited from \( X \) is the same as the relative topology on \( A \) inherited from \( Y \). Since connectivity is a statement about the relative topologies on \( A, X \) is connected in \( X \) iff \( A \) is connected in \( Y \).

The following elementary but important lemma is left as an exercise to the reader.

Lemma 17.46. Suppose that \( f : X \to Y \) is a continuous map between topological spaces. Then \( f(X) \subset Y \) is connected if \( X \) is connected.

Here is a typical way these connectedness ideas are used.

Example 17.17. Suppose that \( f : X \to Y \) is a continuous map between two topological spaces, the space \( X \) is connected and the space \( Y \) is "T1," i.e. \( \{y\} \) is a closed set for all \( y \in Y \) as in Definition \( 25.35 \) below. Further assume \( f \) is locally constant, i.e. for all \( x \in X \) there exists an open neighborhood \( V \) of \( x \) in \( X \) such that \( f|_V \) is constant. Then \( f \) is constant, i.e. \( f(X) = \{y_0\} \) for some \( y_0 \in Y \). To prove this, let \( y_0 \in f(X) \) and let \( W := f^{-1}(\{y_0\}) \). Since \( \{y_0\} \subset Y \).
is a closed set and since \( f \) is continuous \( W \subset X \) is also closed. Since \( f \) is locally constant, \( W \) is open as well and since \( X \) is connected it follows that \( W = X \), i.e. \( f(X) = \{ y_0 \} \).

As a concrete application of this result, suppose that \( X \) is a connected open subset of \( \mathbb{R}^d \) and \( f : X \to \mathbb{R} \) is a \( C^1 \) function such that \( \nabla f \equiv 0 \). If \( x \in X \) and \( \varepsilon > 0 \) such that \( B(x, \varepsilon) \subset X \), we have, for any \( |v| < \varepsilon \) and \( t \in [-1, 1] \), that
\[
\frac{d}{dt} f(x + tv) = \nabla f(x + tv) \cdot v = 0.
\]
Therefore \( f(x + v) = f(x) \) for all \( |v| < \varepsilon \) and this shows \( f \) is locally constant.

Hence, by what we have just proved, \( f \) is constant on \( X \).

**Theorem 17.48 (Properties of Connected Sets).** Let \((X, \tau)\) be a topological space.

1. If \( B \subset X \) is a connected set and \( X \) is the disjoint union of two open sets \( U \) and \( V \), then either \( B \subset U \) or \( B \subset V \).
2. If \( A \subset X \) is connected,
   a) then \( \overline{A} \) is connected,
   b) More generally, if \( A \) is connected and \( B \subset \text{acc}(A) \), then \( A \cup B \) is connected as well. (Recall that \( \text{acc}(A) \) — the set of accumulation points of \( A \) was defined in Definition 17.29 above.)
3. If \( \{ E_\alpha \}_{\alpha \in A} \) is a collection of connected sets such that \( \bigcap_{\alpha \in A} E_\alpha \neq \emptyset \), then \( Y := \bigcup_{\alpha \in A} E_\alpha \) is connected as well.
4. Suppose \( A, B \subset X \) are non-empty connected subsets of \( X \) such that \( \overline{A} \cap B \neq \emptyset \), then \( A \cup B \) is connected in \( X \).
5. Every point \( x \in X \) is contained in a unique maximal connected subset \( C_x \) of \( X \) and this subset is closed. The set \( C_x \) is called the connected component of \( x \).

**Proof.**

1. Since \( B \) is the disjoint union of the relatively open sets \( B \cap U \) and \( B \cap V \), we must have \( B \cap U = B \) or \( B \cap V = B \) for otherwise \( \{ B \cap U, B \cap V \} \) would be a disconnection of \( B \).
2. a) Let \( Y = \overline{A} \) be equipped with the relative topology from \( X \). Suppose that \( U, V \subset \partial Y \) form a disconnection of \( Y = \overline{A} \). Then by 1. either \( A \subset U \) or \( A \subset V \). Say that \( A \subset U \). Since \( U \) is both open and closed in \( Y \), it follows that \( Y = \overline{A} \subset U \). Therefore \( V = \emptyset \) and we have a contradiction to the assumption that \( \{ U, V \} \) is a disconnection of \( Y = \overline{A} \). Hence we must conclude that \( Y = \overline{A} \) is connected as well.
   b) Now let \( Y = A \cup B \) with \( B \subset \text{acc}(A) \), then
   \[
   \overline{A} = \overline{A} \cap Y = (A \cup \text{acc}(A)) \cap Y = A \cup B.
   \]
   Because \( A \) is connected in \( Y \), by (2a) \( Y = A \cup B = \overline{A} \) is also connected.
3. Let \( Y := \bigcup_{\alpha \in A} E_\alpha \). By Remark 17.45 we know that \( E_\alpha \) is connected in \( Y \) for each \( \alpha \in A \). If \( \{ U, V \} \) were a disconnection of \( Y \), by item 1, either \( E_\alpha \subset U \) or \( E_\alpha \subset V \) for all \( \alpha \). Let \( A = \{ \alpha \in A : E_\alpha \subset U \} \) then \( U = \bigcup_{\alpha \in A} E_\alpha \) and \( V = \bigcup_{\alpha \in A \setminus A} E_\alpha \). (Notice that neither \( A \) or \( A \setminus A \) can be empty since \( U \) and \( V \) are not empty.) Since
\[
\emptyset = U \cap V = \bigcup_{\alpha \in A} (E_\alpha \cap E_{\beta}) \cup \bigcap_{\alpha \in A} E_\alpha \neq \emptyset.
\]
we have reached a contradiction and hence no such disconnection exists.
4. (A good example to keep in mind here is \( X = \mathbb{R} \), \( A = (0, 1) \) and \( B = [1, 2) \).)
   For sake of contradiction suppose that \( \{ U, V \} \) were a disconnection of \( Y = A \cup B \). By item 1 either \( A \subset U \) or \( A \subset V \), say \( A \subset U \) in which case \( B \subset V \). Since \( Y = A \cup B \) we must have \( A = U \) and \( B = V \) and so we may conclude: \( A \) and \( B \) are disjoint subsets of \( Y \) which are both open and closed. This implies
\[
A = \overline{A} = \overline{A} \cap Y = \overline{A} \cap (A \cup B) = A \cup (\overline{A} \cap B)
\]
and therefore
\[
\emptyset = A \cap B = (A \cup (\overline{A} \cap B)) \cap B = \overline{A} \cap B \neq \emptyset
\]
which gives us the desired contradiction.
5. Let \( C \) denote the collection of connected subsets \( C \subset X \) such that \( x \in C \).
   Then by item 3., the set \( C_x := \cup C \) is also a connected subset of \( X \) which contains \( x \) and clearly this is the unique maximal connected set containing \( x \). Since \( C_x \) is also connected by item 2) and \( C_x \) is maximal, \( C_x = \overline{C}_x \), i.e. \( C_x \) is closed.

**Theorem 17.49 (The Connected Subsets of \( \mathbb{R} \)).** The connected subsets of \( \mathbb{R} \) are intervals.

**Proof.** Suppose that \( A \subset \mathbb{R} \) is a connected subset and that \( a, b \in A \) with \( a < b \). If there exists \( c \in (a, b) \) such that \( c \notin A \), then \( U := (-\infty, c) \cap A \) and \( V := (c, \infty) \cap A \) would form a disconnection of \( A \). Hence \( (a, b) \subset A \). Let \( \alpha := \inf(A) \) and \( \beta := \sup(A) \) and choose \( \alpha_n, \beta_n \in A \) such that \( \alpha_n < \beta_n \) and \( \alpha_n \uparrow \alpha \) and \( \beta_n \downarrow \beta \) as \( n \to \infty \). By what we have just shown, \( (\alpha_n, \beta_n) \subset A \) for all \( n \) and hence \( (\alpha_n, \beta_n) \subseteq \bigcup_{n=1}^{\infty} (\alpha_n, \beta_n) \subset A \). From this it follows that \( A = (\alpha, \beta) \), \( (\alpha, \beta) \subset (\alpha, \beta) \), or \( (\alpha, \beta) \), i.e. \( A \) is an interval.
   Conversely suppose that \( A \) is an interval, and for sake of contradiction, suppose that \( \{ U, V \} \) is a disconnection of \( A \) with \( a \in U \), \( b \in V \). After relabelling \( U \) and \( V \) if necessary we may assume that \( a < b \). Since \( A \) is an interval \([a, b] \subset A \).
   Let \( p = \sup \{[a, b] \cap U \} \), then because \( U \) and \( V \) are open, \( a < p < b \). Now \( p \)}
Proposition 17.52. Let $X$ be a topological space.

1. If $X$ is path connected then $X$ is connected.
2. If $X$ is connected and locally path connected, then $X$ is path connected.
3. If $X$ is any connected open subset of $\mathbb{R}^n$, then $X$ is path connected.

Proof. The reader is asked to prove this proposition in Exercises 17.27–17.29 below.

Proposition 17.53 (Stability of Connectedness Under Products). Let $(X_\alpha, \tau_\alpha)$ be connected topological spaces. Then the product space $X_A = \prod_{\alpha \in A} X_\alpha$ equipped with the product topology is connected.

Proof. Let us begin with the case of two factors, namely assume that $X$ and $Y$ are connected topological spaces, then we will show that $X \times Y$ is connected as well. Given $x \in X$, let $f_x : Y \to X \times Y$ be the map $f_x(y) = (x, y)$ and notice that $f_x$ is continuous since $\pi_X \circ f_x(y) = x$ and $\pi_Y \circ f_x(y) = y$ are continuous maps. From this we conclude that $\{x\} \times Y = f_x(Y)$ is connected by Lemma 17.46. A similar argument shows $X \times \{y\}$ is connected for all $y \in Y$.

Let $p = (x_0, y_0) \in X \times Y$ and $C_p$ denote the connected component of $p$. Since $\{x_0\} \times Y$ is connected and $p \in \{x_0\} \times Y$ it follows that $\{x_0\} \times Y \subset C_p$ and hence $C_p$ is also the connected component $\{x_0, y_0\}$ for all $y \in Y$. Similarly, $X \times \{y\} \subset C_{(x_0, y)} = C_p$ is connected, and therefore $X \times \{y\} \subset C_p$. So we have shown $(x, y) \in C_p$ for all $x \in X$ and $y \in Y$, see Figure 17.4. By induction the theorem holds whenever $A$ is a finite set, i.e. for products of a finite number of connected spaces.

For the general case, again choose a point $p \in X_A = X^A$ and again let $C = C_p$ be the connected component of $p$. Recall that $C_p$ is closed and therefore cannot be in $U$ for otherwise $\sup([a, b] \cap U) > p$ and $p$ can not be in $V$ for otherwise $p < \sup([a, b] \cap U)$. From this it follows that $p \notin U \cup V$ and hence $A \neq U \cup V$ contradicting the assumption that $\{U, V\}$ is a disconnection.

Theorem 17.50 (Intermediate Value Theorem). Suppose that $(X, \tau)$ is a connected topological space and $f : X \to \mathbb{R}$ is a continuous map. Then $f$ satisfies the intermediate value property. Namely, for every pair $x, y \in X$ such that $f(x) < f(y)$ and $c \in (f(x), f(y))$, there exists $z \in X$ such that $f(z) = c$.

Proof. By Lemma 17.46 $f(X)$ is a connected subset of $\mathbb{R}$. So by Theorem 17.49 $f(X)$ is a subinterval of $\mathbb{R}$ and this completes the proof.

Definition 17.51. A topological space $X$ is path connected if to every pair of points $\{x_0, x_1\} \subset X$ there exists a continuous path, $\sigma \in C([0, 1], X)$, such that $\sigma(0) = x_0$ and $\sigma(1) = x_1$. The space $X$ is said to be locally path connected if for each $x \in X$, there is an open neighborhood $V \subset X$ of $x$ which is path connected.

if $C_p$ is a proper subset of $X_A$, then $X_A \setminus C_p$ is a non-empty open set. By the definition of the product topology, this would imply that $X_A \setminus C_p$ contains an open set of the form

$$V := \cap_{\alpha \in A} \pi_\alpha^{-1}(V_\alpha) = V_A \times X_A \setminus A$$

where $A \subset A$ and $V_\alpha \in \tau_\alpha$ for all $\alpha \in A$. We will now show that no such $V$ can exist and hence $X_A = C_p$, i.e. $X_A$ is connected.

Define $\varphi : X_A \to X_A$ by $\varphi(y) = x$ where

$$x_\alpha = \begin{cases} y_\alpha & \text{if } \alpha \in A \\ p_\alpha & \text{if } \alpha \notin A. \end{cases}$$

If $\alpha \in A$, $\pi_\alpha \circ \varphi(y) = y_\alpha = \pi_\alpha(y)$ and if $\alpha \in A \setminus A$ then $\pi_\alpha \circ \varphi(y) = p_\alpha$ so that in every case $\pi_\alpha \circ \varphi : X_A \to X_A$ is continuous and therefore $\varphi$ is continuous. Since $X_A$ is a product of a finite number of connected spaces and so is connected and thus so is the continuous image, $\varphi(X_A) = X_A \times \{p_\alpha\}_{\alpha \in A \setminus A} \subset X_A$. Now $p \in \varphi(X_A)$ and $\varphi(X_A)$ is connected implies that $\varphi(X_A) \subset C$. On the other hand one easily sees that

$$\emptyset \neq V \cap \varphi(X_A) \subset V \cap C$$

contradicting the assumption that $V \subset C$.

Fig. 17.4. This picture illustrates why the connected component of $p$ in $X \times Y$ must contain all points of $X \times Y$.}\end{quote}
17.6 Compactness

**Definition 17.54.** The subset $A$ of a topological space $(X, \tau)$ is said to be compact if every open cover (Definition 17.18) of $A$ has a finite sub-cover, i.e. if $U$ is an open cover of $A$ there exists $U_0 \subseteq U$ such that $U_0$ is a cover of $A$. (We will write $A \subseteq X$ to denote that $A \subseteq X$ and $A$ is compact.) A subset $A \subseteq X$ is precompact if $\bar{A}$ is compact.

**Proposition 17.55.** Suppose that $K \subseteq X$ is a compact set and $F \subseteq K$ is a closed subset. Then $F$ is compact. If $\{K_i\}_{i=1}^n$ is a finite collections of compact subsets of $X$ then $K = \bigcup_{i=1}^n K_i$ is also a compact subset of $X$.

**Proof.** Let $U \subset \tau$ be an open cover of $F$, then $U \cup \{F^c\}$ is an open cover of $K$. The cover $U \cup \{F^c\}$ of $K$ has a finite subcover which we denote by $U_0 \cup \{F^c\}$ where $U_0 \subseteq U$. Since $F \cap F^c = \emptyset$, it follows that $U_0$ is the desired subcover of $F$. For the second assertion suppose $U \subset \tau$ is an open cover of $K$. Then $U$ covers each compact set $K_i$ and therefore there exists a finite subset $U_0 \subseteq U$ for each $i$ such that $K_i \subseteq \bigcup U_0$. Then $U_0 := \bigcup_{i=1}^n U_0$ is a finite cover of $K$. \hfill \blacksquare

**Exercise 17.14 (Suggested by Michael Gurvich).** Show by example that the intersection of two compact sets need not be compact. (This pathology disappears if one assumes the topology is Hausdorff, see Definition 17.2 below.)

**Exercise 17.15.** Suppose $f : X \to Y$ is continuous and $K \subseteq X$ is compact, then $f(K)$ is a compact subset of $Y$. Give an example of continuous map, $f : X \to Y$, and a compact subset $K$ of $X$ such that $f^{-1}(K)$ is not compact.

**Exercise 17.16 (Dini’s Theorem).** Let $X$ be a compact topological space and $f_n : X \to [0, \infty)$ be a sequence of continuous functions such that $f_n(x) \to 0$ as $n \to \infty$ for each $x \in X$. Show that in fact $f_n \to 0$ uniformly in $x$, i.e. $\sup_{x \in X} f_n(x) \to 0$ as $n \to \infty$. \textbf{Hint:} Given $\varepsilon > 0$, consider the open sets $V_n := \{x \in X : f_n(x) < \varepsilon\}$.  

**Definition 17.56.** A collection $\mathcal{F}$ of closed subsets of a topological space $(X, \tau)$ has the finite intersection property if $\bigcap_{\mathcal{F}_0} \neq \emptyset$ for all $\mathcal{F}_0 \subseteq \mathcal{F}$.

The notion of compactness may be expressed in terms of closed sets as follows.

**Proposition 17.57.** A topological space $X$ is compact iff every family of closed sets $\mathcal{F} \subseteq 2^X$ having the finite intersection property satisfies $\bigcap \mathcal{F} \neq \emptyset$.

**Proof.** ($\Rightarrow$) Suppose that $X$ is compact and $\mathcal{F} \subseteq 2^X$ is a collection of closed sets such that $\bigcap \mathcal{F} = \emptyset$. Let 

$$\mathcal{U} = \mathcal{F}^c := \{C^c : C \in \mathcal{F}\} \subseteq \tau,$$

then $\mathcal{U}$ is a cover of $X$ and hence has a finite subcover, $\mathcal{U}_0$. Let $\mathcal{F}_0 = \mathcal{U}_0^c \subseteq \mathcal{F}$, then $\bigcap \mathcal{F}_0 = \emptyset$ so that $\mathcal{F}$ does not have the finite intersection property. ($\Leftarrow$) If $X$ is not compact, there exists an open cover $\mathcal{U}$ of $X$ with no finite subcover. Let 

$$\mathcal{F} = \mathcal{U}^c := \{U^c : U \in \mathcal{U}\},$$

then $\mathcal{F}$ is a collection of closed sets with the finite intersection property while $\bigcap \mathcal{F} = \emptyset$. \hfill \blacksquare

**Exercise 17.17.** Let $(X, \tau)$ be a topological space. Show that $A \subseteq X$ is compact iff $(A, \tau_A)$ is a compact topological space.

**Metric Space Compactness Criteria**

Let $(X, d)$ be a metric space and for $x \in X$ and $\varepsilon > 0$ let 

$$B_x(\varepsilon) := B_x(\varepsilon) \setminus \{x\}$$

be the ball centered at $x$ of radius $\varepsilon > 0$ with $x$ deleted. Recall from Definition 17.29 that a point $x \in X$ is an accumulation point of a subset $E \subseteq X$ if $0 \neq E \cap V \setminus \{x\}$ for all open neighborhoods, $V$, of $x$. The proof of the following elementary lemma is left to the reader.

**Lemma 17.58.** Let $E \subseteq X$ be a subset of a metric space $(X, d)$. Then the following are equivalent:

1. $x \in E$ is an accumulation point of $E$.
2. $B_x(\varepsilon) \cap E \neq \emptyset$ for all $\varepsilon > 0$.
3. $B_x(\varepsilon) \cap E$ is a finite set for all $\varepsilon > 0$.
4. There exists $\{x_n\}_{n=1}^\infty \subseteq E \setminus \{x\}$ with $\lim_{n \to \infty} x_n = x$.

**Definition 17.59.** A metric space $(X, d)$ is $\varepsilon-$bounded ($\varepsilon > 0$) if there exists a finite cover of $X$ by balls of radius $\varepsilon$ and it is totally bounded if it is $\varepsilon-$bounded for all $\varepsilon > 0$.

**Theorem 17.60.** Let $(X, d)$ be a metric space. The following are equivalent.

(a) $X$ is compact.
(b) Every infinite subset of $X$ has an accumulation point.
(c) Every sequence $\{x_n\}_{n=1}^\infty \subseteq X$ has a convergent subsequence.
(d) $X$ is totally bounded and complete.

**Proof.** The proof will consist of showing that $a \Rightarrow b \Rightarrow c \Rightarrow d \Rightarrow a$.

$(a \Rightarrow b)$ We will show that not $b \Rightarrow not a$. Suppose there exists an infinite subset $E \subseteq X$ with no accumulation points. Then for all $x \in X$ there exists $\delta_x > 0$ such that $V_x := B_x(\delta_x)$ satisfies $(V_x \setminus \{x\}) \cap E = \emptyset$. Clearly
$\mathcal{V} = \{V_x\}_{x \in X}$ is a cover of $X$, yet $\mathcal{V}$ has no finite sub cover. Indeed, for each $x \in X$, $V_x \cap E \subseteq \{x\}$ and hence if $A \subseteq X$, $\cup_{x \in A} V_x$ can only contain a finite number of points from $E$ (namely $A \cap E$). Thus for any $A \subseteq X$, $E \nsubseteq \cup_{x \in A} V_x$ and in particular $X \neq \cup_{x \in A} V_x$. (See Figure 17.5)

\begin{figure}[h]
\centering
\includegraphics[width=0.5\textwidth]{fig17_5.png}
\caption{The construction of an open cover with no finite sub-cover.}
\end{figure}

$(b \Rightarrow c)$ Let $\{x_n\}_{n=1}^{\infty} \subseteq X$ be a sequence and $E := \{x_n : n \in \mathbb{N}\}$. If $\#(E) < \infty$, then $\{x_n\}_{n=1}^{\infty}$ has a subsequence $\{x_{n_k}\}_{k=1}^{\infty}$ which is constant and hence convergent. On the other hand if $\#(E) = \infty$ then by assumption $E$ has an accumulation point and hence by Lemma 17.58 $\{x_n\}_{n=1}^{\infty}$ has a convergent subsequence.

$(c \Rightarrow d)$ Suppose $\{x_n\}_{n=1}^{\infty} \subseteq X$ is a Cauchy sequence. By assumption there exists a subsequence $\{x_{n_k}\}_{k=1}^{\infty}$ which is convergent to some point $x \in X$. Since $\{x_n\}_{n=1}^{\infty}$ is Cauchy it follows that $x_n \to x$ as $n \to \infty$ showing $X$ is complete. We now show that $X$ is totally bounded. Let $\varepsilon > 0$ be given and choose an arbitrary point $x_1 \in X$. If possible choose $x_2 \in X$ such that $d(x_2, x_1) \geq \varepsilon$, then if possible choose $x_3 \in X$ such that $d(x_3, x_2) \geq \varepsilon$ and continue inductively choosing points $\{x_j\}_{j=1}^{\infty} \subseteq X$ such that $d(x_j, x_{j-1}) \geq \varepsilon$. (See Figure 17.6) This process must terminate, for otherwise we would produce a sequence $\{x_n\}_{n=1}^{\infty} \subseteq X$ which can have no convergent subsequences. Indeed, the $x_n$ have been chosen so that $d(x_n, x_m) \geq \varepsilon > 0$ for every $m \neq n$ and hence no subsequence of $\{x_n\}_{n=1}^{\infty}$ can be Cauchy.

$(d \Rightarrow a)$ For sake of contradiction, assume there exists an open cover $\mathcal{V} = \{V_a\}_{a \in A}$ of $X$ with no finite subcover. Since $X$ is totally bounded for each $n \in \mathbb{N}$ there exists $A_n \subseteq X$ such that

\[ X = \bigcup_{x \in A_n} B_x(1/n) \subseteq \bigcup_{x \in A_n} C_x(1/n). \]

Choose $x_1 \in A_1$ such that no finite subset of $\mathcal{V}$ covers $K_1 := C_{x_1}(1)$. Since $K_1 = \cup_{x \in A_1} K_1 \cap C_{x_1}(1/2)$, there exists $x_2 \in A_2$ such that $K_2 := K_1 \cap C_{x_2}(1/2)$ cannot be covered by a finite subset of $\mathcal{V}$, see Figure 17.7. Continuing this way inductively, we construct sets $K_n = K_{n-1} \cap C_{x_n}(1/n)$ with $x_n \in A_n$ such that no $K_n$ can be covered by a finite subset of $\mathcal{V}$. Now choose $y_n \in K_n$ for each $n$. Since $\{K_n\}_{n=1}^{\infty}$ is a decreasing sequence of closed sets such that $\text{diam}(K_n) \leq 2/n$, it follows that $\{y_n\}$ is a Cauchy and hence convergent with

\[ y = \lim_{n \to \infty} y_n \in \cap_{n=1}^{\infty} K_n. \]

Since $\mathcal{V}$ is a cover of $X$, there exists $V \in \mathcal{V}$ such that $y \in V$. Since $K_n \downarrow \{y\}$ and $\text{diam}(K_n) \to 0$, it now follows that $K_n \subseteq V$ for some $n$ large. But this violates the assertion that $K_n$ can not be covered by a finite subset of $\mathcal{V}$.

\includegraphics[width=0.5\textwidth]{fig17_6.png}
\caption{Constructing a set without an accumulation point.}
\end{figure}

\begin{figure}[h]
\centering
\includegraphics[width=0.5\textwidth]{fig17_7.png}
\caption{Nested Sequence of cubes.}
\end{figure}

Corollary 17.61. Any compact metric space $(X,d)$ is second countable and hence also separable by Exercise 17.11. (See Example 25.23 below for an example of a compact topological space which is not separable.)

Proof. To each integer $n$, there exists $A_n \subseteq X$ such that $X = \cup_{x \in A_n} B(x,1/n)$. The collection of open balls,
forms a countable basis for the metric topology on $X$. To check this, suppose that $x_0 \in X$ and $\varepsilon > 0$ are given and choose $n \in \mathbb{N}$ such that $1/n < \varepsilon/2$ and $x \in A_n$ such that $d(x_0, x) < 1/n$. Then $B(x, 1/n) \subset B(x_0, \varepsilon)$ because for $y \in B(x, 1/n)$,
\[
d(y, x_0) \leq d(y, x) + d(x, x_0) < 2/n < \varepsilon.
\]

\[\square\]

**Corollary 17.62.** The compact subsets of $\mathbb{R}^n$ are the closed and bounded sets.

**Proof.** This is a consequence of Theorem 50.2 and Theorem 17.60. Here is another proof. If $K$ is closed and bounded then $K$ is complete (being the closed subset of a complete space) and $K$ is contained in $[-M, M]^n$ for some positive integer $M$. For $\delta > 0$, let
\[
A_\delta = \delta \mathbb{Z}^n \cap [-M, M]^n := \{\delta x : x \in \mathbb{Z}^n \text{ and } |x_i| \leq M \text{ for } i = 1, 2, \ldots, n\}.
\]
We will show, by choosing $\delta > 0$ sufficiently small, that
\[
K \subset [-M, M]^n \subset \bigcup_{x \in A_\delta} B(x, \varepsilon) \tag{17.15}
\]
which shows that $K$ is totally bounded. Hence by Theorem 17.60, $K$ is compact. Suppose that $y \in [-M, M]^n$, then there exists $x \in A_\delta$ such that $|y_i - x_i| \leq \delta$ for $i = 1, 2, \ldots, n$. Hence
\[
d^2(x, y) = \sum_{i=1}^{n} (y_i - x_i)^2 \leq n \delta^2
\]
which shows that $d(x, y) \leq \sqrt{n} \delta$. Hence if choose $\delta < \varepsilon/\sqrt{n}$ we have shows that $d(x, y) < \varepsilon$, i.e. Eq. (17.15) holds. \[\square\]

**Example 17.63.** Let $X = \ell^p(\mathbb{N})$ with $p \in [1, \infty)$ and $\mu \in \ell^p(\mathbb{N})$ such that $\mu(k) \geq 0$ for all $k \in \mathbb{N}$. The set
\[
K := \{x \in X : |x(k)| \leq \mu(k) \text{ for all } k \in \mathbb{N}\}
\]
is compact. To prove this, let $\{x_n\}_{n=1}^{\infty} \subset K$ be a sequence. By compactness of closed bounded sets in $\mathbb{C}$, for each $k \in \mathbb{N}$ there is a subsequence of $\{x_n(k)\}_{n=1}^{\infty} \subset \mathbb{C}$ which is convergent. By Cantor’s diagonalization trick, we may choose a subsequence $\{y_n\}_{n=1}^{\infty}$ of $\{x_n\}_{n=1}^{\infty}$ such that $y(k) := \lim_{n \to \infty} y_n(k)$ exists for all $k \in \mathbb{N}$.

$k \in \mathbb{N}$: Since $|y_n(k)| \leq \mu(k)$ for all $n$ it follows that $|y(k)| \leq \mu(k)$, i.e. $y \in K$. Finally
\[
\lim_{n \to \infty} \|y - y_n\|_p = \lim_{n \to \infty} \sum_{k=1}^{\infty} |y(k) - y_n(k)|^p = \sum_{k=1}^{\infty} \lim_{n \to \infty} |y(k) - y_n(k)|^p = 0
\]
wherein we have used the Dominated convergence theorem. (Note
\[
|y(k) - y_n(k)|^p \leq 2^p \mu^p(k)
\]
and $\mu^p$ is summable.) Therefore $y_n \to y$ and we are done.

Alternatively, we can prove $K$ is compact by showing that $K$ is closed and totally bounded. It is simple to show $K$ is closed, for if $\{x_n\}_{n=1}^{\infty} \subset K$ is a convergent sequence in $X$, $x := \lim_{n \to \infty} x_n$, then
\[
|x(k)| \leq \lim_{n \to \infty} |x_n(k)| \leq \mu(k) \quad \forall k \in \mathbb{N}.
\]
This shows that $x \in K$ and hence $K$ is closed. To see that $K$ is totally bounded, let $\varepsilon > 0$ and choose $N$ such that $\left(\sum_{k=N+1}^{\infty} |\mu(k)|^p\right)^{1/p} < \varepsilon$. Since
\[
\prod_{k=1}^{N} C_{\mu(k)}(0) \subset \mathbb{C}^N
\]
is compact, it is compact. Therefore there exists a finite subset $A \subset \prod_{k=1}^{N} C_{\mu(k)}(0)$ such that
\[
\prod_{k=1}^{N} C_{\mu(k)}(0) \subset \bigcup_{z \in A} B_z(\varepsilon)
\]
where $B_z^N(\varepsilon)$ is the open ball centered at $z \in \mathbb{C}^N$ relative to the $\ell^p(\{1, 2, 3, \ldots, N\})$-norm. For each $z \in A$, let $\tilde{z} \in X$ be defined by $\tilde{z}(k) = z(k)$ if $k \leq N$ and $\tilde{z}(k) = 0$ for $k \geq N + 1$. I now claim that
\[
K \subset \bigcup_{z \in A} B_2(\tilde{z}) \tag{17.16}
\]
which, when verified, shows $K$ is totally bounded. To verify Eq. (17.16), let $x \in K$ and write $x = u + v$ where $u(k) = x(k)$ for $k \leq N$ and $u(k) = 0$ for $k < N$. Then by construction $u \in B_2(\varepsilon)$ for some $\varepsilon \in A$ and

\footnote{The argument is as follows. Let $\{n_j^1\}_{j=1}^{\infty}$ be a subsequence of $\mathbb{N} = \{n\}_{n=1}^{\infty}$ such that $\lim_{j \to \infty} x_{n_j^1}(1)$ exists. Now choose a subsequence $\{n_j^2\}_{j=1}^{\infty}$ of $\{n_j^1\}_{j=1}^{\infty}$ such that $\lim_{j \to \infty} x_{n_j^2}(2)$ exists and similarly $\{n_j^3\}_{j=1}^{\infty}$ of $\{n_j^2\}_{j=1}^{\infty}$ such that $\lim_{j \to \infty} x_{n_j^3}(3)$ exists. Continue on this way inductively to get
\[
\{n\}_{n=1}^{\infty} \supset \{n^1_j\}_{j=1}^{\infty} \supset \{n^2_j\}_{j=1}^{\infty} \supset \{n^3_j\}_{j=1}^{\infty} \supset \ldots
\]
such that $\lim_{j \to \infty} x_{n_j^k}(k)$ exists for all $k \in \mathbb{N}$. Let $m_j := n_j^k$ so that eventually $\{m_j\}_{j=1}^{\infty}$ is a subsequence of $\{n_j^k\}_{j=1}^{\infty}$ for all $k$. Therefore, we may take $y_j := x_{m_j}$.}
\[
\|v\|_p \leq \left( \sum_{k=N+1}^{\infty} |\mu(k)|^p \right)^{1/p} < \varepsilon.
\]

So we have
\[
\|x - \tilde{z}\|_p = \|u + v - \tilde{z}\|_p \leq \|u - \tilde{z}\|_p + \|v\|_p < 2\varepsilon.
\]

**Exercise 17.18 (Extreme value theorem).** Let \((X, \tau)\) be a compact topological space and \(f : X \to \mathbb{R}\) be a continuous function. Show \(-\infty < \inf f \leq \sup f < \infty\) and there exists \(a, b \in X\) such that \(f(a) = \inf f\) and \(f(b) = \sup f\). Hint: use Exercise 17.15 and Corollary 17.62.

**Exercise 17.19 (Uniform Continuity).** Let \((X, \rho)\) be a compact metric space, \((Y, \rho)\) be a metric space and \(f : X \to Y\) be a continuous function. Show that \(f\) is uniformly continuous, i.e. if \(\varepsilon > 0\) there exists \(\delta > 0\) such that \(\rho(f(y), f(x)) < \varepsilon\) if \(x, y \in X\) with \(d(x, y) < \delta\). Hint: you could follow the argument in the proof of Theorem 50.2.

**Definition 17.64.** Let \(L\) be a vector space. We say that two norms, \(\|\cdot\|\) and \(\|\cdot\|_2\), on \(L\) are equivalent if there exists constants \(\alpha, \beta \in (0, \infty)\) such that
\[
\alpha \|f\| \leq \|f\| \leq \beta \|f\| \quad \text{for all } f \in L.
\]

**Theorem 17.65.** Let \(L\) be a finite dimensional vector space. Then any two norms \(\|\cdot\|\) and \(\|\cdot\|_2\) on \(L\) are equivalent. (This is typically not true for norms on infinite dimensional spaces, see for example Exercise 14.6.)

**Proof.** Let \(\{f_i\}_{i=1}^n\) be a basis for \(L\) and define a new norm on \(L\) by
\[
\left\| \sum_{i=1}^n a_i f_i \right\|_2 := \left( \sum_{i=1}^n |a_i|^2 \right)^{1/2} \quad \text{for } a_i \in \mathbb{F}.
\]

By the triangle inequality for the norm \(\|\cdot\|\), we find
\[
\left| \sum_{i=1}^n a_i f_i \right| \leq \sum_{i=1}^n |a_i| |f_i| \leq \left\| \sum_{i=1}^n |a_i|^2 \right\|^{1/2} \left\| \sum_{i=1}^n |a_i|^2 \right\| \leq M \left\| \sum_{i=1}^n a_i f_i \right\|_2
\]
where \(M = \sqrt{\sum_{i=1}^n |f_i|^2}\). Thus we have
\[
\|f\| \leq \alpha \|f\| \quad \text{and} \quad \|f\| \leq \beta \|f\| \quad \text{for all } f \in L.
\]

\[|f| \leq M \|f\|_2\]

for all \(f \in L\) and this inequality shows that \(|\cdot|\) is continuous relative to \(\|\cdot\|_2\). Since the normed space \((L, \|\cdot\|_2)\) is homeomorphic and isomorphic to \(\mathbb{F}^n\) with the standard euclidean norm, the closed bounded set, \(S := \{f \in L : \|f\|_2 = 1\} \subset L\), is a compact subset of \(L\) relative to \(\|\cdot\|_2\). Therefore by Exercise 17.18 there exists \(f_0 \in S\) such that
\[
m = \inf \{ |f| : f \in S \} = |f_0| > 0.
\]

Hence given \(0 \neq f \in L\), then \(\frac{f}{\|f\|_2} \in S\) so that
\[
m \leq \frac{|f|}{\|f\|_2} = \frac{1}{\|f\|_2} \quad \text{or equivalently} \quad \|f\|_2 \leq \frac{1}{m} |f|.
\]

This shows that \(|\cdot|\) and \(\|\cdot\|_2\) are equivalent norms. Similarly one shows that \(\|\cdot\|\) and \(\|\cdot\|_2\) are equivalent and hence so are \(|\cdot|\) and \(\|\cdot\|\).

**Corollary 17.66.** If \((L, \|\cdot\|)\) is a finite dimensional normed space, then \(A \subset L\) is compact iff \(A\) is closed and bounded relative to the given norm, \(\|\cdot\|\).

**Corollary 17.67.** Every finite dimensional normed vector space \((L, \|\cdot\|)\) is complete. In particular any finite dimensional subspace of a normed vector space is automatically closed.

**Proof.** If \(\{f_n\}_{n=1}^\infty \subset L\) is a Cauchy sequence, then \(\{f_n\}_{n=1}^\infty\) is bounded and hence has a convergent subsequence, \(g_k = f_{n_k}\), by Corollary 17.66. It is now routine to show \(\lim_{n \to \infty} f_n = f = \lim_{k \to \infty} g_k\).

**Theorem 17.68.** Suppose that \((X, \|\cdot\|)\) is a normed vector in which the unit ball, \(V := B_0(1)\), is precompact. Then \(\dim X \subset X\).

**Proof.** Since \(V\) is compact, we may choose \(A \subset X\) such that
\[
\bar{V} \subset \bigcup_{x \in A} \left( x + \frac{1}{2} \delta x \right)
\]
where, for any \(\delta > 0\)
\[
\delta V := \{ \delta x : x \in V \} = B_0(\delta).
\]

Let \(Y := \text{span}(A)\), then Eq. (17.17) implies,
Indeed, if Eq. (17.18) holds, then

\[ V \subset \tilde{V} \subset Y + \frac{1}{2}V. \]

Multiplying this equation by \( \frac{1}{2} \) then shows

\[ \frac{1}{2}V \subset \frac{1}{2}Y + \frac{1}{4}V = Y + \frac{1}{4}V \]

and hence

\[ V \subset Y + \frac{1}{2} \sqrt{2} V \subset Y + Y + \frac{1}{4}V = Y + \frac{1}{4}V. \]

Continuing this way inductively then shows that

\[ V \subset Y + \frac{1}{2^n}V \text{ for all } n \in \mathbb{N}. \]  

(17.18)

Indeed, if Eq. (17.18) holds, then

\[ V \subset Y + \frac{1}{2^n}V \subset Y + \frac{1}{2^n} \left( Y + \frac{1}{2^n}V \right) = Y + \frac{1}{2^n+1}V. \]

Hence if \( x \in V \), there exists \( y_n \in Y \) and \( z_n \in B_0(2^{-n}) \) such that \( y_n + z_n \to x \).

Since \( \lim_{n \to \infty} z_n = 0 \), it follows that \( x = \lim_{n \to \infty} y_n \in \tilde{Y} \). Since \( \dim(Y) \leq \#(A) < \infty \), Corollary 17.67 implies \( Y = \tilde{Y} \) and so we have shown that \( V \subset Y \).

Since for any \( x \in X, \frac{1}{2^n}x \in V \subset Y \), we have \( x \in Y \) for all \( x \in X \), i.e. \( X = Y \).

**Exercise 17.20.** Suppose \((Y, \|\cdot\|_Y)\) is a normed space and \((X, \|\cdot\|_X)\) is a finite dimensional norm space. Show every linear transformation \(T : X \to Y\) is necessarily bounded.

### 17.7 Exercises

#### 17.7.1 General Topological Space Problems

**Exercise 17.21.** Let \( V \) be an open subset of \( \mathbb{R} \). Show \( V \) may be written as a disjoint union of open intervals \( J_n = (a_n, b_n) \), where \( a_n, b_n \in \mathbb{R} \cup \{ \pm \infty \} \) for \( n = 1, 2, \ldots < N \) with \( N = \infty \) possible.

**Exercise 17.22.** Let \((X, \tau)\) and \((Y, \tau')\) be a topological spaces, \( f : X \to Y \) be a function, \( U \) be an open cover of \( X \) and \( \{ F_j \}_{j=1}^n \) be a finite cover of \( X \) by closed sets.

1. If \( A \subset X \) is any set and \( f : X \to Y \) is \((\tau, \tau')\) – continuous then \( f|_A : A \to Y \) is \((\tau_A, \tau')\) – continuous.

2. Show \( f : X \to Y \) is \((\tau, \tau')\) – continuous iff \( f|_U : U \to Y \) is \((\tau_U, \tau')\) – continuous for all \( U \in \mathcal{U} \).

3. Show \( f : X \to Y \) is \((\tau, \tau')\) – continuous iff \( f|_{F_j} : F_j \to Y \) is \((\tau_{F_j}, \tau')\) – continuous for all \( j = 1, 2, \ldots, n \).

**Exercise 17.23.** Suppose that \( X \) is a set, \{\((Y_\alpha, \tau_\alpha) : \alpha \in A\)\} is a family of topological spaces and \( f_\alpha : X \to Y_\alpha \) is given function for all \( \alpha \in A \). Assuming that \( S_\alpha \subset \tau_\alpha \) is a sub-base for the topology \( \tau_\alpha \) for each \( \alpha \in A \), show \( S := \bigcup_{\alpha \in A} f_\alpha^{-1}(S_\alpha) \) is a sub-base for the topology \( \tau := \tau(f_\alpha : \alpha \in A) \).

### 17.7.2 Connectedness Problems

**Exercise 17.24.** Show any non-trivial interval in \( \mathbb{Q} \) is disconnected.

**Exercise 17.25.** Suppose \( a < b \) and \( f : (a, b) \to \mathbb{R} \) is a non-decreasing function. Show if \( f \) satisfies the intermediate value property (see Theorem 17.50), then \( f \) is continuous.

**Exercise 17.26.** Suppose \(-\infty < a < b \leq \infty \) and \( f : (a, b) \to \mathbb{R} \) is a strictly increasing continuous function. By Lemma 17.46 \( f((a, b)) \) is an interval and since \( f \) is strictly increasing it must of the form \([c, d] \) for some \( c \in \mathbb{R} \) and \( d \in \mathbb{R} \) with \( c < d \). Show the inverse function \( f^{-1} : [c, d] \to (a, b) \) is continuous and is strictly increasing. In particular if \( n \in \mathbb{N} \), apply this result to \( f(x) = x^n \) for \( x \in (0, \infty) \) to construct the positive \( n^{\text{th}} \) root of a real number. Compare with Exercise 17.13.

**Exercise 17.27.** Prove item 1. of Proposition 17.52. **Hint:** show \( X \) is not connected implies \( X \) is not path connected.

**Exercise 17.28.** Prove item 2. of Proposition 17.52. **Hint:** fix \( x_0 \in X \) and let \( W \) denote the set of \( x \in X \) such that there exists \( \sigma \in C([0, 1], X) \) satisfying \( \sigma(0) = x_0 \) and \( \sigma(1) = x \). Then show \( W \) is both open and closed.

**Exercise 17.29.** Prove item 3. of Proposition 17.52.

**Exercise 17.30.** Let

\[ X := \{(x, y) \in \mathbb{R}^2 : y = \sin(x^{-1})\} \cup \{(0, 0)\} \]

equipped with the relative topology induced from the standard topology on \( \mathbb{R}^2 \). Show \( X \) is connected but not path connected.
17.7.3 Metric Spaces as Topological Spaces

**Definition 17.69.** Two metrics \( d \) and \( \rho \) on a set \( X \) are said to be **equivalent** if there exists a constant \( c \in (0, \infty) \) such that \( c^{-1} \rho \leq d \leq c \rho \).

**Exercise 17.31.** Suppose that \( d \) and \( \rho \) are two metrics on \( X \).
1. Show \( \tau_d = \tau_\rho \) if \( d \) and \( \rho \) are equivalent.
2. Show by example that it is possible for \( \tau_d = \tau_\rho \) even though \( d \) and \( \rho \) are inequivalent.

**Exercise 17.32.** Let \( (X_i, d_i) \) for \( i = 1, \ldots, n \) be a finite collection of metric spaces and for \( 1 \leq p \leq \infty \) and \( x = (x_1, x_2, \ldots, x_n) \) and \( y = (y_1, \ldots, y_n) \) in \( X := \prod_{i=1}^n X_i \), let
\[
\rho_p(x, y) = \left( \sum_{i=1}^n (d_i(x_i, y_i))^p \right)^{1/p} \text{ if } p \neq \infty
\]
\[
\max_i d_i(x_i, y_i) \text{ if } p = \infty.
\]
1. Show \((X, \rho_p)\) is a metric space for \( p \in [1, \infty] \). **Hint:** Minkowski’s inequality.
2. Show for any \( p, q \in [1, \infty] \), the metrics \( \rho_p \) and \( \rho_q \) are equivalent. **Hint:** This can be done with explicit estimates or you could use Theorem 17.65 below.

**Notation 17.70.** Let \( X \) be a set and \( p := \{p_n\}_{n=0}^\infty \) be a family of semi-metrics on \( X \), i.e. \( p_n : X \times X \to [0, \infty) \) are functions satisfying the assumptions of metric except for the assertion that \( p_n(x, y) = 0 \) implies \( x = y \). Further assume that \( p_n(x, y) \leq p_{n+1}(x, y) \) for all \( n \) and if \( p_n(x, y) = 0 \) for all \( n \in \mathbb{N} \) then \( x = y \). Given \( n \in \mathbb{N} \) and \( x, y \in X \) let
\[
B_n(x, \varepsilon) := \{ y \in X : p_n(x, y) < \varepsilon \}.
\]
We will write \( \tau(p) \) form the smallest topology on \( X \) such that \( p_n(x, \cdot) : X \to [0, \infty) \) is continuous for all \( n \in \mathbb{N} \) and \( x \in X \), i.e. \( \tau(p) := \tau(p_n(x, \cdot) : n \in \mathbb{N} \) and \( x \in X \).

**Exercise 17.33.** Using Notation 17.70 show that collection of balls,
\[
\mathcal{B} := \{ B_n(x, \varepsilon) : n \in \mathbb{N}, x \in X \text{ and } \varepsilon > 0 \}.
\]
forms a base for the topology \( \tau(p) \). **Hint:** Use Exercise 17.23 to show \( \mathcal{B} \) is a sub-base for the topology \( \tau(p) \) and then use Exercise 17.2 to show \( \mathcal{B} \) is in fact a base for the topology \( \tau(p) \).

**Exercise 17.34 (A minor variant of Exercise 13.12).** Let \( p_n \) be as in Notation 17.70 and
\[
d(x, y) := \sum_{n=0}^\infty 2^{-n} \frac{p_n(x, y)}{1 + p_n(x, y)}.
\]
Show \( d \) is a metric on \( X \) and \( \tau_d = \tau(p) \). Conclude that a sequence \( \{x_k\}_{k=1}^\infty \subset X \) converges to \( x \in X \) iff
\[
\lim_{k \to \infty} p_n(x_k, x) = 0 \text{ for all } n \in \mathbb{N}.
\]

**Exercise 17.35.** Let \( \{ (X_n, d_n) \}_{n=1}^\infty \) be a sequence of metric spaces, \( X := \prod_{n=1}^\infty X_n \), and for \( x = (x(n))_{n=1}^\infty \) and \( y = (y(n))_{n=1}^\infty \) in \( X \) let
\[
d(x, y) = \sum_{n=1}^\infty 2^{-n} \frac{d_n(x(n), y(n))}{1 + d_n(x(n), y(n))}.
\]
(See Exercise 13.12) Moreover, let \( \pi_n : X \to X_n \) be the projection maps, show
\[
\tau_d = \otimes_{n=1}^\infty \tau_{d_n} := \tau(\{ \pi_n : n \in \mathbb{N} \}).
\]
That is show the \( d \) metric topology is the same as the product topology on \( X \). **Suggestions:** 1) show \( \pi_n \) is \( \tau_d \) continuous for each \( n \) and 2) show for each \( x \in X \) that \( d(x, \cdot) \) is \( \otimes_{n=1}^\infty \tau_{d_n} \) - continuous. For the second assertion notice that \( d(x, \cdot) = \sum_{n=1}^\infty f_n \) where \( f_n = 2^{-n} \left( \frac{d_n(x(n), \cdot)}{1 + d_n(x(n), \cdot)} \right) \circ \pi_n \).

17.7.4 Compactness Problems

**Exercise 17.36 (Tychonoff’s Theorem for Compact Metric Spaces).** Let us continue the Notation used in Exercise 13.12. Further assume that the spaces \( X_n \) are compact for all \( n \). Show (without using Theorem 24.16 below) that \( (X, d) \) is compact. **Hint:** Either use Cantor’s method to show every sequence \( \{x_m\}_{m=1}^\infty \subset X \) has a convergent subsequence or alternatively show \( (X, d) \) is complete and totally bounded. (Compare with Example 17.63 and see Theorem 24.16 below for the general version of this theorem.)
$L^p$ Spaces and Geometric Measures
The proof is essentially identical to the proof of Theorem 4.29.

When \( p = \infty \), let

\[
\|f\|_\infty = \inf \{a \geq 0 : \mu(\{f > a\}) = 0\}
\]

For \( 0 < p \leq \infty \), let

\[
L^p(X, \mathcal{M}, \mu) = \{f : X \to \mathbb{C} : f \text{ is measurable and } \|f\|_p < \infty\} / \sim
\]

where \( f \sim g \) iff \( f = g \) a.e. Notice that \( \|f - g\|_p = 0 \) iff \( f \sim g \) and if \( f \sim g \) then \( \|f\|_p = \|g\|_p \). In general we will (by abuse of notation) use \( f \) to denote both the function \( f \) and the equivalence class containing \( f \).

**Remark 18.1.** Suppose that \( \|f\|_\infty \leq M \), then for all \( a > M \), \( \mu(|f| > a) = 0 \) and therefore \( \mu(|f| > M) = \lim_{n \to \infty} \mu(|f| > M + 1/n) = 0 \), i.e. \( |f(x)| \leq M \) for \( \mu \)-a.e. \( x \). Conversely, if \( |f| \leq M \) a.e. and \( a > M \) then \( \mu(|f| > a) = 0 \) and hence \( \|f\|_\infty \leq M \). This leads to the identity:

\[
\|f\|_\infty = \inf \{a \geq 0 : \mu(\{|f| > a\}) = 0\}.
\]

The next theorem is a generalization Theorem 4.29 to general integrals and the proof is essentially identical to the proof of Theorem 4.29.

**Theorem 18.2 (Hölder’s inequality).** Suppose that \( 1 \leq p \leq \infty \) and \( q := \frac{p}{p-1} \), or equivalently \( p^{-1} + q^{-1} = 1 \). If \( f \) and \( g \) are measurable functions then

\[
\|fg\|_1 \leq \|f\|_p \cdot \|g\|_q.
\]

Assuming \( p \in (1, \infty) \) and \( \|f\|_p \cdot \|g\|_q < \infty \), equality holds in Eq. (18.3) iff \( |f|^p \) and \( |g|^q \) are linearly dependent as elements of \( L^1 \) which happens iff

\[
|g|^q \|f\|_p^p = \|g\|_q^q |f|^p \text{ a.e.}
\]

**Proof.** The cases where \( \|f\|_q = 0 \) or \( \|g\|_p = 0 \) or \( \|f\|_q = \infty \) or \( \|g\|_p = \infty \) are easy to deal with and are left to the reader. So we will now assume that \( 0 < \|f\|_q, \|g\|_p < \infty \). Let \( s = |f|/\|f\|_p \) and \( t = |g|/\|g\|_q \) then Lemma 4.28 implies

\[
\frac{|fg|}{\|fg\|_1} \leq \frac{1}{p} \|f\|_p + \frac{1}{q} \|g\|_q
\]

with equality iff \( |g|/\|g\|_q = |f|^{p-1}/\|f\|_p^{(p-1)} = |f|^{p/q} / \|f\|_p^{p/q} \), i.e. \( |g|^q \|f\|_p = \|g\|_q^q |f|^p \). Integrating Eq. (18.5) implies

\[
\frac{\|fg\|_1}{\|fg\|_p} \leq \frac{1}{p} + \frac{1}{q} = 1
\]

with equality iff Eq. (18.4) holds. The proof is finished since it is easily checked that equality holds in Eq. (18.3) when \( \|f\|^p = c |g|^q \) or \( |g|^q = c |f|^p \) for some constant \( c \).

The following corollary is an easy extension of Hölder’s inequality.

**Corollary 18.3.** Suppose that \( f_i : X \to \mathbb{C} \) are measurable functions for \( i = 1, \ldots, n \) and \( p_1, \ldots, p_n \) and \( r \) are positive numbers such that \( \sum_{i=1}^{n} p_i \cdot r^{-1} = 1 \), then

\[
\left\| \prod_{i=1}^{n} f_i \right\|_r \leq \prod_{i=1}^{n} \left\| f_i \right\|_{p_i} \quad \text{where } \sum_{i=1}^{n} p_i \cdot r^{-1} = r^{-1}.
\]

**Proof.** To prove this inequality, start with \( n = 2, \) then for any \( p \in [1, \infty), \)

\[
\|fg\|_r = \int_X |f|^r |g|^r \, d\mu \leq \|f^r\|_p \|g^r\|_{p^*},
\]

where \( p^* = \frac{p}{p-1} \) is the conjugate exponent. Let \( p_1 = p r \) and \( p_2 = p^* r \) so that \( p_1^{-1} + p_2^{-1} = r^{-1} \) as desired. Then the previous equation states that

\[
\|fg\|_r \leq \|f\|_{p_1} \cdot \|g\|_{p_2}
\]

as desired. The general case is now proved by induction. Indeed,

\[
\left\| \prod_{i=1}^{n+1} f_i \right\|_r = \left\| \prod_{i=1}^{n} f_i \cdot f_{n+1} \right\|_r \leq \left\| \prod_{i=1}^{n} f_i \right\|_{p_n} \cdot \left\| f_{n+1} \right\|_{p_{n+1}}
\]
where \( q^{-1} + p_{n+1}^{-1} = r^{-1} \). Since \( \sum_{i=1}^{n} p_i^{-1} = q^{-1} \), we may now use the induction hypothesis to conclude
\[
\prod_{i=1}^{n} f_i \leq \prod_{i=1}^{n} \|f_i\|_{p_i},
\]
which combined with the previous displayed equation proves the generalized form of Hölder’s inequality.

**Theorem 18.4 (Minkowski’s Inequality).** If \( 1 \leq p \leq \infty \) and \( f, g \in L^p \) then
\[
\|f + g\|_p \leq \|f\|_p + \|g\|_p. \tag{18.6}
\]
Moreover, assuming \( f \) and \( g \) are not identically zero, equality holds in Eq. \( \text{(18.6)} \) iff \( \text{sgn}(f) \equiv \text{sgn}(g) \) a.e. (see the notation in Definition \( \text{4.36} \)) when \( p = 1 \) and \( f = cg \) a.e. for some \( c > 0 \) for \( p \in (1, \infty) \).

**Proof.** When \( p = \infty \), \( \|f\|_\infty \) a.e. and \( \|g\|_\infty \) a.e. so that \( \|f + g\| \leq \|f\|_\infty + \|g\|_\infty \) a.e. and therefore
\[
\|f + g\|_\infty \leq \|f\|_\infty + \|g\|_\infty.
\]
When \( p < \infty \),
\[
\|f + g\|_p \leq (2 \max(\|f\|_\infty, \|g\|_\infty))^p = 2^p \max(\|f\|^p_\infty, \|g\|^p_\infty) \leq 2^p (\|f\|^p + \|g\|^p) \leq 2^p (\|f\|^p_\infty + \|g\|^p_\infty) < \infty.
\]
In case \( p = 1 \),
\[
\|f + g\|_1 = \int_X |f + g| d\mu \leq \int_X |f| d\mu + \int_X |g| d\mu
\]
with equality iff \( |f| + |g| = |f + g| \) a.e. which happens iff \( \text{sgn}(f) \equiv \text{sgn}(g) \). In case \( p \in (1, \infty) \), we may assume \( \|f + g\|_p, \|f\|_p \) and \( \|g\|_p \) are all positive since otherwise the theorem is easily verified. Now
\[
\|f + g\|^p = \|f + g\|^{p-1} (\|f + g\|) \leq (\|f\| + \|g\|)(\|f + g\|^{p-1})
\]
with equality iff \( \text{sgn}(f) \equiv \text{sgn}(g) \). Integrating this equation and applying Hölder’s inequality with \( q = p/(p - 1) \) gives
\[
\int_X |f + g|^p d\mu \leq \int_X |f| + g|^{p-1} d\mu + \int_X |g| + f|^{p-1} d\mu \leq \left( \|f\|_p + \|g\|_p \right) \|f + g\|^{p-1}_q \tag{18.7}
\]
with equality iff
\[
\frac{\|f\|^p}{\|f\|_p} = \frac{|f|^p}{\|f\|^p} \frac{|f + g|^p}{\|f + g\|_p} \frac{|g|^p}{\|g\|^p}
\]
and
\[
\text{sgn}(f) \equiv \text{sgn}(g) \quad \text{and} \quad \frac{|f|^p}{\|f\|^p} = \frac{|f + g|^p}{\|f + g\|_p} \frac{|g|^p}{\|g\|^p} \text{ a.e.} \tag{18.8}
\]
Therefore
\[
\|f + g\|^p_\infty = \int_X (|f + g|^p_\infty)^q d\mu = \int_X |f + g|^p d\mu. \tag{18.9}
\]
Combining Eqs. \( \text{(18.7)} \) and \( \text{(18.9)} \) implies
\[
\|f + g\|_p^p \leq \|f\|_p^p \|f\|_p^{p/q} + \|g\|_p^p \|g\|_p^{p/q} \tag{18.10}
\]
with equality iff Eq. \( \text{(18.8)} \) holds which happens iff \( f = cg \) a.e. with \( c > 0 \). Solving for \( \|f + g\|_p \) in Eq. \( \text{(18.10)} \) gives Eq. \( \text{(18.6)} \).

The next theorem gives another example of using Hölder’s inequality

**Theorem 18.5.** Suppose that \( (X, \mathcal{M}, \mu) \) and \( (Y, \mathcal{N}, \nu) \) be \( \sigma \) – finite measure spaces, \( p \in [1, \infty] \), \( q = p/(p - 1) \) and \( k : X \times Y \to \mathbb{C} \) be a \( \mathcal{M} \otimes \mathcal{N} \) – measurable function. Assume there are finite constants \( C_1 \) and \( C_2 \) such that
\[
\int_X |k(x, y)| d\mu(x) \leq C_1 \text{ for } \nu \text{ a.e. } y \quad \text{and} \quad \int_Y |k(x, y)| d\nu(y) \leq C_2 \text{ for } \mu \text{ a.e. } x.
\]
If \( f \in L^p(\nu) \), then
\[
\int_Y |k(x, y)| f(x) (y) d\nu(y) < \infty \text{ for } \mu - \text{a.e. } x,
\]
x \to \( Kf(x) := \int_Y k(x, y) f(y) d\nu(y) \in L^p(\mu) \) and
\[
\|Kf\|_{L^p(\mu)} \leq C_1^{1/p} C_2^{1/q} \|f\|_{L^p(\nu)}. \tag{18.11}
\]

**Proof.** Suppose \( p \in (1, \infty) \) to begin with and let \( q = p/(p - 1) \), then by Hölder’s inequality,
\[
\int_Y |k(x, y)| f(x) |y) d\nu(y) = \int_Y |k(x, y)|^{1/q} |y) f(x) |y) d\nu(y)
\leq \left[ \int_Y |k(x, y)| d\nu(y) \right]^{1/q} \left[ \int_Y |k(x, y)| f(y)^p d\nu(y) \right]^{1/p}
\leq C_2^{1/q} \left[ \int_Y |k(x, y)| f(y)^p d\nu(y) \right]^{1/p}.
\]
Therefore,
\[
\left\| \left| k(x,y) f(y) \right| \right\|_{L^p(\mu)}^p = \int_X d\mu(x) \left[ \int_Y \left| k(x,y) f(y) \right| d\nu(y) \right]^p
\]
\[
\leq C_2^{p/q} \int_X d\mu(x) \int_Y \left| k(x,y) \right| \left| f(y) \right|^p = C_2^{p/q} \int_Y \left| f(y) \right|^p \int_X d\mu(x) \left| k(x,y) \right|
\]
\[
\leq C_2^{p/q} C_1 \int_Y \left| f(y) \right|^p = C_2^{p/q} C_1 \left\| f \right\|_{L^p(\nu)}^p,
\]
wherein we used Tonelli’s theorem in third line. From this it follows that
\[
\int_Y \left| k(x,y) f(y) \right| d\nu(y) < \infty \text{ for } \mu - \text{a.e. } x,
\]
\[
x \rightarrow Kf(x) := \int_Y k(x,y) f(y) d\nu(y) \in L^p(\mu)
\]
and that Eq. \([18.11]\) holds.

Similarly if \( p = \infty \),
\[
\int_Y \left| k(x,y) f(y) \right| d\nu(y) \leq \left\| f \right\|_{L^\infty(\nu)} \int_Y \left| k(x,y) \right| d\nu(y) \leq C_2 \left\| f \right\|_{L^\infty(\nu)} \text{ for } \mu - \text{a.e. } x.
\]
so that \( \left\| Kf \right\|_{L^1(\mu)} \leq C_2 \left\| f \right\|_{L^1(\nu)} \). If \( p = 1 \), then
\[
\int_X d\mu(x) \int_Y d\nu(y) \left| k(x,y) f(y) \right| = \int_Y d\nu(y) \left| f(y) \right| \int_X d\mu(x) \left| k(x,y) \right|
\]
\[
\leq C_1 \int_Y d\nu(y) \left| f(y) \right|
\]
which shows \( \left\| Kf \right\|_{L^1(\mu)} \leq C_1 \left\| f \right\|_{L^1(\nu)} \). \( \blacksquare \)

### 18.1 Jensen’s Inequality

**Definition 18.6.** A function \( \varphi : (a, b) \rightarrow \mathbb{R} \) is convex if for all \( a < x_0 < x_1 < b \) and \( t \in [0, 1] \)
\( \varphi(x_1) \leq t \varphi(x_1) + (1-t) \varphi(x_0) \) where \( x_t = tx_1 + (1-t)x_0 \).

**Example 18.7.** The functions \( \exp(x) \) and \( -\log(x) \) are convex and \( x^p \) is convex iff \( p \geq 1 \) as follows from Corollary \([18.9]\) below which in part states that any \( \varphi \in C^2((a,b), \mathbb{R}) \) such that \( \varphi'' \geq 0 \) is convex.

The following Proposition is clearly motivated by Figure \([18.1]\).

**Proposition 18.8.** Suppose \( \varphi : (a, b) \rightarrow \mathbb{R} \) is a convex function, then

1. For all \( u, v, w, z \in (a, b) \) such that \( u < z, w \in [u, z) \) and \( v \in (u, z) \),
\[
\frac{\varphi(v) - \varphi(u)}{v-u} \leq \frac{\varphi(z) - \varphi(w)}{z-w}.
\]
(18.12)

2. For each \( c \in (a, b) \), the right and left sided derivatives \( \varphi'_\pm(c) \) exists in \( \mathbb{R} \) and if \( a < u < v < b \), then
\[
\varphi'_+(u) \leq \varphi'_-(v) \leq \varphi'_+(v).
\]
(18.13)

3. The function \( \varphi \) is continuous and differentiable except on an at most countable subset of \((a,b)\).

4. For all \( t \in (a, b) \) and \( \beta \in [\varphi'_-(t), \varphi'_+(t)] \), \( \varphi(x) \geq \varphi(t) + \beta(x-t) \) for all \( x \in (a,b) \). In particular,
\[
\varphi(x) \geq \varphi(t) + \varphi'_-(t)(x-t) \text{ for all } x, t \in (a, b).
\]

**Proof.** 1a) Suppose first that \( u < v = w < z \), in which case Eq. \([18.12]\) is equivalent to
\[
(\varphi(v) - \varphi(u))(z-v) \leq (\varphi(z) - \varphi(v))(v-u)
\]
which after solving for \( \varphi(v) \) is equivalent to the following equations holding:
\[
\varphi(v) \leq \varphi(z) \frac{v-u}{z-u} + \varphi(u) \frac{z-v}{z-u}.
\]
But this last equation states that \( \varphi(v) \leq \varphi(z)t + \varphi(u)(1-t) \) where \( t = \frac{v-u}{z-u} \) and \( v = tz + (1-t)u \) and hence is valid by the definition of \( \varphi \) being convex.

1b) Now assume \( u = w < v < z \), in which case Eq. (18.12) is equivalent to

\[
(\varphi(v) - \varphi(u))(z-u) \leq (\varphi(z) - \varphi(u))(v-u)
\]

which after solving for \( \varphi(v) \) is equivalent to

\[
\varphi(v)(z-u) \leq \varphi(z)(v-u) + \varphi(u)(z-v)
\]

which is equivalent to

\[
\varphi(v) \leq \varphi(z) \frac{v-u}{z-u} + \varphi(u) \frac{z-v}{z-u}
\]

Again this equation is valid by the convexity of \( \varphi \).

1c) \( u < w < v = z \), in which case Eq. (18.12) is equivalent to

\[
(\varphi(z) - \varphi(u))(z-w) \leq (\varphi(z) - \varphi(w))(z-u)
\]

and this is equivalent to the inequality,

\[
\varphi(w) \leq \varphi(z) \frac{w-u}{z-u} + \varphi(u) \frac{z-w}{z-u}
\]

which again is true by the convexity of \( \varphi \).

1) General case. If \( u < w < v < z \), then by 1a-1c

\[
\frac{\varphi(z) - \varphi(u)}{z-w} \geq \frac{\varphi(v) - \varphi(w)}{v-w} \geq \frac{\varphi(v) - \varphi(u)}{v-u}
\]

and if \( u < v < w < z \)

\[
\frac{\varphi(z) - \varphi(w)}{z-w} \geq \frac{\varphi(w) - \varphi(v)}{w-v} \geq \frac{\varphi(w) - \varphi(u)}{w-u}
\]

We have now taken care of all possible cases.

2) On the set \( a < w < z < b \), Eq. (18.12) shows that \( (\varphi(z) - \varphi(w))/(z-w) \) is a decreasing function in \( w \) and an increasing function in \( z \) and therefore \( \varphi'_x(x) \) exists for all \( x \in (a,b) \). Also from Eq. (18.12) we learn that

\[
\varphi'_+(u) \leq \frac{\varphi(z) - \varphi(w)}{z-w} \text{ for all } a < u < w < z < b,
\]

\[
\frac{\varphi(v) - \varphi(u)}{v-u} \leq \varphi'_-(z) \text{ for all } a < u < v < z < b,
\]

and letting \( w \uparrow z \) in the first equation also implies that \( \varphi'_+(u) \leq \varphi'_-(z) \) for all \( a < u < z < b \).

The inequality, \( \varphi'_-(z) \leq \varphi'_+(z) \), is also an easy consequence of Eq. (18.12).

3) Since \( \varphi(x) \) has both left and right finite derivatives, it follows that \( \varphi \) is continuous. (For an alternative proof, see Rudin.) Since \( z \to \varphi'_-(z) \) is an increasing function, it has at most a countable set of discontinuities. If \( \varphi'_- \) is continuous at \( u \), then by Eq. (18.13),

\[
\varphi'_+(u) \leq \lim_{x \to u} \varphi'_-(v) = \varphi'_-(u) \leq \varphi'_+(u)
\]

from which it follows that \( \varphi'_-(u) = \varphi'_+(u) \) and \( \varphi \) is differentiable at \( u \).

4) Given \( t \), let \( \beta \in [\varphi'_-(t), \varphi'_+(t)] \), then by Eqs. (18.14) and (18.15),

\[
\frac{\varphi(t) - \varphi(u)}{t-u} \leq \frac{\varphi(x) - \varphi(t)}{z-t} \leq \frac{\varphi(z) - \varphi(x)}{z-t}
\]

for all \( a < u < t < z < b \). Item 4. now follows.

**Corollary 18.9.** Suppose \( \varphi : (a,b) \to \mathbb{R} \) is differentiable then \( \varphi \) is convex iff \( \varphi' \) is non-decreasing. In particular if \( \varphi \in C^2(a,b) \) then \( \varphi \) is convex iff \( \varphi'' \geq 0 \).

**Proof.** By Proposition 18.8 if \( \varphi \) is convex then \( \varphi' \) is non-decreasing. Conversely if \( \varphi' \) is increasing then by the mean value theorem,

\[
\frac{\varphi(x_1) - \varphi(c)}{x_1 - c} = \varphi'(\xi_1) \text{ for some } \xi_1 \in (c,x_1)
\]

and

\[
\frac{\varphi(c) - \varphi(x_0)}{c - x_0} = \varphi'(\xi_2) \text{ for some } \xi_2 \in (x_0,c).
\]

Hence

\[
\frac{\varphi(x_1) - \varphi(c)}{x_1 - c} \geq \frac{\varphi(c) - \varphi(x_0)}{c - x_0}
\]

for all \( x_0 < c < x_1 \). Solving this inequality for \( \varphi(c) \) gives

\[
\varphi(c) \leq \frac{c-x_0}{x_1-x_0} \varphi(x_1) + \frac{x_1-c}{x_1-x_0} \varphi(x_0)
\]

showing \( \varphi \) is convex.

**Theorem 18.10 (Jensen’s Inequality).** Suppose that \((X,\mathcal{M},\mu)\) is a probability space, i.e. \( \mu \) is a positive measure and \( \mu(X) = 1 \). Also suppose that \( f \in L^1(\mu) \), \( f : X \to (a,b) \), and \( \varphi : (a,b) \to \mathbb{R} \) is a convex function. Then

\[
\varphi \left( \int_X f \, d\mu \right) \leq \int_X \varphi(f) \, d\mu
\]

where if \( \varphi \circ f \notin L^1(\mu) \), then \( \varphi \circ f \) is integrable in the extended sense and \( \int_X \varphi(f) \, d\mu = \infty \).
Moreover, if \( \varphi(f) \) is not integrable, then \( \varphi(f) \geq \varphi(t) + \beta(f - t) \) which shows that negative part of \( \varphi(f) \) is integrable. Therefore, \( \int_X \varphi(f) d\mu = \infty \) in this case.

**Example 18.11.** The convex functions in Example 18.7 lead to the following inequalities,

\[
\exp\left( \int_X f d\mu \right) \leq \int_X e^f d\mu, \tag{18.16}
\]

and for \( p \geq 1, \)

\[
\left( \int_X |f| d\mu \right)^p \leq \int_X |f|^p d\mu.
\]

The last equation may also easily be derived using Hölder’s inequality. As a special case of the first equation, we get another proof of Lemma 1.28. Indeed, more generally, suppose \( p_i, s_i > 0 \) for \( i = 1, 2, \ldots, n \) and \( \sum_{i=1}^n \frac{1}{p_i} = 1, \) then

\[
s_1 \cdots s_n = e^{\sum_{i=1}^n \ln s_i} = e^{\sum_{i=1}^n \frac{1}{p_i} \ln s_i} \leq \sum_{i=1}^n \frac{1}{p_i} \ln s_i^p_i \leq \sum_{i=1}^n \frac{s_i^p}{p_i} \leq \sum_{i=1}^n \frac{s_i^p}{p_i} \tag{18.17}
\]

where the inequality follows from Eq. (18.16) with \( X = \{1, 2, \ldots, n\}, \) \( \mu = \sum_{i=1}^n \frac{1}{p_i} \delta_i \) and \( f(i) := \ln s_i^p. \) Of course Eq. 18.17 may be proved directly using the convexity of the exponential function.

**Exercise 18.1.** Use the inequality in Eq. (18.17) to give another proof of Corollary 18.3.

### 18.2 Modes of Convergence

As usual let \((X, \mathcal{M}, \mu)\) be a fixed measure space, assume \(1 \leq p \leq \infty\) and let \( \{f_n\}_{n=1}^\infty \cup \{f\} \) be a collection of complex valued measurable functions on \( X. \) We have the following notions of convergence and Cauchy sequences.

**Definition 18.12.**

1. \( f_n \to f \) a.e. if there is a set \( E \in \mathcal{M} \) such that \( \mu(E) = 0 \) and \( \lim_{n \to \infty} 1_{E^c} f_n = 1_{E^c} f. \)
2. \( f_n \to f \) in \( \mu \) - measure if \( \lim_{n \to \infty} \mu(|f_n - f| > \varepsilon) = 0 \) for all \( \varepsilon > 0. \) We will abbreviate this by saying \( f_n \to f \) in \( L^0 \) or by \( f_n \xrightarrow{\text{a.e.}} f. \)
3. \( f_n \to f \) in \( L^p \) iff \( f \in L^p \) and \( f_n \in L^p \) for all \( n, \) and \( \lim_{n \to \infty} \|f_n - f\|_p = 0. \)

**Definition 18.13.**

1. \( \{f_n\} \) is a.e. Cauchy if there is a set \( E \in \mathcal{M} \) such that \( \mu(E) = 0 \) and \( \{1_{E^c} f_n\} \) is a pointwise Cauchy sequences.
2. \( \{f_n\} \) is Cauchy in \( \mu \) - measure (or \( L^0 \) - Cauchy) if \( \lim_{n \to \infty} \mu(|f_n - f_m| > \varepsilon) = 0 \) for all \( \varepsilon > 0. \)
3. \( \{f_n\} \) is Cauchy in \( L^p \) if \( \lim_{n \to \infty} \|f_n - f_m\|_p = 0 \).

**Lemma 18.14 (Chebyshev’s inequality again).** Let \( p \in [1, \infty) \) and \( f \in L^p, \) then

\[
\mu(|f| \geq \varepsilon) \leq \frac{1}{\varepsilon^p} \|f\|_p^p
\]

In particular if \( \{f_n\} \subset L^p \) is \( L^p \) - convergent (Cauchy) then \( \{f_n\} \) is also convergent (Cauchy) in measure.

**Proof.** By Chebyshev’s inequality (15.3),

\[
\mu(|f| \geq \varepsilon) = \mu(|f|^p \geq \varepsilon^p) \leq \frac{1}{\varepsilon^p} \int_X |f|^p d\mu = \frac{1}{\varepsilon^p} \|f\|_p^p
\]

and therefore if \( \{f_n\} \) is \( L^p \) - Cauchy, then

\[
\mu(|f_n - f_m| \geq \varepsilon) \leq \frac{1}{\varepsilon^p} \|f_n - f_m\|_p^p \to 0 \text{ as } m, n \to \infty
\]

showing \( \{f_n\} \) is \( L^0 \) – Cauchy. A similar argument holds for the \( L^p \) – convergent case.

Here is a sequence of functions where \( f_n \to 0 \) a.e., \( f_n \not\to 0 \) in \( L^1, \) \( f_n \not\to 0 \) in measure.

Above is a sequence of functions where \( f_n \to 0 \) a.e., yet \( f_n \not\to 0 \) in \( L^1. \) or in measure.
Here is a sequence of functions where $f_n \to 0$ a.e., $f_n \overset{m}{\to} 0$ but $f_n \not\to 0$ in $L^1$.

Above is a sequence of functions where $f_n \to 0$ in $L^1$, $f_n \to 0$ a.e., and $f_n \overset{m}{\to} 0$.

**Lemma 18.15.** Suppose $a_n \in \mathbb{C}$ and $|a_{n+1} - a_n| \leq \varepsilon_n$ and $\sum_{n=1}^{\infty} \varepsilon_n < \infty$. Then

$$\lim_{n \to \infty} a_n = a \in \mathbb{C} \text{ exists and } |a - a_n| \leq \delta_n := \sum_{k=n}^{\infty} \varepsilon_k.$$

**Proof.** (This is a special case of Exercise 18.9) Let $m > n$ then

$$|a_m - a_n| = \left| \sum_{k=n}^{m-1} (a_{k+1} - a_k) \right| \leq \sum_{k=n}^{m-1} |a_{k+1} - a_k| \leq \sum_{k=n}^{\infty} \varepsilon_k := \delta_n. \quad (18.18)$$

So $|a_m - a_n| \leq \delta_{\min(m,n)} \to 0$ as $m, n \to \infty$, i.e., $\{a_n\}$ is Cauchy. Let $m \to \infty$ in (18.18) to find $|a - a_n| \leq \delta_n$. \hfill \blacksquare

**Theorem 18.16.** Suppose $\{f_n\}$ is $L^0$-Cauchy. Then there exists a subsequence $g_j = f_{n_j}$ of $\{f_n\}$ such that $\lim g_j := f$ exists a.e. and $f_n \overset{m}{\to} f$ as $n \to \infty$. Moreover if $g$ is a measurable function such that $f_n \overset{m}{\to} g$ as $n \to \infty$, then $f = g$ a.e.

**Proof.** Let $\varepsilon > 0$ such that $\sum_{n=1}^{\infty} \varepsilon_n < \infty$ ($\varepsilon_n = 2^{-n}$ would do) and set

$$\delta_n = \sum_{k=n}^{\infty} \varepsilon_k. \quad \text{Choose } g_j = f_{n_j} \text{ such that } \{n_j\} \text{ is a subsequence of } \mathbb{N} \text{ and }$$

$$\mu(|\{g_{j+1} - g_j| > \varepsilon_j}\}) \leq \varepsilon_j.$$

Let $E_j = \{|g_{j+1} - g_j| > \varepsilon_j\}$,

$$F_N = \bigcup_{j=N}^{\infty} E_j = \bigcup_{j=N}^{\infty} \{|g_{j+1} - g_j| > \varepsilon_j\}$$

and

$$E := \bigcap_{N=1}^{\infty} F_N = \bigcap_{N=1}^{\infty} \bigcup_{j=N}^{\infty} E_j = \{|g_{j+1} - g_j| > \varepsilon_j \text{ i.o.}\}.$$

Then $\mu(E) = 0$ by Lemma 18.15 or the computation

$$\mu(E) \leq \sum_{j=1}^{\infty} \mu(E_j) \leq \sum_{j=1}^{\infty} \varepsilon_j = \delta \to 0 \text{ as } N \to \infty.$$

If $x \notin F_N$, i.e. $|g_{j+1}(x) - g_j(x)| \leq \varepsilon_j$ for all $j \geq N$, then by Lemma 18.15 $f(x) = \lim_{j \to \infty} g_j(x)$ exists and $|f(x) - g_j(x)| \leq \delta_j$ for all $j \geq N$. Therefore, since

$$E_c = \bigcup_{N=1}^{\infty} F_N^c, \quad \lim_{j \to \infty} g_j(x) = f(x) \text{ exists for all } x \notin E. \quad \text{Moreover, } \{x : |f(x) - g_j(x)| > \delta_j\} \subset F_j \text{ for all } j \geq N \text{ and hence}$$

$$\mu(|f - g_j| > \delta_j) \leq \mu(F_j) \leq \delta_j \to 0 \text{ as } j \to \infty.$$

Therefore $g_j \overset{m}{\to} f$ as $j \to \infty$. Since

$$\{|f_n - f| > \varepsilon\} = \{|f - g_j + g_j - f_n| > \varepsilon\} \subset \{|f - g_j| > \varepsilon/2\} \cup \{|g_j - f_n| > \varepsilon/2\},$$

$$\mu(\{|f_n - f| > \varepsilon\}) \leq \mu(\{|f - g_j| > \varepsilon/2\}) + \mu(\{|g_j - f_n| > \varepsilon/2\})$$

and

$$\mu(\{|f_n - f| > \varepsilon\}) \leq \lim_{j \to \infty} \sup \mu(|g_j - f_n| > \varepsilon/2) \to 0 \text{ as } n \to \infty.$$

If there is another function $g$ such that $f_n \overset{m}{\to} g$ as $n \to \infty$, then arguing as above

$$\mu(|f - g| > \varepsilon) \leq \mu(\{|f - f_n| > \varepsilon/2\}) + \mu(|g - f_n| > \varepsilon/2) \to 0 \text{ as } n \to \infty.$$

Hence

$$\mu(|f - g| > 0) = \mu(\bigcup_{n=1}^{\infty} \{|f - g| > 1/n\}) \leq \sum_{n=1}^{\infty} \mu(|f - g| > 1/n) = 0,$$

i.e. $f = g$ a.e. \hfill \blacksquare
Corollary 18.17 (Dominated Convergence Theorem). Suppose \( \{f_n\} \), \( \{g_n\} \), and \( g \) are in \( L^1 \) and \( f \in L^0 \) are functions such that
\[
|f_n| \leq g \text{ a.e.}, \quad f_n \xrightarrow{m} f, \quad g_n \xrightarrow{m} g, \quad \text{and} \quad \int g_n \to \int g \text{ as } n \to \infty.
\]
Then \( f \in L^1 \) and \( \lim_{n \to \infty} \|f - f_n\|_1 = 0 \), i.e. \( f_n \to f \) in \( L^1 \). In particular \( \lim_{n \to \infty} \int f_n = \int f \).

**Proof.** First notice that \(|f| \leq g \text{ a.e.} \) and hence \( f \in L^1 \) since \( g \in L^1 \). To see that \(|f| \leq g \), use Theorem 18.16 to find subsequences \( \{f_{n_k}\} \) and \( \{g_{n_k}\} \) of \( \{f_n\} \) and \( \{g_n\} \) respectively which are almost everywhere convergent. Then
\[
|f| = \lim_{k \to \infty} |f_{n_k}| \leq \lim_{k \to \infty} g_{n_k} = g \text{ a.e.}
\]
If (for sake of contradiction) \( \lim_{n \to \infty} \|f - f_n\|_1 \neq 0 \) there exists \( \varepsilon > 0 \) and a subsequence \( \{f_{n_k}\} \) of \( \{f_n\} \) such that
\[
\int |f - f_{n_k}| \geq \varepsilon \text{ for all } k.
\]
Using Theorem 18.16 again, we may assume (by passing to a further subsequence if necessary) that \( f_{n_k} \to f \) and \( g_{n_k} \to g \) almost everywhere. Noting, \( |f - f_{n_k}| \leq g + g_{n_k} \to 2g \) and \( \int (g + g_{n_k}) \to \int 2g \), an application of the dominated convergence Theorem 45.26 implies \( \lim_{k \to \infty} \int |f - f_{n_k}| = 0 \) which contradicts Eq. (18.19).

**Exercise 18.2 (Fatou’s Lemma).** If \( f_n \geq 0 \) and \( f_n \to f \) in measure, then \( \int f \leq \liminf_{n \to \infty} \int f_n \).

**Theorem 18.18 (Egoroff’s Theorem).** Suppose \( \mu(X) < \infty \) and \( f_n \to f \) a.e. Then for all \( \varepsilon > 0 \) there exists \( E \in \mathcal{M} \) such that \( \mu(E) < \varepsilon \) and \( f_n \to f \) uniformly on \( E^c \). In particular \( f_n \xrightarrow{m} f \) as \( n \to \infty \).

**Proof.** Let \( f_n \to f \) a.e. Then \( \mu(\{|f_n - f| > \frac{1}{k}\} \text{ i.o. } n) = 0 \) for all \( k > 0 \), i.e.
\[
\lim_{N \to \infty} \mu \left( \bigcup_{n \geq N} \left\{|f_n - f| > \frac{1}{k}\right\} \right) = \mu \left( \bigcap_{N=1}^{\infty} \bigcup_{n \geq N} \left\{|f_n - f| > \frac{1}{k}\right\} \right) = 0.
\]
Let \( E_k := \bigcup_{n \geq N} \left\{|f_n - f| > \frac{1}{k}\right\} \) and choose an increasing sequence \( \{N_k\}_{k=1}^{\infty} \) such that \( \mu(E_k) < \varepsilon 2^{-k} \) for all \( k \). Setting \( E := \bigcup_{k \geq 1} E_k, \mu(E) < \sum_{k \geq 1} \varepsilon 2^{-k} = \varepsilon \) and if \( x \notin E \), then \( |f_n - f| \leq \frac{1}{k} \) for all \( n \geq N_k \) and all \( k \). That is \( f_n \to f \) uniformly on \( E^c \).

**Exercise 18.3.** Show that Egoroff’s Theorem remains valid when the assumption \( \mu(X) < \infty \) is replaced by the assumption that \( |f_n| \leq g \in L^1 \) for all \( n \).

**Hint:** make use of Theorem 18.18 applied to \( f_n |_{X_k} \) where \( X_k := \{|\cdot| \geq k^{-1}\} \).

### 18.3 Completeness of \( L^p \)-spaces

**Theorem 18.19.** Let \( \|\cdot\|_\infty \) be as defined in Eq. (18.2), then \( L^\infty(X, \mathcal{M}, \mu) \) is a Banach space. A sequence \( \{f_n\}_{n=1}^{\infty} \subset L^\infty \) converges to \( f \in L^\infty \) iff there exists \( E \in \mathcal{M} \) such that \( \mu(E) = 0 \) and \( f_n \to f \) uniformly on \( E^c \). Moreover, bounded simple functions are dense in \( L^\infty \).

**Proof.** By Minkowski’s Theorem 18.4 \( \|\cdot\|_\infty \) satisfies the triangle inequality. The reader may easily check the remaining conditions that ensure \( \|\cdot\|_\infty \) is a norm. Suppose that \( \{f_n\}_{n=1}^{\infty} \subset L^\infty \) is a sequence such \( f_n \to f \in L^\infty \), i.e. \( \|f - f_n\|_\infty \to 0 \) as \( n \to \infty \). Then for all \( n \in \mathbb{N} \), there exists \( N_k < \infty \) such that
\[
\mu(|f - f_n| > k^{-1}) = 0 \text{ for all } n \geq N_k.
\]
Let
\[
E = \bigcup_{k=1}^{\infty} \bigcup_{n \geq N_k} \{|f - f_n| > k^{-1}\}.
\]
Then \( \mu(E) = 0 \) and for \( x \in E^c \), \( |f(x) - f_n(x)| \leq k^{-1} \) for all \( n \geq N_k \). This shows that \( f_n \to f \) uniformly on \( E^c \). Conversely, if there exists \( E \in \mathcal{M} \) such that \( \mu(E) = 0 \) and \( f_n \to f \) uniformly on \( E^c \), then for any \( \varepsilon > 0 \),
\[
\mu(|f - f_n| \geq \varepsilon) = \mu(\{|f - f_n| \geq \varepsilon \} \cap E^c) = 0
\]
for all \( n \) sufficiently large. That is to say \( \limsup_{n \to \infty} \|f - f_n\|_\infty \leq \varepsilon \) for all \( \varepsilon > 0 \). The density of simple functions follows from the approximation Theorem 14.3. So the last item to prove is the completeness of \( L^\infty \) for which we will use Theorem 14.3.

Suppose that \( \{f_n\}_{n=1}^{\infty} \subset L^\infty \) is a sequence such that \( \sum_{n=1}^{\infty} \|f_n\|_\infty < \infty \). Let \( M_n := \|f_n\|_\infty, E_n := \{|f_n| > M_n\} \), and \( E := \bigcup_{n=1}^{\infty} E_n \) so that \( \mu(E) = 0 \). Then
\[
\sum_{n=1}^{\infty} \sup_{x \in E^c} |f_n(x)| \leq \sum_{n=1}^{\infty} M_n < \infty
\]
which shows that \( S_N(x) = \sum_{n=1}^{N} f_n(x) \) converges uniformly to \( S(x) := \sum_{n=1}^{\infty} f_n(x) \) on \( E^c \), i.e. \( \lim_{n \to \infty} \|S - S_N\|_\infty = 0 \).

Alternatively, suppose \( \varepsilon_{m,n} := \|f_m - f_n\|_\infty \to 0 \) as \( m, n \to \infty \). Let \( E_{m,n} = \{|f_m - f_n| > \varepsilon_{m,n}\} \) and \( E := \bigcup_{m,n=1}^{\infty} E_{m,n} \), then \( \mu(E) = 0 \) and
\[
\sup_{x \in E^c} |f_m(x) - f_n(x)| \leq \varepsilon_{m,n} \to 0 \text{ as } m, n \to \infty.
\]
Therefore, \( f := \lim_{n \to \infty} f_n \) exists on \( E^c \) and the limit is uniform on \( E^c \). Letting \( f = \lim_{n \to \infty} f_n \), it then follows that \( \lim_{n \to \infty} \|f_n - f\|_\infty = 0 \).

**Theorem 18.20 (Completeness of \( L^p(\mu) \)).** For \( 1 \leq p < \infty \), \( L^p(\mu) \) equipped with the \( L^p \)-norm, \( \|\cdot\|_p \) (see Eq. 18.1), is a Banach space.
Proof. By Minkowski’s Theorem 18.4, $\| \cdot \|_p$ satisfies the triangle inequality. As above the reader may easily check the remaining conditions that ensure $\| \cdot \|_p$ is a norm. So we are left to prove the completeness of $L^p(\mu)$ for $1 \leq p < \infty$, the case $p = \infty$ being done in Theorem 18.19.

Let $\{f_n\}_{n=1}^\infty \subset L^p(\mu)$ be a Cauchy sequence. By Chebyshev’s inequality (Lemma 18.14), $\{f_n\}$ is $L^0$-Cauchy (i.e. Cauchy in measure) and by Theorem 18.16 there exists a subsequence $\{g_j\}$ of $\{f_n\}$ such that $g_j \to f$ a.e. by Fatou’s Lemma,

$$
\|g_j - f\|^p_p = \lim_{k \to \infty} \inf \int |g_j - g_k|^p d\mu \leq \lim_{k \to \infty} \inf \int |g_j - g_k|^p d\mu
$$

$$
= \lim_{k \to \infty} \inf \|g_j - g_k\|^p \to 0 \text{ as } j \to \infty.
$$

In particular, $\|f\|^p_p \leq \|g_j - f\|^p_p + \|g_j\|^p_p < \infty$ so the $f \in L^p$ and $g_j \xrightarrow{L^p} f$. The proof is finished because,

$$
\|f_n - f\|^p_p \leq \|f_n - g_j\|^p_p + \|g_j - f\|^p_p \to 0 \text{ as } j, n \to \infty.
$$

The $L^p(\mu)$ - norm controls two types of behaviors of $f$, namely the “behavior at infinity” and the behavior of “local singularities.” So in particular, if $f$ blows up at a point $x_0 \in X$, then locally near $x_0$ it is harder for $f$ to be in $L^p(\mu)$ as $p$ increases. On the other hand a function $f \in L^p(\mu)$ is allowed to decay at “infinity” slower and slower as $p$ increases. With these insights in mind, we should not in general expect $L^p(\mu) \subset L^q(\mu)$ or $L^q(\mu) \subset L^p(\mu)$. However, there are two notable exceptions. (1) If $\mu(X) < \infty$, then there is no behavior at infinity to worry about and $L^q(\mu) \subset L^p(\mu)$ for all $q \geq p$ as is shown in Corollary 18.21 below. (2) If $\mu$ is counting measure, i.e. $\mu(A) = \#(A)$, then all functions in $L^p(\mu)$ for any $p$ can not blow up on a set of positive measure, so there are no local singularities. In this case $L^p(\mu) \subset L^q(\mu)$ for all $q \geq p$, see Corollary 18.25 below.

Corollary 18.21. If $\mu(X) < \infty$ and $0 < p < q \leq \infty$, then $L^q(\mu) \subset L^p(\mu)$, the inclusion map is bounded and in fact

$$
\|f\|^p_p \leq \mu(X)^{\frac{p}{q} - \frac{q}{p}} \|f\|^q_q.
$$

Proof. Take $a \in [1, \infty]$ such that

$$
\frac{1}{p} = \frac{1}{a} + \frac{1}{q}, \text{ i.e. } a = \frac{pq}{q - p}.
$$

Then by Corollary 18.3

$$
\|f\|^p_p = \|f \cdot 1\|^p_p \leq \|f\|^q_q \cdot \|1\|^p_a = \mu(X)^{1/a} \|f\|^q_q = \mu(X)^{\frac{p}{q} - \frac{q}{p}} \|f\|^q_q.
$$

The reader may easily check this final formula is correct even when $q = \infty$ provided we interpret $1/p - 1/\infty$ to be $1/p$.

Proposition 18.22. Suppose that $0 < p_0 < p_1 \leq \infty$, $\lambda \in (0,1)$ and $p_\lambda \in (p_0, p_1)$ be defined by

$$
\frac{1}{p_\lambda} = \frac{1}{p_0} - \frac{\lambda}{p_1} + \frac{\lambda}{p_1}
$$

with the interpretation that $\lambda/p_1 = 0$ if $p_1 = \infty$. Then $L^{p_\lambda} \subset L^{p_0} + L^{p_1}$, i.e. every function $g \in L^{p_\lambda}$ may be written as $g = g + h$ with $g \in L^{p_0}$ and $h \in L^{p_1}$. For $1 \leq p_0 < p_1 \leq \infty$ and $f \in L^{p_0} + L^{p_1}$ let

$$
\|f\| := \inf \{ \|g\|_{p_0} + \|h\|_{p_1} : f = g + h \}.
$$

Then $(L^{p_0} + L^{p_1}, \| \cdot \|)$ is a Banach space and the inclusion map from $L^{p_\lambda}$ to $L^{p_0} + L^{p_1}$ is bounded; in fact $\|f\| \leq 2 \|f\|_{p_\lambda}$ for all $f \in L^{p_\lambda}$.

Proof. Let $M > 0$, then the local singularities of $f$ are contained in the set $E := \{|f| > M\}$ and the behavior of $f$ at “infinity” is solely determined by $f$ on $E^c$. Hence let $g = f1_{E^c}$ and $h = f1_E$, so that $f = g + h$. By our earlier discussion we expect that $g \in L^{p_0}$ and $h \in L^{p_1}$ and this is the case since,

$$
\|g\|^p_{p_0} = \int |f|^{p_0} 1_{|f| > M} = M^{p_0} \int \frac{|f|^p}{M^p} 1_{|f| > M}
$$

$$
\leq M^{p_0} \int \frac{|f|^p}{M^p} 1_{|f| > M} \leq M^{p_0 - p_\lambda} \|f\|_{p_\lambda}^{p_\lambda} < \infty
$$

and

$$
\|h\|^p_{p_1} = \|f1_{|f| \leq M}\|^p_{p_1} = \int |f|^{p_1} 1_{|f| \leq M} = M^{p_1} \int \frac{|f|^p}{M^p} 1_{|f| \leq M}
$$

$$
\leq M^{p_1} \int \frac{|f|^p}{M^p} 1_{|f| \leq M} \leq M^{p_1 - p_\lambda} \|f\|_{p_\lambda}^{p_\lambda} < \infty.
$$

Moreover this shows

$$
\|f\| \leq M^{1 - p_\lambda/p_0} \|f\|_{p_\lambda}^{p_\lambda/p_0} + M^{1 - p_\lambda/p_1} \|f\|_{p_\lambda}^{p_\lambda/p_1}.
$$

Taking $M = \lambda \|f\|_{p_\lambda}$ then gives

$$
\lambda = \frac{p_0}{p_\lambda} \frac{p_1 - p_\lambda}{p_1 - p_0}.
$$
Corollary 18.23 (Interpolation of $L^p$ – norms). Suppose that $0 < p < p_1 \leq \infty$, $\lambda \in (0,1)$ and $p_\lambda \in (p_0, p_1)$ be defined as in Eq. (18.20), then $L^{p_0} \cap L^{p_1} \subset L^{p_\lambda}$ and
\[
\|f\|_{p_\lambda} \leq \|f\|_{p_0}^{1-\lambda} \|f\|_{p_1}^\lambda.
\] (18.21)
Further assume $1 \leq p_0 < p_\lambda < p_1 \leq \infty$, and for $f \in L^{p_0} \cap L^{p_1}$ let
\[
\|f\| := \|f\|_{p_0} + \|f\|_{p_1}.
\]
Then $(L^{p_0} \cap L^{p_1}, |||\|)$ is a Banach space and the inclusion map of $L^{p_0} \cap L^{p_1}$ into $L^{p_\lambda}$ is bounded, in fact
\[
\|f\|_{p_\lambda} \leq \max (\lambda^{-1}, (1-\lambda)^{-1}) \left( \|f\|_{p_0} + \|f\|_{p_1} \right).
\] (18.22)
The heuristic explanation of this corollary is that if $f \in L^{p_0} \cap L^{p_1}$, then $f$ has local singularities no worse than an $L^{p_1}$ function and behavior at infinity no worse than an $L^{p_0}$ function. Hence $f \in L^{p_\lambda}$ for any $p_\lambda$ between $p_0$ and $p_1$.

Exercise 18.4. Show that Eq. (18.21) may be alternatively stated by saying that $\varphi(p) := \ln \|f\|_p^p$ is a convex function of $p$. Also show that $\varphi(p)$ is convex in $p$ by explicitly computing $\varphi''(p)$ when $f$ is nice. Then pass to the limit to get the general case from these considerations.

Proof. Let $\lambda$ be determined as above, $a = p_0/(1-\lambda)$ and $b = p_1/\lambda$, then by Corollary 18.3
\[
\|f\|_{p_\lambda} = \|f\|_{a} \|f\|_{b} \leq \|f\|_{a}^{1-\lambda} \|f\|_{b}^\lambda \leq \|f\|_{p_0}^{1-\lambda} \|f\|_{p_1}^\lambda = \|f\|_{p_0}^{1-\lambda} \|f\|_{p_1}^\lambda.
\]
which proves Eq. (18.21).

It is easily checked that $\|\cdot\|$ is a norm on $L^{p_0} \cap L^{p_1}$. To show this space is complete, suppose that $\{f_n\} \subset L^{p_0} \cap L^{p_1}$ is a $\|\cdot\|$ – Cauchy sequence. Then $\{f_n\}$ is both $L^{p_0}$ and $L^{p_1}$ – Cauchy. Hence there exist $f \in L^{p_0}$ and $g \in L^{p_1}$ such that $\lim_{n \to \infty} \|f - f_n\|_{p_0} = 0$ and $\lim_{n \to \infty} \|g - f_n\|_{p_1} = 0$. By Chebyshev’s inequality (Lemma 18.14), $f_n \to f$ and $f_n \to g$ in measure and therefore by Theorem 18.16 $f = g$ a.e. It now is clear that $\lim_{n \to \infty} \|f - f_n\| = 0$. The estimate in Eq. (18.22) is left as Exercise 18.8 to the reader.

Remark 18.24. Combining Proposition 18.22 and Corollary 18.23 gives
\[
L^{p_0} \cap L^{p_1} \subset L^{p_\lambda} \subset L^{p_0} + L^{p_1}
\]
for $0 < p_0 < p_1 \leq \infty$, $\lambda \in (0,1)$ and $p_\lambda \in (p_0, p_1)$ as in Eq. (18.20).

18.4 Converse of Hölder’s Inequality

Throughout this section we assume $(X, M, \mu)$ is a $\sigma$ – finite measure space, $q \in [1, \infty]$ and $p \in [1, \infty]$ are conjugate exponents, i.e. $p^{-1} + q^{-1} = 1$. For $g \in L^q$, let $\varphi_g \in (L^p)^*$ be given by
\[
\varphi_g(f) = \int g f \ d\mu = : \langle g, f \rangle.
\]
(18.23)

By Hölder’s inequality
\[
|\varphi_g(f)| \leq \int |g f| \ d\mu \leq \|g\|_q \|f\|_p
\]
(18.24)
which implies that
\[
\|\varphi_g\|_{(L^p)^*} := \text{sup}\{|\varphi_g(f)| : \|f\|_p = 1\} \leq \|g\|_q.
\]
(18.25)
Proposition 18.26 (Converse of Hölder’s Inequality). Let \((X, M, \mu)\) be a \(\sigma\) - finite measure space and \(1 \leq p \leq \infty\) as above. For all \(g \in L^q\),
\[
\|g\|_q = \|\varphi_g\|_{(L^p)^*} := \sup \left\{ |\varphi_g(f)| : \|f\|_p = 1 \right\}
\]
(18.26)
and for any measurable function \(g : X \to \mathbb{C}\),
\[
\|g\|_q = \sup \left\{ \int_X |g| \, d\mu : \|f\|_p = 1 \text{ and } f \geq 0 \right\}.
\]
(18.27)
(In Theorem 22.14 below we will see that every element of \((L^p)^*\) is of the form \(\varphi_g\) for some \(g \in L^q\).)

**Proof.** We begin by proving Eq. (18.26). Assume first that \(q < \infty\) so \(p > 1\). Then
\[
|\varphi_g(f)| = \left| \int g \varphi_g \, d\mu \right| \leq \int |gf| \, d\mu \leq \|g\|_q \|f\|_p
\]
and equality occurs in the first inequality when \(\text{sgn}(gf)\) is constant a.e. while equality in the second occurs, by Theorem 18.2 when \(|f|^p = c|g|^q\) for some constant \(c > 0\). So let \(f := \text{sgn}(g)|g|^{q/p}\) which for \(p = \infty\) is to be interpreted as \(f = \text{sgn}(g)\), i.e. \(|g|^{q/\infty} \equiv 1\). When \(p = \infty\),
\[
|\varphi_g(f)| = \int_X g \text{sgn}(g) d\mu = \|g\|_{L^1(\mu)} = \|g\|_1 \|f\|_{L^\infty}
\]
which shows that \(\|\varphi_g\|_{(L^\infty)^*} \geq \|g\|_1\). If \(p < \infty\), then
\[
\|f\|_p^p = \int |f|^p = \int |g|^q = \|g\|_q^q
\]
while
\[
\varphi_g(f) = \int g f \, d\mu = \int |g|^{q/p} d\mu = \|g\|_q^{q/p} = \|g\|^{q(1 - \frac{1}{p})} = \|g\|_q.
\]
Hence
\[
\frac{|\varphi_g(f)|}{\|f\|_p} = \frac{\|g\|_q^{q/p}}{\|g\|_q^{q(p-1)/p}} = \|g\|_q.
\]
This shows that \(\|\varphi_g\| \geq \|g\|_q\) which combined with Eq. (18.25) implies Eq. (18.26).

The last case to consider is \(p = 1\) and \(q = \infty\). Let \(M := \|g\|_\infty\) and choose \(X_n \in M\) such that \(X_n \uparrow X\) as \(n \to \infty\) and \(\mu(X_n) < \infty\) for all \(n\). For any \(\varepsilon > 0\), \(\mu(|g| \geq M - \varepsilon) > 0\) and \(X_n \cap \{|g| \geq M - \varepsilon\} \uparrow\{|g| \geq M - \varepsilon\} \). Therefore, \(\mu(X_n \cap \{|g| \geq M - \varepsilon\}) > 0\) for \(n\) sufficiently large. Let
\[
f = \text{sgn}(g)1_{X_n \cap \{|g| \geq M - \varepsilon\}},
\]
then
\[
\|f\|_1 = \mu(X_n \cap \{|g| \geq M - \varepsilon\}) \in (0, \infty)
\]
and
\[
|\varphi_g(f)| = \int_{X_n \cap \{|g| \geq M - \varepsilon\}} \text{sgn}(g) g d\mu = \int_{X_n \cap \{|g| \geq M - \varepsilon\}} |g| d\mu \\
\geq (M - \varepsilon) \mu(X_n \cap \{|g| \geq M - \varepsilon\}) = (M - \varepsilon) \|f\|_1.
\]
Since \(\varepsilon > 0\) is arbitrary, it follows from this equation that \(\|\varphi_g\|_{(L^1)^*} \geq M = \|g\|_\infty\).

Now for the proof of Eq. (18.27). The key new point is that we no longer are assuming that \(q < L^q\). Let \(M(g)\) denote the right member in Eq. (18.27) and set \(g_n := 1_{X_n \cap \{|g| \leq n\}} g\). Then \(|g_n| \uparrow |g|\) as \(n \to \infty\) and it is clear that \(M(g_n)\) is increasing in \(n\). Therefore using Lemma 4.10 and the monotone convergence theorem,
\[
\lim_{n \to \infty} M(g_n) = \sup_n M(g_n) = \sup_n \left\{ \int_X |g_n| f d\mu : \|f\|_p = 1 \text{ and } f \geq 0 \right\} = \sup_n \left\{ \sup_n \int_X |g_n| f d\mu : \|f\|_p = 1 \text{ and } f \geq 0 \right\} = M(g).
\]
Since \(g_n \in L^q\) for all \(n\) and \(M(g_n) = \|\varphi_{g_n}\|_{(L^p)^*}\) (as you should verify), it follows from Eq. (18.26) that \(M(g_n) = \|g_n\|_q\). When \(q < \infty\) (by the monotone convergence theorem) and when \(q = \infty\) (directly from the definitions) one learns that \(\lim_{n \to \infty} \|g_n\|_q = \|g\|_q\). Combining this fact with \(\lim_{n \to \infty} M(g_n) = M(g)\) just proved shows \(M(g) = \|g\|_q\).

As an application we can derive a sweeping generalization of Minkowski’s inequality. (See Reed and Simon, Vol II. Appendix IX.4 for a more thorough discussion of complex interpolation theory.)

Theorem 18.27 (Minkowski’s Inequality for Integrals). Let \((X, M, \mu)\) and \((Y, N, \nu)\) be \(\sigma\) - finite measure spaces and \(1 \leq p \leq \infty\). If \(f\) is a \(M \otimes N\) measurable function, then \(y \to \|f(\cdot, y)\|_{L^p(\mu)}\) is measurable and

1. if \(f\) is a positive \(M \otimes N\) measurable function, then
\[
\left\| \int_Y f(\cdot, y) d\nu(y) \right\|_{L^p(\mu)} \leq \int_Y \|f(\cdot, y)\|_{L^p(\mu)} d\nu(y).
\]
(18.28)
2. If \( f : X \times Y \to \mathbb{C} \) is a \( \mathcal{M} \otimes \mathcal{N} \) measurable function and \( \int_Y |f(\cdot, y)|^{p_1} d\nu(y) < \infty \) then
\( a) \) for \( \mu \)-a.e. \( x \), \( f(x, \cdot) \in L^1(\nu) \),
\( b) \) the \( \mu \)-a.e. defined function, \( x \to \int_Y f(x, y) d\nu(y) \), is in \( L^p(\mu) \) and
\( c) \) the bound in Eq. \[(18.28)\] holds.

**Proof.** For \( p \in [1, \infty) \), let \( F_p(y) := \|f(\cdot, y)\|_{L^p(\mu)} \). If \( p \in [1, \infty) \)

\[ F_p(y) = \|f(\cdot, y)\|_{L^p(\mu)} = \left( \int_X |f(x, y)|^p d\mu(x) \right)^{1/p} \]

is a measurable function on \( Y \) by Fubini’s theorem. To see that \( F_\infty \) is measurable, let \( X_n \in \mathcal{M} \) such that \( X_n \uparrow X \) and \( \mu(X_n) < \infty \) for all \( n \). Then by Exercise \[18.7\]

\[ F_\infty(y) = \lim_{n \to \infty} \lim_{p \to \infty} \|f(\cdot, y)1_{X_n}\|_{L^p(\mu)} \]

which shows that \( F_\infty \) is \((Y, \mathcal{N})\)–measurable as well. This shows that integral on the right side of Eq. \[(18.28)\] is well defined.

Now suppose that \( f \geq 0 \), \( q = p/(p-1) \) and \( g \in L^q(\mu) \) such that \( g \geq 0 \) and \( \|g\|_{L^q(\mu)} = 1 \). Then by Tonelli’s theorem and Hölder’s inequality,

\[
\int_X \left( \int_Y f(x, y) d\nu(y) \right) g(x) d\mu(x) = \int_Y \left( \int_X f(x, y) d\mu(x) \right) g(x) y(x) d\nu(y) \\
\leq \|g\|_{L^q(\mu)} \int_X \|f(\cdot, y)\|_{L^p(\mu)} d\nu(y) \\
= \int_Y \|f(\cdot, y)\|_{L^p(\mu)} d\nu(y).
\]

Therefore by the converse to Hölder’s inequality (Proposition \[18.26\]),

\[
\int_Y \|f(\cdot, y)\|_{L^p(\mu)} d\nu(y) \\
= \sup \left\{ \int_X \left( \int_Y f(x, y) d\nu(y) \right) g(x) d\mu(x) : \|g\|_{L^q(\mu)} = 1 \text{ and } g \geq 0 \right\} \\
\leq \int_Y \|f(\cdot, y)\|_{L^p(\mu)} d\nu(y)
\]

proving Eq. \[(18.28)\] in this case.

Now let \( f : X \times Y \to \mathbb{C} \) be as in item 2) of the theorem. Applying the first part of the theorem to \(|f|\) shows

\[
\int_Y |f(x, y)| d\nu(y) < \infty \text{ for } \mu \text{-a.e. } x,
\]
i.e. \( f(x, \cdot) \in L^1(\nu) \) for the \( \mu \)-a.e. \( x \). Since \( \int_Y f(x, y) d\nu(y) \) \( \leq \int_Y |f(x, y)| d\nu(y) \) it follows by item 1) that

\[
\int_Y f(\cdot, y) d\nu(y) \leq \int_Y |f(\cdot, y)| d\nu(y) \leq \int_Y \|f(\cdot, y)\|_{L^p(\mu)} d\nu(y).
\]

Hence the function, \( x \in X \to \int_Y f(x, y) d\nu(y) \), is in \( L^p(\mu) \) and the bound in Eq. \[(18.28)\] holds.

Here is an application of Minkowski’s inequality for integrals. In this theorem we will be using the convention that \( x^{-1/\infty} := 1 \).

**Theorem 18.28 (Theorem 6.20 inolland).** Suppose that \( k : (0, \infty) \times (0, \infty) \to \mathbb{C} \) is a measurable function such that \( k \) is homogenous of degree \(-1\), i.e. \( k(\lambda x, \lambda y) = \lambda^{-1} k(x, y) \) for all \( \lambda > 0 \). If, for some \( p \in [1, \infty) \),

\[
C_p := \int_0^\infty |k(x, 1)| x^{-1/p} dx < \infty
\]

then for \( f \in L^p((0, \infty), m) \), \( k(x, \cdot) f(\cdot) \in L^1((0, \infty), m) \) for \( m \)-a.e. \( x \). Moreover, the \( m \)-a.e. defined function

\[
(Kf)(x) = \int_0^\infty k(x, y) f(y) dy
\]

is in \( L^p((0, \infty), m) \) and

\[
\|Kf\|_{L^p((0, \infty), m)} \leq C_p \|f\|_{L^p((0, \infty), m)}.
\]

**Proof.** By the homogeneity of \( k \), \( k(x, y) = x^{-1/k} k(1, y/x) \). Using this relation and making the change of variables, \( y = zx \), gives

\[
\int_0^\infty |k(x, y) f(y)| dy = \int_0^\infty x^{-1} \left| k(1, y/x) f(y) \right| dy \\
= \int_0^\infty x^{-1} |k(1, z) f(xz)| x dz = \int_0^\infty |k(1, z) f(xz)| dz.
\]

Since

\[
\|f(\cdot, z)\|_{L^p((0, \infty), m)} = \int_0^\infty |f(yz)|^p dy = \int_0^\infty |f(xz)|^p \frac{dx}{z},
\]

\[
\|f(\cdot, z)\|_{L^p((0, \infty), m)} = z^{-1/p} \|f\|_{L^p((0, \infty), m)}.
\]

Using Minkowski’s inequality for integrals then shows

\[
\int_0^\infty |k(\cdot, y) f(y)| dy \leq \int_0^\infty |k(1, z) \| f(\cdot)\|_{L^p((0, \infty), m)} dz \\
= \|f\|_{L^p((0, \infty), m)} \int_0^\infty |k(1, z)| z^{-1/p} dz \\
= C_p \|f\|_{L^p((0, \infty), m)} < \infty.
\]
This shows that $Kf$ in Eq. [18.29] is well defined from $m$ – a.e. $x$. The proof is finished by observing

$$
\|Kf\|_{L^p((0,\infty),m)} \leq \left( \int_0^\infty |k(\cdot, y) f(y)| \, dy \right)_{L^p((0,\infty),m)} \leq C_p \|f\|_{L^p((0,\infty),m)}
$$

for all $f \in L^p((0,\infty),m)$.

The following theorem is a strengthening of Proposition [18.26]. It may be skipped on the first reading.

**Theorem 18.29 (Converse of H"older’s Inequality II).** Assume that $(X, \mathcal{M}, \mu)$ is a $\sigma$ – finite measure space, $q, p \in [1, \infty]$ are conjugate exponents and let $S_f$ denote the set of simple functions $\varphi$ on $X$ such that $\mu(\varphi \neq 0) < \infty$. Let $g : X \rightarrow \mathbb{C}$ be a measurable function such that $\varphi g \in L^1(\mu)$ for all $\varphi \in S_f$\(^2\) and define

$$
M_q(g) := \sup \left\{ \left| \int_X \varphi g \, d\mu \right| : \varphi \in S_f \text{ with } \|\varphi\|_p = 1 \right\}.
$$

(18.30)

If $M_q(g) < \infty$ then $g \in L^q(\mu)$ and $M_q(g) = \|g\|_q$.

**Proof.** Let $X_n \in \mathcal{M}$ be sets such that $\mu(X_n) < \infty$ and $X_n \uparrow X$ as $n \uparrow \infty$. Suppose that $q = 1$ and hence $p = \infty$. Choose simple functions $\varphi_n$ on $X$ such that $|\varphi_n| \leq 1$ and $\text{sgn}(g) = \lim_{n \rightarrow \infty} \varphi_n$ in the pointwise sense. Then $1_{X_n} \varphi_n \in S_f$ and therefore

$$
\left| \int_X 1_{X_n} \varphi_n g d\mu \right| \leq M_q(g)
$$

for all $m, n$. By assumption $1_{X_n} g \in L^1(\mu)$ and therefore by the dominated convergence theorem we may let $n \rightarrow \infty$ in this equation to find

$$
\int_X 1_{X_n} |g| d\mu \leq M_q(g)
$$

for all $m$. The monotone convergence theorem then implies that

$$
\int_X |g| d\mu = \lim_{m \rightarrow \infty} \int_X 1_{X_n} |g| d\mu \leq M_q(g)
$$

showing $g \in L^1(\mu)$ and $\|g\|_1 \leq M_q(g)$. Since Holder’s inequality implies that $M_q(g) \leq \|g\|_1$, we have proved the theorem in case $q = 1$. For $q > 1$, we will begin by assuming that $g \in L^q(\mu)$. Since $p \in [1, \infty)$ we know that $S_f$ is a dense subspace of $L^p(\mu)$ and therefore, using $\varphi_g$ is continuous on $L^p(\mu)$,

$$
M_q(g) = \sup \left\{ \left| \int_X \varphi g d\mu \right| : \varphi \in L^p(\mu) \text{ with } \|\varphi\|_p = 1 \right\} = \|g\|_q
$$

where the last equality follows by Proposition [18.26]. So it remains to show that if $\varphi g \in L^1$ for all $\varphi \in S_f$ and $M_q(g) < \infty$ then $g \in L^q(\mu)$. For $n \in \mathbb{N}$, let $g_n := 1_{X_n} |g| \leq n g$. Then $g_n \in L^q(\mu)$, in fact $\|g_n\|_q \leq n \mu(X_n)^{1/q} < \infty$. So by the previous paragraph, $\|g_n\|_q = M_q(g_n)$ and hence

$$
\|g_n\|_q = \sup \left\{ \left| \int_X \varphi 1_{X_n} |g| \leq n g d\mu \right| : \varphi \in L^p(\mu) \text{ with } \|\varphi\|_p = 1 \right\}
$$

\leq M_q(g) \|\varphi 1_{X_n} |g| \leq n g\|_p \leq M_q(g) \cdot 1 = M_q(g)

wherein the second to last inequality we have made use of the definition of $M_q(g)$ and the fact that $\varphi 1_{X_n} |g| \leq n \in S_f$. If $q \in (1, \infty)$, an application of the monotone convergence theorem (or Fatou’s Lemma) along with the continuity of the norm, $\|\cdot\|_p$, implies

$$
\|g\|_q = \lim_{n \rightarrow \infty} \|g_n\|_q \leq M_q(g) < \infty.
$$

If $q = \infty$, then $\|g_n\|_\infty \leq M_q(g) < \infty$ for all $n$ implies $|g_n| \leq M_q(g)$ a.e. which then implies that $|g| \leq M_q(g)$ a.e. since $|g| = \lim_{n \rightarrow \infty} |g_n|$. That is $g \in L^\infty(\mu)$ and $\|g\|_\infty \leq M_\infty(g)$.

**18.5 Uniform Integrability**

This section will address the question as to what extra conditions are needed in order that an $L^0$ – convergent sequence is $L^p$ – convergent.

**Notation 18.30** For $f \in L^1(\mu)$ and $E \in \mathcal{M}$, let

$$
\mu(f : E) := \int_E f \, d\mu.
$$

and more generally if $A, B \in \mathcal{M}$ let

$$
\mu(f : A, B) := \int_{A \cap B} f \, d\mu.
$$

**Lemma 18.31.** Suppose $g \in L^1(\mu)$, then for any $\varepsilon > 0$ there exist a $\delta > 0$ such that $\mu(|g| : E) < \varepsilon$ whenever $\mu(E) < \delta$.

**Proof.** If the Lemma is false, there would exist $\varepsilon > 0$ and sets $E_n$ such that $\mu(E_n) \rightarrow 0$ while $\mu(|g| : E_n) \geq \varepsilon$ for all $n$. Since $|1_{E_n} |g| \geq |g| \in L^1$ and for any $\delta \in (0, 1)$, $\mu(1_{E_n} |g| > \delta) \leq \mu(E_n) \rightarrow 0$ as $n \rightarrow \infty$, the dominated convergence...
theorem of Corollary 18.17 implies \( \lim_{n \to \infty} \mu(\{|g| : E_n\}) = 0 \). This contradicts \( \mu(\{|g| : E_n\}) \geq \varepsilon \) for all \( n \) and the proof is complete. \( \blacksquare \)

Suppose that \( \{f_n\}_{n=1}^\infty \) is a sequence of measurable functions which converge in \( L^1(\mu) \) to a function \( f \). Then for \( E \in \mathcal{M} \) and \( n \in \mathbb{N} \),

\[
|\mu(f_n : E)| \leq |\mu(f - f_n : E)| + |\mu(f : E)| \leq \|f - f_n\|_1 + |\mu(f : E)|.
\]

Let \( \varepsilon_N := \sup_{n>N} \|f - f_n\|_1 \), then \( \varepsilon_N \downarrow 0 \) as \( N \uparrow \infty \) and

\[
\sup_n |\mu(f_n : E)| \leq \sup_{n \leq N} |\mu(f_n : E)| \vee (\varepsilon_N + |\mu(f : E)|) \leq \varepsilon_N + \mu(g : E),
\]

where \( g = |f| + \sum_{n=1}^N |f_n| \in L^1 \). From Lemma 18.31 and Eq. (18.31) one easily concludes,

\[
\forall \varepsilon > 0 \exists \delta > 0 \exists \sup_n |\mu(f_n : E)| < \varepsilon \text{ when } \mu(E) < \delta. \tag{18.32}
\]

**Definition 18.32.** Functions \( \{f_n\}_{n=1}^\infty \in L^1(\mu) \) satisfying Eq. (18.32) are said to be uniformly integrable.

**Remark 18.33.** Let \( \{f_n\} \) be real functions satisfying Eq. (18.32). \( E \) be a set where \( \mu(E) < \delta \) and \( E_n = E \cap \{f_n \geq 0\} \). Then \( \mu(E_n) < \delta \) so that \( \mu(f_n^+ : E) = \mu(f_n : E) < \varepsilon \) and similarly \( \mu(f_n^- : E) < \varepsilon \). Therefore if Eq. (18.32) holds then

\[
\sup_n |\mu(f_n : E)| < 2\varepsilon \text{ when } \mu(E) < \delta. \tag{18.33}
\]

Similar arguments work for the complex case by looking at the real and imaginary parts of \( f_n \). Therefore \( \{f_n\}_{n=1}^\infty \subset L^1(\mu) \) is uniformly integrable iff

\[
\forall \varepsilon > 0 \exists \delta > 0 \exists \sup_n |\mu(f_n : E)| < \varepsilon \text{ when } \mu(E) < \delta. \tag{18.34}
\]

**Lemma 18.34.** Assume that \( \mu(X) < \infty \), then \( \{f_n\} \) is uniformly bounded in \( L^1(\mu) \) (i.e. \( K = \sup_n \|f_n\|_1 < \infty \)) and \( \{f_n\} \) is uniformly integrable iff

\[
\lim_{M \to \infty} \sup_n |\mu(f_n : |f_n| \geq M)| = 0. \tag{18.35}
\]

**Proof.** Since \( \{f_n\} \) is uniformly bounded in \( L^1(\mu) \), \( \mu(|f_n| \geq M) \leq K/M \). So if (18.34) holds and \( \varepsilon > 0 \) is given, we may choose \( M \) sufficiently large so that \( \mu(|f_n| \geq M) < \delta(\varepsilon) \) for all \( n \) and therefore,

\[
\sup_n |\mu(f_n : |f_n| \geq M)| \leq \varepsilon.
\]

Since \( \varepsilon \) is arbitrary, we concluded that Eq. (18.35) must hold. Conversely, suppose that Eq. (18.35) holds, then automatically \( K = \sup_n \mu(|f_n|) < \infty \) because

\[
\mu(|f_n|) = \mu(|f_n| : |f_n| \geq M) + \mu(|f_n| : |f_n| < M)
\]

\[
\leq \sup_n |\mu(f_n : |f_n| \geq M)| + \mu(M \mu(X) < \infty.
\]

Moreover,

\[
\mu(|f_n| : E) = \mu(|f_n| : |f_n| \geq M, E) + \mu(|f_n| : |f_n| < M, E)
\]

\[
\leq \sup_n |\mu(f_n : |f_n| \geq M)| + \mu(X).
\]

So given \( \varepsilon > 0 \) choose \( M \) so large that \( \sup_n \mu(|f_n| : |f_n| \geq M) < \varepsilon/2 \) and then take \( \delta = \varepsilon/(2M) \).

**Lemma 18.35 (Saks’ Lemma [4, Lemma 7 on p. 308]).** Suppose that \( (\Omega, \mathcal{B}, P) \) is a probability space such that \( P \) has no atoms. (Recall that \( A \in \mathcal{B} \) is an atom if \( P(A) > 0 \) and for any \( B \subset A \) with \( B \in \mathcal{B} \) we have either \( P(B) = 0 \) or \( P(B) = P(A) \).) Then for every \( \delta > 0 \) there exists a partition \( \{E_i\}_{i=1}^n \subset \Omega \) with \( \mu(E_i) < \delta \). (For related results along this line also see [3][5][8][11] to name a few.)

**Proof.** For any \( A \in \mathcal{B} \) let

\[
\beta(A) := \sup \{P(B) : B \subset A \text{ and } P(B) \leq \delta\}.
\]

We begin by showing if \( \mu(A) > 0 \) then \( \beta(A) > 0 \). As there are no atoms there exists \( A_1 \subset A \) such that \( 0 < P(A_1) < P(A) \). Similarly there exists \( A_2 \subset A \setminus A_1 \) such that \( 0 < P(A_2) < P(A \setminus A_1) \) and continuing inductively we find \( \{A_n\}_{n=1}^\infty \) disjoint subsets of \( A \) such that \( A_n \subset A \setminus (A_1 \cup \cdots \cup A_{n-1}) \) and

\[
0 < P(A_n) < P(A \setminus (A_1 \cup \cdots \cup A_{n-1})).
\]

As \( \sum_{n=1}^\infty A_n \subset A \) we must have \( \sum_{n=1}^\infty P(A_n) \leq P(A) < \infty \) and therefore \( \lim_{n \to \infty} P(A_n) = 0 \). Thus for sufficiently large \( n \) we have \( 0 < P(A_n) \leq \delta \) and therefore \( \beta(A) \geq P(A_n) > 0 \).

Now to construct the desired partition. Choose \( A_1 \subset \Omega \) such that \( \delta \geq P(A_1) \geq P(A) \). If \( P(\Omega \setminus A_1) > 0 \) we may then choose \( A_2 \subset \Omega \setminus A_1 \) such that \( \delta \geq P(A_2) \geq P(\Omega \setminus [A_1 \cup A_2]) \). We may continue on this way inductively to find disjoint subsets \( \{A_k\}_{k=1}^\infty \) of \( \Omega \)

\[
\delta \geq P(A_k) \geq \frac{1}{2} \beta(\Omega \setminus [A_1 \cup \cdots \cup A_{k-1}])
\]

with either \( P(\Omega \setminus [A_1 \cup \cdots \cup A_{n-1}]) > 0 \). If it happens that \( P(\Omega \setminus [A_1 \cup \cdots \cup A_n]) = 0 \) it is easy to see we are done. So we may assume that process can be carried on indefinitely. We then let \( F := \Omega \setminus \cup_{k=1}^\infty A_k \) and observe that
\( \beta(F) \leq \beta(\Omega \setminus \bigcup_{k=1}^{n} A_k) \leq 2P(A_n) \to 0 \) as \( n \to \infty \)

as

\[
\sum_{n=1}^{\infty} P(A_n) \leq P(\Omega) < \infty.
\]

But by the first paragraph this implies that \( P(F) = 0 \). Hence there exists \( n < \infty \) such that \( P(\Omega \setminus \bigcup_{k=1}^{n} A_k) \leq \delta \). We may then define \( E_k = A_k \) for \( 1 \leq k \leq n-1 \) and \( E_n = \Omega \setminus \bigcup_{k=1}^{n} A_k \) in order to construct the desired partition.

**Corollary 18.36.** Suppose that \( (\Omega, \mathcal{B}, P) \) is a probability space such that \( P \) has no atoms. Then for any \( \alpha \in (0,1) \) there exists \( A \in \mathcal{B} \) with \( P(A) = \alpha \).

**Proof.** We may assume the \( \alpha \in (0,1/2) \). By dividing \( \Omega \) into a partition \( \{E_i\}_{i=1}^{N} \) with \( P(E_i) \leq \alpha/2 \) we may let \( A_1 := \bigcup_{i=1}^{k} E_i \) with \( k \) chosen so that \( P(A_1) \leq \alpha \) but

\[
\alpha < P(A_1 \cup E_{k+1}) \leq \frac{3}{2} \alpha.
\]

Notice that \( \alpha/2 \leq P(A_1) \leq \alpha \). Appply this procedure to \( \Omega \setminus A_1 \) in order to find \( A_2 \supset A_1 \) such that \( \alpha/4 \leq P(A_2) \leq \alpha \). Continue this way inductively to find \( A_n \uparrow A \) such that \( P(A_n) \uparrow \alpha = P(A) \). (BRUCE: clean this proof up.)

**Remark 18.37.** It is not in general true that if \( \{f_n\} \subset L^1(\mu) \) is uniformly integrable then \( \lim_{n} \mu(|f_n|) < \infty \). For example take \( X = \{*,\} \) and \( \mu(\{\} = 1 \). Let \( f_n(*) = n \). Since for \( \delta < 1 \) a set \( E \subset X \) such that \( \mu(E) \leq \delta \) is in fact the empty set, we see that Eq. \((18.33)\) holds in this example. However, for finite measure spaces without "atoms", for every \( \delta > 0 \) we may find a finite partition of \( X \) by sets \( \{E_i\}_{i=1}^{k} \) with \( \mu(E_i) < \delta \). Then if Eq. \((18.33)\) holds with \( 2\varepsilon = 1 \), then

\[
\mu(|f_n|) = \sum_{\ell=1}^{k} \mu(|f_n| : E_{i}) \leq k
\]

showing that \( \mu(|f_n|) \leq k \) for all \( n \).

The following Lemmas give a concrete necessary and sufficient conditions for verifying a sequence of functions is uniformly bounded and uniformly integrable.

**Lemma 18.38.** Suppose that \( \mu(X) < \infty \), and \( A \subset L^0(X) \) is a collection of functions.

1. If there exists a non-decreasing function \( \varphi : \mathbb{R}_+ \to \mathbb{R}_+ \) such that \( \lim_{x \to \infty} \varphi(x)/x = \infty \) and

\[
K := \sup_{f \in A} \mu(\varphi(|f|)) < \infty
\]

then

\[
\lim_{M \to \infty} \sup_{f \in A} \mu(|f| 1_{|f| \geq M}) = 0.
\]

2. Conversely if Eq. \((18.37)\) holds, there exists a non-decreasing continuous function \( \varphi : \mathbb{R}_+ \to \mathbb{R}_+ \) such that \( \varphi(0) = 0 \), \( \lim_{x \to \infty} \varphi(x)/x = \infty \) and Eq. \((18.36)\) is valid.

**Proof.** 1. Let \( \varphi \) be as in item 1. above and set \( \varepsilon_M := \sup_{x \geq M} \frac{\varphi(x)}{x} \to 0 \) as \( M \to \infty \) by assumption. Then for \( f \in A \)

\[
\mu(|f| : |f| \geq M) = \mu(\varphi(|f|)) \leq \varepsilon_M \mu(\varphi(|f|)) \leq \varepsilon_M |\varphi(|f|)| \leq K \varepsilon_M
\]

and hence

\[
\lim_{M \to \infty} \sup_{f \in A} \mu(|f| 1_{|f| \geq M}) \leq \lim_{M \to \infty} K \varepsilon_M = 0.
\]

2. By assumption, \( \varepsilon_M := \sup_{f \in A} \mu(|f| 1_{|f| \geq M}) \to 0 \) as \( M \to \infty \). Therefore we may choose \( M_n \uparrow \infty \) such that

\[
\sum_{n=0}^{\infty} (n+1) \varepsilon_{M_n} < \infty
\]

where by convention \( M_0 := 0 \). Now define \( \varphi \) so that \( \varphi(0) = 0 \) and

\[
\varphi'(x) = \sum_{n=0}^{\infty} (n+1) 1_{[M_n,M_{n+1}])(x),
\]

i.e.

\[
\varphi(x) = \int_{0}^{x} \varphi'(y) dy = \sum_{n=0}^{\infty} (n+1) (x \wedge M_{n+1} - x \wedge M_n).
\]

By construction \( \varphi \) is continuous, \( \varphi(0) = 0 \), \( \varphi'(x) \) is increasing (so \( \varphi \) is convex) and \( \varphi'(x) \geq (n+1) \) for \( x \geq M_n \). In particular

\[
\frac{\varphi(x)}{x} = \frac{\varphi(M_n) + (n+1)x}{x} \geq n+1 \text{ for } x \geq M_n
\]

from which we conclude \( \lim_{x \to \infty} \varphi(x)/x = \infty \). We also have \( \varphi'(x) \leq (n+1) \) on \([0, M_{n+1}]\) and therefore

\[
\varphi(x) \leq (n+1)x \text{ for } x \leq M_{n+1}.
\]
So for $f \in A$,
\[
\mu(\varphi(|f|)) = \sum_{n=0}^{\infty} \mu(\varphi(|f|)1_{(M_n,M_{n+1})}(|f|)) \\
\leq \sum_{n=0}^{\infty} (n+1) \mu(\varphi(|f|)1_{(M_n,M_{n+1})}(|f|)) \\
\leq \sum_{n=0}^{\infty} (n+1) \mu(\varphi(|f|)1_{|f|\geq M_n}) \leq \sum_{n=0}^{\infty} (n+1) \varepsilon \mu_n.
\]
and hence
\[
\sup_{f \in A} \mu(\varphi(|f|)) \leq \sum_{n=0}^{\infty} (n+1) \varepsilon \mu_n < \infty.
\]

Theorem 18.39 (Vitali Convergence Theorem). (Folland 6.15) Suppose that $1 \leq p < \infty$. A sequence $\{f_n\} \subset L^p$ is Cauchy iff

1. $\{f_n\}$ is $L^0$ - Cauchy,
2. $\{|f_n|^p\}$ is uniformly integrable.
3. For all $\varepsilon > 0$, there exists a set $E \in \mathcal{M}$ such that $\mu(E) < \infty$ and $\int_{E^c} |f_n|^p d\mu < \varepsilon$ for all $n$. (This condition is vacuous when $\mu(X) < \infty$.)

Proof. ($\Rightarrow$) Suppose $\{f_n\} \subset L^p$ is Cauchy. Then (1) $\{f_n\}$ is $L^0$ - Cauchy by Lemma 18.14. (2) By completeness of $L^p$, there exists $f \in L^p$ such that $\|f_n - f\|_p \to 0$ as $n \to \infty$. By the mean value theorem,
\[
\|f_n|^p - |f_n|^p \leq p(\max(|f|, |f_n|))^{p-1} \|f_n - f\| \leq p(|f| + |f_n|)^{p-1} \|f_n - f\|
\]
and therefore by Hölder’s inequality,
\[
\int \|f_n|^p - |f_n|^p d\mu \leq p \int (|f| + |f_n|)^{p-1} \|f_n - f\| d\mu \\
\leq p \|f_n - f\|_p \int (|f| + |f_n|)^{p-1} d\mu \\
\leq p \|f_n - f\|_p \int (|f| + |f_n|)^{p-1} d\mu \\
\leq p \|f_n - f\|_p \int (|f_n| + |f_n|)^{p-1} d\mu \\
\leq p \|f_n - f\|_p \int (|f_n| + |f_n|)^{p-1} d\mu \\
\leq p \|f_n - f\|_p \int (|f_n| + |f_n|)^{p-1} d\mu.
\]
where $q := p/(p-1)$. This shows that $\int \|f_n|^p - |f_n|^p d\mu \to 0$ as $n \to \infty$.\[3\] By the remarks prior to Definition 18.32, $\{f_n|^p\}$ is uniformly integrable. To verify

(3), for $M > 0$ and $n \in \mathbb{N}$ let $E_M = \{|f| \geq M\}$ and $E_M(n) = \{|f_n| \geq M\}$. Then $\mu(E_M) \leq \frac{1}{M^p} \|f\|_p^p < \infty$ and by the dominated convergence theorem,
\[
\int_{E_M^c} |f|^p d\mu = \int_{E_M^c} |f|^p 1_{|f| < M} d\mu \to 0 \text{ as } M \to 0.
\]

Moreover,
\[
\|f_n1_{E_M^c}|p \leq \|f1_{E_M^c}|p + \|(f_n - f)1_{E_M^c}|p \leq \|f1_{E_M^c}|p + \|f_n - f|p.
\]
(18.38)
So given $\varepsilon > 0$, choose $N$ sufficiently large such that for all $n \geq N$, $\|f_n - f|p < \varepsilon$. Then choose $M$ sufficiently small such that $\int_{E_M^c} |f|^p d\mu < \varepsilon$ and $\int_{E_M^c(n)} |f|^p d\mu < \varepsilon$ for all $n = 1, 2, \ldots, N - 1$. Letting $E := E_M \cup E_M(1) \cup \cdots \cup E_M(N - 1)$, we have
\[
\mu(E) < \infty, \quad \int_{E^c} |f_n|^p d\mu < \varepsilon \text{ for } n \leq N - 1
\]
and by Eq. (18.38)
\[
\int_{E^c} |f_n|^p d\mu < (\varepsilon^{1/p} + \varepsilon^{1/p})^p \leq 2^p \varepsilon \text{ for } n \geq N.
\]
Therefore we have found $E \in \mathcal{M}$ such that $\mu(E) < \infty$ and
\[
\sup_n \int_{E^c} |f_n|^p d\mu \leq 2^p \varepsilon
\]
which verifies (3) since $\varepsilon > 0$ was arbitrary. ($\Leftarrow$) Now suppose $\{f_n\} \subset L^p$ satisfies conditions (1) - (3). Let $\varepsilon > 0$, $E$ be as in (3) and
\[
A_{mn} := \{x \in E \mid f_m(x) - f_n(x) \geq \varepsilon\}.
\]
Then
\[
\|(f_n - f_m)1_{E^c}|p \leq \|f_n1_{E^c}|p + \|f_m1_{E^c}|p < 2 \varepsilon^{1/p}
\]
and
\[
\|f_n - f_m|p = \|(f_n - f_m)1_{E^c}|p + \|f_n - f_m1_{A_{mn}}|p
\]
\[
\leq \|(f_n - f_m)1_{E \setminus A_{mn}}|p + \|f_n - f_m1_{A_{mn}}|p + 2 \varepsilon^{1/p}.
\]
(18.39)
Using properties (1) and (3) and $1_{E \setminus \{f_n - f_m \leq \varepsilon\}|p \leq \varepsilon|p1 \leq L^1$, the dominated convergence theorem in Corollary 18.17 implies...
\[
\| (f_n - f_m) 1_{E \setminus A_{mn}} \|_p^p = \int 1_{E \setminus \{|f_n - f_m| < \varepsilon\}} |f_n - f_m|^p \to 0.
\]

which combined with Eq. (18.33) implies
\[
\limsup_{m,n \to \infty} \| f_n - f_m \|_p \leq \limsup_{m,n \to \infty} \| (f_n - f_m) 1_{A_{mn}} \|_p + 2\varepsilon^{1/p}.
\]

Finally
\[
\| (f_n - f_m) 1_{A_{mn}} \|_p \leq \| f_n 1_{A_{mn}} \|_p + \| f_m 1_{A_{mn}} \|_p \leq 2\delta(\varepsilon)
\]

where \( \delta(\varepsilon) := \sup_n \sup \{ \| f_n 1_E \|_p : E \in \mathcal{M} \ni \mu(E) \leq \varepsilon \} \)

By property (2), \( \delta(\varepsilon) \to 0 \) as \( \varepsilon \to 0 \). Therefore
\[
\limsup_{m,n \to \infty} \| f_n - f_m \|_p \leq 2\varepsilon^{1/p} + 2\delta(\varepsilon) \to 0 \quad \text{as} \quad \varepsilon \downarrow 0
\]

and therefore \( \{ f_n \} \) is \( L^p \)-Cauchy.

Here is another version of Vitali’s Convergence Theorem.

**Theorem 18.40 (Vitali Convergence Theorem).** *(This is problem 9 on p. 133 in Rudin.) Assume that \( \mu(X) < \infty \), \( \{ f_n \} \) is uniformly integrable, \( f_n \to f \) a.e. and \( |f| < \infty \) a.e., then \( f \in L^1(\mu) \) and \( f_n \to f \) in \( L^1(\mu) \).

**Proof.** Let \( \varepsilon > 0 \) be given and choose \( \delta > 0 \) as in the Eq. (18.33). Now use Egoroff’s Theorem [18.18] to choose a set \( E^c \) where \( \{ f_n \} \) converges uniformly on \( E^c \) and \( \mu(E) < \delta \). By uniform convergence on \( E^c \), there is an integer \( N < \infty \) such that \( |f_n - f_m| \leq 1 \) on \( E^c \) for all \( m, n \geq N \). Letting \( m \to \infty \), we learn that
\[
|f_N - f| \leq 1 \quad \text{on} \quad E^c.
\]

Therefore \(|f| \leq |f_N| + 1 \) on \( E^c \) and hence
\[
\mu(|f|) = \mu(|f| : E^c) + \mu(|f| : E) \leq \mu(|f_N|) + \mu(X) + \mu(|f| : E).
\]

Now by Fatou’s lemma,
\[
\mu(|f| : E) \leq \liminf_{n \to \infty} \mu(|f_n| : E) \leq 2\varepsilon < \infty
\]

by Eq. (18.33). This shows that \( f \in L^1 \). Finally
\[
\mu(|f_n - f_m|) = \mu(|f_n - f_m| : E^c) + \mu(|f_n - f_m| : E) \leq \mu(|f_n - f_m| : E^c) + \mu(|f| + |f_n| : E) \leq \mu(|f_n - f_m| : E^c) + 4\varepsilon
\]

and so by the Dominated convergence theorem we learn that
\[
\limsup_{n \to \infty} \mu(|f - f_n|) \leq 4\varepsilon.
\]

Since \( \varepsilon > 0 \) was arbitrary this completes the proof.

**Theorem 18.41 (Vitali again).** Suppose that \( f_n \to f \) in \( \mu \) measure and Eq. (18.35) holds, then \( f_n \to f \) in \( L^1 \).

**Proof.** This could of course be proved using 18.40 after passing to sub-sequences to get \( \{ f_n \} \) to converge a.s. However I wish to give another proof. First off, by Fatou’s lemma, \( f \in L^1(\mu) \). Now let
\[
\varphi_K(x) = x 1_{|x| \leq K} + K 1_{|x| > K}.
\]

then \( \varphi_K(f_n) \Rightarrow \varphi_K(f) \) because \( |\varphi_K(f) - \varphi_K(f_n)| \leq |f - f_n| \) and since
\[
|f - f_n| \leq |f - \varphi_K(f)| + |\varphi_K(f) - \varphi_K(f_n)| + |\varphi_K(f_n) - f_n|
\]

we have that
\[
\mu(|f - f_n|) \leq \mu(|f|) + \mu(|f - \varphi_K(f)|) + \mu(|\varphi_K(f) - \varphi_K(f_n)|) + \mu(|\varphi_K(f_n) - f_n|)
\]

\[
= \mu(|f| : |f| \geq K) + \mu(|f - \varphi_K(f)|) + \mu(|\varphi_K(f) - \varphi_K(f_n)|) + \mu(|f_n| : |f_n| \geq K).
\]

Therefore by the dominated convergence theorem
\[
\limsup_{n \to \infty} \mu(|f - f_n|) \leq \mu(|f| : |f| \geq K) + \limsup_{n \to \infty} \mu(|f_n| : |f_n| \geq K).
\]

This last expression goes to zero as \( K \to \infty \) by uniform integrability.

### 18.6 Exercises

**Definition 18.42.** The **essential range** of \( f \), \( essran(f) \), consists of those \( \lambda \in \mathbb{C} \) such that \( \mu(|f - \lambda| < \varepsilon) > 0 \) for all \( \varepsilon > 0 \).

**Definition 18.43.** Let \( (X, \tau) \) be a topological space and \( \nu \) be a measure on \( B_X = \sigma(\tau) \). The **support** of \( \nu \), \( \text{supp}(\nu) \), consists of those \( x \in X \) such that \( \nu(V) > 0 \) for all open neighborhoods, \( V \), of \( x \).

**Exercise 18.5.** Let \( (X, \tau) \) be a second countable topological space and \( \nu \) be a measure on \( B_X \) – the Borel \( \sigma \) – algebra on \( X \). Show

1. \( \text{supp}(\nu) \) is a closed set. (This is actually true on all topological spaces.)
2. $\nu(X \setminus \text{supp}(\nu)) = 0$ and use this to conclude that $W := X \setminus \text{supp}(\nu)$ is the largest open set in $X$ such that $\nu(W) = 0$. \textbf{Hint:} let $\mathcal{U} \subset \tau$ be a countable base for the topology $\tau$. Show that $W$ may be written as a union of elements from $V \in \mathcal{V}$ with the property that $\mu(V) = 0$.

\textbf{Exercise 18.6.} Prove the following facts about $\text{essran}(f)$.

1. Let $\nu = f_* \mu := \mu \circ f^{-1}$ a Borel measure on $\mathbb{C}$. Show $\text{essran}(f) = \text{supp}(\nu)$.
2. $\text{essran}(f)$ is a closed set and $f(x) \in \text{essran}(f)$ for almost every $x$, i.e. $\mu(f \notin \text{essran}(f)) = 0$.
3. If $F \subset \mathbb{C}$ is a closed set such that $f(x) \in F$ for almost every $x$ then $\text{essran}(f) \subset F$. So $\text{essran}(f)$ is the smallest closed set $F$ such that $f(x) \in F$ for almost every $x$.
4. $\|f\|_\infty = \sup \{|\lambda| : \lambda \in \text{essran}(f)\}$.

\textbf{Exercise 18.7.} Let $f \in L^p \cap L^\infty$ for some $p < \infty$. Show $\|f\|_\infty = \lim_{q \to \infty} \|f\|_q$. If we further assume $\mu(X) < \infty$, show $\|f\|_\infty = \lim_{q \to \infty} \|f\|_q$ for all measurable functions $f: X \to \mathbb{C}$. In particular, $f \in L^\infty$ iff $\lim_{q \to \infty} \|f\|_q < \infty$. \textbf{Hints:} Use Corollary 18.23 to show $\limsup_{q \to \infty} \|f\|_q \leq \|f\|_\infty$ and to show $\liminf_{q \to \infty} \|f\|_q \geq \|f\|_\infty$, let $M < \|f\|_\infty$ and make use of Chebyshev’s inequality.

\textbf{Exercise 18.8.} Prove Eq. (18.22) in Corollary 18.23 (Part of Folland 6.3 on p. 186.) \textbf{Hint:} Use the inequality, with $a, b \geq 1$ with $a^{-1} + b^{-1} = 1$ chosen appropriately,

$$st \leq \frac{s^a}{a} + \frac{t^b}{b},$$

(see Lemma 4.28 for Eq. (18.17)) applied to the right side of Eq. (18.21).

\textbf{Exercise 18.9.} Complete the proof of Proposition 18.22 by showing $(L^p + L^r, \|\cdot\|)$ is a Banach space. \textbf{Hint:} you may find using Theorem 14.13 is helpful here.

\textbf{Exercise 18.10.} Folland 6.5 on p. 186.

\textbf{Exercise 18.11.} By making the change of variables, $u = \ln x$, prove the following facts:

$$ \int_0^{1/2} x^{-a} |\ln x|^b \, dx < \infty \iff a < 1 \text{ or } a = 1 \text{ and } b < -1 $$
$$ \int_2^\infty x^{-a} |\ln x|^b \, dx < \infty \iff a > 1 \text{ or } a = 1 \text{ and } b < -1 $$
$$ \int_1^r x^{-a} |\ln x|^b \, dx < \infty \iff a < 1 \text{ and } b > -1 $$
$$ \int_0^\infty x^{-a} |\ln x|^b \, dx < \infty \iff a > 1 \text{ and } b > -1 $$

Suppose $0 < p_0 < p_1 \leq \infty$ and $m$ is Lebesgue measure on $(0, \infty)$. Use the above results to manufacture a function $f$ on $(0, \infty)$ such that $f \in L^p ((0, \infty), m)$ iff (a) $p \in (p_0, p_1)$, (b) $p \in [p_0, p_1]$ and (c) $p = p_0$.

\textbf{Exercise 18.12.} Folland 6.9 on p. 186.

\textbf{Exercise 18.14.} Let $(X, \mathcal{M}, \mu)$ and $(Y, \mathcal{N}, \nu)$ be $\sigma$-finite measure spaces, $f \in L^2(\nu)$ and $k \in L^2(\mu \otimes \nu)$. Show

$$ \int |k(x, y)f(y)| \, d\nu(y) < \infty \text{ for } \mu - \text{a.e. } x.$$ 

Let $Kf(x) := \int_Y k(x, y)f(y)\, d\nu(y)$ when the integral is defined. Show $Kf \in L^2(\mu)$ and $K : L^2(\nu) \to L^2(\mu)$ is a bounded operator with $\|K\|_{op} \leq \|k\|_{L^2(\mu \otimes \nu)}$.

\textbf{Exercise 18.16.} Folland 2.32 on p. 63.

\textbf{Exercise 18.17.} Folland 2.38 on p. 63.
Approximation Theorems and Convolutions

19.1 Density Theorems

In this section, \((X, \mathcal{M}, \mu)\) will be a measure space \(\mathcal{A}\) will be a subalgebra of \(\mathcal{M}\).

**Notation 19.1** Suppose \((X, \mathcal{M}, \mu)\) is a measure space and \(\mathcal{A} \subset \mathcal{M}\) is a subalgebra of \(\mathcal{M}\). Let \(\mathbb{S}(\mathcal{A})\) denote those simple functions \(\varphi : X \to \mathbb{C}\) such that \(\varphi^{-1}(\{\lambda\}) \in \mathcal{A}\) for all \(\lambda \in \mathbb{C}\) and let \(\mathbb{S}(\mathcal{A}, \mu)\) denote those \(\varphi \in \mathbb{S}(\mathcal{A})\) such that \(\mu(\varphi \neq 0) < \infty\).

**Remark 19.2.** For \(\varphi \in \mathbb{S}(\mathcal{A}, \mu)\) and \(p \in [1, \infty)\), \(|\varphi|^p = \sum_{z \neq 0} |z|^p \mathbb{1}_{\{\varphi = z\}}\) and hence
\[
\int |\varphi|^p d\mu = \sum_{z \neq 0} |z|^p \mu(\varphi = z) < \infty
\]
so that \(\mathbb{S}(\mathcal{A}, \mu) \subset L^p(\mu)\). Conversely if \(\varphi \in \mathbb{S}(\mathcal{A}) \cap L^p(\mu)\), then from Eq. \ref{eq:19.1} it follows that \(\mu(\varphi = z) < \infty\) for all \(z \neq 0\) and therefore \(\mu(\varphi \neq 0) < \infty\). Hence we have shown, for any \(1 \leq p < \infty\),
\[
\mathbb{S}(\mathcal{A}, \mu) = \mathbb{S}(\mathcal{A}) \cap L^p(\mu).
\]

**Lemma 19.3 (Simple Functions are Dense).** The simple functions, \(\mathbb{S}(\mathcal{A}, \mu)\), form a dense subspace of \(L^p(\mu)\) for all \(1 \leq p < \infty\).

**Proof.** Let \(\{\varphi_n\}_{n=1}^\infty\) be the simple functions in the approximation Theorem 44.34. Since \(|\varphi_n| \leq |f|\) for all \(n\), \(\varphi_n \in \mathbb{S}(\mathcal{A}, \mu)\) and
\[
|f - \varphi_n|^p \leq (|f| + |\varphi_n|)^p \leq 2^p |f|^p \in L^1(\mu).
\]
Therefore, by the dominated convergence theorem,
\[
\lim_{n \to \infty} \int |f - \varphi_n|^p d\mu = \int \lim_{n \to \infty} |f - \varphi_n|^p d\mu = 0.
\]

The goal of this section is to find a number of other dense subspaces of \(L^p(\mu)\) for \(p \in [1, \infty)\). The next theorem is the key result of this section.

**Theorem 19.4 (Density Theorem).** Let \(p \in [1, \infty)\), \((X, \mathcal{M}, \mu)\) be a measure space and \(\mathcal{M}\) be an algebra of bounded \(\mathbb{F}\) - valued (\(\mathbb{F} = \mathbb{R}\) or \(\mathbb{F} = \mathbb{C}\)) measurable functions such that

1. \(M \subset L^p(\mu, \mathbb{F})\) and \(\sigma(\mathcal{M}) = \mathcal{M}\).
2. There exists \(\psi_k \in M\) such that \(\psi_k \to 1\) boundedly.
3. If \(\mathbb{F} = \mathbb{C}\), we further assume that \(\mathcal{M}\) is closed under complex conjugation.

Then to every function \(f \in L^p(\mu, \mathbb{F})\), there exist \(\varphi_n \in M\) such that
\[
\lim_{n \to \infty} \|f - \varphi_n\|_{L^p(\mu)} = 0, \text{ i.e. } M \text{ is dense in } L^p(\mu, \mathbb{F})\).

**Proof.** Fix \(k \in \mathbb{N}\) for the moment and let \(\mathcal{H}\) denote those bounded \(\mathcal{M}\) - measurable functions, \(f : X \to \mathbb{F}\), for which there exists \(\{\varphi_n\}_{n=1}^\infty \subset M\) such that \(\lim_{n \to \infty} \|\psi_k f - \varphi_n\|_{L^p(\mu)} = 0\). A routine check shows \(\mathcal{H}\) is a subspace of \(\ell^\infty(\mathcal{M}, \mathbb{F})\) such that \(1 \in \mathcal{H}\), \(M \subset \mathcal{H}\) and \(\mathcal{H}\) is closed under complex conjugation if \(\mathbb{F} = \mathbb{C}\). Moreover, \(\mathcal{H}\) is closed under bounded convergence. To see this suppose
\[
\psi_n \in \mathcal{H}\) and \(\psi_n \to f\) boundedly. Then, by the dominated convergence theorem,
\[
\lim_{n \to \infty} \|\psi_k (f - \psi_n)\|_{L^p(\mu)} = 0
\]
(\(\text{Take the dominating function to be } g = [2C|\psi_k|^p\) where \(C\) is a constant bounding all of the \(\{|f_n|\}_{n=1}^\infty\)). We may now choose \(\varphi_n \in M\) such that \(\|\varphi_n - \psi_k \psi_n\|_{L^p(\mu)} \leq \frac{1}{n}\), then
\[
\limsup_{n \to \infty} \|\psi_k f - \varphi_n\|_{L^p(\mu)} \leq \limsup_{n \to \infty} \|\psi_k (f - \psi_n)\|_{L^p(\mu)} + \limsup_{n \to \infty} \|\psi_k \psi_n - \varphi_n\|_{L^p(\mu)} = 0
\]
which implies \(f \in \mathcal{H}\). An application of Dynkin’s Multiplicative System Theorem 11.26 if \(\mathbb{F} = \mathbb{R}\) or Theorem 11.27 if \(\mathbb{F} = \mathbb{C}\) now shows \(\mathcal{H}\) contains all bounded measurable functions on \(X\).

Let \(f \in L^p(\mu)\) be given. The dominated convergence theorem implies
\[
\lim_{k \to \infty} \|\psi_k 1_{\{|f| \leq k\}} f - f\|_{L^p(\mu)} = 0.
\]
(\(\text{Take the dominating function to be } g = [2C|f|^p\) where \(C\) is a bound on all of the \(\{|\psi_k|\}\) Using this and what we have just proved, there exists \(\varphi_k \in M\) such that
\[
\|\psi_k 1_{\{|f| \leq k\}} f - \varphi_k\|_{L^p(\mu)} \leq \frac{1}{k}
\]
The same line of reasoning used in Eq. \ref{eq:19.2} now implies
\[
\lim_{k \to \infty} \|f - \varphi_k\|_{L^p(\mu)} = 0.
\]
1 It is at this point that the proof would break down if \(p = \infty\).
Exercise 19.1. Show that $M = \psi_{\varepsilon}(x)$ such that $\int_{|x|} |f| \, d\mu < \infty$ for all compact subsets $K \subset X$. We will write $L^1_{\text{loc}}(\mu)$ for the space of locally integrable functions. More generally we say $f \in L^p_{\text{loc}}(\mu)$ iff $\|f\|_{L^p(\mu)} < \infty$ for all compact subsets $K \subset X$.

Definition 19.6. Let $(X, \tau)$ be a topological space. A $K$-finite measure on $X$ is a measure $\mu$ such that $\mu(K) < \infty$ for all compact subsets $K \subset X$.

Lemma 19.11. Let $(X, \tau)$ be a second countable locally compact Hausdorff space and $\mu : B_X \to [0, \infty]$ be a $K$-finite measure on $X$. If $h \in L^1(\mu)$ is a function such that
\[
\int_X fhd\mu = 0 \text{ for all } f \in C_c(X) \tag{19.3}
\]
then $h(x) = 0$ for $\mu$ - a.e. $x$. (See also Corollary 27.20 below.)

Proof. Let $dv(x) = |h(x)| \, dx$, then $\nu$ is a $K$-finite measure on $X$ and hence $C_c(X)$ is dense in $L^1(\nu)$ by Theorem 19.8. Notice that
\[
\int_X f \cdot \text{sgn}(h)dv = \int_X fhd\mu = 0 \text{ for all } f \in C_c(X). \tag{19.4}
\]
Let $\{K_k\}_{k=1}^\infty$ be a sequence of compact sets such that $K_k \uparrow X$ as in Lemma 24.5. Then $1_{K_k} \text{sgn}(h) \in L^1(\nu)$ and therefore there exists $f_m \in C_c(X)$ such that $f_m \to 1_{K_k} \text{sgn}(h)$ in $L^1(\nu)$. So by Eq. (19.4),
\[
\nu(K_k) = \int_X 1_{K_k}dv = \lim_{m \to \infty} \int_X f_m \text{sgn}(h)dv = 0.
\]
Since $K_k \uparrow X$ as $k \to \infty$, $0 = \nu(X) = \int_X |h| \, d\mu$, i.e. $h(x) = 0$ for $\mu$ - a.e. $x$. ■

As an application of Lemma 19.11 and Example 25.34 we will show that the Laplace transform is injective.

Theorem 19.12 (Injectivity of the Laplace Transform). For $f \in L^1([0, \infty), dx)$, the Laplace transform of $f$ is defined by
\[
Lf(\lambda) := \int_0^\infty e^{-\lambda x} f(x) \, dx \text{ for all } \lambda > 0.
\]
If $Lf(\lambda) := 0$ then $f(x) = 0$ for $m$ - a.e. $x$.

Proof. Suppose that $f \in L^1([0, \infty), dx)$ such that $Lf(\lambda) \equiv 0$. Let $g \in C_0([0, \infty), \mathbb{R})$ and $\varepsilon > 0$ be given. By Example 25.34 we may choose $\{\alpha_k\}_{k=1}^\infty$ such that $\#(\{\lambda > 0 : \alpha_k \neq 0\}) < \infty$ and
\[
|g(x) - \sum_{\lambda > 0} \alpha_k e^{-\lambda x}| < \varepsilon \text{ for all } x \geq 0.
\]
Let $M := BC_f(X)$ be a metric space, $\tau_d$ be the topology on $X$ generated by $d$ and $B_X = \sigma(\tau_d)$ be the Borel $\sigma$-algebra. Suppose $\mu : B_X \to [0, \infty]$ is a measure which is $\sigma$-finite on $\tau_d$ and let $BC_f(X)$ denote the bounded continuous functions on $X$ such that $\mu(f \neq 0) < \infty$. Then $BC_f(X)$ is a dense subspace of $L^p(\mu)$ for any $p \in [1, \infty)$.

**Proof.** Let $X_k \in \tau_d$ be open sets such that $X_k \uparrow X$ and $\mu(X_k) < \infty$ and let

$$\psi_k(x) = \min(1, k \cdot d_{X_k}(x)) = \varphi_k(d_{X_k}(x)),$$

see Figure 19.1 below. It is easily verified that $M := BC_f(X)$ is an algebra, $\psi_k \in M$ for all $k$ and $\psi_k \to 1$ boundedly as $k \to \infty$. Given $V \in \tau$ and $k, n \in \mathbb{N}$, let

$$f_{k,n}(x) := \min(1, n \cdot d(V \cap X_k)(x)).$$

Then $\{f_{k,n} \neq 0\} = V \cap X_k$ so $f_{k,n} \in BC_f(X)$. Moreover

$$\lim_{k \to \infty} \lim_{n \to \infty} f_{k,n} = \lim_{k \to \infty} 1_{V \cap X_k} = 1_V$$

which shows $V \in \sigma(M)$ and hence $\sigma(M) = B_X$. The proof is now completed by an application of Theorem 19.4.

**Exercise 19.2.** (BRUCE: Should drop this exercise.) Suppose that $(X, d)$ is a metric space, $\mu$ is a measure on $B_X := \sigma(\tau_d)$ which is finite on bounded measurable subsets of $X$. Show $BC_b(X, \mathbb{R})$, defined in Eq. (45.18), is dense in $L^p(\mu)$. **Hints:** let $\psi_k$ be as defined in Eq. (45.19) which incidentally may be used to show $\sigma(BC_b(X, \mathbb{R})) = \sigma(BC(X, \mathbb{R}))$. Then use the argument in the proof of Corollary 11.30 to show $\sigma(BC(X, \mathbb{R})) = B_X$.

**Theorem 19.14.** Suppose $p \in [1, \infty)$, $A \subset M$ is an algebra such that $\sigma(A) = M$ and $\mu$ is $\sigma$-finite on $A$. Then $S_f(A, \mu)$ is dense in $L^p(\mu)$. (See also Remark 11.3 above.)

**Proof.** Let $M := S_f(A, \mu)$. By assumption there exists $X_k \subset A$ such that $\mu(X_k) < \infty$ and $X_k \uparrow X$ as $k \to \infty$. If $A \subset A$, then $X_k \cap A \in A$ and $\mu(X_k \cap A) < \infty$ so that $1_{X_k \cap A} \in M$. Therefore $1_A = \lim_{k \to \infty} 1_{X_k \cap A}$ is $\sigma(M)$-measurable for every $A \subset A$. So we have shown that $A \subset \sigma(M) \subset M$ and therefore $M = \sigma(A) \subset \sigma(M) \subset M$, i.e. $\sigma(M) = M$. The theorem now follows from Theorem 19.1 after observing $\psi_k := 1_{X_k} \in M$ and $\psi_k \to 1$ boundedly.

**Theorem 19.15 (Separability of $L^p$ – Spaces).** Suppose, $p \in [1, \infty)$, $A \subset M$ is a countable algebra such that $\sigma(A) = M$ and $\mu$ is $\sigma$-finite on $A$. Then $L^p(\mu)$ is separable and

$$D = \{\sum a_j 1_{A_j} : a_j \in \mathbb{Q} + i\mathbb{Q}, A_j \in A \text{ with } \mu(A_j) < \infty\}$$

is a countable dense subset.

**Proof.** It is left to reader to check $D$ is dense in $S_f(A, \mu)$ relative to the $L^p(\mu)$-norm. The proof is then complete since $S_f(A, \mu)$ is a dense subspace of $L^p(\mu)$ by Theorem 19.14.

**Example 19.16.** The collection of functions of the form $\varphi = \sum_{k=1}^\infty c_k 1_{[a_k,b_k]}$ with $a_k, b_k \in \mathbb{Q}$ and $a_k < b_k$ are dense in $L^p(\mathbb{R}, \mathbb{B}_\mathbb{R}, m; \mathbb{C})$ and $L^p(\mathbb{R}, \mathbb{B}_\mathbb{R}, m; \mathbb{C})$ is separable for any $p \in [1, \infty)$. To prove this simply apply Theorem 19.14 with $A$ being the algebra on $\mathbb{R}$ generated by the half open intervals $(a, b] \subset \mathbb{R}$ with $a < b$ and $a, b \in \mathbb{Q} \cup \{\pm \infty\}$, i.e. $A$ consists of sets of the form $\bigcup_{k=1}^\infty (a_k, b_k] \subset \mathbb{R}$, where $a_k, b_k \in \mathbb{Q} \cup \{\pm \infty\}$.

**Exercise 19.3.** Show $L^\infty([0, 1], \mathbb{B}_\mathbb{R}, m; \mathbb{C})$ is not separable. **Hint:** Consider $\Gamma$ to be a dense subset of $L^\infty([0, 1], \mathbb{B}_\mathbb{R}, m; \mathbb{C})$ and for $\lambda \in (0, 1)$, let $f_\lambda(x) := \chi_{[0, \lambda]}(x)$. For each $\lambda \in (0, 1)$, choose $g_\lambda \in \Gamma$ such that $\|f_\lambda - g_\lambda\|_\infty < 1/2$ and then show the map $\lambda \in (0, 1) \mapsto g_\lambda \in \Gamma$ is injective. Use this to conclude that $\Gamma$ must be uncountable.

**Corollary 19.17 (Riemann Lebesgue Lemma).** Suppose that $f \in L^1(\mathbb{R}, m)$, then

$$\lim_{\lambda \to \pm \infty} \int_{\mathbb{R}} f(x)e^{i\lambda x} dm(x) = 0.$$
Corollary 19.18. Suppose $A \subset \mathcal{M}$ is an algebra such that $\sigma(A) = \mathcal{M}$ and $\mu$ is $\sigma$-finite on $A$. Then for every $B \in \mathcal{M}$ such that $\mu(B) < \infty$ and $\varepsilon > 0$ there exists $D \in A$ such that $\mu(B \Delta D) < \varepsilon$. (See also Remark 18.4 below.)

Proof. By Theorem 19.14 there exists a collection, $\{A_i\}_{i=1}^n$, of pairwise disjoint subsets of $A$ and $\lambda_i \in \mathbb{R}$ such that $\int_X |1_B - f| \, d\mu < \varepsilon$ where $f = \sum_{i=1}^n \lambda_i 1_{A_i}$. Let $A_0 := X \setminus \bigcup_{i=1}^n A_i \in A$ then

$$
\int_X |1_B - f| \, d\mu = \sum_{i=0}^n \int_{A_i} |1_B - f| \, d\mu
$$

$$
= \mu(A_0 \cap B) + \sum_{i=1}^n \left[ \int_{A_i \cap B} |1_B - \lambda_i| \, d\mu + \int_{A_i \setminus B} |1_B - \lambda_i| \, d\mu \right]
$$

$$
\geq \mu(A_0 \cap B) + \sum_{i=1}^n \min \{\mu(B \cap A_i), \mu(A_i \setminus B)\}
$$

(19.5)

where the last equality is a consequence of the fact that $1 \leq |\lambda_i| + |1 - \lambda_i|$. Let

$$
\alpha_i = \begin{cases} 0 & \text{if } \mu(B \cap A_i) < \mu(A_i \setminus B) \\ 1 & \text{if } \mu(B \cap A_i) \geq \mu(A_i \setminus B) 
\end{cases}
$$

and $g = \sum_{i=1}^n \alpha_i 1_{A_i} = 1_D$ where

$$
D := \bigcup \{A_i : i > 0 \& \alpha_i = 1\} \in A.
$$

Equation (19.5) with $\lambda_i$ replaced by $\alpha_i$ and $f$ by $g$ implies

$$
\int_X |1_B - 1_D| \, d\mu = \mu(A_0 \cap B) + \sum_{i=1}^n \min \{\mu(B \cap A_i), \mu(A_i \setminus B)\}.
$$

The latter expression, by Eq. (19.6), is bounded by $\int_X |1_B - f| \, d\mu < \varepsilon$ and therefore,

$$
\mu(B \Delta D) = \int_X |1_B - 1_D| \, d\mu < \varepsilon.
$$

Remark 19.19. We have to assume that $\mu(B) < \infty$ as the following example shows. Let $X = \mathbb{R}$, $\mathcal{M} = \mathcal{B}$, $\mu = m$, $A$ be the algebra generated by half open intervals of the form $(a,b]$, and $B = \cup_{n=1}^{\infty} (2n, 2n+1]$. It is easily checked that for every $D \in A$, that $m(B \Delta D) = \infty$.

19.2 Convolution and Young’s Inequalities

Throughout this section we will be solely concerned with $d$-dimensional Lebesgue measure, $m$, and we will simply write $L^p$ for $L^p(\mathbb{R}^d, m)$. 
Definition 19.20 (Convolution). Let \( f, g : \mathbb{R}^d \to \mathbb{C} \) be measurable functions. We define
\[
f \ast g(x) = \int_{\mathbb{R}^d} f(x - y)g(y)dy
\]
whenever the integral is defined, i.e. either \( f(x - \cdot)g(\cdot) \in L^1(\mathbb{R}^d, m) \) or \( f(x - \cdot)g(\cdot) \geq 0 \). Notice that the condition that \( f(x - \cdot)g(\cdot) \in L^1(\mathbb{R}^d, m) \) is equivalent to writing \( |f| \ast |g| (x) < \infty \). By convention, if the integral in Eq. \[19.7\] is not defined, let \( f \ast g(x) := 0 \).

Notation 19.21 Given a multi-index \( \alpha \in \mathbb{Z}^d_+ \), let \( |\alpha| = \alpha_1 + \cdots + \alpha_d \),
\[
x^\alpha := \prod_{j=1}^d x_j^{\alpha_j}, \text{ and } \partial_x^\alpha = \left( \frac{\partial}{\partial x} \right)^\alpha := \prod_{j=1}^d \left( \frac{\partial}{\partial x_j} \right)^{\alpha_j}.
\]
For \( z \in \mathbb{R}^d \) and \( f : \mathbb{R}^d \to \mathbb{C} \), let \( \tau_z f : \mathbb{R}^d \to \mathbb{C} \) be defined by \( \tau_z f(x) = f(x - z) \).

Remark 19.22 (The Significance of Convolution).

1. Suppose that \( f, g \in L^1(m) \) are positive functions and let \( \mu \) be the measure on \( (\mathbb{R}^d)^2 \) defined by
\[
d\mu((x, y)) := f(x)g(y)dm(x)dm(y).
\]
Then if \( h : \mathbb{R} \to [0, \infty] \) is a measurable function we have
\[
\int_{(\mathbb{R}^d)^2} h(x + y)d\mu(x, y) = \int_{(\mathbb{R}^d)^2} h(x + y)f(x)g(y)dm(x)dm(y)
\]
\[
= \int_{(\mathbb{R}^d)^2} h(x)f(x - y)g(y)dm(x)dm(y)
\]
\[
= \int_{\mathbb{R}^d} h(x)f(x - y)g(y)dy.
\]
In other words, this shows the measure \( (f \ast g)m \) is the same as \( S \mu \) where \( S(x, y) := x + y \). In probability lingo, the distribution of a sum of two “independent” (i.e. product measure) random variables is the the convolution of the individual distributions.

2. Suppose that \( L = \sum_{|\alpha| \leq k} \alpha \partial^\alpha \) is a constant coefficient differential operator and suppose that we can solve (uniquely) the equation \( Lu = g \) in the form
\[
u(x) = Kg(x) := \int_{\mathbb{R}^d} k(x, y)g(y)dy
\]
where \( k(x, y) \) is an “integral kernel.” (This is a natural sort of assumption since, in view of the fundamental theorem of calculus, integration is the inverse operation to differentiation.) Since \( \tau_z L = L \tau_z \) for all \( z \in \mathbb{R}^d \), (this is another way to characterize constant coefficient differential operators) and \( L^{-1} = K \) we should have \( \tau_z K = K \tau_z \). Writing out this equation then says
\[
\int_{\mathbb{R}^d} \kappa(x - z, y)g(y)dy = (Kg)(x - z) = \tau_z Kg(x) = (K\tau_z g)(x)
\]
\[
= \int_{\mathbb{R}^d} k(x, y)g(y - z)dy = \int_{\mathbb{R}^d} k(x, y + z)g(y)dy.
\]
Since \( g \) is arbitrary we conclude that \( k(x - z, y) = k(x, y + z) \). Taking \( y = 0 \) then gives
\[
k(x, z) = k(x - z, 0) := \rho(x - z).
\]
We thus find that \( K\rho = \rho \ast g \). Hence we expect the convolution operation to appear naturally when solving constant coefficient partial differential equations. More about this point later.

Proposition 19.23. Suppose \( p \in [1, \infty] \), \( f \in L^1 \) and \( g \in L^p \), then \( f \ast g(x) \) exists for almost every \( x \), \( f \ast g \in L^p \) and
\[
\|f \ast g\|_p \leq \|f\|_1 \|g\|_p.
\]

Proof. This follows directly from Minkowski’s inequality for integrals, Theorem 18.27. \( \square \)

Proposition 19.24. Suppose that \( p \in [1, \infty] \), then \( \tau_z : L^p \to L^p \) is an isometric isomorphism and for \( f \in L^p \), \( z \in \mathbb{R}^d \rightarrow \tau_z f \in L^p \) is continuous.

Proof. The assertion that \( \tau_z : L^p \to L^p \) is an isometric isomorphism follows from translation invariance of Lebesgue measure and the fact that \( \tau_{-z} \circ \tau_z = \text{id} \). For the continuity assertion, observe that
\[
\|\tau_z f - \tau_y f\|_p = \|\tau_{z-y}(\tau_z f - \tau_y f)\|_p = \|\tau_{z-y}f - f\|_p
\]
from which it follows that it is enough to show \( \tau_z f \to f \) in \( L^p \) as \( z \to 0 \in \mathbb{R}^d \).
When \( f \in C_c(\mathbb{R}^d) \), \( \tau_z f \to f \) uniformly and since the \( K := \cup_{|\alpha| \leq 1}\text{supp}(\tau_z f) \) is compact, it follows by the dominated convergence theorem that \( \tau_z f \to f \) in \( L^p \) as \( z \to 0 \in \mathbb{R}^d \). For general \( g \in L^p \) and \( f \in C_c(\mathbb{R}^d) \),
\[
\|\tau_z g - g\|_p \leq \|\tau_z g - \tau_z f\|_p + \|\tau_z f - f\|_p + \|f - g\|_p
\]
and thus
\[
\limsup_{z \to 0} \|\tau_z g - g\|_p \leq \limsup_{z \to 0} \|\tau_z f - f\|_p + 2\|f - g\|_p = 2\|f - g\|_p.
\]
Because \( C_c(\mathbb{R}^d) \) is dense in \( L^p \), the term \( \|f - g\|_p \) may be made as small as we please. \( \square \)
Exercise 19.4. Let $p \in [1, \infty]$ and $\|\tau_z - I\|_{L^p(m)}$ be the operator norm $\tau_z - I$. Show $\|\tau_z - I\|_{L^p(m)} = 2$ for all $z \in \mathbb{R}^d \setminus \{0\}$ and conclude from this that $z \in \mathbb{R}^d \to \tau_z \in L(L^p(m))$ is not continuous.

Hints: 1) Show $\|\tau_z - I\|_{L^p(m)} = \|\tau_z|_{\mathbb{R}^d} - I\|_{L^p(m)}$. 2) Let $z = te_1$ with $t > 0$ and look for $f \in L^p(m)$ such that $\tau_z f$ is approximately equal to $-f$.

(In fact, if $p = \infty$, you can find $f \in L^\infty(m)$ such that $\tau_z f = -f$.) (BRUCE: add on a problem somewhere showing that $\sigma(\tau_z) = S^1 \subset \mathbb{C}$.

This is very simple to prove if $p = 2$ by using the Fourier transform.)

Definition 19.25. Suppose that $(X, \tau)$ is a topological space and $\mu$ is a measure on $\mathcal{B}_X = \sigma(\tau)$. For a measurable function $f : X \to \mathbb{C}$ we define the essential support of $f$

$$\text{supp}_e(f) = \{x \in X : \mu(\{y \in V : f(y) \neq 0\}) > 0 \text{ for all neighborhoods } V \text{ of } x\}.$$  \hspace{1cm} (19.8)

Equivalently, $x \notin \text{supp}_e(f)$ iff there exists an open neighborhood $V$ of $x$ such that $1_V f = 0$ a.e.

It is not hard to show that if $\text{supp}(\mu) = X$ (see Definition 18.43) and $f \in C(X)$ then $\text{supp}_e(f) = \text{supp}(f) := \{f \neq 0\}$, see Exercise 19.7.

Lemma 19.26. Suppose $(X, \tau)$ is second countable and $f : X \to \mathbb{C}$ is a measurable function and $\mu$ is a measure on $\mathcal{B}_X$. Then $X := U \setminus \text{supp}_e(f)$ may be described as the largest open set $W$ such that $f|_W(x) = 0$ for $\mu - \text{a.e. } x$. Equivalently put, $C := \text{supp}_\mu(f)$ is the smallest closed subset of $X$ such that $f = f|_C$ a.e.

Proof. To verify that the two descriptions of $\text{supp}_\mu(f)$ are equivalent, suppose $\text{supp}_\mu(f)$ is defined as in Eq. (19.8) and $W := X \setminus \text{supp}_\mu(f)$. Then

$$W = \{x \in X : \exists \tau \ni V \ni x \text{ such that } \mu(\{y \in V : f(y) \neq 0\}) = 0\}$$

$$= \cup \{V \subset \tau : \mu(f|_V \neq 0) = 0\}$$

$$= \cup \{V \subset \tau : f|_V = 0 \text{ for } \mu \text{- a.e.}\}.$$  \hspace{1cm} (19.8)

So to finish the argument it suffices to show $\mu(f|_W \neq 0) = 0$. To this let $U$ be a countable base for $\tau$ and set $U_f := \{V \in U : f|_V = 0 \text{ a.e.}\}$.

Then it is easily seen that $W = \cup U_f$ and since $U_f$ is countable

$$\mu(f|_W \neq 0) \leq \sum_{V \in U_f} \mu(f|_V \neq 0) = 0.$$  \hspace{1cm} (19.8)

Lemma 19.27. Suppose $f, g, h : \mathbb{R}^d \to \mathbb{C}$ are measurable functions and assume that $x$ is a point in $\mathbb{R}^d$ such that $|f| g(x) < \infty$ and $|f| (|g| * |h|)(x) < \infty$, then

1. $f * (g * x) = (f * g)(x)$
2. $f * (g * h)(x) = (f * g) * h(x)$
3. If $x \in \mathbb{R}^d$ and $\tau_z(|f| |g|)(x) = |f| |g|(x - z) < \infty$, then

$$\tau_z(f * g)(x) = \tau_z f * g(x) = f * \tau_z g(x)$$

4. If $x \notin \text{supp}_m(f) \cup \text{supp}_m(g)$ then $f * g(x) = 0$ and in particular,

$$\text{supp}_m(f * g) \subset \text{supp}_m(f) \cup \text{supp}_m(g)$$

where in defining $\text{supp}_m(f * g)$ we will use the convention that “$f * g(x) \neq 0$” when $|f| |g|(x) = \infty$.

Proof. For item 1.,

$$|f| |g|(x) = \int_{\mathbb{R}^d} |f|(x - y) |g|(y) dy = \int_{\mathbb{R}^d} |f|(y) |g|(y - x) dy = |g| * |f|(x)$$

where in the second equality we made use of the fact that Lebesgue measure invariant under the transformation $y \to x - y$. Similar computations prove all of the remaining assertions of the first three items of the lemma. Item 4. Since $f * g(x) = f * g(x)$ if $f = f$ and $g = g$ a.e. we may, by replacing $f$ by $f|_{\text{supp}_m(f)}$ and $g$ by $g|_{\text{supp}_m(g)}$ if necessary, assume that $\{f \neq 0\} \subset \text{supp}_m(f)$ and $\{g \neq 0\} \subset \text{supp}_m(g)$.

So if $x \notin \{f \neq 0\} \cup \{g \neq 0\}$ and for all $y \in \mathbb{R}^d$, either $x - y \notin \{f \neq 0\}$ or $y \notin \{g \neq 0\}$. That is to say either $x - y \in \{f = 0\}$ or $y \in \{g = 0\}$ and hence $f(x - y) g(y) = 0$ for all $y$ and therefore $f * g(x) = 0$. This shows that $f * g(x) = 0$ in $\mathbb{R}^d \setminus \bigl(\text{supp}_m(f) \cup \text{supp}_m(g)\bigr)$ and therefore

$$\mathbb{R}^d \setminus \left(\text{supp}_m(f) \cup \text{supp}_m(g)\right) \subset \mathbb{R}^d \setminus \text{supp}_m(f * g),$$

i.e. $\text{supp}_m(f * g) \subset \text{supp}_m(f) \cup \text{supp}_m(g)$.

Remark 19.28. Let $A, B$ be closed sets of $\mathbb{R}^d$, it is not necessarily true that $A + B$ is still closed. For example, take $A = \{(x, y) : x > 0 \text{ and } y \geq 1/x\}$ and $B = \{(x, y) : x > 0 \text{ and } y \geq 1/|x|\}$, then every point of $A + B$ has a positive $y$-component and hence is not closed. On the other hand, for $x > 0$ we have $(x, 1/x) + (-x, 1/x) = (0, 2/x) \in A + B$ for all $x$ and hence $0 \in A + B$ showing $A + B$ is not closed. Nevertheless if one of the sets $A$ or $B$ is compact, then $A + B$ is closed again. Indeed, if $A$ is compact
and \( x_n = a_n + b_n \in A + B \) and \( x_n \to x \in \mathbb{R}^d \), then by passing to a subsequence if necessary we may assume \( \lim_{n \to \infty} a_n = a \in A \) exists. In this case
\[
\lim_{n \to \infty} b_n = \lim_{n \to \infty} (x_n - a_n) = x - a \in B
\]
exists as well, showing \( x = a + b \in A + B \).

**Proposition 19.29.** Suppose that \( p, q \in [1, \infty] \) and \( p \) and \( q \) are conjugate exponents, \( f \in L^p \) and \( g \in L^q \), then \( f * g \in C(\mathbb{R}^d) \), \( \| f * g \|_\infty \leq \| f \|_p \| g \|_q \) and if \( p, q \in (1, \infty) \) then \( f * g \in C_0(\mathbb{R}^d) \).

**Proof.** The existence of \( f * g(x) \) and the estimate \( |f * g|(x) \leq \| f \|_p \| g \|_q \) for all \( x \in \mathbb{R}^d \) is a simple consequence of Hölder's inequality and the translation invariance of Lebesgue measure. In particular this shows \( \| f * g \|_\infty \leq \| f \|_p \| g \|_q \).

By relabeling \( p \) and \( q \) if necessary we may assume that \( p \in (1, \infty) \). Since
\[
\| \tau_z (f * g) - f * g \|_u = \| \tau_z f * g - f * g \|_u \\
\leq \| \tau_z f - f \|_p \| g \|_q \to 0 \text{ as } z \to 0
\]
it follows that \( f * g \) is uniformly continuous. Finally if \( p, q \in (1, \infty) \), we learn from Lemma 19.27 and what we have just proved that \( f_m * g_m \in C(\mathbb{R}^d) \) where \( f_m = f 1_{|f| \leq m} \) and \( g_m = g 1_{|g| \leq m} \). Moreover,
\[
\| f * g - f_m * g_m \|_\infty \leq \| f * g - f_m * g \|_\infty + \| f_m * g - f_m * g_m \|_\infty \\
\leq \| f - f_m \|_p \| g \|_q + \| f_m \|_p \| g - g_m \|_q \\
\leq \| f - f_m \|_p \| g \|_q + \| f \|_p \| g - g_m \|_q \to 0 \text{ as } m \to \infty
\]
showing, with the aid of Proposition 25.23, \( f * g \in C_0(\mathbb{R}^d) \). \( \blacksquare \)

**Theorem 19.30 (Young’s Inequality).** Let \( p, q, r \in [1, \infty] \) satisfy
\[
\frac{1}{p} + \frac{1}{q} = 1 + \frac{1}{r}. \tag{19.9}
\]
If \( f \in L^p \) and \( g \in L^q \) then \( |f| \| g \| < \infty \) for \( m - a.e. \) \( x \) and
\[
\| f * g \| \leq \| f \|_p \| g \|_q. \tag{19.10}
\]
In particular \( L^1 \) is closed under convolution. (The space \( (L^1, \ast) \) is an example of a “Banach algebra” without unit.)

**Remark 19.31.** Before going to the formal proof, let us first understand Eq. 19.9 by the following scaling argument. For \( \lambda > 0 \), let \( f_\lambda(x) := f(\lambda x) \), then after a few simple change of variables we find
\[
\| f_\lambda \|_p = \lambda^{-d/p} \| f \| \text{ and } (f * g)_\lambda = \lambda^d (f * g).
\]
Therefore if Eq. 19.10 holds for some \( p, q, r \in [1, \infty] \), we would also have
\[
\| f * g \|_r = \lambda^{d/r} \| (f * g)_\lambda \|_r \leq \lambda^{d/r} \lambda^d \| f \|_p \| g \|_q = (\lambda^{d/d} + \lambda^{r/d} - d/q) \| f \|_p \| g \|_q
\]
for all \( \lambda > 0 \). This is only possible if Eq. 19.9 holds.

**Proof.** By the usual sorts of arguments, we may assume \( f \) and \( g \) are positive functions. Let \( \alpha, \beta \in [0, 1] \) and \( p_1, p_2 \in (0, \infty) \) satisfy \( p_1^{-1} + p_2^{-1} = r^{-1} = 1 \). Then by Hölder’s inequality, Corollary 18.3,
\[
f * g(x) = \int_{\mathbb{R}^d} \left[ f(x - y)^{(1-\alpha)} g(y)^{(1-\beta)} \right] f(x - y)^\alpha g(y)^\beta dy
\]
\[
\leq \left( \int_{\mathbb{R}^d} f(x - y)^{(1-\alpha)r} g(y)^{(1-\beta)r} dy \right)^{1/r} \left( \int_{\mathbb{R}^d} f(x - y)^{\alpha p_1} dy \right)^{1/p_1}
\]
\[
\times \left( \int_{\mathbb{R}^d} g(y)^{\beta p_2} dy \right)^{1/p_2}
\]
\[
= \left( \int_{\mathbb{R}^d} f(x - y)^{(1-\alpha)} g(y)^{(1-\beta)} dy \right)^{1/r} \| f \|_{\alpha p_1} \| g \|_{\beta p_2}.
\]
Taking the \( r \)th power of this equation and integrating on \( x \) gives
\[
\| f * g \| r^r \leq \left( \int_{\mathbb{R}^d} f(x - y)^{(1-\alpha)r} g(y)^{(1-\beta)r} dy \right) dx \cdot \| f \|_{\alpha p_1} \| g \|_{\beta p_2}
\]
\[
= \| f \|_{(1-\alpha)r} \| g \|_{(1-\beta)r} \| f \|_{\alpha p_1} \| g \|_{\beta p_2}.
\]
Let us now suppose, \((1-\alpha)r = \alpha p_1\) and \((1-\beta)r = \beta p_2\), in which case Eq. 19.11 becomes,
\[
\| f * g \| r \leq \| f \|_{\alpha p_1} \| g \|_{\beta p_2}
\]
which is Eq. 19.10 with
\[
p := (1-\alpha)r = \alpha p_1 \quad q := (1-\beta)r = \beta p_2. \tag{19.12}
\]
So to finish the proof, it suffices to show \( p \) and \( q \) are arbitrary indices in \([1, \infty)\) satisfying \( p^{-1} + q^{-1} = 1 + r^{-1} \). If \( \alpha, \beta, p_1, p_2 \) satisfy the relations above, then
\[
\alpha = \frac{r}{r + p_1} \quad \beta = \frac{r}{r + p_2}
\]
and
\[
\frac{1}{r} + \frac{1}{q} = \frac{1}{r} + \frac{1}{\alpha p_1} + \frac{1}{\alpha p_2} = \frac{r + p_1}{r} + \frac{r + p_2}{r} = \frac{1}{p_1} + \frac{1}{p_2} + \frac{2}{r} = 1 + \frac{1}{r}.
\]
Conversely, if \( p, q, r \) satisfy Eq. \((19.9)\), then let \( \alpha \) and \( \beta \) satisfy \( p = (1 - \alpha)r \) and \( q = (1 - \beta)r \), i.e.

\[
\alpha := \frac{r - p}{r} = 1 - \frac{p}{r} \leq 1 \quad \text{and} \quad \beta = \frac{r - q}{r} = 1 - \frac{q}{r} \leq 1.
\]

Using Eq. \((19.9)\) we may also express \( \alpha \) and \( \beta \) as

\[
\alpha = p(1 - \frac{1}{q}) \geq 0 \quad \text{and} \quad \beta = q(1 - \frac{1}{p}) \geq 0
\]

and in particular we have shown \( \alpha, \beta \in [0, 1] \). If we now define \( p_1 := p/\alpha \in (0, \infty) \) and \( p_2 := q/\beta \in (0, \infty) \), then

\[
\frac{1}{p_1} + \frac{1}{p_2} + \frac{1}{r} = \beta \frac{1}{p} + \alpha + \frac{1}{r}
\]

\[
= (1 - \frac{1}{q}) + (1 - \frac{1}{p}) + \frac{1}{r}
\]

\[
= 2 - \left(1 + \frac{1}{r}\right) + \frac{1}{r} = 1
\]

as desired.

\[\square\]

**Theorem 19.32 (Approximate \( \delta \)-functions).** Let \( p \in [1, \infty] \), \( \varphi \in L^1(\mathbb{R}^d) \),

\[
a := \int_{\mathbb{R}^d} \varphi(x) \, dx,
\]

and for \( t > 0 \) let \( \varphi_t(x) = t^{-d} \varphi(x/t) \). Then

1. If \( f \in L^p \) with \( p < \infty \) then \( \varphi_t * f \to af \) in \( L^p \) as \( t \downarrow 0 \).
2. If \( f \in BC(\mathbb{R}^d) \) and \( f \) is uniformly continuous then \( \| \varphi_t * f - af \|_\infty \to 0 \) as \( t \downarrow 0 \).
3. If \( f \in L^\infty \) and \( f \) is continuous on \( U \subset \mathbb{R}^d \) then \( \varphi_t * f \to af \) uniformly on compact subsets of \( U \) as \( t \downarrow 0 \).

*(See Proposition 19.33 below and for a statement about almost everywhere convergence.)*

**Proof.** Making the change of variables \( y = tz \) implies

\[
\varphi_t * f(x) = \int_{\mathbb{R}^d} f(x-y) \varphi_t(y) \, dy = \int_{\mathbb{R}^d} f(x-tz) \varphi(z) \, dz
\]

so that

\[
\varphi_t * f(x) - af(x) = \int_{\mathbb{R}^d} [f(x-tz) - f(x)] \varphi(z) \, dz
\]

\[
= \int_{\mathbb{R}^d} [\tau_z f(x) - f(x)] \varphi(z) \, dz.
\]

(19.13)

Hence by Minkowski’s inequality for integrals (Theorem 18.27, Proposition 19.21) and the dominated convergence theorem,

\[
\| \varphi_t * f - af \|_p \leq \int_{\mathbb{R}^d} \| \tau_z f - f \|_p \| \varphi(z) \| \, dz \to 0 \text{ as } t \downarrow 0.
\]

Item 2. is proved similarly. Indeed, form Eq. \((19.13)\)

\[
\| \varphi_t * f - af \|_\infty \leq \int_{\mathbb{R}^d} \| \tau_z f - f \|_\infty \| \varphi(z) \| \, dz
\]

which again tends to zero by the dominated convergence theorem because \( \lim_{t \downarrow 0} \| \tau_z f - f \|_\infty = 0 \) uniformly in \( z \) by the uniform continuity of \( f \).

Item 3. Let \( B_R = B(0, R) \) be a large ball in \( \mathbb{R}^d \) and \( K \subset U \), then

\[
sup_{x \in K} \| \varphi_t * f(x) - af(x) \| \\
\leq \int_{B_R} |f(x-tz) - f(x)| \varphi(z) \, dz + \int_{B_R^c} |f(x-tz) - f(x)| \varphi(z) \, dz
\]

\[
\leq \int_{B_R} \| \varphi(z) \| \, dz \cdot \sup_{x \in K \subset B_R} |f(x-tz) - f(x)| + 2 \| f \|_\infty \int_{B_R} |\varphi(z) \| \, dz
\]

\[
\leq \| \varphi \|_1 \cdot \sup_{x \in K \subset B_R} |f(x-tz) - f(x)| + 2 \| f \|_\infty \int_{|z| > R} |\varphi(z) \| \, dz
\]

so that using the uniform continuity of \( f \) on compact subsets of \( U \),

\[
\limsup_{t \downarrow 0} \sup_{x \in K} \| \varphi_t * f(x) - af(x) \| \leq 2 \| f \|_\infty \int_{|z| > R} |\varphi(z) \| \, dz \to 0 \text{ as } R \to \infty.
\]

The next two results give a version of Theorem 19.32 where the convergence holds almost everywhere. For \( f \in L^1_{loc}(\mathbb{R}^n) \) let

\[
\mathcal{L}(f) := \left\{ x \in \mathbb{R}^n : \lim_{r \downarrow 0} \frac{1}{|B(x,r)|} \int_{B(x,r)} |f(y) - f(x)| \, dy = 0 \right\}
\]

be the Lebesgue set of \( f \). We will see below in Theorem 23.13 that \( m(\mathbb{R}^n \setminus \mathcal{L}(f)) = 0 \).

**Proposition 19.33 (Theorem 19.32 continued).** Let \( p \in [1, \infty] \), \( \rho > 0 \) and \( \varphi \in L^\infty(\mathbb{R}^d) \) such that \( 0 \leq \varphi \leq C1_{B(0, \rho)} \) for some \( C < \infty \) and \( \int_{\mathbb{R}^d} \varphi(x) \, dx = 1 \). If \( f \in L^1_{loc}(m) \), and \( x \in \mathcal{L}(f) \), then

\[
\lim_{t \downarrow 0} (\varphi_t * f)(x) = f(x),
\]

where \( \varphi_t(x) := t^{-d} \varphi(x/t) \). In particular, \( \varphi_t * f \to f \) a.e. as \( t \downarrow 0 \).
Proof. Notice that \( 0 \leq \varphi_t \leq Ct^{-d}1_{B(0,pt)} \) and therefore for \( x \in L(f) \) we have,

\[
|\varphi_t * f(x) - f(x)| = \left| \int_{\mathbb{R}^d} [f(x) - f(y)] \varphi_t(y) \, dy \right|
\leq \int_{\mathbb{R}^d} |f(x) - f(y)| \varphi_t(y) \, dy
\leq Ct^{-d} \int_{B(0,pt)} |f(x) - f(y)| \, dy
= C(\rho, d) \frac{1}{|B(0, pt)|} \int_{B(0, pt)} |f(x) - f(y)| \, dy
\to 0 \text{ as } t \downarrow 0.
\]

\[\Box\]

Theorem 19.34 (Theorem 8.15 of Folland). More general version, assume that \( |\varphi(x)| \leq C(1 + |x|)^{-(d+\varepsilon)} \) and \( \int_{\mathbb{R}^d} \varphi(x) \, dx = a \). Then for all \( x \in L(f) \),

\[
\lim_{t \downarrow 0} (\varphi_t * f)(x) = af(x)
\]

and in fact,

\[
\lim_{t \downarrow 0} \int |f(x) - f(y)| |\varphi_t(y)| \, dy = 0.
\]

Proof. Let \( 0 < a < b \), then

\[
\int_{a < |y| \leq b} |f(x-y) - f(x)| |\varphi_t(y)| \, dy
\leq Ct^{-d} \int_{a < |y| \leq b} |f(x-y) - f(x)| \left( 1 + \frac{|y|}{t} \right)^{-(d+\varepsilon)} \, dy
\leq Ct^{-d} \int_{a < |y| \leq b} |f(x-y) - f(x)| \left( 1 + \frac{a}{t} \right)^{-(d+\varepsilon)} \, dy
\leq Ct^{-d} \delta(b) \left( 1 + \frac{a}{t} \right)^{-(d+\varepsilon)}
= Ct^{-(d+\varepsilon)} \delta(b) \left( 1 + \frac{a}{t} \right)^{-(d+\varepsilon)} t^{d-\varepsilon}
= C \delta(b) \left( \frac{t}{b} \right)^{\varepsilon} \frac{1}{(t + \frac{a}{t})^{d+\varepsilon}}.
\]

Taking \( a = b/2 \) in this expression shows

\[
\int_{a < |y| \leq b} |f(x-y) - f(x)| |\varphi_t(y)| \, dy
\leq C \delta(b) \left( \frac{t}{b} \right)^{\varepsilon} \frac{1}{(t + \frac{a}{t})^{d+\varepsilon}}
= C \delta(b) \left( \frac{t}{b} \right)^{\varepsilon} \frac{1}{(t + \frac{a}{t})^{d+\varepsilon}}
\]

Taking \( b = 2^{-\varepsilon} \eta \) for \( k = 0, \ldots, K \),

\[
\sum_{k=0}^{K-1} \int_{2^{-(k+1)} \eta \leq |y| \leq 2^{-k} \eta} |f(x-y) - f(x)| |\varphi_t(y)| \, dy
\leq C \sum_{k=0}^{K-1} \delta(2^{-\varepsilon} \eta) \left( \frac{t}{\eta} \right)^{\varepsilon} \sum_{k=0}^{2^k} 2^{k\varepsilon}
= C \delta(\eta) \left( \frac{t}{\eta} \right)^{\varepsilon} \frac{2^{K-1} - 1}{2^\varepsilon - 1}.
\]

We now choose \( K \) so that \( 2^k \leq \frac{\eta}{\varepsilon} \sim 1 \), and we have shown,

\[
\sum_{k=0}^{K-1} \int_{2^{-(k+1)} \eta \leq |y| \leq 2^{-k} \eta} |f(x-y) - f(x)| |\varphi_t(y)| \, dy \leq C \delta(\eta).
\]

Moreover,

\[
\int_{|y| \leq 2^{-K} \eta} |f(x-y) - f(x)| |\varphi_t(y)| \, dy
\leq Ct^{-d} \delta \left( 2^{-K} \eta \right) \cdot \left( 2^{-K} \eta \right)^d
\leq C \delta(\eta) \left( \frac{2^{-K} \eta}{t} \right)^d \sim C \delta(\eta)
\]

and we have shown

\[
\int_{|y| \leq \eta} |f(x-y) - f(x)| |\varphi_t(y)| \, dy \leq C \delta(\eta).
\]

Now for \( |y| > \eta \) and \( f \in L^1 \),
\[ \int_{|y| > \eta} |f(x) - f(x)| \, |\varphi_t(y)| \, dy \]
\[ \leq \int_{|y| > \eta} |f(x) - f(x)| \, |\varphi_t(y)| \, dy + \int_{|y| > \eta} |f(x)| \, |\varphi_t(y)| \, dy \]
\[ \leq C t^{-n} \int_{|y| > \eta} |f(x) - f(x)| \left( \frac{1}{1 + |y/t|} \right)^{\eta + \varepsilon} \, dy + \int_{|y| > \eta} |f(x)| \, |\varphi(z)| \, dy \]
\[ \leq \frac{C t^{n}}{(t + \eta)^{\eta + \varepsilon}} \|f\|_1 + \|f(x)\|_{|z| > \eta/t} \, |\varphi(z)| \, dy \to 0 \text{ as } t \to 0. \]

Exercise 19.5. Let
\[ f(t) = \begin{cases} e^{-1/t} & \text{if } t > 0 \\ 0 & \text{if } t \leq 0. \end{cases} \]
Show \( f \in C^\infty(\mathbb{R}, [0, 1]). \)

Lemma 19.35. There exists \( \varphi \in C^\infty_c(\mathbb{R}^d, [0, \infty)) \) such that \( \varphi(0) > 0 \), \( \text{supp}(\varphi) \subset B(0, 1) \) and \( \int_{\mathbb{R}^d} \varphi(x) \, dx = 1. \)

Proof. Define \( h(t) = e^{-1/t} f(t + 1) \) where \( f \) as in Exercise 19.5. Then \( h \in C^\infty_c(\mathbb{R}, [0, 1]), \) \( \text{supp}(h) \subset [-1, 1] \) and \( h(0) = e^{-2} > 0. \) Define \( c = \int_{\mathbb{R}^d} h(|x|^2) \, dx. \)
Then \( \varphi(x) = c^{-1/2} h(|x|^2) \) is the desired function.

The reader asked to prove the following proposition in Exercise 19.9 below.

Proposition 19.36. Suppose \( f \in L_1^1(\mathbb{R}^d, m) \) and \( \varphi \in C^\infty_c(\mathbb{R}^d) \), then \( \int \varphi \, \mu \) and \( \partial_i (f \ast \varphi) = f \ast \partial_i \varphi. \) Moreover if \( \varphi \in C^\infty_c(\mathbb{R}^d) \) then \( f \ast \varphi \in C^\infty(\mathbb{R}^d). \)

Corollary 19.37 (\( C^\infty \) – Uryson’s Lemma). Given \( K \subset U \subset \mathbb{R}^d \), there exists \( \varphi \in C^\infty_c(\mathbb{R}^d, [0, 1]) \) such that \( \text{supp}(f) \subset U \) and \( f = 1 \) on \( K. \)

Proof. Let \( \varphi \) be as in Lemma 19.35. \( \varphi_t(x) = t^{-d} \varphi(x/t) \) be as in Theorem 19.32, \( d \) be the standard metric on \( \mathbb{R}^d \) and \( \varepsilon = d(K, U). \) Since \( K \) is compact and \( U \) is closed, \( \varepsilon > 0. \) Let \( V_\delta = \{ x \in \mathbb{R}^d: d(K, U) < \delta \} \) and \( f = \varphi_{\varepsilon/3} \ast 1_{V_{\varepsilon/3}}. \) Then
\[ \text{supp}(f) \subset \text{supp}(\varphi_{\varepsilon/3}) + V_{\varepsilon/3} \subset \bar{V}_{2\varepsilon/3} \subset U. \]
Since \( \bar{V}_{2\varepsilon/3} \) is closed and bounded, \( f \in C^\infty_c(U) \) and for \( x \in K, \)
\[ f(x) = \int_{\mathbb{R}^d} 1_{d(y, K) < \varepsilon/3} \cdot \varphi_{\varepsilon/3}(x - y) \, dy = \int_{\mathbb{R}^d} \varphi_{\varepsilon/3}(x - y) \, dy = 1. \]
The proof will be finished after the reader (easily) verifies \( 0 \leq f \leq 1. \)

Here is an application of this corollary whose proof is left to the reader, Exercise 19.10.
Lemma 19.27 there exists a compact set $K$ and set $\psi$. Proposition 19.41 (Smooth Partitions of Unity for Compacts). One simply uses the smooth version of Urysohn’s Lemma and Corollary 25.20. The proofs of these results are the same as their continuous counterparts. We have the following smooth variants of Proposition 25.16, Theorem 25.18

1. The dominated convergence theorem (with dominating function being $\|f\|_1 K$), shows $\psi \to f$ in $L^p(\mu)$ as $t \downarrow 0$. This proves Item 1., since Theorem 19.8 guarantees that $C_c(X)$ is dense in $L^p(\mu)$. Keeping the same notation as above, the dominated convergence theorem (with dominating function being $\|f\|_1 K$) implies

$$0 = \lim_{t \downarrow 0} \int_X \psi_t h \, d\mu = \int_X \lim_{t \downarrow 0} \psi_t h \, d\mu = \int_X f h \, d\mu.$$  

The proof is now finished by an application of Lemma 19.11.  

### 19.2.1 Smooth Partitions of Unity

We have the following smooth variants of Proposition 25.16, Theorem 25.18 and Corollary 25.20. The proofs of these results are the same as their continuous counterparts. One simply uses the smooth version of Urysohn’s Lemma of Corollary 19.37 in place of Lemma 25.8.

Proposition 19.41 (Smooth Partitions of Unity for Compacts). Suppose that $X$ is an open subset of $\mathbb{R}^d$, $K \subset X$ is a compact set and $U = \{U_j\}_{j=1}^n$ is an open cover of $K$. Then there exists a smooth (i.e. $h_j \in C^\infty_0([0,1])$) partition of unity $\{h_j\}_{j=1}^n$ of $K$ such that $h_j \prec U_j$ for all $j = 1, 2, \ldots, n$.

Theorem 19.42 (Locally Compact Partitions of Unity). Suppose that $X$ is an open subset of $\mathbb{R}^d$ and $U$ is an open cover of $X$. Then there exists a smooth partition of unity $\{h_i\}_{i=1}^N$ of $X$ such that $\text{supp}(h_i)$ is compact for all $i$.

Corollary 19.43. Suppose that $X$ is an open subset of $\mathbb{R}^d$ and $U = \{U_\alpha\}_{\alpha \in A} \subset \tau$ is an open cover of $X$. Then there exists a smooth partition of unity $\{h_\alpha\}_{\alpha \in A}$ subordinate to the cover $U$ such that $\text{supp}(h_\alpha) \subset U_\alpha$ for all $\alpha \in A$. Moreover if $U_\alpha$ is compact for each $\alpha \in A$ we may choose $h_\alpha$ so that $h_\alpha \prec U_\alpha$.

### 19.3 Exercises

Exercise 19.6. Let $(X, \tau)$ be a topological space, $\mu$ a measure on $B_X = \sigma(\tau)$ and $f : X \to \mathbb{C}$ be a measurable function. Letting $\nu$ be the measure, $d\nu = |f|\, d\mu$, show $\text{supp}(\nu) = \text{supp}_\mu(f)$, where $\text{supp}(\nu)$ is defined in Definition 18.43.

Exercise 19.7. Let $(X, \tau)$ be a topological space, $\mu$ a measure on $B_X = \sigma(\tau)$ such that $\text{supp}(\mu) = X$ (see Definition 18.43). Show $\text{supp}_\mu(f) = \{f \neq 0\}$ for all $f \in C(X)$.

Exercise 19.8. Prove the following strong version of item 3. of Proposition 17.52, namely to every pair of points, $x_0, x_1$, in a connected open subset $V$ of $\mathbb{R}^d$ there exists $\sigma \in C^\infty(\mathbb{R}, V)$ such that $\sigma(0) = x_0$ and $\sigma(1) = x_1$. Hint: First choose a continuous path $\gamma : [0,1] \to V$ such that $\gamma(t) = x_0$ for $t < 0$ and $\gamma(t) = x_1$ for $t > 1$ and then use a convolution argument to smooth $\gamma$.

Exercise 19.10 (Integration by Parts). Suppose that $(x, y) \in \mathbb{R} \times \mathbb{R}^{d-1}$ to $f(x, y) \in \mathbb{C}$ and $(x, y) \in \mathbb{R} \times \mathbb{R}^{d-1} \to g(x, y) \in \mathbb{C}$ are measurable functions such that for each fixed $y \in \mathbb{R}^d$, $x \to f(x, y)$ and $x \to g(x, y)$ are continuously differentiable. Also assume $f \cdot g$, $\partial_x f \cdot g$ and $f \cdot \partial_x g$ are integrable relative to Lebesgue measure on $\mathbb{R} \times \mathbb{R}^{d-1}$, where $\partial_x f(x, y) := \frac{\partial}{\partial t} f(x + t, y)|_{t=0}$. Show

$$\int_{\mathbb{R} \times \mathbb{R}^{d-1}} \partial_x f(x, y) \cdot g(x, y) \, dx \, dy = - \int_{\mathbb{R} \times \mathbb{R}^{d-1}} f(x, y) \cdot \partial_x g(x, y) \, dx \, dy. \quad (19.15)$$

(Note: this result and Fubini’s theorem proves Lemma 19.38.)

HINTS: Let $\psi \in C_c^\infty(\mathbb{R})$ be a function which is 1 in a neighborhood of $0 \in \mathbb{R}$ and set $\psi(x) = \psi(\varepsilon x)$. First verify Eq. (19.15) with $f(x, y)$ replaced by $\psi(x) f(x, y)$ by doing the $x$-integral first. Then use the dominated convergence theorem to prove Eq. (19.15) by passing to the limit, $\varepsilon \downarrow 0$.

Exercise 19.11. Let $\mu$ be a finite measure on $\mathbb{R}$, then $\mathbb{D} := \text{span}\{e^{\lambda x} : \lambda \in \mathbb{R}\}$ is a dense subspace of $L^p(\mu)$ for all $1 \leq p < \infty$. HINTS: By Theorem 19.8, $C_c(\mathbb{R}^d)$ is a dense subspace of $L^p(\mu)$. For $f \in C_c(\mathbb{R}^d)$ and $N \in \mathbb{N}$, let

$$f_N(x) := \sum_{n \in \mathbb{Z}^d} f(x + 2\pi N n).$$

Show $f_N \in BC(\mathbb{R}^d)$ and $x \to f_N(Nx)$ is $2\pi$-periodic, so by Exercise 25.12 $x \to f_N(Nx)$ can be approximated uniformly by trigonometric polynomials. Use this fact to conclude that $f_N \in \mathbb{D} L^p(\mu)$. After this show $f_N \to f$ in $L^p(\mu)$. 

Page: 217   job: newanal   macro: svmobob.cls   date/time: 6-Jan-2012/17:01
Exercise 19.12. Suppose that \( \mu \) and \( \nu \) are two finite measures on \( \mathbb{R}^d \) such that
\[
\int_{\mathbb{R}^d} e^{i\lambda \cdot x} d\mu(x) = \int_{\mathbb{R}^d} e^{i\lambda \cdot x} d\nu(x)
\]  
for all \( \lambda \in \mathbb{R}^d \). Show \( \mu = \nu \).

**Hint:** Perhaps the easiest way to do this is to use Exercise 19.11 with the measure \( \mu \) being replaced by \( \mu + \nu \). Alternatively, use the method of proof of Exercise 19.11 to show Eq. (19.16) implies \( \int_{\mathbb{R}^d} f d\mu(x) = \int_{\mathbb{R}^d} f d\nu(x) \) for all \( f \in C_c(\mathbb{R}^d) \) and then apply Corollary 11.33.

Exercise 19.13. Again let \( \mu \) be a finite measure on \( B_{\mathbb{R}^d} \). Further assume that \( C_M := \int_{\mathbb{R}^d} e^{M|x|} d\mu(x) < \infty \) for all \( M \in (0, \infty) \). Let \( \mathcal{P}(\mathbb{R}^d) \) be the space of polynomials, \( \rho(x) = \sum_{|\alpha| \leq N} \rho_\alpha x^\alpha \) with \( \rho_\alpha \in \mathbb{C}, \) on \( \mathbb{R}^d \). (Notice that \( |\rho(x)|^p \leq C e^{M|x|} \) for some constant \( C = C(\rho, p, M) \), so that \( \mathcal{P}(\mathbb{R}^d) \subset L^p(\mu) \) for all \( 1 \leq p < \infty \).) Show \( \mathcal{P}(\mathbb{R}^d) \) is dense in \( L^p(\mu) \) for all \( 1 \leq p < \infty \). Here is a possible outline.

**Outline:** Fix a \( \lambda \in \mathbb{R}^d \) and let \( f_n(x) = (\lambda \cdot x)^n / n! \) for all \( n \in \mathbb{N} \).

1. Use calculus to verify \( \sup_{t \geq 0} t^\alpha e^{-Mt} = (\alpha/M)^\alpha e^{-\alpha} \) for all \( \alpha \geq 0 \) where \( (0/M)^0 := 1 \). Use this estimate along with the identity
   \[
   |\lambda \cdot x|^p \leq |\lambda|^p |x|^p = \left( |x|^p e^{-M|x|} \right) |\lambda|^p e^{M|x|}
   \]
   to find an estimate on \( \|f_n\|_p \).

2. Use your estimate on \( \|f_n\|_p \) to show there exists \( \delta > 0 \) such that \( \sum_{n=0}^{\infty} \|f_n\|_p < \infty \) when \( |\lambda| \leq \delta \) and conclude for \( |\lambda| \leq \delta \) that \( e^{i\lambda \cdot x} = L^p(\mu) \).

3. Let \( \lambda \in \mathbb{R}^d \) (|\lambda| not necessarily small) and set \( g(t) := \int_{\mathbb{R}^d} e^{it\lambda \cdot x} h(x) d\mu(x) \) for \( t \in \mathbb{R} \). Show \( g \in C^\infty(\mathbb{R}) \) and
   \[
   g^{(n)}(t) = \int_{\mathbb{R}^d} (i\lambda \cdot x)^n e^{it\lambda \cdot x} h(x) d\mu(x) \text{ for all } n \in \mathbb{N}.
   \]

4. Let \( T = \sup \{ \tau \geq 0 \mid g|_{[0, \tau]} \equiv 0 \} \). By Step 2., \( T \geq \delta \). If \( T < \infty \), then
   \[
   0 = g^n(T) = \int_{\mathbb{R}^d} (i\lambda \cdot x)^n e^{iT\lambda \cdot x} h(x) d\mu(x) \text{ for all } n \in \mathbb{N}.
   \]

Use Step 3. with \( h \) replaced by \( e^{iT\lambda \cdot x} h(x) \) to conclude
\[
0 = g(T + t) = \int_{\mathbb{R}^d} e^{i(T + t)\lambda \cdot x} h(x) d\mu(x) = 0 \text{ for all } t \leq \delta / |\lambda|.
\]
This violates the definition of \( T \) and therefore \( T = \infty \) and in particular we may take \( T = 1 \) to learn
\[
\int_{\mathbb{R}^d} h(x) e^{i\lambda \cdot x} d\mu(x) = 0 \text{ for all } \lambda \in \mathbb{R}^d.
\]

5. Use Exercise 19.11 to conclude that
   \[
   \int_{\mathbb{R}^d} h(x) g(x) d\mu(x) = 0
   \]
   for all \( g \in L^p(\mu) \). Now choose \( g \) judiciously to finish the proof.
Geometric Integration

Definition 20.1. A subset $M \subset \mathbb{R}^n$ is a n−1 dimensional $C^k$-Hypersurface if for all $x_0 \in M$ there exists $\varepsilon > 0$ an open set $0 \subset D \subset \mathbb{R}^n$ and a $C^k$-diffeomorphism $\psi : D \to B(x_0, \varepsilon)$ such that $\psi(D \cap \{x_n = 0\}) = B(x_0, \varepsilon) \cap M$. See Figure 20.1 below.

![Fig. 20.1. An embedded submanifold of $\mathbb{R}^2$.](image1)

Example 20.2. Suppose $V \subset_0 \mathbb{R}^{n−1}$ and $g : V \xrightarrow{C^k} \mathbb{R}$. Then $M := \Gamma(g) = \{(y, g(y)) : y \in V\}$ is a $C^k$ hypersurface. To verify this assertion, given $x_0 = (y_0, g(y_0)) \in \Gamma(g)$ define

$$\psi(y, z) := (y + y_0, g(y + y_0) − z).$$

Then $\psi : \{V − y_0\} \times \mathbb{R} \xrightarrow{C^k} V \times \mathbb{R}$ diffeomorphism

$$\psi((V − y_0) \times \{0\}) = \{(y + y_0, g(y + y_0)) : y \in V − y_0\} = \Gamma(g).$$

Proposition 20.3 (Parametrized Surfaces). Let $k \geq 1$, $D \subset_0 \mathbb{R}^{n−1}$ and $\Sigma \in C^k(D, \mathbb{R}^n)$ satisfy

1. $\Sigma : D \to M := \Sigma(D)$ is a homeomorphism and
2. $\Sigma'(y) : \mathbb{R}^{n−1} \to \mathbb{R}^n$ is injective for all $y \in D$. (We will call $M$ a $C^k$–parametrized surface and $\Sigma : D \to M$ a parametrization of $M$.)

Then $M$ is a $C^k$-hypersurface in $\mathbb{R}^n$. Moreover if $f \in C(W \subset_0 \mathbb{R}^d, \mathbb{R}^n)$ is a continuous function such that $f(W) \subset M$, then $f \in C^k(W, \mathbb{R}^n)$ iff $\Sigma^{-1} \circ f \in C^k(U, D)$.

Proof. Let $y_0 \in D$ and $x_0 = \Sigma(y_0)$ and $n_0$ be a normal vector to $M$ at $x_0$, i.e. $n_0 \perp \text{Ran} (\Sigma'(y_0))$, and let

$$\psi(t, y) := \Sigma(y_0 + y) + t n_0 \text{ for } t \in \mathbb{R} \text{ and } y \in D − y_0,$$

see Figure 20.2 below. Since $D_y \psi(0, 0) = \Sigma'(y_0)$ and $\frac{\partial \psi}{\partial y}(0, 0) = n_0 \notin \Sigma'(D)$. Ran $(\Sigma'(y_0))$, $\psi'(0, 0)$ is invertible, so by the inverse function theorem there exists a neighborhood $V$ of $(0, 0) \in \mathbb{R}^n$ such that $\psi|_V : V \to \mathbb{R}^n$ is a $C^k$–diffeomorphism. Choose an $\varepsilon > 0$ such that $B(x_0, \varepsilon) \cap M \subset \Sigma(V \cap \{t = 0\})$ and $B(x_0, \varepsilon) \subset \psi(V)$. Then set $U := \psi^{-1}(B(x_0, \varepsilon))$. One finds $\psi|_U : U \to B(x_0, \varepsilon)$ has the desired properties. Now suppose $f \in C(W \subset_0 \mathbb{R}^d, \mathbb{R}^n)$ such that $f(W) \subset M$, $a \in W$ and $x_0 = f(a) \in M$. By shrinking $W$ if necessary we
may assume \( f(W) \subset B(x_0, \varepsilon) \) where \( B(x_0, \varepsilon) \) is the ball used previously. (This is where we used the continuity of \( f \).) Then
\[
\Sigma^{-1} \circ f = \pi \circ \psi^{-1} \circ f
\]
where \( \pi \) is projection onto \( \{ t = 0 \} \). Form this identity it clearly follows \( \Sigma^{-1} \circ f \) is \( C^k \) if \( f \) is \( C^k \). The converse is easier since if \( \Sigma^{-1} \circ f \) is \( C^k \) then \( f = \Sigma \circ (\Sigma^{-1} \circ f) \) is \( C^k \) as well. \( \blacksquare \)

### 20.1 Surface Integrals

**Definition 20.4.** Suppose \( \Sigma : D \subset \mathbb{R}^{n-1} \to M \subset \mathbb{R}^n \) is a \( C^1 \)-parameterized hypersurface of \( \mathbb{R}^n \) and \( f \in C_c(M, \mathbb{R}) \). Then the surface integral of \( f \) over \( M \), \( \int_M f \, d\sigma \), is defined by
\[
\int_M f \, d\sigma = \int_D f \circ \Sigma(y) \left| \det \frac{\partial \Sigma(y)}{\partial y_1}, \ldots, \frac{\partial \Sigma(y)}{\partial y_{n-1}} \right| \, dy
\]
where \( n(y) \in \mathbb{R}^n \) is a unit normal vector perpendicular of \( \operatorname{ran}(\Sigma'(y)) \) for each \( y \in D \). We will abbreviate this formula by writing
\[
d\sigma = \left| \det \frac{\partial \Sigma(y)}{\partial y_1}, \ldots, \frac{\partial \Sigma(y)}{\partial y_{n-1}} \right| \, dy, \tag{20.1}
\]
see Figure 20.3 below for the motivation.

**Remark 20.5.** Let \( A = A(y) := [\Sigma'(y)e_1, \ldots, \Sigma'(y)e_{n-1}, n(y)] \). Then
\[
A^{tr} A = \\
= \begin{bmatrix}
\frac{\partial_1 \Sigma'}{\partial y_1} & \frac{\partial_2 \Sigma'}{\partial y_1} & \ldots & \frac{\partial_{n-1} \Sigma'}{\partial y_1} & n(y) \\
\vdots & \vdots & \ddots & \vdots & \vdots \\
\frac{\partial_1 \Sigma'}{\partial y_{n-1}} & \frac{\partial_2 \Sigma'}{\partial y_{n-1}} & \ldots & \frac{\partial_{n-1} \Sigma'}{\partial y_{n-1}} & n(y) \\
\frac{\partial_1 \Sigma \cdot \partial_1 \Sigma'}{\partial y_1} & \frac{\partial_2 \Sigma \cdot \partial_1 \Sigma'}{\partial y_1} & \ldots & \frac{\partial_{n-1} \Sigma \cdot \partial_{n-1} \Sigma'}{\partial y_1} & 0 \\
\frac{\partial_2 \Sigma \cdot \partial_1 \Sigma'}{\partial y_1} & \frac{\partial_2 \Sigma \cdot \partial_2 \Sigma'}{\partial y_1} & \ldots & \frac{\partial_{n-1} \Sigma \cdot \partial_{n-1} \Sigma'}{\partial y_1} & 0 \\
\vdots & \vdots & \ddots & \vdots & \vdots \\
\frac{\partial_{n-1} \Sigma \cdot \partial_1 \Sigma'}{\partial y_1} & \frac{\partial_{n-1} \Sigma \cdot \partial_2 \Sigma'}{\partial y_1} & \ldots & \frac{\partial_{n-1} \Sigma \cdot \partial_{n-1} \Sigma'}{\partial y_1} & 0 \\
0 & 0 & \ldots & 0 & 1
\end{bmatrix}
\]
and therefore
\[
\left| \det \frac{\partial \Sigma'(y)}{\partial y_1}, \ldots, \frac{\partial \Sigma'(y)}{\partial y_{n-1}} \right| = |\det(A)| \, dy = \sqrt{\det \left( A^{tr} A \right)} dy
\]
where
\[
\rho^{\Sigma}(y) := \sqrt{\det \left( (\partial_i \Sigma \cdot \partial_j \Sigma)^{n-1}_{i,j=1} \right)} = \sqrt{\det \left( (\Sigma')^{tr} \Sigma' \right)}.
\]
This implies \( d\sigma = \rho^{\Sigma}(y) \, dy \) or more precisely that
\[
\int_M f \, d\sigma = \int_D f \circ \Sigma(y) \rho^{\Sigma}(y) \, dy
\]
where
\[
\rho^{\Sigma}(y) := \sqrt{\det \left( (\partial_i \Sigma \cdot \partial_j \Sigma)^{n-1}_{i,j=1} \right)} = \sqrt{\det \left( (\Sigma')^{tr} \Sigma' \right)}.
\]
The next lemma shows that \( \int_M f \, d\sigma \) is well defined, i.e. independent of how \( M \) is parametrized.

**Example 20.6.** Suppose \( V \subset_0 \mathbb{R}^{n-1} \) and \( g : V \overset{C^k}{\to} \mathbb{R} \) and \( M := \Gamma(g) = \{ (y, g(y)) : y \in V \} \) as in Example 20.2. We now compute \( d\sigma \) in the parametrization \( \Sigma : V \to M \) defined by \( \Sigma(y) = (y, g(y)) \). To simplify notation, let
\[ \nabla g(y) := (\partial_1 g(y), \ldots, \partial_{n-1} g(y)). \]

As is standard from multivariable calculus (and is easily verified),

\[ n(y) := \frac{\nabla g(y), -1}{\sqrt{1 + |\nabla g(y)|^2}} \]

is a normal vector to \( M \) at \( \Sigma(y) \), i.e. \( n(y) \cdot \partial_k \Sigma(y) = 0 \) for all \( k = 1, 2, \ldots, n-1 \). Therefore,

\[ d\sigma = \frac{1}{\sqrt{1 + |\nabla g(y)|^2}} \left| \det \left[ I_{n-1} g \nabla g, 0 \right] \right| dy \]

\[ = \frac{1}{\sqrt{1 + |\nabla g(y)|^2}} \left( 1 + |\nabla g(y)|^2 \right) dy = \sqrt{1 + |\nabla g(y)|^2} dy. \]

Hence if \( g : M \to \mathbb{R} \), we have

\[ \int_M g d\sigma = \int_V g(\Sigma(y)) \sqrt{1 + |\nabla g(y)|^2} dy. \]

**Example 20.7.** Keeping the same notation as in Example 20.6 but now taking \( V := B(0, r) \subset \mathbb{R}^{n-1} \) and \( g(y) := \sqrt{r^2 - |y|^2} \). In this case \( M = S^n_{+1} \), the upper-hemisphere of \( S^n_{+1} \), \( \nabla g(y) = -y/g(y) \),

\[ d\sigma = \sqrt{1 + |y|^2/y^2} dy = \frac{r}{g(y)} dy \]

and so

\[ \int_{S^n_{+1} M} g d\sigma = \int_{|y|<r} g(y, \sqrt{r^2 - |y|^2}) \frac{r}{\sqrt{r^2 - |y|^2}} dy. \]

A similar computation shows, with \( S^n_{-1} \) being the lower hemisphere, that

\[ \int_{S^n_{-1} M} g d\sigma = \int_{|y|<r} g(y, -\sqrt{r^2 - |y|^2}) \frac{r}{\sqrt{r^2 - |y|^2}} dy. \]

**Lemma 20.8.** If \( \Sigma : \tilde{D} \to M \) is another \( C^k \) – parametrization of \( M \), then

\[ \int_D f \circ \Sigma(y) \rho^{\Sigma}(y) dy = \int_{\tilde{D}} f \circ \tilde{\Sigma}(y) \rho^{\tilde{\Sigma}}(y) dy. \]

**Proof.** By Proposition 20.3 \( \phi := \Sigma^{-1} \circ \tilde{\Sigma} : \tilde{D} \to D \) is a \( C^k \) – diffeomorphism. By the change of variables theorem on \( \mathbb{R}^{n-1} \) with \( y = \phi(\tilde{y}) \) (using \( \Sigma = \Sigma \circ \phi \), see Figure 20.4) we find

\[ \int_D f \circ \Sigma(\tilde{y}) \rho^{\Sigma}(\tilde{y}) d\tilde{y} = \int_{\tilde{D}} f \circ \tilde{\Sigma}(\tilde{y}) \rho^{\tilde{\Sigma}}(\tilde{y}) d\tilde{y} \]

\[ = \int_D f \circ \Sigma \circ \phi \sqrt{\det (\Sigma \circ \phi)'tr} (\Sigma \circ \phi)' d\tilde{y} \]

\[ = \int_D f \circ \Sigma \circ \phi \sqrt{\det [\phi' tr [\Sigma'(\phi)' tr \Sigma'(\phi) \phi'] d\tilde{y} \]

\[ = \int_D \rho(\phi \cdot \sqrt{\det \Sigma'^{tr} \Sigma'} \circ \phi \cdot |\det \phi'| d\tilde{y} \]

\[ = \int_D f \circ \Sigma \circ \phi \sqrt{\det \Sigma'^{tr} \Sigma'} d\tilde{y}. \]

**Definition 20.9.** Let \( M \) be a \( C^1 \)-embedded hypersurface and \( f \in C_c(M) \). Then we define the **surface integral** of \( f \) over \( M \) as

\[ \int_M f d\sigma = \sum_{i=1}^n \int_{M_i} \phi_i f d\sigma \]

where \( \phi_i \in C^1_c(M, [0, 1]) \) are chosen so that \( \sum_i \phi_i \leq 1 \) with equality on \( \text{supp}(f) \) and the \( \text{supp}(\phi_i f) \subset M_i \subset M \) where \( M_i \) is a subregion of \( M \) which may be viewed as a parametrized surface.

**Remark 20.10.** The integral \( \int_M f d\sigma \) is well defined for if \( \psi_j \in C^1_c(M, [0, 1]) \) is another sequence satisfying the properties of \( \{\phi_i\} \) with \( \text{supp}(\psi_j) \subset M_j \subset M \) then (using Lemma 20.8 implicitly)
Lemma 20.12 (Surface Measure). Let \( M \) be a \( C^2 \) - embedded hypersurface in \( \mathbb{R}^n \) and \( B \subset M \) be a measurable set such that \( B \) is compact and contained inside \( \Sigma(D) \) where \( \Sigma : D \to M \subset \mathbb{R}^n \) is a parametrization. Then

\[
\sigma(B) = \lim_{\varepsilon \to 0} m(B^\varepsilon) = \frac{d}{d\varepsilon}|_{\varepsilon=0} m(B^\varepsilon)
\]

where

\[
B^\varepsilon := \{ x + t n(x) : x \in B, 0 \leq t \leq \varepsilon \}
\]

and \( n(x) \) is a unit normal to \( M \) at \( x \in M \), see Figure 20.5.

Proof. Let \( A := \Sigma^{-1}(B) \) and \( \nu(y) := n(\Sigma(y)) \) so that \( \nu \in C^{k-1}(D, \mathbb{R}^n) \) if \( \Sigma \in C^k(D, \mathbb{R}^n) \). Define

\[
\psi(y, t) = \Sigma(y) + tn(\Sigma(y)) = \Sigma(y) + t\nu(y)
\]

so that \( B^\varepsilon = \psi(A \times [0,\varepsilon]) \). Hence by the change of variables formula

\[
m(B^\varepsilon) = \int_{A \times [0,\varepsilon]} |\det \psi'(y, t)| dy \, dt = \int_0^\varepsilon dt \int_A dy |\det \psi'(y, t)|
\]

(20.2)

so that by the fundamental theorem of calculus,

\[
\frac{d}{d\varepsilon}|_{\varepsilon=0} m(B^\varepsilon) = \frac{d}{d\varepsilon}|_{\varepsilon=0} \int_A dy |\det \psi'(y, t)| = \int_A |\det \psi'(y, 0)| dy.
\]

But

\[
|\det \psi'(y, 0)| = |\det [\Sigma'(y)|n(\Sigma(y))]| = \rho_{\Sigma}(y)
\]

which shows

\[
\frac{d}{d\varepsilon}|_{\varepsilon=0} m(B^\varepsilon) = \int_A \rho_{\Sigma}(y) dy = \int_D 1_B(\Sigma(y)) \rho_{\Sigma}(y) dy =: \sigma(B).
\]

Example 20.13. Let \( \Sigma = rS^{n-1} \) be the sphere of radius \( r > 0 \) contained in \( \mathbb{R}^n \) and for \( B \subset \Sigma \) and \( \alpha > 0 \) let

\[
B_\alpha := \{ tw : \omega \in B, 0 \leq t \leq \alpha \} = \alpha B_1.
\]

Assuming \( N(\omega) = \omega/r \) is the outward pointing normal to \( rS^{n-1} \), we have

\[
B^\varepsilon = B_{(1+\varepsilon/r)} \setminus B_1 = [(1+\varepsilon/r)B_1] \setminus B_1
\]
and hence
\[ m(B') = m \left( [(1 + \varepsilon/r)B_1] \setminus B_1 \right) = m \left( [(1 + \varepsilon/r)B_1] \right) - m(B_1) = [(1 + \varepsilon/r)^n - 1] m(B_1). \]

Therefore,
\[ \sigma(B) = \frac{d}{d\varepsilon} \left| [(1 + \varepsilon/r)^n - 1] m(B_1) \right| = \frac{n}{r} m(B_1) = n r^{n-1} m (r^{-1}B_1) = r^{n-1} \sigma(r^{-1}B), \]
i.e.
\[ \sigma(B) = \frac{n}{r} m(B_1) = n r^{n-1} m (r^{-1}B_1) = r^{n-1} \sigma(r^{-1}B). \]

\[ \text{Fig. 20.6.} \text{ Computing the area of region } B \text{ on the surface of the sphere of radiur } r. \]

**Theorem 20.14.** If \( f : \mathbb{R}^n \to [0, \infty] \) is a \((B_{\mathbb{R}^n}, \mathcal{B})\)-measurable function then
\[
\int_{\mathbb{R}^n} f(x) \, dm(x) = \int_{[0, \infty) \times S^{n-1}} f(r \omega) \, r^{n-1} \, drd\sigma(\omega). \tag{20.3}
\]

In particular if \( f : \mathbb{R}_+ \to \mathbb{R}_+ \) is measurable then
\[
\int_{\mathbb{R}^n} f(|x|) \, dx = \int_0^\infty f(r) \, dV(r) \tag{20.4}
\]
where \( V(r) = m(B(0, r)) = r^n m(B(0, 1)) = n^{-1} \sigma(S^{n-1}) \, r^n \).

**Proof.** Let \( B \subset S^{n-1}, 0 < a < b \) and let \( f(x) = 1_{B \setminus B_a}(x) \), see Figure 20.7.

Then
\[
\int_{[0, \infty) \times S^{n-1}} f(r \omega) r^{n-1} \, drd\sigma(\omega) = \int_{[0, \infty) \times S^{n-1}} 1_B(\omega)1_{[a,b]}(r) r^{n-1} \, drd\sigma(\omega)
\]
\[
= \sigma(B) \int_a^b r^{n-1} \, dr = n^{-1} \sigma(B) (b^n - a^n)
\]
\[
= m(B_1) (b^n - a^n) = m (B_1 \setminus B_a)
\]
\[
= \int_{\mathbb{R}^n} f(x) \, dm(x).
\]

Since sets of the form \( B_b \setminus B_a \) generate \( B_{\mathbb{R}^n} \) and are closed under intersections, this suffices to prove the theorem. Alternatively one may show that any \( f \in C_c(\mathbb{R}^n) \) may be uniformly approximated by linear combinations of characteristic functions of the form \( 1_{B_b \setminus B_a} \). Indeed, let \( S^{n-1} = \bigcup_{i=1}^K B_i \) be a partition of \( S^{n-1} \) with each \( B_i \) small and choose \( w_i \in B_i \). Let \( 0 < r_1 < r_2 < r_3 < \cdots < r_n = R < \infty \). Assume \( \text{supp}(f) \subset B(0, R) \). Then \( \{(B_i)_{r_{i+1}} \setminus (B_i)_{r_i}\}_{i,j} \) partitions \( \mathbb{R}^n \) into small regions. Therefore

\[ \text{Fig. 20.7.} \text{ The region } B_b \setminus B_a. \]
The result now extends to general  as follows. Suppose first \( f \in C^1_c((0, \infty)) \) then
\[
\int_{\mathbb{R}^n} f(x) dx \approx \sum f(r_j \omega_i) m(B_n(r_{j+1}) \backslash B_n(r_j))
\]
\[
= \sum f(r_j \omega_i) (r_j^{n+1} - r_j^n) m(B_n(r_j))
\]
\[
= \sum f(r_j \omega_i) \int_{r_j}^{r_{j+1}} r^{n-1} dr n m(B_n(r_j))
\]
\[
= \sum \int_{r_j}^{r_{j+1}} f(r_j \omega_i) r^{n-1} dr \sigma(B_i)
\]
\[
= \sum \int_{r_j}^{r_{j+1}} \left( \int_{\mathbb{R}^{n-1}} f(r_j \omega) d\sigma(\omega) \right) r^{n-1} dr
\]
\[
= \int_0^\infty \left( \int_{\mathbb{R}^{n-1}} f(r \omega) d\sigma(\omega) \right) r^{n-1} dr.
\]

Eq. (20.4) is a simple special case of Eq. (20.3) It can also be proved directly as follows. Suppose first \( f \in C^1_c((0, \infty)) \) then
\[
\int_{\mathbb{R}^n} f(|x|) dx = - \int_{\mathbb{R}^n} dx \int_{|x|}^{\infty} dr f'(r) = - \int_{\mathbb{R}^n} dx \int_{|x|}^{\infty} r f'(r) dr
\]
\[
= - \int_0^\infty V(r) f'(r) dr = \int_0^\infty V(r) f'(r) dr.
\]

The result now extends to general \( f \) by a density argument.

We are now going to work out some integrals using Eq. (20.3). The first we leave as an exercise.

**Exercise 20.1.** Use the results of Example 20.7 and Theorem 20.14 to show,
\[
\sigma(S^{n-1}) = 2\sigma(S^{n-2}) \int_0^1 \frac{1}{\sqrt{1-\rho^2}} \rho^{n-2} d\rho.
\]

The result in Exercise 20.1 may be used to compute the volume of spheres in any dimension. This method will be left to the reader. We will do this in another way. The first step will be to directly compute the following Gaussian integrals. The result will also be needed for later purposes.

**Lemma 20.15.** Let \( a > 0 \) and
\[
I_n(a) := \int_{\mathbb{R}^n} e^{-a|x|^2} dm(x).
\]

Then \( I_n(a) = (\pi/a)^{n/2} \).

**Proof.** By Tonelli’s theorem and induction,
\[
I_n(a) = \int_{\mathbb{R}^{n-1} \times \mathbb{R}} e^{-a|x|^2} m_{n-1} dx dt
\]
\[
= I_{n-1}(a)I_1(a) = I_1(a).
\]

So it suffices to compute:
\[
I_2(a) = \int_{\mathbb{R}^2} e^{-a|x|^2} dm(x) = \int_0^\infty e^{-a(x_1^2 + x_2^2)} dx_1 dx_2.
\]

Writing this integral in polar coordinates (see Example 17.32) gives
\[
I_2(a) = \int_0^\infty dr \int_0^{2\pi} d\theta e^{-ar^2} = 2\pi \int_0^\infty r e^{-ar^2} dr
\]
\[
= 2\pi \lim_{M \to \infty} \int_0^M r e^{-ar^2} dr = 2\pi \lim_{M \to \infty} \frac{e^{-ar^2}}{-2a} \bigg|_0^M = \frac{2\pi}{2a} = \pi/a.
\]

This shows that \( I_2(a) = \pi/a \) and the result now follows from Eq. (20.6).

**Corollary 20.16.** Let \( S^{n-1} \subset \mathbb{R}^n \) be the unit sphere in \( \mathbb{R}^n \) and
\[
\Gamma(x) := \int_0^\infty u^{x-1} e^{-u} du \text{ for } x > 0
\]

be the gamma function. Then

1. The surface area \( \sigma(S^{n-1}) \) of the unit sphere \( S^{n-1} \subset \mathbb{R}^n \) is
\[
\sigma(S^{n-1}) = \frac{2\pi^{n/2}}{\Gamma(n/2)}.
\]

2. The \( \Gamma \) - function satisfies
   a) \( \Gamma(1/2) = \sqrt{\pi}, \Gamma(1) = 1 \) and \( \Gamma(x+1) = x\Gamma(x) \) for \( x > 0 \).
   b) For \( n \in \mathbb{N} \),
\[
\Gamma(n+1) = n! \text{ and } \Gamma(n+1/2) = \frac{(2n-1)!!}{2^n} \sqrt{\pi}.
\]

3. For \( n \in \mathbb{N} \),
\[
\sigma(S^{2n+1}) = \frac{2\pi^{n+1}}{n!} \text{ and } \sigma(S^{2n}) = \frac{2(2\pi)^n}{(2n-1)!!}.
\]
Proof. Let \( I_n \) be as in Lemma 20.15 Using Theorem 20.14 we may alternatively compute \( \pi^{n/2} = I_n(1) \) as

\[
\pi^{n/2} = I_n(1) = \int_0^\infty dr \ r^{n-1} e^{-r^2} \int_{S^{n-1}} d\sigma = \sigma(S^{n-1}) \int_0^\infty r^{n-1} e^{-r^2} dr.
\]

We simplify this last integral by making the change of variables \( u = r^2 \) so that \( r = u^{1/2} \) and \( dr = \frac{1}{2} u^{-1/2} du \). The result is

\[
\int_0^\infty u^{n/2 - 1} e^{-u} du = \frac{1}{2} \int_0^\infty u^{n/2 - 1} e^{-u} du = \frac{1}{2} \Gamma(n/2).
\]

Collecting these observations implies that

\[
\pi^{n/2} = I_n(1) = \frac{1}{2} \sigma(S^{n-1}) \Gamma(n/2)
\]

which proves Eq. 20.7. The computation of \( \Gamma(1) \) is easy and is left to the reader. By Eq. (20.10),

\[
\Gamma(1/2) = 2 \int_0^\infty e^{-u^2} du = \int_{-\infty}^\infty e^{-u^2} du = I(1) = \sqrt{\pi}.
\]

The relation, \( \Gamma(x + 1) = x \Gamma(x) \) is the consequence of integration by parts:

\[
\Gamma(x + 1) = \int_0^\infty u^{x} e^{-u} du = \int_0^\infty u^x \left( -\frac{1}{u^2} e^{-u} \right) du
\]

\[
= x \int_0^\infty u^{x-1} e^{-u} du = x^\Gamma(x).
\]

Eq. (20.8) follows by induction from the relations just proved. Eq. 20.9 is a consequence of items 1. and 2. as follows:

\[
\sigma(S^{2n+1}) = \frac{2\pi^{(2n+2)/2}}{\Gamma((2n+2)/2)} = \frac{2\pi^{n+1}}{\Gamma(n+1)} = \frac{2n+1}{n!}
\]

and

\[
\sigma(S^{2n}) = \frac{2\pi^{(2n+1)/2}}{\Gamma((2n+1)/2)} = \frac{2n+1/2}{\Gamma(n+1/2)} = \frac{2n+1}{2^{n+1}} \cdot \sqrt{\pi}
\]

\[
= \frac{2 \pi^n}{(2n-1)!!}
\]

\[
\square
\]

20.2 More spherical coordinates

In this section we will define spherical coordinates in all dimensions. Along the way we will develop an explicit method for computing surface integrals on spheres. As usual when \( n = 2 \) define spherical coordinates \( (r, \theta) \in (0, \infty) \times [0, 2\pi) \) so that

\[
\begin{pmatrix} x_1 \\ x_2 \\ x_3 \end{pmatrix} = \begin{pmatrix} r \cos \theta \\ r \sin \theta \end{pmatrix} = \psi_2(\theta, r).
\]

For \( n = 3 \) we let \( x_3 = r \cos \phi_1 \) and then

\[
\begin{pmatrix} x_1 \\ x_2 \end{pmatrix} = \psi_2(\theta, r \sin \phi_1),
\]

as can be seen from Figure 20.8, so that

Fig. 20.8. Setting up polar coordinates in two and three dimensions.

\[
\begin{pmatrix} x_1 \\ x_2 \\ x_3 \end{pmatrix} = \begin{pmatrix} \psi_2(\theta, r \sin \phi_1) \\ r \cos \phi_1 \end{pmatrix} = \begin{pmatrix} r \sin \phi_1 \cos \theta \\ r \sin \phi_1 \sin \theta \end{pmatrix} = : \psi_3(\theta, \phi_1, r, \).
\]

We continue to work inductively this way to define

\[
\begin{pmatrix} x_1 \\ \vdots \\ x_n \\ x_{n+1} \end{pmatrix} = \begin{pmatrix} \psi_n(\theta, \phi_1, \ldots, \phi_{n-2}, r \sin \phi_{n-1}) \\ r \cos \phi_{n-1} \end{pmatrix} = \psi_{n+1}(\theta, \phi_1, \ldots, \phi_{n-2}, \phi_{n-1}, r).
\]

So for example,

\[
\begin{align*}
x_1 &= r \sin \phi_2 \sin \phi_1 \cos \theta \\
x_2 &= r \sin \phi_2 \sin \phi_1 \sin \theta \\
x_3 &= r \sin \phi_2 \cos \phi_1 \\
x_4 &= r \cos \phi_2
\end{align*}
\]

\[
\square
\]
and more generally,

\[
\begin{align*}
&x_1 = r \sin \phi_2 \sin \phi_1 \cos \theta \\
&x_2 = r \sin \phi_2 \sin \phi_1 \sin \theta \\
&x_3 = r \sin \phi_2 \cos \phi_1 \\
&\vdots \\
&x_{n-2} = r \sin \phi_{n-2} \sin \phi_{n-3} \cos \phi_{n-4} \\
&x_{n-1} = r \sin \phi_{n-2} \cos \phi_{n-3} \\
&x_n = r \cos \phi_{n-2}.
\end{align*}
\]

By the change of variables formula,

\[
\int_{\mathbb{R}^n} f(x) dm(x) = \int_0^\infty d\rho \int_{S^{n-1}} d\phi_1 \cdots d\phi_{n-2} d\theta \Delta_n(\theta, \phi_1, \ldots, \phi_{n-2}, r) f(\psi_n(\theta, \phi_1, \ldots, \phi_{n-2}, r))
\]

where

\[
\Delta_n(\theta, \phi_1, \ldots, \phi_{n-2}, r) := |\det \psi'_n(\theta, \phi_1, \ldots, \phi_{n-2}, r)|.
\]

**Proposition 20.17.** The Jacobian, \(\Delta_n\), is given by

\[
\Delta_n(\theta, \phi_1, \ldots, \phi_{n-2}, r) = r^{n-1} \sin^{n-2} \phi_2 \sin \phi_1, \quad (20.13)
\]

If \(f\) is a function on \(rS^{n-1}\) – the sphere of radius \(r\) centered at 0 inside of \(\mathbb{R}^n\), then

\[
\int_{rS^{n-1}} f(x) d\sigma(x) = r^{n-1} \int_{S^{n-1}} f(r \omega) d\sigma(\omega)
\]

as a simple application, Eq. (20.14) implies

\[
\sigma(S^{n-1}) = 2\pi \prod_{k=1}^{n-2} \gamma_k = \sigma(S^{n-2}) \gamma_{n-2}.
\]

To arrive at this result we have expanded the determinant along the bottom row, 

\[
\Delta_n(\theta, \phi_1, \ldots, \phi_{n-2}, r) = r \Delta_{n-1}(\theta, \phi_1, \ldots, \phi_{n-2}, r \sin \phi_{n-1}).
\]

(20.15)

which proves Eq. (20.13). Eq. (20.14) now follows from Eqs. (20.3), (20.12) and (20.13). 

As a simple application, Eq. (20.14) implies

\[
\sigma(S^{n-1}) = \int_{0 \leq \phi \leq \pi, 0 \leq \theta \leq 2\pi} \sin^{n-2} \phi_2 \sin \phi_1 d\phi_1 \cdots d\phi_{n-2} d\theta
\]

where \(\gamma_k := \int_0^\pi \sin^k \phi d\phi\). If \(k \geq 1\), we have by integration by parts that,

\[
\gamma_k = \int_0^\pi \sin^k \phi d\phi = -\int_0^\pi \sin^{k-1} \phi \cos \phi d\phi = 2\delta_{k,1} + (k-1) \int_0^\pi \sin^{k-2} \phi \cos^2 \phi d\phi
\]

2\delta_{k,1} + (k-1) \int_0^\pi \sin^{k-2} \phi (1 - \sin^2 \phi) d\phi = 2\delta_{k,1} + (k-1) [\gamma_{k-2} - \gamma_k]

and hence \(\gamma_k\) satisfies \(\gamma_0 = \pi, \gamma_1 = 2\) and the recursion relation

\[
\gamma_k = \frac{k-1}{k} \gamma_{k-2} \quad \text{for} \quad k \geq 2.
\]

Hence we may conclude

\[
\gamma_0 = \pi, \quad \gamma_1 = 2, \quad \gamma_2 = \frac{1}{2} \pi, \quad \gamma_3 = \frac{2}{3} \pi, \quad \gamma_4 = \frac{3}{4} \pi, \quad \gamma_5 = \frac{4}{5} \pi, \quad \gamma_6 = \frac{5}{6} \pi
\]

and more generally by induction that

\[
\gamma_{2k} = \frac{(2k-1)!!}{(2k)!!} \quad \text{and} \quad \gamma_{2k+1} = \frac{2(2k)!!}{(2k+1)!!}.
\]
Indeed,

\[
\frac{\gamma_{2(k+1)+1}}{\gamma_{2k+1}} = \frac{2k + 2}{2k + 3} (2k+1)!! = \frac{2}{2k+3} \frac{(2k)!}{(2k+1+1)!!} = \frac{2(2k+1)!}{(2k+1+1)!!}
\]

and

\[
\frac{\gamma_{2(k+1)+1}}{\gamma_{2k+1}} = \frac{2k + 2}{2k + 1} \frac{(2k-1)!}{(2k)!} = \pi \frac{(2k+1)!}{(2k+2)!!}
\]

The recursion relation in Eq. (20.16) may be written as

\[
\sigma(S^n) = \sigma(S^{n-1}) \gamma_{n-1}
\]

which combined with \(\sigma(S^1) = 2\pi\) implies

\[
\sigma(S^1) = 2\pi,
\sigma(S^2) = 2\pi \cdot \gamma_1 = 2\pi \cdot 2,
\sigma(S^3) = 2\pi \cdot 2 \cdot \gamma_2 = 2\pi \cdot 2 \cdot \frac{1}{2} \pi = \frac{2^2 \pi^2}{2!!},
\sigma(S^4) = \frac{2^2 \pi^2}{2!!} \cdot \gamma_3 = \frac{2^2 \pi^2}{2!!} \cdot 3 = \frac{3^2 \pi^2}{3!!},
\sigma(S^5) = 2\pi \cdot 2 \cdot \frac{1}{2} \pi \cdot 2 \cdot \frac{3}{3} \pi = \frac{3^3 \pi^3}{4!!},
\sigma(S^6) = 2\pi \cdot 2 \cdot \frac{1}{2} \pi \cdot 2 \cdot \frac{3}{3} \pi \cdot 2 \cdot \frac{5}{5} \pi = \frac{5^4 \pi^4}{5!!}
\]

and more generally that

\[
\sigma(S^{2n}) = \frac{2(2\pi)^n}{(2n-1)!!} \text{ and } \sigma(S^{2n+1}) = \frac{(2\pi)^{n+1}}{(2n)!!} (20.18)
\]

which is verified inductively using Eq. (20.17). Indeed,

\[
\sigma(S^{2n+1}) = \sigma(S^{2n}) \gamma_{2n+1} = \frac{2(2\pi)^n}{(2n-1)!!} \cdot \frac{(2n+1)!}{(2n)!} = \frac{(2\pi)^{n+1}}{(2n)!!}
\]

and

\[
\sigma(S^{n+1}) = \sigma(S^n) \gamma_{n+1} = \frac{(2\pi)^n}{(2n)!!} \cdot \frac{(2n+1)!}{(2n+1)!!} = \frac{2(2\pi)^n}{(2n+1)!!}
\]

Using

\[
(2n)!! = 2n (2(n-1)) \ldots (2 \cdot 1) = 2^n n!
\]

we may write \(\sigma(S^{2n+1}) = \frac{2^{n+1}}{n!!} \) which shows that Eqs. (20.9) and (20.18) are in agreement. We may also write the formula in Eq. (20.18) as

\[
\sigma(S^n) = \begin{cases} 
\frac{2(2\pi)^{n/2}}{(n-1)!!} & \text{for } n \text{ even} \\
\frac{(2\pi)^{n+1}}{(n+1)!!} & \text{for } n \text{ odd.}
\end{cases}
\]

### 20.3 n- dimensional manifolds with boundaries

**Definition 20.18.** A set \(\Omega \subset \mathbb{R}^n\) is said to be a \(C^k\) manifold with boundary if for each \(x_0 \in \partial \Omega := \Omega \setminus \Omega^0\) (here \(\Omega^0\) is the interior of \(\Omega\)) there exists \(\varepsilon > 0\) an open set \(0 \in D \subset \mathbb{R}^n\) and a \(C^k\)-diffeomorphism \(\psi : D \to B(x_0, \varepsilon)\) such that \(\psi(D \cap \{y_n \geq 0\}) = B(x_0, \varepsilon) \cap \Omega\). See Figure 20.9 below. We call \(\partial \Omega\) the manifold boundary of \(\Omega\).

**Remarks 20.19.** 1. In Definition 20.18 we have defined \(\partial \Omega = \Omega \setminus \Omega^0\) which is not the topological boundary of \(\Omega\), defined by bd(\(\Omega\)) := \(\Omega \setminus \Omega^0\). Clearly we always have \(\partial \Omega \subset \text{bd}(\Omega)\) with equality iff \(\Omega\) is closed.

2. It is easily checked that if \(\Omega \subset \mathbb{R}^n\) is a \(C^k\)– manifold with boundary, then \(\partial \Omega\) is a \(C^k\)– hypersurface in \(\mathbb{R}^n\).

The reader is left to verify the following examples.

**Example 20.20.** Let \(\mathbb{H}^n = \{x \in \mathbb{R}^n : x_n > 0\}\).

1. \(\mathbb{H}^n\) is a \(C^\infty\)– manifold with boundary and

\[
\partial \mathbb{H}^n = \text{bd}(\mathbb{H}^n) = \mathbb{R}^{n-1} \times \{0\}.
\]
2. \( \Omega = B(\xi, r) \) is a \( C^\infty \) - manifold with boundary and \( \partial \Omega = \text{bd} (B(\xi, r)) \), as the reader should verify. See Exercise 20.3 for a general result containing this statement.

3. Let \( U \) be the open unit ball in \( \mathbb{R}^{n-1} \), then \( \Omega = \mathbb{H}^n \cup (U \times \{0\}) \) is a \( C^\infty \) - manifold with boundary and \( \partial \Omega = U \times \{0\} \) while \( \text{bd}(\Omega) = \mathbb{R}^{n-1} \times \{0\} \).

4. Now let \( \Omega = \mathbb{H}^n \cup (U \times \{0\}) \), then \( \Omega \) is not a \( C^1 \) - manifold with boundary.

The bad points are \( \text{bd}(U) \times \{0\} \).

5. Suppose \( V \) is an open subset of \( \mathbb{R}^{n-1} \) and \( g : V \to \mathbb{R} \) is a \( C^k \) - function and set

\[
\Omega := \{(y, z) \in V \times \mathbb{R} : z \geq g(y)\},
\]

then \( \Omega \) is a \( C^k \) - manifold with boundary and \( \partial \Omega = \Gamma(g) \) – the graph of \( g \).

Again the reader should check this statement.

6. Let

\[
\Omega = [(0, 1) \times (0, 1)] \cup [(-1, 0) \times (-1, 0)] \cup [(-1, 1) \times \{0\}]
\]

in which case

\[
\Omega^o = [(0, 1) \times (0, 1)] \cup [(-1, 0) \times (-1, 0)]
\]

and hence \( \partial \Omega = (-1, 1) \times \{0\} \) is a \( C^k \) - hypersurface in \( \mathbb{R}^2 \). Nevertheless \( \Omega \) is not a \( C^k \) - manifold with boundary as can be seen by looking at the point \((0, 0) \in \partial \Omega \).

7. If \( \Omega = S^{n-1} \subset \mathbb{R}^n \), then \( \partial \Omega = \partial S^n \) is a \( C^\infty \) - hypersurface. However, as in the previous example \( \Omega \) is not an \( n \) - dimensional \( C^k \) - manifold with boundary despite the fact that \( \Omega \) is now closed. (Warning: there is a clash of notation here with that of the more general theory of manifolds where \( \partial S^n = \emptyset \) when viewing \( S^n \) as a manifold in its own right.)

**Lemma 20.21.** Suppose \( \Omega \subset \mathbb{R}^n \) such that \( \text{bd}(\Omega) \) is a \( C^k \) - hypersurface, then \( \Omega \) is a \( C^k \) - manifold with boundary. (It is not necessarily true that \( \partial \Omega = \text{bd}(\Omega) \).

For example, let \( \Omega := B(0, 1) \cup \{x \in \mathbb{R}^n : 1 < |x| < 2\} \). In this case \( \Omega = B(0, 2) \), so \( \partial \Omega = \{x \in \mathbb{R}^n : |x| = 2\} \) while \( \text{bd}(\Omega) = \{x \in \mathbb{R}^n : |x| = 2 \text{ or } |x| = 1\} \).

**Proof.** Claim: Suppose \( U = (-1, 1)^n \subset \mathbb{R}^n \) and \( V \subset \mathbb{R}^n \) such that \( \text{bd}(V) \cap \partial \Omega = \partial \mathbb{H}^n \cap U \) is a \( C^k \) - manifold with boundary. Then \( V \in \partial \mathbb{H}^n \cap U \) is either \( U \cap \{x_n = 0\} \) or \( U \setminus \partial \mathbb{H}^n = U_+ \cup U_- \). To prove the claim, first observe that \( V \subset U \setminus \partial \mathbb{H}^n \) and \( V \) is not empty, so either \( V \subset U_+ \) or \( V \subset U_- \).

Suppose for example there exists \( \xi \in V \cap U_+ \). Let \( \sigma : [0, 1) \to U \cap \mathbb{H}^n \) be a continuous path such that \( \sigma(0) = \xi \) and \( T = \sup \{t < 1 : \sigma([0, t]) \subset V\} \).

If \( T \neq 1 \), then \( \eta := \sigma(T) \) is a point in \( U_+ \) which is also in \( \text{bd}(V) \setminus \partial \mathbb{H}^n \cap U \). But this contradicts \( \text{bd}(V) \cap U = \partial \mathbb{H}^n \cap U \) and hence \( T = 1 \). Because \( U_+ \) is path connected, we have shown \( U_+ \subset V \). Similarly if \( V \cap U_- \neq \emptyset \), then \( U_- \subset V \) as well and this completes the proof of the claim. We are now ready to show \( \Omega \) is a \( C^k \) - manifold with boundary. To this end, suppose

\[
\xi \in \partial \Omega = \text{bd}(\Omega) = \Omega \setminus \Omega^c \subset \Omega \setminus \Omega = \text{bd}(\Omega).
\]

Since \( \text{bd}(\Omega) \) is a \( C^k \) - hypersurface, we may find an open neighborhood \( O \) of \( \xi \) such that there exists a \( C^k \) - diffeomorphism \( \psi : U \to O \) such that \( \psi(\Omega \cap \text{bd}(\Omega)) = U \cap \mathbb{H}^n \). Recall that

\[
O \cap \text{bd}(\Omega) = O \cap \Omega \cap \Omega^c = \overline{O \cap \Omega^c} \setminus (O \setminus \Omega) = \text{bd}_O (\Omega \cap O)
\]

where \( \overline{O} \) and \( \text{bd}_O (A) \) denotes the closure and boundary of a set \( A \subset O \) in the relative topology on \( O \). Since \( \psi \) is a \( C^k \) - diffeomorphism, it follows that \( V := \psi (\Omega \cap O) \) is an open set such that

\[
\text{bd}(V) \cap U = \text{bd}_U (V) = \psi \left( \text{bd}_O (\Omega \cap O) \right) = \psi (O \cap \text{bd}(\Omega)) = U \cap \mathbb{H}^n.
\]

Therefore by the claim, we either \( V = U_+ \) or \( U_- \cup \Omega \). However the latter case can not occur because in this case \( \xi \) would be in the interior of \( \Omega \) and hence not in \( \text{bd}(\Omega) \). This completes the proof, since by changing the sign on the \( n \) th coordinate of \( \psi \) if necessary, we may arrange it so that \( \psi (\overline{\Omega} \cap O) = U_+ \).

**Exercise 20.2.** Suppose \( F : \mathbb{R}^n \to \mathbb{R} \) is a \( C^k \) - function such that

\[
\{F < 0\} := \{x \in \mathbb{R}^n : F(x) < 0\} \neq \emptyset
\]

and \( F' (\xi) : \mathbb{R}^n \to \mathbb{R} \) is surjective (or equivalently \( \nabla F (\xi) \neq 0 \) for all \( \xi \in \{F = 0\} \)).

Then \( \Omega := \{F \leq 0\} \) is a \( C^k \) - manifold with boundary and \( \partial \Omega = \{F = 0\} \).

**Hint:** For \( \xi \in \{F = 0\} \), let \( A : \mathbb{R}^n \to \mathbb{R}^{n-1} \) be a linear transformation such that \( A [ \text{Nul}(F'(\xi))] : \text{Nul}(F'(\xi)) \to \mathbb{R}^{n-1} \) is invertible and \( A [ \text{Nul}(F'(\xi))]^1 \equiv 0 \) and then define

\[
\phi(x) := (A (x - \xi), -F(x)) \in \mathbb{R}^{n-1} \times \mathbb{R} = \mathbb{R}^n.
\]

Now use the inverse function theorem to construct \( \psi \).

**Definition 20.22 (Outward pointing unit normal vector).** Let \( \Omega \) be a \( C^1 \) - manifold with boundary, the outward pointing unit normal vector to \( \partial \Omega \) is the unique function \( n : \partial \Omega \to \mathbb{R}^n \) satisfying the following requirements.

1. (Unit length.) \( |n(x)| = 1 \) for all \( x \in \partial \Omega \).
2. (Orthogonality to \( \partial \Omega \).) If \( x_0 \in \partial \Omega \) and \( \psi : D \to B(x_0, \varepsilon) \) is as in the Definition 20.18 then \( n(x_0) \perp \psi'(0)(\mathbb{H}^n) \), i.e. \( n(x_0) \) is perpendicular to \( \partial \Omega \).
3. (Outward Pointing.) If \( \phi : \psi^{-1} \) then \( \phi'(0)(n(x_0)) \cdot e_n < 0 \) or equivalently put \( \psi'(0)e_n \cdot n(x_0) < 0 \), see Figure 20.11 below.
20.4 Divergence Theorem

Theorem 20.23 (Divergence Theorem). Let $\Omega \subset \mathbb{R}^n$ be a manifold with $C^2$ boundary and $n : \partial \Omega \to \mathbb{R}^n$ be the unit outward pointing normal to $\Omega$. If $Z \in C_c(\Omega, \mathbb{R}^n) \cap C^1(\Omega^o, \mathbb{R}^n)$ and

$$\int_{\Omega} |\nabla \cdot Z| dm < \infty$$

then

$$\int_{\partial \Omega} Z(x) \cdot n(x) d\sigma(x) = \int_{\Omega} \nabla \cdot Z(x) \, dx. \quad (20.20)$$

The proof of Theorem 20.23 will be given after stating a few corollaries and then a number preliminary results.

Example 20.24. Let

$$f(x) = \begin{cases} x \sin \left( \frac{1}{x} \right) & \text{on } [0, 1], \\ 0 & \text{if } x = 0, \end{cases}$$

then $f \in C([0, 1]) \cap C^\infty((0, 1))$ and $f'(x) = \sin \left( \frac{1}{x} \right) - \frac{1}{x} \sin \left( \frac{1}{x} \right)$ for $x > 0$. Since

$$\int_{0}^{1} \frac{1}{x} \sin \left( \frac{1}{x} \right) \, dx = \int_{0}^{\infty} u \sin(u) \frac{1}{u^2} \, du = \int_{0}^{\infty} \frac{\sin(u)}{u} \, du = \infty,$$ 

and $1 \cdot f'(x) \, dx = \infty$ and the integrability assumption, $\int_{\Omega} |\nabla \cdot Z| \, dx < \infty$, in Theorem 20.23 is necessary.

Corollary 20.25. Let $\Omega \subset \mathbb{R}^n$ be a closed manifold with $C^2$ boundary and $n : \partial \Omega \to \mathbb{R}^n$ be the outward pointing unit normal to $\Omega$. If $Z \in C(\Omega, \mathbb{R}^n) \cap C^1(\Omega^o, \mathbb{R}^n)$ and

$$\int_{\Omega} \{ |Z| + |\nabla \cdot Z| \} \, dm + \int_{\partial \Omega} |Z \cdot n| \, d\sigma < \infty \quad (20.21)$$

then Eq. (20.20) is valid, i.e.

$$\int_{\partial \Omega} Z(x) \cdot n(x) d\sigma(x) = \int_{\Omega} \nabla \cdot Z(x) \, dx.$$ 

**Proof.** Let $\psi \in C^\infty_c(\mathbb{R}^n, [0, 1])$ such that $\psi = 1$ in a neighborhood of 0 and set $\psi_k(x) := \psi(x/k)$ and $Z_k := \psi_k Z$. We have supp($Z_k$) $\subset$ supp($\psi_k$) $\cap$ $\Omega$ — which is a compact set since $\Omega$ is closed. Since $\nabla \psi_k(x) = \frac{1}{k} (\nabla \psi) (x/k)$ is bounded,

$$\int_{\Omega} |\nabla \cdot Z_k| \, dm = \int_{\Omega} |\nabla \psi_k \cdot Z + \psi_k \nabla \cdot Z| \, dm \leq C \int_{\Omega} |Z| \, dm + \int_{\Omega} |\nabla \cdot Z| \, dm < \infty.$$ 

Hence Theorem 20.23 implies

$$\int_{\Omega} \nabla \cdot Z_k dm = \int_{\partial \Omega} Z_k \cdot n d\sigma. \quad (20.22)$$

By the D.C.T.,

$$\int_{\Omega} \nabla \cdot Z_k dm \to \int_{\Omega} \nabla \cdot Z dm$$

and

$$\int_{\partial \Omega} Z_k \cdot n d\sigma \to \int_{\partial \Omega} Z \cdot n d\sigma,$$

which completes the proof by passing the limit in Eq. (20.22). \hfill \blacksquare

**Corollary 20.26 (Integration by parts I).** Let $\Omega \subset \mathbb{R}^n$ be a closed manifold with $C^2$ boundary, $n : \partial \Omega \to \mathbb{R}^n$ be the outward pointing normal to $\Omega$, $Z \in C(\Omega, \mathbb{R}^n) \cap C^1(\Omega^o, \mathbb{R}^n)$ and $f \in C(\Omega, \mathbb{R}) \cap C^1(\Omega^o, \mathbb{R})$ such that

$$\int_{\Omega} \{ |f| |Z| + |\nabla \cdot Z| + |\nabla f| |Z| \} \, dm + \int_{\partial \Omega} |f| |Z \cdot n| \, d\sigma < \infty$$

then

$$\int_{\Omega} f(x) \nabla \cdot Z(x) \, dx = - \int_{\Omega} \nabla f(x) \cdot Z(x) \, dx + \int_{\partial \Omega} f(x) Z(x) \cdot n(x) \, d\sigma(x).$$

**Proof.** Apply Corollary 20.25 with $Z$ replaced by $fZ$. \hfill \blacksquare

**Corollary 20.27 (Integration by parts II).** Let $\Omega \subset \mathbb{R}^n$ be a closed manifold with $C^2$ boundary, $n : \partial \Omega \to \mathbb{R}^n$ be the outward pointing normal to $\Omega$ and $f, g \in C(\Omega, \mathbb{R}) \cap C^1(\Omega^o, \mathbb{R})$ such that

$$\int_{\Omega} \{ |f| |g| + |\partial_if| |g| + |f| |\partial_ig| \} \, dm + \int_{\partial \Omega} |fg_n| \, d\sigma < \infty$$
then
\[
\int_{\Omega} f(x) \partial_i g(x) \, dm = - \int_{\Omega} \partial_i f(x) \cdot g(x) \, dm + \int_{\partial \Omega} f(x) g(x) n_i(x) \, d\sigma(x).
\]

**Proof.** Apply Corollary 20.26 with \( Z \) chosen so that \( Z_j = 0 \) if \( j \neq i \) and \( Z_i = g \), (i.e. \( Z = (0, \ldots, g, 0, \ldots, 0) \)).

**Proposition 20.28.** Let \( \Omega \) be as in Corollary 20.26 and suppose \( u, v \in C^2(\Omega^0) \cap C^1(\Omega) \) such that \( u, v, \nabla u, \nabla v, \Delta u, \Delta v \in L^2(\Omega) \) and \( u, v, \partial u, \partial v \in L^2(\partial \Omega, d\sigma) \) then
\[
\int_{\Omega} \Delta u \cdot v \, dm = - \int_{\Omega} \nabla u \cdot \nabla v \, dm + \int_{\partial \Omega} \frac{\partial u}{\partial n} \, d\sigma \tag{20.23}
\]
and
\[
\int_{\Omega} (\Delta uv - \Delta v u) \, dm = \int_{\partial \Omega} \left( \frac{\partial u}{\partial n} - \frac{\partial v}{\partial n} \right) \, d\sigma. \tag{20.24}
\]

**Proof.** Eq. (20.23) follows by applying Corollary 20.26 with \( f = v \) and \( Z = \nabla u \). Similarly applying Corollary 20.26 with \( f = u \) and \( Z = \nabla v \) implies
\[
\int_{\Omega} \Delta v \cdot u \, dm = - \int_{\Omega} \nabla u \cdot \nabla v \, dm + \int_{\partial \Omega} \frac{\partial v}{\partial n} \, d\sigma
\]
and subtracting this equation from Eq. (20.23) implies Eq. (20.24).

**Lemma 20.29.** Let \( \Omega_t = \phi_t(\Omega) \) be a smoothly varying domain and \( f : \mathbb{R}^n \to \mathbb{R} \). Then
\[
\frac{d}{dt} \int_{\Omega_t} f \, dx = \int_{\Omega_t} f \, (Y_t \cdot n) \, d\sigma
\]
where \( Y_t(x) = \frac{d}{dt} \bigg|_0 \phi_{t+\epsilon}(\phi_t^{-1}(x)) \) as in Figure 20.10.

**Proof.** With out loss of generality we may compute the derivative at \( t = 0 \) and replace \( \Omega \) by \( \phi_0(\Omega) \) and \( \phi_t \) by \( \phi_t \circ \phi_0^{-1} \) if necessary so that \( \phi_0(x) = x \) and \( Y(x) = \frac{d}{dt} \bigg|_0 \phi_t(x) \). By the change of variables theorem,
\[
\int_{\Omega_t} f \, dx = \int_{\Omega} f \, (\phi_t^{-1}) \det[\phi_t'(x)] \, dx
\]
and hence
\[
\frac{d}{dt} \int_{\Omega_t} f \, dx = \int_{\partial \Omega} f \, (Y_t \cdot n) \, d\sigma.
\]

**Fig. 20.10.** The vector-field \( Y_t(x) \) measures the velocity of the boundary point \( x \) at time \( t \).

**Lemma 20.30.** Suppose \( \Omega \subset \mathbb{R}^n \) and \( Z \in C^1(\Omega, \mathbb{R}^n) \) and \( f \in C^1_c(\Omega, \mathbb{R}) \), then
\[
\int_{\Omega} f \nabla \cdot Z \, dx = - \int_{\partial \Omega} \nabla f \cdot Z \, d\sigma.
\]

**Proof.** Let \( W := fZ \) on \( \Omega \) and \( W = 0 \) on \( \Omega^c \), then \( W \in C^1_c(\mathbb{R}^n, \mathbb{R}) \). By Fubini’s theorem and the fundamental theorem of calculus,
\begin{align*}
\int_{\Omega} \nabla \cdot (fZ) \, dx &= \int_{\mathbb{R}^n} (\nabla \cdot W) \, dx = \sum_{i=1}^{n} \int_{\mathbb{R}^n} \frac{\partial W_i}{\partial x^i} \, dx_1 \ldots \, dx_n = 0.
\end{align*}

This completes the proof because $\nabla \cdot (fZ) = \nabla f \cdot Z + f \nabla \cdot Z$. \hfill \blacksquare

**Corollary 20.31.** If $\Omega \subset \mathbb{R}^n$, $Z \in C^1(\mathbb{R}^n)$ and $g \in C(\mathbb{R}^n)$ then $g = \nabla \cdot Z$ iff
\begin{equation}
\int_{\Omega} g f \, dx = - \int_{\Omega} Z \cdot \nabla f \, dx \quad \text{for all } f \in C^1_c(\Omega). \tag{20.25}
\end{equation}

**Proof.** By Lemma 20.30 Eq. (20.25) holds iff
\begin{equation}
\int_{\Omega} g f \, dx = \int_{\Omega} \nabla \cdot Z \ f \ dx \quad \text{for all } f \in C^1_c(\Omega)
\end{equation}
which happens iff $g = \nabla \cdot Z$. \hfill \blacksquare

**Proposition 20.32 (Behavior of $\nabla$ under coordinate transformations).**

Let $\psi: W \to \Omega$ is a $C^2$-diffeomorphism where $W$ and $\Omega$ and open subsets of $\mathbb{R}^n$. Given $f \in C^1_c(\Omega, \mathbb{R})$ and $Z \in C^1(\mathbb{R}^n)$ let $f^\psi = f \circ \psi \in C^1(W, \mathbb{R})$ and $Z^\psi \in C^1(W, \mathbb{R}^n)$ be defined by $Z^\psi(y) = (\psi'(y))^{-1} \psi(\psi(y))$. Then
\begin{enumerate}
\item \begin{equation*}
\nabla f^\psi = \nabla (f \circ \psi) = (\psi')^t (\nabla f) \circ \psi
\end{equation*}
\item \begin{equation*}
\nabla \cdot [\det \psi^\prime \ Z^\psi] = (\nabla \cdot Z) \circ \psi \cdot \det \psi'. \quad \text{(Notice that we use $\psi$ is $C^2$ at this point.)}
\end{equation*}
\end{enumerate}

**Proof.** 1. Let $v \in \mathbb{R}^n$, then by definition of the gradient and using the chain rule,
\begin{equation*}
\nabla (f \circ \psi) \cdot v = \partial_v (f \circ \psi) = \nabla f(\psi) \cdot \psi' v = (\psi')^t \nabla f(\psi) \cdot v.
\end{equation*}

2. Let $f \in C^1_c(\Omega)$. By the change of variables formula,
\begin{align*}
\int_{\Omega} f \nabla \cdot Z \, dm &= \int_{W} f \circ \psi \cdot (\nabla \cdot Z) \circ \psi \det \psi' \, dm \\
&= \int_{W} f^\psi \cdot (\nabla \cdot Z) \circ \psi \det \psi' \, dm. \tag{20.26}
\end{align*}

On the other hand
\begin{align*}
\int_{\Omega} f \nabla \cdot Z \, dm &= - \int_{\Omega} \nabla f(\psi) \cdot Z(\psi) \det \psi' \, dm \\
&= - \int_{W} \left[ (\psi')^t \right]^{-1} \nabla f^\psi \cdot Z(\psi) \det \psi' \, dm \\
&= - \int_{W} \nabla f^\psi \cdot (\psi')^{-1} Z(\psi) \det \psi' \, dm \\
&= - \int_{W} (\nabla f^\psi \cdot Z^\psi) \det \psi' \, dm \\
&= \int_{W} f^\psi \nabla \cdot (\det \psi' \ Z^\psi) \, dm. \tag{20.27}
\end{align*}

Since Eqs. (20.26) and (20.27) hold for all $f \in C^1_c(\Omega)$ we may conclude
\begin{align*}
\nabla \cdot (\det \psi' \ Z^\psi) &= (\nabla \cdot Z) \circ \psi \det \psi' + \nabla \psi \cdot (\det \psi) \ Z^\psi.
\end{align*}

and by linearity this proves item 2. \hfill \blacksquare

**Lemma 20.33.** Eq. (20.20) of the divergence theorem of the Divergence Theorem 20.23 holds when $\Omega = \mathbb{H}^n = \{ x \in \mathbb{R}^n : x_n \geq 0 \}$ and $Z \in C^1(\mathbb{H}^n, \mathbb{R}^n) \cap C^1(\mathbb{H}^n, \mathbb{R}^n)$ satisfies
\begin{equation}
\int_{\mathbb{H}^n} |\nabla \cdot Z| \, dx < \infty.
\end{equation}

**Proof.** In this case $\partial \Omega = \mathbb{R}^{n-1} \times \{0\}$ and $n(x) = -e_n$ for $x \in \partial \Omega$ is the outward pointing normal to $\Omega$. By Fubini’s theorem and the fundamental theorem of calculus,
\begin{equation*}
\sum_{i=1}^{n-1} \int_{x_n > \delta} \frac{\partial Z_i}{\partial x_i} \, dx = 0
\end{equation*}
and
\begin{equation*}
\int_{x_n > \delta} \frac{\partial Z_n}{\partial x_n} \, dx = - \int_{\mathbb{R}^{n-1}} Z_n(y, \delta) \, dy.
\end{equation*}

Therefore, using the dominated convergence theorem,
\begin{align*}
\int_{\mathbb{H}^n} \nabla \cdot Z \, dx &= \lim_{\delta \to 0} \int_{x_n > \delta} \nabla \cdot Z \, dx = - \lim_{\delta \to 0} \int_{\mathbb{R}^{n-1}} Z_n(y, \delta) \, dy \\
&= - \int_{\mathbb{R}^{n-1}} Z_n(y, 0) \, dy = \int_{\partial \mathbb{H}^n} Z(x) \cdot n(x) \, d\sigma(x).
\end{align*}
Remark 20.34. The same argument used in the proof of Lemma 20.33 shows Theorem 20.23 holds when
\[ \Omega = \mathbb{R}^n_+ := \{ x \in \mathbb{R}^n : x_i \geq 0 \text{ for all } i \} . \]

Notice that \( \mathbb{R}^n_+ \) has a corners and edges, etc. and so \( \partial \Omega \) is not smooth in this case.

20.5.1 The Proof of the Divergence Theorem 20.23

Proof. First suppose that \( \text{supp}(Z) \) is a compact subset of \( B(x_0, \varepsilon) \cap \Omega \) for some \( x_0 \in \partial \Omega \) and \( \varepsilon > 0 \) is sufficiently small so that there exists \( V \subset_0 \mathbb{R}^n \) and \( C^2 \) diffeomorphism \( \psi : V \rightarrow B(x_0, \varepsilon) \) (see Figure 20.11) such that \( \psi(V \cap \{ y_n > 0 \}) = B(x_0, \varepsilon) \cap \Omega^o \)
\[ \psi(V \cap \{ y_n = 0 \}) = B(x_0, \varepsilon) \cap \partial \Omega. \]

Because \( n \) is the outward pointing normal, \( n(\psi(y)) \cdot \psi'(y)e_n < 0 \) on \( y_n = 0 \).

![Fig. 20.11. Reducing the divergence theorem for general \( \Omega \) to \( \Omega = \mathbb{R}^n \).](image)

Since \( V \) is connected and \( \det \psi'(y) \) is never zero on \( V \), \( \varsigma := \text{sgn}(\det \psi'(y)) \in \{ \pm 1 \} \) is constant independent of \( y \in V \). For \( y \in \partial \mathbb{R}^n \),
\[
(Z \cdot n)(\psi(y))|\det[\psi'(y)e_1|\ldots|\psi'(y)e_{n-1}|n(\psi(y))]| = -\varsigma(Z \cdot n)(\psi(y))|\det[\psi'(y)e_1|\ldots|\psi'(y)e_{n-1}|n(\psi(y))] = -\varsigma \det[\psi'(y)e_1|\ldots|\psi'(y)e_{n-1}|\psi'(y)Z_n(y)] = -\varsigma \det(\psi'(y)) \cdot \det[|e_1|\ldots|e_{n-1}|Z_n(y)] = -|\det \psi'(y)| Z_n(y) \cdot e_n,
\]
wherein the second equality we used the linearity properties of the determinant and the identity
\[ Z(\psi(y)) = Z \cdot n(\psi(y)) + \sum_{i=1}^{n-1} \alpha_i \psi'(y)e_i \text{ for some } \alpha_i. \]

Starting with the definition of the surface integral we find
\[
\int_{\partial \Omega} Z \cdot n \, d\sigma = \int_{\partial \mathbb{R}^n} (Z \cdot n)(\psi(y))|\det[\psi'(y)e_1|\ldots|\psi'(y)e_{n-1}|n(\psi(y))]| \, dy
\]
\[ = \int_{\mathbb{R}^n} \det \psi'(y)Z_n(y) \cdot (-e_n) \, dy
\]
\[ = \int_{\mathbb{R}^n} \nabla \cdot [\det \psi'Z_n^\varsigma] \, dm \text{ (by Lemma 20.33)}
\]
\[ = \int_{\mathbb{R}^n} [\nabla \cdot Z] \, \det \psi' \, dm \text{ (by Proposition 20.32)}
\]
\[ = \int_{\Omega} (\nabla \cdot Z) \, dm \text{ (by the Change of variables theorem)}. \]

2) We now prove the general case where \( Z \in C_c(\Omega, \mathbb{R}^n) \cap C^1(\Omega^o, \mathbb{R}^n) \) and \( \int_{\Omega} |\nabla \cdot Z| \, dm < \infty \). Using Theorem 20.28, we may choose \( \phi_i \in C_c^{\infty}(\mathbb{R}^n) \) such that

1. \( \sum_{i=1}^N \phi_i \leq 1 \) with equality in a neighborhood of \( K = \text{Supp}(Z) \).
2. For all \( i \) either \( \text{supp}(\phi_i) \subset \Omega \) or \( \text{supp}(\phi_i) \subset B(x_0, \varepsilon) \) where \( x_0 \in \partial \Omega \) and \( \varepsilon > 0 \) are as in the previous paragraph.

Then by special cases proved in the previous paragraph and in Lemma 20.30
\[
\int_{\Omega} \nabla \cdot Z \, dx = \int_{\Omega} \nabla \cdot (\sum_i \phi_i Z) \, dx = \sum_i \int_{\Omega} \nabla \cdot (\phi_i Z) \, dx = \sum_i \int_{\partial \Omega} (\phi_i Z) \cdot n \, d\sigma
\]
\[ = \int_{\partial \Omega} \sum_i \phi_i Z \cdot n \, d\sigma = \int_{\partial \Omega} Z \cdot n \, d\sigma. \]

\( \blacksquare \)
20.5.2 Extensions of the Divergence Theorem to Lipschitz domains

BRUCE: This should be done after the fact about Lip-functions being a.e. differentiable are proved.

The divergence theorem holds more generally for manifolds $\Omega$ with Lipschitz boundary. By this we mean, locally near a boundary point, $\Omega$ should be of the form

$$\Omega := \{(y, z) \in D \times \mathbb{R} \cap \mathbb{R}^n : z \geq g(y)\} = \{z \geq g\}$$

where $g : D \to \mathbb{R}$ is a Lipschitz function and $D$ is the open unit ball in $\mathbb{R}^{n-1}$.

To prove this remark, first suppose that $Z \in C^1_c(\mathbb{R}^n, \mathbb{R}^n)$ such that $\text{supp}(Z) \subset D \times \mathbb{R}$. Let $\delta_m(x) = m^n \rho(mx)$ where $\rho \in C_0^\infty(B(0, 1), [0, \infty))$ such that $\int_{\mathbb{R}^n} \rho dm = 1$ and let $g := g \ast \delta_m$ defined on $D_{1-1/m}$ – the open ball of radius $1 - 1/m$ in $\mathbb{R}^{n-1}$ and let $\Omega_m := \{z \geq g_m\}$. For $m$ large enough we will have $\text{supp}(Z) \subset D_{1-1/m} \times \mathbb{R}$ and so by the divergence theorem we have already proved,

$$\int_{\Omega_m} \nabla \cdot Z dm = \int_{\partial \Omega_m} Z \cdot nd\sigma = \int_D Z(y, g_m(y)) \cdot (\nabla g_m(y), -1) \, dy.$$

Now

$$\left|z \geq g - \lim_{m \to \infty} z \geq g_m\right| \leq 1_{z \geq g(y)}$$

and by Fubini’s theorem,

$$\int_D z \geq g(y) \, d\rho \, d\zeta = \int_D dy \int_\mathbb{R} 1_{z \geq g(y)} \, d\zeta = 0.$$

Hence by the dominated convergence theorem,

$$\lim_{m \to \infty} \int_{\Omega_m} \nabla \cdot Z dm = \lim_{m \to \infty} \int_{z \geq g_m} \nabla \cdot Z dm = \lim_{m \to \infty} \int_{z \geq g_m} \nabla \cdot Z dm = \int_{\Omega} \nabla \cdot Z dm = \int_{\partial \Omega} Z \cdot nd\sigma.$$

Moreover we also have from results to be proved later in the course that $\nabla g(y)$ exists for a.e. $y$ and is bounded by the Lipschitz constant $K$ for $g$ and

$$\nabla g_m = \nabla g \ast \delta_m \to \nabla g$$

in $L_p(\mathbb{R}^n)$ for any $1 \leq p < \infty$.

Therefore,

$$\lim_{m \to \infty} \int_D Z(y, g_m(y)) \cdot (\nabla g_m(y), -1) \, dy = \int_D Z(y, g(y)) \cdot (\nabla g(y), -1) \, dy = \int_{\partial \Omega} Z \cdot nd\sigma$$

where $n d\sigma$ is the vector valued measure on $\partial \Omega$ determined in local coordinates by $(\nabla g_m(y), -1) \, dy$.

Finally if $Z \in C^1(\mathbb{R}^n) \cap C_c(\mathbb{R}^n)$ with $\int_{\Omega} \nabla \cdot Z \, dm < \infty$ with $\Omega$ as above. We can use the above result applied to the vector field $Z_{y, z} := Z(y, z, \varepsilon)$ which we may now view as an element of $C^1(\Omega)$.

We then have

$$\int_{\Omega} \nabla \cdot Z(y, \varepsilon + z) \, dm = \int_{\Omega} Z(y, g(y) + \varepsilon) \cdot (\nabla g(y), -1) \, dy$$

$$\to \int_{\Omega} Z(y, g(y)) \cdot (\nabla g(y), -1) \, dy = \int_{\partial \Omega} Z \cdot nd\sigma. \quad (20.28)$$

And again by the dominated convergence theorem,

$$\lim_{\varepsilon \to 0} \int_{\Omega} \nabla \cdot Z(y, \varepsilon + z) \, dm = \lim_{\varepsilon \to 0} \int_{\Omega} 1_{\Omega}(y, z) \nabla \cdot Z(y, z + \varepsilon) \, d\rho \, d\zeta$$

$$= \lim_{\varepsilon \to 0} \int_{\Omega} 1_{\Omega}(y, z - \varepsilon) \nabla \cdot Z(y, z) \, d\rho \, d\zeta$$

$$= \int_{\mathbb{R}^n} \lim_{\varepsilon \to 0} 1_{\Omega}(y, z - \varepsilon) \nabla \cdot Z(y, z) \, d\rho \, d\zeta$$

$$= \int_{\mathbb{R}^n} 1_{\Omega}(y, z) \nabla \cdot Z(y, z) \, d\rho \, d\zeta = \int_{\partial \Omega} \nabla \cdot Z dm. \quad (20.29)$$

wherein we have used

$$\lim_{\varepsilon \to 0} 1_{\Omega}(y, z - \varepsilon) = \lim_{\varepsilon \to 0} 1_{\Omega} \big|_{z \geq g(y)} + \varepsilon = 1_{z \geq g(y)}.$$ 

Comparing Eqs. (20.28) and (20.29) finishes the proof of the extension.

20.6 Application to Holomorphic functions

Let $\Omega \subset \mathbb{C} \equiv \mathbb{R}^2$ be a compact manifold with $C^2$ boundary.

**Definition 20.35.** Let $\Omega \subset \mathbb{C} \equiv \mathbb{R}^2$ be a compact manifold with $C^2$ boundary and $f \in C(\partial \Omega, \mathbb{C})$. The contour integral, $\int_{\partial \Omega} f(z) \, dz$, of $f$ along $\partial \Omega$ is defined by

$$\int_{\partial \Omega} f(z) \, dz := \int_{\partial \Omega} f \, n \, d\sigma$$

where $n : \partial \Omega \to S^1 \subset \mathbb{C}$ is chosen so that $n := (\text{Re} n, \text{Im} n)$ is the outward pointing normal, see Figure 20.12.

In order to carry out the integral in Definition 20.35 more effectively, suppose that $z = \gamma(t)$ with $a \leq t \leq b$ is a parametrization of a part of the boundary
of $\Omega$ and $\gamma$ is chosen so that $T := \dot{\gamma}(t)/|\dot{\gamma}(t)| = \text{in}(\gamma(t))$. That is to say $T$ is gotten from $n$ by a $90^\circ$ rotation in the counterclockwise direction. Combining this with $d\sigma = |\dot{\gamma}(t)|dt$ we see that

$$i\ n\ d\sigma = T|\dot{\gamma}(t)|dt = \dot{\gamma}(t)dt = dz$$

so that

$$\int_{\gamma} f(z)dz = \int_{a}^{b} f(\gamma(t))\dot{\gamma}(t)dt.$$

**Proposition 20.36.** Let $f \in C^1(\bar{\Omega}, \mathbb{C})$ and $\bar{\partial} := \frac{i}{2}(\partial_x + i\partial_y)$, then

$$\int_{\partial\Omega} f(z)dz = 2i\int_{\Omega} \bar{\partial}f dm.$$  \hspace{1cm} (20.30)

Now suppose $w \in \Omega$, then

$$f(w) = \frac{1}{2\pi i} \int_{\partial\Omega} \frac{f(z)}{z-w}dz - \frac{1}{\pi} \int_{\bar{\Omega}} \frac{\bar{\partial}f(z)}{z-w}dm(z).$$  \hspace{1cm} (20.31)

**Proof.** By the divergence theorem,

$$\int_{\Omega} \bar{\partial}f dm = \frac{1}{2} \int_{\partial\Omega} (\partial_x + i\partial_y) f dm = \frac{1}{2} \int_{\partial\Omega} f(n_1 + in_2) d\sigma$$

$$= \frac{1}{2} \int_{\partial\Omega} fnd\sigma = -\frac{i}{2} \int_{\partial\Omega} f(z)dz.$$ 

Given $\varepsilon > 0$ small, let $\Omega_{\varepsilon} := \Omega \setminus B(w, \varepsilon)$. Eq. (20.30) with $\Omega = \Omega_{\varepsilon}$ and $f$ being replaced by $\frac{f(z)}{z-w}$ implies

$$\int_{\partial\Omega_{\varepsilon}} f(z)dz = 2i\int_{\Omega_{\varepsilon}} \bar{\partial}f dm.$$  \hspace{1cm} (20.32)

wherein we have used the product rule and the fact that $\bar{\partial}(z-w)^{-1} = 0$ to conclude

$$\bar{\partial} \left[ \frac{f(z)}{z-w} \right] = \frac{\bar{\partial}f(z)}{z-w}.$$ 

Noting that $\partial\Omega_{\varepsilon} = \partial\Omega \cup \partial B(w, \varepsilon)$ and $\partial B(w, \varepsilon)$ may be parametrized by $z = w + \varepsilon e^{-i\theta}$ with $0 \leq \theta \leq 2\pi$, we have

$$\int_{\partial\Omega_{\varepsilon}} \frac{f(z)}{z-w}dz = \int_{\partial\Omega} \frac{f(z)}{z-w}dz + \int_{0}^{2\pi} \frac{f(w + \varepsilon e^{-i\theta})}{\varepsilon e^{-i\theta}} (-i\varepsilon) e^{-i\theta}d\theta$$

$$= \int_{\partial\Omega} \frac{f(z)}{z-w}dz - i\int_{0}^{2\pi} f(w + \varepsilon e^{-i\theta})d\theta$$

and hence

$$\int_{\partial\Omega} \frac{f(z)}{z-w}dz - i\int_{0}^{2\pi} f(w + \varepsilon e^{-i\theta})d\theta = 2i\int_{\Omega_{\varepsilon}} \bar{\partial}f dm(z)$$  \hspace{1cm} (20.33)

Since

$$\lim_{\varepsilon \downarrow 0} \int_{0}^{2\pi} f(w + \varepsilon e^{-i\theta})d\theta = 2\pi f(w)$$

and

$$\lim_{\varepsilon \downarrow 0} \int_{\partial\Omega_{\varepsilon}} \frac{\bar{\partial}f(z)}{z-w}dm = \int_{\Omega} \frac{\bar{\partial}f(z)}{z-w}dm(z),$$

we may pass to the limit in Eq. (20.33) to find

$$\int_{\partial\Omega} \frac{f(z)}{z-w}dz - 2\pi if(w) = 2i\int_{\Omega} \frac{\bar{\partial}f(z)}{z-w}dm(z)$$

which is equivalent to Eq. (20.31).

**Remark 20.37.** Eq. (20.31) implies $\bar{\partial} \frac{1}{z} = \pi \delta(z)$. Indeed if $f \in C^{\infty}_{c}(\mathbb{C} \cong \mathbb{R}^2)$, then by Eq. (20.31)

$$\langle \bar{\partial} \frac{1}{z}, f \rangle := \langle \frac{1}{z^2}, -\bar{\partial}f \rangle = -\frac{1}{\pi} \int_{\mathbb{C}} \frac{1}{z} \bar{\partial}f dm(z) = f(0)$$

which is equivalent to $\bar{\partial} \frac{1}{z} = \pi \delta(z)$.

**Exercise 20.3.** Let $\Omega$ be as above and assume $f \in C^1(\bar{\Omega}, \mathbb{C})$ satisfies $\bar{\partial}f \in C^{\infty}(\Omega, \mathbb{C})$. Show $f \in C^{\infty}(\Omega, \mathbb{C})$. Hint, let $w_0 \in \Omega$ and $\varepsilon > 0$ be small.
and choose \( \phi \in C_c^\infty (B(z_0, \varepsilon)) \) such that \( \phi = 1 \) in a neighborhood of \( w_0 \) and let
\[ \psi = 1 - \phi. \]
Then by Eq. (20.31),
\[
f(w) = \frac{1}{2\pi i} \int_{\partial D} \frac{f(z)}{z - w} \, dz - \frac{1}{\pi} \int_D \frac{g(z)}{z - w} \phi(z) \, dm(z)
- \frac{1}{\pi} \int_{\partial D} \frac{g(z)}{z - w} \psi(z) \, dm(z).
\]
Now show each of the three terms above are smooth in \( w \) for \( w \) near \( w_0 \). To handle the middle term notice that
\[
\int _{ \Omega } \frac{g(z)}{z - w} \phi (z) \, dm(z) = \int _{ \Omega } \frac{g(z + w)}{z} \phi (z + w) \, dm(z)
\]
for \( w \) near \( w_0 \).

**Definition 20.38.** A function \( f \in C^1(\Omega, \mathbb{C}) \) is said to be holomorphic if \( \bar{\partial}f = 0 \).

By Proposition 20.36 if \( f \in C^1(\Omega, \mathbb{C}) \) and \( \bar{\partial}f = 0 \) on \( \Omega \), then Cauchy’s integral formula holds for \( w \in \Omega \), namely
\[
f(w) = \frac{1}{2\pi i} \int_{\partial \Omega} \frac{f(z)}{z - w} \, dz
\]
and \( f \in C^\infty(\Omega, \mathbb{C}) \). For more details on Holomorphic functions, see the complex variable appendix.

### 20.7 Dirichlet Problems on \( D \)

**BRUCE:** This should be moved to the sections on Fourier Series.

Let \( D := \{ z \in \mathbb{C} : |z| < 1 \} \) be the open unit disk in \( \mathbb{C} \cong \mathbb{R}^2 \), where we write \( z = x + iy = re^{i\theta} \) in the usual way. Also let \( \Delta = \frac{\partial^2}{\partial x^2} + \frac{\partial^2}{\partial y^2} \) and recall that \( \Delta \) may be computed in polar coordinates by the formula,
\[
\Delta u = r^{-1} \partial_r \left( r^{-1} \partial_r u \right) + \frac{1}{r^2} \partial_\theta^2 u.
\]

Indeed if \( v \in C^1_c(D) \), then
\[
\int_D \Delta uv \, dm = -\int_D \nabla u \cdot \nabla v \, dm = -\int_{0 \leq \theta < 2\pi} \int_{0 \leq r < 1} \left( u_r v_r + \frac{1}{r^2} u_{r\theta} v_{r\theta} \right) r \, dr \, d\theta
\]
\[
= \int_{0 \leq \theta < 2\pi} \int_{0 \leq r < 1} \left( (ru_r)_r + \frac{1}{r^2} ru_{r\theta} v_{r\theta} \right) r \, dr \, d\theta
\]
\[
= \int_{0 \leq \theta < 2\pi} \int_{0 \leq r < 1} \left( \frac{1}{r} ru_r \right)_r + \frac{1}{r^2} u_{r\theta} v_{r\theta} \right) r \, dr \, d\theta
\]
which shows Eq. (20.34) is valid. See Exercises 20.5 and 20.6 for more details.

Suppose that \( u \in C(\overline{D}) \cap C^2(D) \) and \( \Delta u(z) = 0 \) for \( z \in D \). Let \( g = u|_{\partial D} \) and
\[
A_k := g_k(k) := \frac{1}{2\pi} \int_{-\pi}^{\pi} g(e^{ik\theta}) e^{-ik\theta} \, d\theta.
\]
(We are identifying \( S^1 = \partial D := \{ z \in D : |z| = 1 \} \) with \( [-\pi, \pi] / (\pi \sim -\pi) \) by the map \( \theta \in [-\pi, \pi] \mapsto e^{i\theta} \in S^1 \).) Let
\[
\hat{u}(r, k) := \frac{1}{2\pi} \int_{-\pi}^{\pi} u(re^{i\theta}) e^{-ik\theta} \, d\theta
\]
then:

1. \( \hat{u}(r, k) \) satisfies the ordinary differential equation
\[
r^{-1} \partial_r (r \partial_r \hat{u}(r, k)) = \frac{1}{r^2} k^2 \hat{u}(r, k)
\]
for \( r \in (0, 1) \).

2. Recall the general solution to
\[
r^{-1} \partial_r (r \partial_r g(r)) = k^2 g(r)
\]
may be found by trying solutions of the form \( g(r) = r^\alpha \) which then implies \( \alpha^2 = k^2 \) or \( \alpha = \pm k \). From this one sees that \( \hat{u}(r, k) \) may be written as
\[
\hat{u}(r, k) = Akr^{1|k|} + Bkr^{-|k|}
\]
for some constants \( A_k \) and \( B_k \) when \( k \neq 0 \). If \( k = 0 \), the solution to Eq. (20.36) is gotten by simple integration and the result is \( \hat{u}(r, 0) = A_0 + B_0 \ln r \). Since \( \hat{u}(r, k) \) is bounded near the origin for each \( k \), it follows that \( B_k = 0 \) for all \( k \in \mathbb{Z} \).

3. So we have shown
\[
A_k r^{1|k|} = \hat{u}(r, k) = \frac{1}{2\pi} \int_{-\pi}^{\pi} u(re^{i\theta}) e^{-ik\theta} \, d\theta
\]
and letting \( r \uparrow 1 \) in this equation implies
\[
A_k = \frac{1}{2\pi} \int_{-\pi}^{\pi} u(e^{i\theta}) e^{-ik\theta} \, d\theta = \frac{1}{2\pi} \int_{-\pi}^{\pi} f(e^{i\theta}) e^{-ik\theta} \, d\theta.
\]
Therefore,
\[
u(re^{i\theta}) = \sum_{k \in \mathbb{Z}} A_k r^{1|k|} e^{ik\theta}
\]
for \( r < 1 \) or equivalently,
\[
u(z) = \sum_{k \in \mathbb{N}_0} A_k z^k + \sum_{k \in \mathbb{N}} A_{-k} z^{-k} = A_0 + \sum_{k \geq 1} A_k z^k + \sum_{k \geq 1} \overline{A_k} z^{-k}
\]
\[
= \text{Re} \left( A_0 + 2 \sum_{k \geq 1} A_k z^k \right)
\]
In particular $\Delta u = 0$ implies $u(z)$ is the sum of a holomorphic and an anti-holomorphic functions and also that $u$ is the real part of a holomorphic function $F(z) := A_0 + \frac{1}{2} \sum_{k \geq 1} A_k z^k$. The imaginary part $v(z) := \text{Im} F(z)$ is harmonic as well and is given by

$$v(z) = 2 \text{Im} \sum_{k \geq 1} A_k z^k = \frac{1}{i} \left( \sum_{k \geq 1} A_k z^k - \sum_{k \geq 1} A_k \overline{z}^k \right)$$

$$= \frac{1}{i} \left( \sum_{k \geq 1} A_k z^k - \sum_{k \geq 1} A_{-k} \overline{z}^k \right)$$

$$= \frac{1}{i} \left( \sum_{k \geq 1} A_k r^k e^{ik\theta} - \sum_{k \geq 1} A_{-k} r^k e^{-ik\theta} \right)$$

$$= \sum_{k \neq 0} \text{sgn}(k) A_k r^k e^{ik\theta} = -\text{sgn}(\frac{1}{i} \frac{d}{d\theta}) u(z)$$

wherein we are writing $z$ as $re^{i\theta}$. Here $\text{sgn}(\frac{1}{i} \frac{d}{d\theta})$ is the bounded self-adjoint operator on $L^2(S^1)$ which satisfies

$$\text{sgn}(\frac{1}{i} \frac{d}{d\theta}) e^{in\theta} = \text{sgn}(n) e^{in\theta}$$

and

$$\text{sgn}(x) = \begin{cases} 1 & \text{if } x > 0 \\ 0 & \text{if } x = 0 \\ -1 & \text{if } x < 0 \end{cases}$$

4. Inserting the formula for $A_k$ into Eq. (20.37) gives

$$u(re^{i\theta}) = \frac{1}{2\pi} \int_{-\pi}^{\pi} \left( \sum_{k \in \mathbb{Z}} r^{\left| k \right|} e^{ik(\theta - \alpha)} \right) u(e^{i\alpha}) d\alpha \text{ for all } r < 1.$$
\textbf{Proposition 20.32} by direct computation. Letting
\[ \psi(A^{-1} Z \circ \psi) = \partial_i (A^{-1} Z \circ \psi) \cdot e_i \]
\[ = e_i \cdot \left( -A^{-1} \partial_i A A^{-1} Z \circ \psi \right) + e_i \cdot A^{-1} (Z' \circ \psi) A e_i \]
\[ = -e_i \cdot (A^{-1} \psi''(e_i, A^{-1} Z \circ \psi)) + \text{tr}(A^{-1} (Z' \circ \psi) A) \]
\[ = -e_i \cdot (A^{-1} \psi''(e_i, A^{-1} Z \circ \psi)) + \text{tr}(Z' \circ \psi) \]
\[ = -\text{tr}(A^{-1} \psi''(Z, \psi')) + (\nabla \cdot Z) \circ \psi \]
\[ = -\text{tr} [A^{-1} \partial Z \psi A] + (\nabla \cdot Z) \circ \psi. \] (20.42)

Combining Eqs. (20.41) and (20.42) gives the desired result:
\[ \nabla \cdot (\det \psi' Z^\psi) = \det \psi' (\nabla \cdot Z) \circ \psi. \]

\textbf{Lemma 20.39} (Flow interpretation of the divergence). Let \( Z \in C^1(\Omega, \mathbb{R}^n) \). Then
\[ \nabla \cdot Z = \frac{d}{dt}\bigg|_0 \det(e^\psi t Z)' \]
and
\[ \int_{\Omega} \nabla \cdot (f Z) dm = \frac{d}{dt}\bigg|_0 \int_{e^\psi t(\Omega)} f dm. \]

\textbf{Proof.} By Exercise 20.4 and the change of variables formula,
\[ \frac{d}{dt}\bigg|_0 \det(e^\psi t Z)' = \text{tr} \left( \frac{d}{dt}\bigg|_0 (e^\psi t Z)' \right) = \text{tr}(V') = \nabla \cdot Z \]
and
\[ \frac{d}{dt}\bigg|_0 \int_{e^\psi t(\Omega)} f(x) dx = \frac{d}{dt}\bigg|_0 \int_{\Omega} f(e^\psi t(y)) \det(e^\psi t Z)'(y)dy \]
\[ = \int_{\Omega} \{ \nabla f(y) \cdot Z(y) + f(y) \nabla \cdot Z(y) \} \ dy \]
\[ = \int_{\Omega} \nabla \cdot (f Z) \ dm. \]

\textbf{Exercise 20.4.} \( \det'(A)B = \det(A) \text{ tr}(A^{-1} B) \).

\textbf{Proof.} 2nd Proof of Proposition 20.32 by direct computation. Letting \( A = \psi' \),
\[ \frac{1}{\det A} \nabla \cdot (\det A Z^\psi) = \frac{1}{\det A} \left[ Z^\psi \cdot \nabla \det A + \det A \nabla \cdot Z^\psi \right] \]
\[ = \text{tr}[A^{-1} \partial Z^\psi A] + \nabla \cdot Z^\psi \] (20.41)

and

\textbf{Proof.} 3rd Proof of Proposition 20.32. Using Lemma 20.39 with \( f = \det \psi' \) and \( Z = Z^\psi \) and the change of variables formula,
Since this is true for all regions $\Omega$, it follows that $\nabla \cdot (\det \, \psi' \, Z^\psi) = \det \, \psi'(\nabla \cdot Z^\psi)$.

**20.8 Exercises**

See Exercises [12.3] as well.

**Exercise 20.5.** Let $x = (x_1, \ldots, x_n) = \psi(y_1, \ldots, y_n) = \psi(y)$ be a $C^2$-diffeomorphism, $\psi : V \rightarrow W$ where $V$ and $W$ are open subsets of $\mathbb{R}^n$. For $y \in V$ define

$$g_{ij}(y) = \frac{\partial \psi}{\partial y_i}(y) \cdot \frac{\partial \psi}{\partial y_j}(y),$$

$$g^{ij}(y) = (g_{ij}(y))^{-1} \quad \text{and} \quad \sqrt{g}(y) = \det (g_{ij}(y)).$$

Show

1. $g_{ij} = (\psi'' \psi')_{ij}$ and $\sqrt{g} = |\det \psi'|$. (So in the making the change of variables $x = \psi(y)$ we have $dx = \sqrt{g} dy$.)
2. Given functions $f, h \in C^1(W)$, let $f^\psi = f \circ \psi$ and $h^\psi = h \circ \psi$. Show

$$\nabla f^\psi \cdot \nabla h^\psi = g^{ij} \frac{\partial f^\psi}{\partial y_i} \frac{\partial h^\psi}{\partial y_j}.$$

3. For $f \in C^2(W)$, show

$$(\Delta f) \circ \psi = \frac{1}{\sqrt{g}} \frac{\partial}{\partial y_j} \left( \sqrt{g} g^{ij} \frac{\partial f^\psi}{\partial y_i} \right). \quad (20.43)$$

Hint: for $h \in C^2(W)$ compute we have

$$\int_W \Delta f(x) h(x) dx = - \int_W \nabla f(x) \cdot \nabla h(x) dx.$$ 

Now make the change of variables $x = \psi(y)$ in both of the above integrals and then do some more integration by parts to prove Eq. [20.43].

**Notation 20.40** We will usually abuse notation in the future and write Eq. (20.43) as

$$\Delta f = \frac{1}{\sqrt{g}} \frac{\partial}{\partial y_j} \left( \sqrt{g} g^{ij} \frac{\partial f}{\partial y_i} \right).$$

**Exercise 20.6.** Let $\psi(\theta, \phi_1, \ldots, \phi_{n-2}, r) = (x_1, \ldots, x_n)$ where $(x_1, \ldots, x_n)$ are as in Eq. (20.11). Show:

1. The vectors $\{ \frac{\partial \psi}{\partial \theta}, \frac{\partial \psi}{\partial \phi_1}, \ldots, \frac{\partial \psi}{\partial \phi_{n-2}}, \frac{\partial \psi}{\partial r} \}$ form an orthogonal set and that

$$\left| \frac{\partial \psi}{\partial \theta} \right| = 1, \quad \left| \frac{\partial \psi}{\partial \phi_j} \right| = \sin \phi_{j-2} \ldots \sin \phi_1 \text{ and} \quad \left| \frac{\partial \psi}{\partial r} \right| = r \sin \phi_{n-2} \ldots \sin \phi_{j+1} \text{ for } j = 1, \ldots, n - 3.$$

2. Use item 1. to give another derivation of Eq. (20.13), i.e.

$$\sqrt{g} = |\det \psi'| = r^{n-1} \sin^{n-2} \phi_{n-2} \ldots \sin^2 \phi_2 \sin \phi_1$$

3. Use Eq. (20.43) to conclude

$$\Delta f = \frac{1}{r^{n-1}} \frac{\partial}{\partial r} \left( r^{n-1} \frac{\partial f}{\partial r} \right) + \frac{1}{r^2} \Delta_{S^{n-1}} f,$$

where

$$\Delta_{S^{n-1}} f := \sum_{j=1}^{n-2} \frac{1}{\sin^2 \phi_{n-2} \ldots \sin^2 \phi_{j+1}} \frac{1}{\sin \phi_j \sin \phi_{j+1}} \frac{\partial^2 f}{\partial \phi_j \partial \phi_{j+1}}$$

and

$$\frac{1}{\sin^2 \phi_{n-2} \ldots \sin^2 \phi_{j+1}} := 1 \text{ if } j = n - 2.$$

In particular if $f = F(r, \phi_{n-2})$ we have
\[
\Delta f = \frac{1}{r^{n-1}} \frac{\partial}{\partial r} \left( r^{n-1} \frac{\partial f}{\partial r} \right) + \frac{1}{r^2 \sin^{n-2} \phi_{n-2}} \frac{\partial}{\partial \phi_{n-2}} \left( \sin^{n-2} \phi_{n-2} \frac{\partial f}{\partial \phi_{n-2}} \right).
\]

(20.44)

It is also worth noting that
\[
\Delta S_{n-1} f := \frac{1}{\sin^{n-2} \phi_{n-2}} \frac{\partial}{\partial \phi_{n-2}} \left( \sin^{n-2} \phi_{n-2} \frac{\partial f}{\partial \phi_{n-2}} \right) + \frac{1}{\sin^{n-2} \phi_{n-2}} \Delta S_{n-1} f.
\]

Let us write \( \psi := \phi_{n-2} \) and suppose \( f = r^\lambda w(\psi) \). According to Eq. (20.44),
\[
\Delta f = \frac{1}{r^{n-1}} \frac{\partial}{\partial r} \left( r^{n-1} \frac{\partial (r^\lambda w(\psi))}{\partial r} \right) + \frac{1}{r^2 \sin^{n-2} \psi} \frac{\partial}{\partial \psi} \left( \sin^{n-2} \psi \frac{\partial (r^\lambda w(\psi))}{\partial \psi} \right)
\]
\[
= w(\psi) \frac{1}{r^{n-1}} \frac{\partial}{\partial r} (r^{n-1+\lambda-1}) + r^{\lambda-2} \frac{1}{\sin^{n-2} \psi} \frac{\partial}{\partial \psi} \left( \sin^{n-2} \psi \frac{\partial w}{\partial \psi} \right)
\]
\[
= w(\psi) \lambda (n + \lambda - 2) r^{\lambda-2} + r^{\lambda-2} \frac{1}{\sin^{n-2} \psi} \frac{\partial}{\partial \psi} \left( \sin^{n-2} \psi \frac{\partial w}{\partial \psi} \right)
\]
\[
= r^{\lambda-2} \left[ \lambda (n + \lambda - 2) w(\psi) + \frac{1}{\sin^{n-2} \psi} \frac{\partial}{\partial \psi} \left( \sin^{n-2} \psi \frac{\partial w}{\partial \psi} \right) \right].
\]

Write \( w(\psi) = W(x) \) where \( x = \cos \psi \), then \( \frac{\partial w}{\partial \psi} = -W'(x) \sin \psi \) and hence
\[
\frac{1}{\sin^{n-2} \psi} \frac{\partial}{\partial \psi} \left( \sin^{n-2} \psi \frac{\partial w}{\partial \psi} \right) = -\frac{1}{\sin^{n-2} \psi} \frac{\partial}{\partial \psi} (\sin^{n-1} \psi W'(x))
\]
\[
= -\frac{(n-1) \sin^{n-2} \psi \cos \psi W'(x)}{\sin^{n-2} \psi} - \frac{\sin^{n-1} \psi}{\sin^{n-2} \psi} \left\{ -W''(x) \sin \psi \right\}
\]
\[
= -(n-1)xW'(x) + (1 - x^2)W''(x).
\]

Hence we have shown, with \( x = \cos \psi \) that
\[
\Delta [r^\lambda W(x)] = r^{\lambda-2} \left[ \lambda (n + \lambda - 2) W(x) - (n-1)xW'(x) + (1 - x^2)W''(x) \right].
\]
Sard’s Theorem

See p. 538 of Taylor and references. Also see Milnor’s topology book. Add in the Brower’s Fixed point theorem here as well. Also Spivak’s calculus on manifolds.

Theorem 21.1. Let $U \subset_0 \mathbb{R}^m$, $f \in C^\infty(U, \mathbb{R}^d)$ and $C := \{x \in U : \text{rank}(f'(x)) < d\}$ be the set of critical points of $f$. Then the critical values, $f(C)$, is a Borel measurable subset of $\mathbb{R}^d$ of Lebesgue measure 0.

Remark 21.2. This result clearly extends to manifolds.

For simplicity in the proof given below it will be convenient to use the norm, $|x| := \max_i |x_i|$. Recall that if $f \in C^1(U, \mathbb{R}^d)$ and $p \in U$, then

$$f(p + x) = f(p) + \int_0^1 f'(p + tx) x dt = f(p) + f'(p)x + \int_0^1 [f'(p + tx) - f'(p)] x dt$$

so that if

$$R(p, x) := f(p + x) - f(p) - f'(p)x = \int_0^1 [f'(p + tx) - f'(p)] x dt$$

we have

$$|R(p, x)| \leq |x| \int_0^1 |f'(p + tx) - f'(p)| dt = |x| \epsilon(p, x).$$

By uniform continuity, it follows for any compact subset $K \subset U$ that

$$\sup \{\epsilon(p, x) : p \in K \text{ and } |x| \leq \delta\} \rightarrow 0 \text{ as } \delta \downarrow 0.$$  

Proof. (BRUCE: This proof needs to be gone through carefully. There are many misprints in the proof.) Notice that if $x \in U \setminus C$, then $f'(x) : \mathbb{R}^m \rightarrow \mathbb{R}^d$ is surjective, which is an open condition, so that $U \setminus C$ is an open subset of $U$. This shows $C$ is relatively closed in $U$, i.e. there exists $\bar{C} \subset \mathbb{R}^m$ such that $C = \bar{C} \cap U$. Let $K_n \subset U$ be compact subsets of $U$ such that $K_n \uparrow U$, then $K_n \cap C \uparrow C$ and $K_n \cap C = K_n \cap \bar{C}$ is compact for each $n$. Therefore, $f(K_n \cap C) \uparrow f(C)$ i.e. $f(C) = \cup_n f(K_n \cap C)$ is a countable union of compact sets and therefore is Borel measurable. Moreover, since $m(f(C)) = \lim_{n \rightarrow \infty} m(f(K_n \cap C))$, it suffices to show $m(f(K)) = 0$ for all compact subsets $K \subset C$.

Case 1. $(m \leq d)$ Let $K = [a, a + \gamma]$ be a cube contained in $U$ and by scaling the domain we may assume $\gamma = (1, 1, \ldots, 1)$. For $N \in \mathbb{N}$ and $j \in S_N := \{0, 1, \ldots, N - 1\}$ let $K_j = j/N + [a, a + \gamma/N]$ so that $K = \cup_{j \in S_N} K_j$ with $K_j \cap K_{j'} = \emptyset$ if $j \neq j'$. Let $\{Q_j : j = 1, \ldots, M\}$ be the collection of those $\{K_j : j \in S_N\}$ which intersect $C$. For each $j$, let $p_j \in Q_j \cap C$ and for $x \in Q_j - p_j$ we have

$$f(p_j + x) = f(p_j) + f'(p_j)x + R_j(x)$$

where $|R_j(x)| \leq \epsilon_j(N)/N$ and $\epsilon(N) := \max_j \epsilon_j(N) \rightarrow 0$ as $N \rightarrow \infty$. Now

$$m(f(Q_j)) = m(f(p_j) + (f'(p_j) + R_j)(Q_j - p_j)) = m((f'(p_j) + R_j)(Q_j - p_j)) = m(O_j f'(p_j) + R_j)(Q_j - p_j))$$

where $O_j \in SO(d)$ is chosen so that $O_j f'(p_j) \mathbb{R}^d \subset \mathbb{R}^{m-1} \times \{0\}$. Now $O_j f'(p_j)(Q_j - p_j)$ is contained in $\Gamma \times \{0\}$ where $\Gamma \subset \mathbb{R}^{m-1}$ is a cube centered at $0 \in \mathbb{R}^{m-1}$ with side length at most $2|f'(p_j)|/N \leq 2M/N$ where $M = \max_{p \in K} |f'(p)|$. It now follows that $O_j f'(p_j) + R_j)(Q_j - p_j)$ is contained the set of all points within $\epsilon(N)/N$ of $\Gamma \times \{0\}$ and in particular

$$O_j f'(p_j) + R_j)(Q_j - p_j) \subset (1 + \epsilon(N)/N) \Gamma \times \{\epsilon(N)/N, \epsilon(N)/N\}.$$  

From this inclusion and Eq. (21.1) it follows that

$$m(f(Q_j)) \leq \left[\frac{2M}{N}(1 + \epsilon(N)/N)\right]^{m-1} 2\epsilon(N)/N$$

and therefore,

$$m(f(C \cap K)) \leq \sum_j m(f(Q_j)) \leq N^d 2^m M^{m-1} [(1 + \epsilon(N)/N)]^{m-1} \epsilon(N) \frac{1}{N^m}$$

$$= 2^d M^{d-1} [(1 + \epsilon(N)/N)]^{d-1} \epsilon(N) \frac{1}{N^{m-d}} \rightarrow 0 \text{ as } N \rightarrow \infty$$

since $m \geq d$. This proves the easy case since we may write $U$ as a countable union of cubes $K$ as above.
Remark. The case \((m < d)\) also follows from the case \(m = d\) as follows. When \(m < d\), \(C = U\) and we must show \(m(f(U)) = 0\). Letting \(F : U \times \mathbb{R}^{d-m} \to \mathbb{R}^d\) be the map \(F(x,y) = f(x)\). Then \(F'(x,y)(v,w) = f'(x)v\), and hence \(C_F := U \times \mathbb{R}^{d-m}\). So if the assertion holds for \(m = d\) we have

\[
m(f(U)) = m(F(U \times \mathbb{R}^{d-m})) = 0.
\]

Case 2. \((m > d)\) This is the hard case and the case we will need in the co-area formula to be proved later. Here I will follow the proof in Milnor. Let

\[
C_i := \{x \in U : \partial^o f(x) = 0\}
\]

so that \(C \supseteq C_1 \supseteq C_2 \supseteq C_3 \supseteq \ldots\). The proof is by induction on \(d\) and goes by the following steps:

1. \(m(f(C \setminus C_1)) = 0\).
2. \(m(f(C_i \setminus C_{i+1})) = 0\) for all \(i \geq 1\).
3. \(m(f(C_i)) = 0\) for all \(i\) sufficiently large.

Step 1. If \(m = 1\), there is nothing to prove since \(C = C_1\) so we may assume \(m \geq 2\). Suppose that \(x \in C \setminus C_1\), then \(f'(p) \neq 0\) and so by reordering the components of \(x\) and \(f(p)\) if necessary we may assume that \(\partial_1 f_1(p) \neq 0\) where we are writing \(\partial f(p) / \partial x_i\) as \(\partial_i f(p)\). The map \(h(x) := (f_1(x), x_2, \ldots, x_d)\) has differential

\[
h'(p) = \begin{bmatrix}
    \partial_1 f_1(p) & \partial_2 f_1(p) & \ldots & \partial_d f_1(p) \\
    0 & 1 & 0 & 0 \\
    \vdots & \vdots & \ddots & \vdots \\
    0 & 0 & 0 & 1
\end{bmatrix}
\]

which is not singular. So by the implicit function theorem, there exists \(V \in \tau_p\) such that \(h : V \to h(V) \in \tau_{h(p)}\) is a diffeomorphism and in particular \(\partial_1 f_1(x) / \partial x_1 \neq 0\) for \(x \in V\) and hence \(V \subset U \setminus C_1\). Consider the map \(g := f \circ h^{-1} : V' := h(V) \to \mathbb{R}^m\), which satisfies

\[
(f_1(x), f_2(x), \ldots, f_m(x)) = f(x) = g(h(x)) = g((f_1(x), x_2, \ldots, x_d))
\]

which implies \(g(t, y) = (t, u(t, y))\) for \((t, y) \in V' : h(V) \in \tau_{h(p)}\), see Figure 21.1 below where \(p = \bar{x}\) and \(m = p\). Since

\[
g'(t, y) = \begin{bmatrix}
    1 & 0 \\
    \partial u(t, y) & \partial y u(t, y)
\end{bmatrix}
\]

it follows that \((t, y)\) is a critical point of \(g\) if \(y \in C'_1\) – the set of critical points of \(y \to u(t, y)\). Since \(h\) is a diffeomorphism we have \(C' := h(C \cap V)\) are the critical points of \(g\) in \(V'\) and

\[
m(f(U)) = m(F(U \times \mathbb{R}^{d-m})) = 0.
\]

By the induction hypothesis, \(m_{m-1}(u_t(C'_i)) = 0\) for all \(t\), and therefore by Fubini’s theorem,

\[
m(f(C \cap V)) = \int_{\mathbb{R}} m_{m-1}(u_t(C'_i))1_{V \neq \emptyset}dt = 0.
\]

Since \(C \setminus C_1\) may be covered by a countable collection of open sets \(V\) as above, it follows that \(m(f(C \setminus C_1)) = 0\). Step 2. Suppose that \(p \in C_k \setminus C_{k+1}\), then there is an \(\alpha\) such that \(|\alpha| = k + 1\) such that \(\partial^\alpha f(p) = 0\) while \(\partial^\beta f(p) = 0\) for all \(|\beta| \leq k\). Again by permuting coordinates we may assume that \(\alpha_1 \neq 0\) and \(\partial^\alpha f_1(p) \neq 0\). Let \(w(x) := \partial^{\alpha_1} f_1(x)\), then \(w(p) = 0\) while \(\partial_1 w(p) \neq 0\). So again the implicit function theorem there exists \(V \in \tau_p\) such that \(h(x) := (w(x), x_2, \ldots, x_d)\) maps \(V \to V' := h(V) \in \tau_{h(p)}\) in a diffeomorphic way and in particular \(\partial_1 w(x) \neq 0\) on \(V\) so that \(V \subset U \setminus C_{k+1}\). As before, let \(g := f \circ h^{-1}\) and notice that \(C'_k := h(C_k \setminus V) \subset \{0\} \times \mathbb{R}^{d-1}\) and

\[
f(C_k \cap V) = g(C'_k) = \bar{g}(C'_k)
\]

where \(\bar{g} := g|_{\{0\} \times \mathbb{R}^{d-1}}\). Clearly \(C'_k\) is contained in the critical points of \(\bar{g}\), and therefore, by induction

\[
0 = m(\bar{g}(C'_k)) = m(f(C_k \cap V)).
\]

Since \(C_k \setminus C_{k+1}\) is covered by a countable collection of such open sets, it follows that

\[
m(f(C_k \setminus C_{k+1})) = 0\] for all \(k \geq 1\).
Step 3. Suppose that $Q$ is a closed cube with edge length $\delta$ contained in $U$ and $k > d/m - 1$. We will show $m(f(Q \cap C_k)) = 0$ and since $Q$ is arbitrary it will follows that $m(f(C_k)) = 0$ as desired. By Taylor’s theorem with (integral) remainder, it follows for $x \in Q \cap C_k$ and $h$ such that $x + h \in Q$ that

$$f(x + h) = f(x) + R(x, h)$$

where

$$|R(x, h)| \leq c \|h\|^{k+1}$$

where $c = c(Q, k)$. Now subdivide $Q$ into $r^d$ cubes of edge size $\delta/r$ and let $Q'$ be one of the cubes in this subdivision such that $Q' \cap C_k \neq \emptyset$ and let $x \in Q' \cap C_k$. It then follows that $f(Q')$ is contained in a cube centered at $f(x) \in \mathbb{R}^m$ with side length at most $2c(\delta/r)^{k+1}$ and hence volume at most $(2c)^m (\delta/r)^{m(k+1)}$. Therefore, $f(Q \cap C_k)$ is contained in the union of at most $r^d$ cubes of volume $(2c)^m (\delta/r)^{m(k+1)}$ and hence

$$m(f(Q \cap C_k)) \leq (2c)^m (\delta/r)^{m(k+1)} r^d = (2c)^m \delta^{m(k+1)} r^{d-m(k+1)} \to 0 \text{ as } r \uparrow \infty$$

provided that $d - m(k + 1) < 0$, i.e. provided $k > d/m - 1$. ■
The Structure of Measures
Complex Measures, Radon-Nikodym Theorem and the Dual of $L^p$

**Definition 22.1.** A **signed measure** $\nu$ on a measurable space $(X, \mathcal{M})$ is a function $\nu: \mathcal{M} \to \mathbb{R}$ such that

1. Either
   \[ \nu(\mathcal{M}) := \{ \nu(A) : A \in \mathcal{M} \} \subset (-\infty, \infty] \]
   or $\nu(\mathcal{M}) \subset [-\infty, \infty)$.
2. $\nu$ is countably additive, this is to say if $E = \bigcup_{j=1}^{\infty} E_j$ with $E_j \in \mathcal{M}$, then
   \[ \nu(E) = \sum_{j=1}^{\infty} \nu(E_j). \]

If $\nu(E) \in \mathbb{R}$ then the series $\sum_{j=1}^{\infty} \nu(E_j)$ is absolutely convergent since it is independent of rearrangements.
3. $\nu(\emptyset) = 0$.

If there exists $X_n \in \mathcal{M}$ such that $|\nu(X_n)| < \infty$ and $X = \bigcup_{n=1}^{\infty} X_n$, then $\nu$ is said to be $\sigma$-finite and if $\nu(\mathcal{M}) \subset \mathbb{R}$ then $\nu$ is said to be a finite signed measure. Similarly, a countably additive set function $\nu: \mathcal{M} \to \mathbb{C}$ such that $\nu(\emptyset) = 0$ is called a complex measure.

**Example 22.2.** Suppose that $\mu_+$ and $\mu_-$ are two positive measures on $\mathcal{M}$ such that either $\mu_+(X) < \infty$ or $\mu_-(X) < \infty$, then $\nu = \mu_+ - \mu_-$ is a signed measure. If both $\mu_+(X)$ and $\mu_-(X)$ are finite then $\nu$ is a finite signed measure and may also be considered to be a complex measure.

**Example 22.3.** Suppose that $g: X \to \mathbb{R}$ is measurable and either $\int_E g^+ d\mu$ or $\int_E g^- d\mu < \infty$, then
\[ \nu(A) = \int_A g d\mu \quad \forall A \in \mathcal{M} \tag{22.1} \]
defines a signed measure. This is actually a special case of the last example with $\mu_+(A) := \int_A g^+ d\mu$. Notice that the measure $\mu_\pm$ in this example have the property that they are concentrated on disjoint sets, namely $\mu_+$ “lives” on $\{ g > 0 \}$ and $\mu_-$ “lives” on the set $\{ g < 0 \}$.

**Example 22.4.** Suppose that $\mu$ is a positive measure on $(X, \mathcal{M})$ and $g \in L^1(\mu)$, then $\nu$ given as in Eq. (22.1) is a complex measure on $(X, \mathcal{M})$. Also if $\{ \mu^\pm_n, \mu_n^- \}$ is any collection of four positive finite measures on $(X, \mathcal{M})$, then
\[ \nu := \mu^+_n - \mu^-_n + i (\mu^+_n - \mu^-_n) \tag{22.2} \]
is a complex measure.

If $\nu$ is given as in Eq. (22.1), then $\nu$ may be written as in Eq. (22.2) with $d\mu^+_n = (\text{Re } g)_\pm d\mu$ and $d\mu^-_n = (\text{Im } g)_\pm d\mu$.

### 22.1 The Radon-Nikodym Theorem

**Definition 22.5.** Let $\nu$ be a complex or signed measure on $(X, \mathcal{M})$. A set $E \in \mathcal{M}$ is a null set or precisely a $\nu$-null set if $\nu(A) = 0$ for all $A \in \mathcal{M}$ such that $A \subset E$, i.e., $\nu|_{\mathcal{M}_E} = 0$. Recall that $\mathcal{M}_E := \{ A \cap E : A \in \mathcal{M} \}$ is the “trace of $\mathcal{M}$ on $E$.”

We will eventually show that every complex and $\sigma$-finite signed measure $\nu$ may be described as in Eq. (22.1). The next theorem is the first result in this direction.

**Theorem 22.6 (A Baby Radon-Nikodym Theorem).** Suppose $(X, \mathcal{M})$ is a measurable space, $\mu$ is a positive finite measure on $\mathcal{M}$ and $\nu$ is a complex measure on $\mathcal{M}$ such that $|\nu(A)| \leq \mu(A)$ for all $A \in \mathcal{M}$. Then $d\nu = \rho d\mu$ where $|\rho| \leq 1$. Moreover if $\nu$ is a positive measure, then $0 \leq \rho \leq 1$.

**Proof.** For a simple function, $f \in \mathcal{S}(X, \mathcal{M})$, let $\nu(f) := \sum_{a \in \mathbb{C}} a \nu(f = a)$. Then
\[ |\nu(f)| \leq \sum_{a \in \mathbb{C}} |a| |\nu(f = a)| \leq \sum_{a \in \mathbb{C}} |a| \mu(f = a) = \int_X |f| d\mu. \]
So, by the B.L.T. Theorem [60.4] $\nu$ extends to a continuous linear functional on $L^1(\mu)$ satisfying the bounds
\[ |\nu(f)| \leq \int_X |f| d\mu \leq \sqrt{\mu(X)} \|f\|_{L^2(\mu)} \text{ for all } f \in L^1(\mu). \]
The Riesz representation theorem then implies there exists a unique $\rho \in L^2(\mu)$ such that
\[ \nu(f) = \int_X f \rho \, d\mu \text{ for all } f \in L^2(\mu). \]

Taking $A \in \mathcal{M}$ and $f = \text{sgn}(\rho) 1_A$ in this equation shows
\[ \int_A |\rho| \, d\mu = \nu(\text{sgn}(\rho) 1_A) \leq \mu(A) = \int_A 1 \, d\mu, \]
from which it follows that $|\rho| \leq 1$, $\mu$ - a.e. If $\nu$ is a positive measure, then for real $f$, $0 = \text{Im} [\nu(f)] = \int_X \text{Im} \rho \, d\mu$ and taking $f = \text{Im} \rho$ shows $0 = \int_X |\text{Im} \rho|^2 \, d\mu$, i.e. $\text{Im}(\rho(x)) = 0$ for $\mu$ - a.e. $x$ and we have shown $\rho$ is real a.e. Similarly,
\[ 0 \leq \nu(\text{Re} \rho < 0) = \int_{\{\text{Re} \rho < 0\}} \rho \, d\mu \leq 0, \]
shows $\rho \geq 0$ a.e.

**Definition 22.7.** Let $\mu$ and $\nu$ be two signed or complex measures on $(X, \mathcal{M})$. Then:

1. $\mu$ and $\nu$ are **mutually singular** (written as $\mu \perp \nu$) if there exists $A \in \mathcal{M}$ such that $A$ is a $\nu$ - null set and $A^c$ is a $\mu$ - null set.
2. The measure $\nu$ is **absolutely continuous** relative to $\mu$ (written as $\nu \ll \mu$) provided $\nu(A) = 0$ whenever $A$ is a $\mu$ - null set, i.e. all $\mu$ - null sets are $\nu$ - null sets as well.

As an example, suppose that $\mu$ is a positive measure and $\rho \in L^1(\mu)$. Then the measure, $\nu := \rho \mu$ is absolutely continuous relative to $\mu$. Indeed, if $\mu(A) = 0$ then
\[ \rho(A) = \int_A \rho \, d\mu = 0 \]
as well.

**Lemma 22.8.** If $\mu_1, \mu_2$ and $\nu$ are signed measures on $(X, \mathcal{M})$ such that $\mu_1 \perp \nu$ and $\mu_2 \perp \nu$ and $\mu_1 + \mu_2$ is well defined, then $(\mu_1 + \mu_2) \perp \nu$. If $\{\mu_i\}_{i=1}^\infty$ is a sequence of positive measures such that $\mu_i \perp \nu$ for all $i$ then $\mu = \sum_{i=1}^\infty \mu_i \perp \nu$ as well.

**Proof.** In both cases, choose $A_i \in \mathcal{M}$ such that $A_i$ is $\nu$ - null and $A_i^c$ is $\mu_i$-null for all $i$. Then by Lemma 22.16, $A := \bigcup_i A_i$ is still a $\nu$ - null set. Since
\[ A^c = \cap_i A_i^c \subseteq A_m^c \text{ for all } m, \]
we see that $A^c$ is a $\mu_s$ - null set for all $i$ and is therefore a null set for $\mu = \sum_{i=1}^\infty \mu_i$. This shows that $\mu \perp \nu$.

Throughout the remainder of this section $\mu$ will be always be a positive measure on $(X, \mathcal{M})$.

**Definition 22.9 (Lebesgue Decomposition).** Suppose that $\nu$ is a signed (complex) measure and $\mu$ is a positive measure on $(X, \mathcal{M})$. Two signed (complex) measures $\nu_s$ and $\nu_a$ form a **Lebesgue decomposition** of $\nu$ relative to $\mu$ if

1. If $\nu(A) = \infty$ ($\nu(A) = -\infty$) for some $A \in \mathcal{M}$ then $\nu_s(A) \neq -\infty$ ($\nu_a(A) \neq -\infty$) and $\nu_a(A) \neq -\infty$ ($\nu_s(A) \neq -\infty$).
2. $\nu = \nu_s + \nu_a$ which is well defined by assumption 1.
3. $\nu_s \ll \mu$ and $\nu_a \perp \mu$.

**Lemma 22.10.** Let $\nu$ be a signed (complex) measure and $\mu$ is a positive measure on $(X, \mathcal{M})$. If there exists a Lebesgue decomposition, $\nu = \nu_s + \nu_a$, of the measure $\nu$ relative to $\mu$ then it is unique. Moreover:

1. If $\nu$ is positive then $\nu_s$ and $\nu_a$ are positive.
2. If $\nu$ is a $\sigma$ - finite measure then so are $\nu_s$ and $\nu_a$.

**Proof.** Since $\nu_s \perp \mu$, there exists $A \in \mathcal{M}$ such that $\mu(A) = 0$ and $A^c$ is $\nu_s$ - null and because $\nu_a \ll \mu$, $A$ is also a null set for $\nu_a$. So for $C \in \mathcal{M}$, $\nu_a(C \cap A) = 0$ and $\nu_a(C \cap A^c) = 0$ from which it follows that
\[ \nu(C) = \nu(C \cap A) + \nu(C \cap A^c) = \nu_a(C \cap A) + \nu_a(C \cap A^c) \]
and hence,
\[ \nu_s(C) = \nu_s(C \cap A) = \nu(C \cap A) \text{ and } \]
\[ \nu_a(C) = \nu_a(C \cap A^c) = \nu(C \cap A^c). \]
(22.3)

Item 1. is now obvious from Eq. (22.3).

For Item 2., if $\nu$ is a $\sigma$ - finite measure then there exists $X_n \in \mathcal{M}$ such that $X = \bigcup_{n=1}^\infty X_n$ and $|\nu(X_n)| < \infty$ for all $n$. Since $\nu(X_n) = \nu_s(X_n) + \nu_a(X_n)$, we must have $\nu_a(X_n) \in \mathcal{R}$ and $\nu_a(X_n) \in \mathcal{R}$ showing $\nu_s$ and $\nu_a$ are $\sigma$ - finite as well.

For the uniqueness assertion, if we have another decomposition $\nu = \tilde{\nu}_s + \tilde{\nu}_a$ with $\tilde{\nu}_s \perp \mu$ and $\tilde{\nu}_a \ll \mu$ we may choose $\tilde{A} \in \mathcal{M}$ such that $\mu(\tilde{A}) = 0$ and $\tilde{A}^c$ is $\tilde{\nu}_s$ - null. Then $B = A \cup \tilde{A}$ is still a $\mu$ - null set and $B^c = A^c \cap \tilde{A}^c$ is a null set for both $\nu_s$ and $\tilde{\nu}_s$. Therefore by the same arguments which proved Eq. (22.3),
\[ \nu_s(C) = \nu(C \cap B) = \tilde{\nu}_s(C) \text{ and } \]
\[ \nu_a(C) = \nu(C \cap B^c) = \nu_a(C) \text{ for all } C \in \mathcal{M}. \]
Lemma 22.11. Suppose \( \mu \) is a positive measure on \((X, \mathcal{M})\) and \( f, g : X \to \mathbb{R} \)
are extended integrable functions such that
\[
\int_A f \, d\mu = \int_A g \, d\mu \text{ for all } A \in \mathcal{M},
\]
\[
\int_X f^- \, d\mu < \infty, \, \int_X g^- \, d\mu < \infty, \text{ and the measures } |f| \, d\mu \text{ and } |g| \, d\mu \text{ are } \sigma \text{-finite.}
\]
Then \( f(x) = g(x) \) for \( \mu - \text{a.e. } x \).

Proof. By assumption there exists \( X_n \in \mathcal{M} \) such that \( X_n \uparrow X \) and \( \int_X |f| \, d\mu < \infty \) and \( \int_X |g| \, d\mu < \infty \) for all \( n \). Replacing \( A \) by \( A \cap X_n \) in Eq. (22.4)
implies
\[
\int_{A \cap X_n} f \, d\mu = \int_{A \cap X_n} g \, d\mu = \int_{A} f \, d\mu \, d\mu = \int_{A} 1_{X_n} g \, d\mu
\]
for all \( A \in \mathcal{M} \). Since \( 1_{X_n} f \) and \( 1_{X_n} g \) are in \( L^1(\mu) \) for all \( n \), this equation implies \( 1_{X_n} f = 1_{X_n} g, \mu - \text{a.e.} \) Letting \( n \to \infty \) then shows that \( f = g, \mu - \text{a.e.} \).

Remark 22.12. Suppose that \( f \) and \( g \) are two positive measurable functions on \((X, \mathcal{M}, \mu)\) such that Eq. (13.15) holds. It is not in general true that \( f = g, \mu - \text{a.e.} \). A trivial counterexample is to take \( \mathcal{M} = 2^X, \mu(A) = \infty \) for all non-empty \( A \in \mathcal{M}, f = 1_X \) and \( g = 2 \cdot 1_X \). Then Eq. (22.4) holds yet \( f \neq g \).

Theorem 22.13 (Radon-Nikodym Theorem for Positive Measures). Suppose that \( \mu \) and \( \nu \) are \( \sigma \) finite positive measures on \((X, \mathcal{M})\). Then \( \nu \) has a unique Lebesgue decomposition \( \nu = \nu_a + \nu_s \) relative to \( \mu \) and there exists a unique (modulo sets of \mu-measure 0) function \( \nu \) such that \( d\nu = \rho d\mu \). Moreover, \( \nu_s = 0 \) if \( \nu \ll \mu \).

Proof. The uniqueness assertions follow directly from Lemmas 22.10 and 22.11.

Existence. (Von-Neumann’s Proof.) First suppose that \( \mu \) and \( \nu \) are finite measures and let \( \lambda = \mu + \nu \). By Theorem 22.6 \( d\nu = h \, d\lambda \) with \( 0 \leq h \leq 1 \) and this implies, for all non-negative measurable functions \( f \), that
\[
\nu(f) = \lambda(h \mu) = \mu(f) + \nu(fh)
\]
or equivalently
\[
\nu(f(1 - h)) = \mu(fh).
\]
Taking \( f = 1_{\{h=1\}} \) in Eq. (22.6) shows that
\[
\mu(\{h=1\}) = \nu(\{h=1\}(1 - h)) = 0,
\]
i.e. \( 0 \leq h(x) < 1 \) for \( \mu \)-a.e. \( x \). Let
\[
\rho := 1_{\{h=1\}} \frac{\nu}{\mu}.
\]
and then take \( f = g1_{\{h<1\}}(1 - h)^{-1} \) with \( g \geq 0 \) in Eq. (22.6) to learn
\[
\nu(g1_{\{h<1\}}) = \mu(g1_{\{h<1\}})(1 - h)^{-1} \nu = \mu(\rho g).
\]
Hence if we define
\[
\nu_a := 1_{\{h<1\}} \nu \text{ and } \nu_s := 1_{\{h=1\}} \nu,
\]
we then have \( \nu_s \perp \mu \) (since \( \nu_s \) “lives” on \( \{h = 1\} \)) while \( \mu(h = 1) = 0 \) and \( \nu_a = \rho \mu \) and in particular \( \nu_a \ll \mu \). Hence \( \nu = \nu_a + \nu_s \) is the desired Lebesgue decomposition of \( \nu \).

If we further assume that \( \nu \ll \mu \), then \( \mu(h = 1) = 0 \) implies \( \nu(h = 1) = 0 \) and hence that \( \nu = \nu_a \). We conclude that \( \nu = \nu_a = \rho \mu \).

For the \( \sigma \) finite case, write \( X = \bigcup_{n=1}^{\infty} X_n \) where \( X_n \in \mathcal{M} \) are chosen so \( \mu(X_n) < \infty \) and \( \nu(X_n) < \infty \) for all \( n \). Let \( d\nu_n = 1_{X_n} d\nu \) and \( d\nu_n = 1_{X_n} d\nu \).
Then by what we have just proved there exists \( \rho_n \in L^1(X, \mu) \) and measure \( \nu_n \) such that \( d\nu_n = \rho_n d\mu_n + d\nu_n^s \) with \( \nu_n^s \perp \mu_n \). Since \( \nu_n^s \) “lives” on \( X_n \) (see Eq. (22.3)) there exists \( A_n \in \mathcal{M}_{X_n} \) such that \( \mu(A_n) = \mu_n(A_n) = 0 \) and
\[
\nu_n^s(X / A_n) = \nu_n^s(X, A_n) = 0.
\]
This shows that \( \nu_n^s \perp \mu \) for all \( n \) and so by Lemma 22.8 \( \nu_s := \sum_{n=1}^{\infty} \nu_n^s \) is singular relative to \( \mu \). Since
\[
\nu = \sum_{n=1}^{\infty} \nu_n = \sum_{n=1}^{\infty} (\rho_n \mu_n + \nu_n^s) = \sum_{n=1}^{\infty} (\rho_n 1_{X_n} \mu + \nu_n^s) = \rho \mu + \nu_s,
\]
where \( \rho := \sum_{n=1}^{\infty} 1_{X_n} \rho_n \), it follows that \( \nu = \nu_a + \nu_s \) with \( \nu_a = \rho \mu \) is the Lebesgue decomposition of \( \nu \) relative to \( \mu \).

\footnote{Here is the motivation for this construction. Suppose that \( d\nu = d\nu_s + \rho d\mu \) is the Radon-Nikodym decomposition and \( X = A \bigcup B \) such that \( \nu_s(B) = 0 \) and \( \mu(A) = 0 \). Then we find \( \nu_s(f) + \mu(\rho f) = \nu(f) = \lambda(fg) = \nu(fg) + \mu(fg) \). Letting \( f \to 1_A \) then implies that \( \nu_s(1_A) = \nu(1_A fg) \) which show that \( g = 1 \) \nu - a.e. on \( A \). Also letting \( f \to 1_B \) implies that \( \mu(\rho A f(1 - g)) = \nu(1_B f(1 - g)) = \mu(1_B fg) = \mu(fg) \) which shows that \( \rho(1 - g) = \rho 1_B (1 - g) = g \mu - a.e. \).}
Theorem 22.14 (Dual of $L^p$ spaces). Let $(X, \mathcal{M}, \mu)$ be a $\sigma$-finite measure space and suppose that $p, q \in [1, \infty]$ are conjugate exponents. Then for $p \in [1, \infty)$, the map $g \in L^q \to \varphi_g \in (L^p)^*$ (where $\varphi_g = \langle \cdot, g \rangle$, $\mu$ was defined in Eq. 18.25) is an isometric isomorphism of Banach spaces. We summarize this by writing $(L^p)^* = L^q$ for all $1 \leq p < \infty$. (The result is in general false for $p = 1$ as can be seen from Theorem 31.14 and Lemma 31.15 below.)

Proof. The only results of this theorem which are not covered in Proposition 18.26 is the surjectivity of the map $g \in L^q \to \varphi_g \in (L^p)^*$. When $p = 2$, this surjectivity is a direct consequence of the Riesz Theorem 16.15.

Case 1. We will begin the proof under the extra assumption that $\mu(X) < \infty$ in which case bounded functions are in $L^p(\mu)$ for all $p$. So let $\varphi \in (L^p)^*$. We need to find $g \in L^q(\mu)$ such that $\varphi = \varphi_g$. When $p \in [1, 2]$, $L^2(\mu) \subset L^p(\mu)$ so that we may restrict $\varphi$ to $L^2(\mu)$ and again the result follows fairly easily from the Riesz Theorem, see Exercise 22.3 below. To handle general $p \in [1, \infty)$, define $\nu(A) := \varphi(1_A)$. If $A = \bigcap_{n=1}^\infty A_n$ with $A_n \in \mathcal{M}$, then

$$\|1_A - \sum_{n=1}^N 1_{A_n}\|_{L^p} = \|1_{\bigcup_{n=N+1}^\infty A_n}\|_{L^p} = \left[\mu(\bigcup_{n=N+1}^\infty A_n)\right]^\frac{1}{p} \to 0 \text{ as } N \to \infty.$$ 

Therefore

$$\nu(A) = \varphi(1_A) = \sum_{n=1}^\infty \varphi(1_{A_n}) = \sum_{n=1}^\infty \nu(A_n)$$

showing $\nu$ is a complex measure. For $A \in \mathcal{M}$, let $|\nu|(A)$ be the “total variation” of $A$ defined by

$$|\nu|(A) := \sup \{ |\varphi(f1_A)| : |f| \leq 1 \} \quad (22.7)$$

and notice that

$$|\nu(A)| \leq |\nu|(A) \leq \|\varphi\|_{(L^p)^*} \mu(A)^{1/p} \text{ for all } A \in \mathcal{M}. \quad (22.8)$$

You are asked to show in Exercise 22.4 that $|\nu|$ is a measure on $(X, \mathcal{M})$. (This can also be deduced from Lemma 22.29 and Proposition 22.23 below.) By Eq. 22.8, $|\nu| \leq \mu$, by Theorem 22.6 $d\nu = hd|\nu|$ for some $h \leq 1$ and by Theorem 22.13 $d|\nu| = \rho d\mu$ for some $\rho \in L^1(\mu)$. Hence, letting $g = \rho h \in L^1(\mu)$, $d\nu = gd\mu$ or equivalently

$$\varphi(1_A) = \int_X g 1_A d\mu \quad \forall \ A \in \mathcal{M}. \quad (22.9)$$

By linearity this equation implies

$$\varphi(f) = \int_X gf d\mu \quad (22.10)$$

for all simple functions $f$ on $X$. Replacing $f$ by $1_{\{|g| \leq M\}} f$ in Eq. 22.10 shows

$$\varphi(f1_{\{|g| \leq M\}}) = \int_X 1_{\{|g| \leq M\}} gfd\mu$$

holds for all simple functions $f$ and then by continuity for all $f \in L^p(\mu)$. By the converse to Holder’s inequality, (Proposition 18.26) we learn that

$$\|1_{\{|g| \leq M\}} g\|_q = \sup_{\|f\|_p = 1} |\varphi(f1_{\{|g| \leq M\}})| \leq \sup_{\|f\|_p = 1} \|\varphi\|_{(L^p)^*} \|f1_{\{|g| \leq M\}}\|_p \leq \|\varphi\|_{(L^p)^*}.$$ 

Using the monotone convergence theorem we may let $M \to \infty$ in the previous equation to learn $\|g\|_q \leq \|\varphi\|_{(L^p)^*}$. With this result, Eq. 22.10 extends by continuity to hold for all $f \in L^p(\mu)$ and hence we have shown that $\varphi = \varphi_g$.

Case 2. Now suppose that $\mu$ is $\sigma$-finite and $X_n \in \mathcal{M}$ are sets such that $\mu(X_n) < \infty$ and $X_n \uparrow X$ as $n \to \infty$. We will identify $f \in L^p(X_n, \mu)$ with $f1_{X_n} \in L^p(X, \mu)$ and this way we may consider $L^p(X_n, \mu)$ as a subspace of $L^p(X, \mu)$ for all $n$ and $p \in [1, \infty]$. By Case 1. there exists $g_n \in L^q(X_n, \mu)$ such that

$$\varphi(f) = \int_{X_n} g_n f d\mu \text{ for all } f \in L^p(X_n, \mu)$$

and

$$\|g_n\|_q = \sup \{|\varphi(f)| : f \in L^p(X_n, \mu) \text{ and } \|f\|_{L^p(X_n, \mu)} = 1\} \leq \|\varphi\|_{(L^p)^*}.$$ 

It is easy to see that $g_n = g_m \text{ a.e. on } X_n \cap X_m$ for all $m, n$ so that $g := \lim_{n \to \infty} g_n$ exists $\mu$ a.e. By the above inequality and Fatou’s lemma, $\|g\|_q \leq \|\varphi\|_{(L^p)^*} < \infty$ and since $\varphi(f) = \int_X g f d\mu$ for all $f \in L^p(X, \mu)$ and $n$ and $\lim_{n \to \infty} L^p(X_n, \mu)$ is dense in $L^p(X, \mu)$ it follows by continuity that $\varphi(f) = \int_X g f d\mu$ for all $f \in L^p(X, \mu)$, i.e. $\varphi = \varphi_g$. □

22.2 The Structure of Signed Measures

Definition 22.15. Let $\nu$ be a signed measure on $(X, \mathcal{M})$ and $E \in \mathcal{M}$, then

1. $E$ is positive if for all $A \in \mathcal{M}$ such that $A \subset E$, $\nu(A) \geq 0$, i.e. $\nu|_{\mathcal{M}_E} \geq 0$.
2. $E$ is negative if for all $A \in \mathcal{M}$ such that $A \subset E$, $\nu(A) \leq 0$, i.e. $\nu|_{\mathcal{M}_E} \leq 0$.

Lemma 22.16. Suppose that $\nu$ is a signed measure on $(X, \mathcal{M})$. Then

1. Any subset of a positive set is positive.
2. The countable union of positive (negative or null) sets is still positive (negative or null).

3. Let us now further assume that $\nu(\mathcal{M}) \subset [-\infty, \infty)$ and $E \in \mathcal{M}$ is a set such that $\nu(E) \in (0, \infty)$. Then there exists a positive set $P \subset E$ such that $\nu(P) \geq \nu(E)$.

Proof. The first assertion is obvious. If $P_j \in \mathcal{M}$ are positive sets, let $P = \bigcap_{n=1}^{\infty} P_n$. By replacing $P_n$ by the positive set $P_n \setminus \bigcup_{j=1}^{n-1} P_j$ we may assume that the $\{P_n\}_{n=1}^{\infty}$ are pairwise disjoint so that $P = \bigcap_{n=1}^{\infty} P_n$. Now if $E \subset P$ and $E \in \mathcal{M}$, $E = \bigcap_{n=1}^{\infty} (E \cap P_n)$ so $\nu(E) = \sum_{n=1}^{\infty} \nu(E \cap P_n) \geq 0$, which shows that $P$ is positive. The proof for the negative and the null case is analogous.

The idea for proving the third assertion is to keep removing “big” sets of negative measure from $E$. The set remaining from this procedure will be $P$. We now proceed to the formal proof. For all $A \in \mathcal{M}$ let

$$n(A) = 1 \wedge \sup \{-\nu(B) : B \subset A\}.$$ 

Since $\nu(\emptyset) = 0$, $n(A) \geq 0$ and $n(A) = 0$ iff $A$ is positive. Choose $A_0 \subset E$ such that $-\nu(A_0) \geq \frac{1}{2} \nu(E)$ and set $E_1 = E \setminus A_0$, then choose $A_1 \subset E_1$ such that $-\nu(A_1) \geq \frac{1}{2} n(E_1)$ and set $E_2 = E \setminus (A_0 \cup A_1)$. Continue this procedure inductively, namely if $A_0, \ldots, A_{k-1}$ have been chosen let $E_k = E \setminus \bigcap_{i=0}^{k-1} A_i$ and choose $A_k \subset E_k$ such that $-\nu(A_k) \geq \frac{1}{2} n(E_k)$. Let $P := E \setminus \bigcap_{k=0}^{\infty} A_k = \bigcup_{k=0}^{\infty} E_k$, then $P \subset P \cup \bigcup_{k=0}^{\infty} A_k$ and hence

$$(0, \infty) \ni \nu(E) = \nu(P) + \sum_{k=0}^{\infty} \nu(A_k) = \nu(P) - \sum_{k=0}^{\infty} -\nu(A_k) \leq \nu(P). \quad (22.11)$$

From Eq. (22.11) we learn that $\sum_{k=0}^{\infty} -\nu(A_k) < \infty$ and in particular that $\lim_{k \to \infty} (-\nu(A_k)) = 0$. Since $0 \leq \frac{1}{2} n(E_k) \leq -\nu(A_k)$, this also implies $\lim_{k \to \infty} n(E_k) = 0$. If $A \in \mathcal{M}$ with $A \subset P$, then $A \subset E_k$ for all $k$ and so, for $k$ large so that $n(E_k) < 1$, we find $-\nu(A) \leq n(E_k)$. Letting $k \to \infty$ in this estimate shows $-\nu(A) \leq 0$ or equivalently $\nu(A) \geq 0$. Since $A \subset P$ was arbitrary, we conclude that $P$ is a positive set such that $\nu(P) \geq \nu(E)$.

22.2.1 Hahn Decomposition Theorem

Definition 22.17. Suppose that $\nu$ is a signed measure on $(X, \mathcal{M})$. A Hahn decomposition for $\nu$ is a partition $\{P, N = P^c\}$ of $X$ such that $P$ is positive and $N$ is negative.

Theorem 22.18 (Hahn Decomposition Theorem). Every signed measure space $(X, \mathcal{M}, \nu)$ has a Hahn decomposition, $\{P, N\}$. Moreover, if $\{P, \tilde{N}\}$ is another Hahn decomposition, then $P \Delta \tilde{P} = N \Delta \tilde{N}$ is a null set, so the decomposition is unique modulo null sets.

Proof. With out loss of generality we may assume that $\nu(\mathcal{M}) \subset [-\infty, \infty)$. If not just consider $-\nu$ instead.

Uniqueness. For any $A \in \mathcal{M}$, we have

$$\nu(A) = \nu(A \cap P) + \nu(A \cap N) \leq \nu(A \cap P) \leq \nu(P).$$

In particular, taking $A = P \cup \tilde{P}$, we learn

$$\nu(P) \leq \nu(P \cup \tilde{P}) \leq \nu(P)$$

or equivalently that $\nu(P) = \nu(P \cup \tilde{P})$. Of course by symmetry we also have

$$\nu(P) = \nu(P \cup \tilde{P}) = \nu(\tilde{P}) =: s.$$ 

Since also,

$$s = \nu(P \cup \tilde{P}) = \nu(P) + \nu(\tilde{P}) - \nu(P \cap \tilde{P}) = 2s - \nu(P \cap \tilde{P}),$$

we also have $\nu(P \cap \tilde{P}) = s$. Finally using $P \cup \tilde{P} = \left[ P \cap \tilde{P} \right] \bigcup (P \Delta \tilde{P})$, we conclude that

$$s = \nu(P \cup \tilde{P}) = \nu(P \cap \tilde{P}) + \nu(P \Delta \tilde{P}) = s + \nu(P \Delta \tilde{P})$$

which shows $\nu(P \Delta \tilde{P}) = 0$. Thus $N \Delta \tilde{N} = P \Delta \tilde{P}$ is a positive set with zero measure, i.e. $N \Delta \tilde{N} = P \Delta \tilde{P}$ is a null set and this proves the uniqueness assertion.

Existence. Let

$$s := \sup \{\nu(A) : A \in \mathcal{M}\}$$

which is non-negative since $\nu(\emptyset) = 0$. If $s = 0$, we are done since $P = \emptyset$ and $N = X$ is the desired decomposition. So assume $s > 0$ and choose $A_0 \in \mathcal{M}$ such that $\nu(A_0) > 0$ and $\lim_{n \to \infty} \nu(A_n) = s$. By Lemma 22.16 there exists positive sets $P_n \subset A_n$ such that $\nu(P_n) \geq \nu(A_n)$. Then $s \geq \nu(P_n) \geq \nu(A_n) \rightarrow s$ as $n \rightarrow \infty$ implies that $s = \lim_{n \to \infty} \nu(P_n)$. The set $P := \bigcup_{n=1}^{\infty} P_n$ is a positive set being the union of positive sets and since $P_n \subset P$ for all $n$. 

This shows that \( \nu(P) \geq s \) as \( n \to \infty \).

I now claim that \( N = P^c \) is a negative set and therefore, \( \{P, N\} \) is the desired Hahn decomposition. If \( N \) were not negative, we could find \( E \subset N = P^c \) such that \( \nu(E) > 0 \). We then would have
\[
\nu(P \cup E) = \nu(P) + \nu(E) = s + \nu(E) > s
\]
which contradicts the definition of \( s \).

\section*{22.2.2 Jordan Decomposition}

\textbf{Theorem 22.19 (Jordan Decomposition).} If \( \nu \) is a signed measure on \((X,M)\), there exist unique positive measures \( \nu_+ \) on \((X,M)\) such that \( \nu_+ \leq \nu \) and \( \nu_+ - \nu = \nu_+ - \nu_- \). This decomposition is called the \textit{Jordan decomposition} of \( \nu \).

\textbf{Proof.} Let \( \{P,N\} \) be a Hahn decomposition for \( \nu \) and define
\[
\nu_+(E) := \nu(P \cap E) \quad \text{and} \quad \nu_-(E) := -\nu(N \cap E) \quad \forall E \in \mathcal{M}.
\]
Then it is easily verified that \( \nu = \nu_+ - \nu_- \) is a Jordan decomposition of \( \nu \). The reader is asked to prove the uniqueness of this decomposition in Exercise 22.10.

\textbf{Definition 22.20.} The measure, \(|\nu| := \nu_+ + \nu_-\) is called the \textit{total variation} of \( \nu \). A signed measure is called \( \sigma\)-\textit{finite} provided that \( \nu_+ \) (or equivalently \(|\nu| := \nu_+ + \nu_-\)) are \( \sigma\)-finite measures.

\textbf{Lemma 22.21.} Let \( \nu \) be a signed measure on \((X,M)\) and \( A \in \mathcal{M} \). If \( \nu(A) \in \mathbb{R} \) then \( \nu(B) \in \mathbb{R} \) for all \( B \subset A \). Moreover, \( \nu(A) \in \mathbb{R} \) if \(|\nu|(A) < \infty \). In particular, \( \nu \) is \( \sigma \) finite iff \(|\nu|(A) < \infty \). Furthermore if \( P, N \in \mathcal{M} \) is a Hahn decomposition for \( \nu \) and \( g = 1_P - 1_N \), then \( d\nu = gd|\nu| \), i.e.
\[
\nu(A) = \int_A gd|\nu| \quad \text{for all} \ A \in \mathcal{M}.
\]

\textbf{Proof.} Suppose that \( B \subset A \) and \(|\nu(B)| = \infty \) then since \( \nu(A) = \nu(B) + \nu(A \setminus B) \) we must have \(|\nu(A)| = \infty \). Let \( P, N \in \mathcal{M} \) be a Hahn decomposition for \( \nu \), then
\[
\nu(A) = \nu(A \cap P) + \nu(A \cap N) = |\nu(A \cap P)| + |\nu(A \cap N)| \quad \text{and} \quad |\nu|(A) = |\nu(A \cap P)| - |\nu(A \cap N)| \quad \text{and} \quad |\nu|(A) = |\nu(A \cap P)| - |\nu(A \cap N)|. \quad (22.12)
\]
Therefore \( \nu(A) \in \mathbb{R} \) iff \( \nu(A \cap P) \in \mathbb{R} \) and \( \nu(A \cap N) \in \mathbb{R} \) iff \(|\nu|(A) < \infty \). Finally,
\[
\nu(A) = \nu(A \cap P) + \nu(A \cap N) = |\nu|(A \cap P) - |\nu|(A \cap N) \quad \text{and} \quad \int_A (1_P - 1_N) d|\nu|,
\]
which shows that \( d\nu = gd|\nu| \).

\textbf{Lemma 22.22.} Suppose that \( \mu \) is a positive measure on \((X,M)\) and \( g : X \to \mathbb{R} \) is an extended \( \mu\)-integrable function. If \( \nu \) is the signed measure \( d\nu = gd\mu \), then \( d\nu_\pm = g_\pm d\mu \) and \( d|\nu| = |g| d\mu \). We also have
\[
|\nu|(A) = \sup \{ \int_A f d\nu : |f| \leq 1 \} \quad \text{for all} \ A \in \mathcal{M}. \quad (22.13)
\]

\textbf{Proof.} The pair, \( P = \{g > 0\} \) and \( N = \{g \leq 0\} = P^c \) is a Hahn decomposition for \( \nu \). Therefore
\[
\nu_+(A) = \nu(A \cap P) = \int_{A \cap P} gd\mu = \int_A 1_{\{g > 0\}} gd\mu = \int_A g_+ d\mu,
\]
\[
\nu_-(A) = -\nu(A \cap N) = -\int_{A \cap N} gd\mu = -\int_A 1_{\{g \leq 0\}} gd\mu = -\int_A g_- d\mu.
\]
and
\[
|\nu|(A) = \nu_+(A) + \nu_-(A) = \int_A g_+ d\mu - \int_A g_- d\mu,
\]
\[
= \int_A (g_+ - g_-) d\mu = \int_A |g| d\mu.
\]
If \( A \in \mathcal{M} \) and \(|f| \leq 1 \), then
\[
\int_A f d\nu = \left\| \int_A f d\nu_+ - \int_A f d\nu_- \right\| \leq \int_A f d\nu_+ + \int_A f d\nu_- \leq \int_A |f| d|\nu| \leq |\nu|(A).
\]
For the reverse inequality, let \( f := 1_P - 1_N \) then
\[
\int_A f d\nu = \nu(A \cap P) - \nu(A \cap N) = \nu_+(A) + \nu_-(A) = |\nu|(A).
\]
Definition 22.23. Let $\nu$ be a signed measure on $(X, \mathcal{M})$, let

$$L^1(\nu) := L^1(\nu_+) \cap L^1(\nu_-) = L^1(|\nu|)$$

and for $f \in L^1(\nu)$ we define

$$\int_X f \, d\nu := \int_X f \, d\nu_+ - \int_X f \, d\nu_-.$$

Lemma 22.24. Let $\mu$ be a positive measure on $(X, \mathcal{M})$, $g$ be an extended integrable function on $(X, \mathcal{M}, \mu)$ and $d\nu = g \, d\mu$. Then $L^1(\nu) = L^1(|g| \, d\mu)$ and for $f \in L^1(\nu)$,

$$\int_X f \, d\nu = \int_X f \, g \, d\mu.$$

Proof. By Lemma 22.22, $\nu_+ = g_+ \, d\mu$, $\nu_- = g_- \, d\mu$, and $d|\nu| = |g| \, d\mu$ so that $L^1(\nu) = L^1(|\nu|) = L^1(|g| \, d\mu)$ and for $f \in L^1(\nu)$,

$$\int_X f \, d\nu = \int_X f \, d\nu_+ - \int_X f \, d\nu_- = \int_X f \, g_+ \, d\mu - \int_X f \, g_- \, d\mu$$

$$= \int_X f \, (g_+ - g_-) \, d\mu = \int_X f \, g \, d\mu.$$

Lemma 22.25. Suppose $\nu$ is a signed measure, $\mu$ is a positive measure and $\nu = \nu_+ + \nu_- \nu_\circ$ is a Lebesgue decomposition (see Definition 22.9) of $\nu$ relative to $\mu$, then $|\nu| = |\nu_+| + |\nu_-|$.

Proof. Let $A \in \mathcal{M}$ be chosen so that $A$ is a null set for $\nu$ and $A^c$ is a null set for $\nu_-$. Let $A = P' \bigcup N'$ be a Hahn decomposition of $\nu_\circ|_{\mathcal{M}_A}$ and $A^c = \bar{P} \bigcup \bar{N}$ be a Hahn decomposition of $\nu_\circ|_{\mathcal{M}_A^c}$. Let $P = P' \cup \bar{P}$ and $N = N' \cup \bar{N}$. Since for $C \in \mathcal{M}$,

$$\nu(C \cap P) = \nu(C \cap P') + \nu(C \cap \bar{P})$$

$$= \nu_+(C \cap P') + \nu_-(C \cap \bar{P}) \geq 0$$

and

$$\nu(C \cap N) = \nu(C \cap N') + \nu(C \cap \bar{N})$$

$$= \nu_+(C \cap N') + \nu_-(C \cap \bar{N}) \leq 0$$

we see that $\{P, N\}$ is a Hahn decomposition for $\nu$. It also easy to see that $\{P, N\}$ is a Hahn decomposition for both $\nu_\circ$ and $\nu_\circ$ as well. Therefore,

Definition 22.22. Let $\nu$ be a signed measure on $(X, \mathcal{M})$, let

$$L^1(\nu) := L^1(\nu_+) \cap L^1(\nu_-) = L^1(|\nu|)$$

and for $f \in L^1(\nu)$ we define

$$\int_X f \, d\nu := \int_X f \, d\nu_+ - \int_X f \, d\nu_-.$$

Lemma 22.24. Let $\mu$ be a positive measure on $(X, \mathcal{M})$, $g$ be an extended integrable function on $(X, \mathcal{M}, \mu)$ and $d\nu = g \, d\mu$. Then $L^1(\nu) = L^1(|g| \, d\mu)$ and for $f \in L^1(\nu)$,

$$\int_X f \, d\nu = \int_X f \, d\nu_+ - \int_X f \, d\nu_- = \int_X f \, g_+ \, d\mu - \int_X f \, g_- \, d\mu$$

$$= \int_X f \, (g_+ - g_-) \, d\mu = \int_X f \, g \, d\mu.$$

Lemma 22.25. Suppose $\nu$ is a signed measure, $\mu$ is a positive measure and $\nu = \nu_+ + \nu_- \nu_\circ$ is a Lebesgue decomposition (see Definition 22.9) of $\nu$ relative to $\mu$, then $|\nu| = |\nu_+| + |\nu_-|$.

Proof. Let $A \in \mathcal{M}$ be chosen so that $A$ is a null set for $\nu_\circ$ and $A^c$ is a null set for $\nu_-$. Let $A = P' \bigcup N'$ be a Hahn decomposition of $\nu_\circ|_{\mathcal{M}_A}$ and $A^c = \bar{P} \bigcup \bar{N}$ be a Hahn decomposition of $\nu_\circ|_{\mathcal{M}_A^c}$. Let $P = P' \cup \bar{P}$ and $N = N' \cup \bar{N}$. Since for $C \in \mathcal{M}$,

$$\nu(C \cap P) = \nu(C \cap P') + \nu(C \cap \bar{P})$$

$$= \nu_+(C \cap P') + \nu_-(C \cap \bar{P}) \geq 0$$

and

$$\nu(C \cap N) = \nu(C \cap N') + \nu(C \cap \bar{N})$$

$$= \nu_+(C \cap N') + \nu_-(C \cap \bar{N}) \leq 0$$

we see that $\{P, N\}$ is a Hahn decomposition for $\nu$. It also easy to see that $\{P, N\}$ is a Hahn decomposition for both $\nu_\circ$ and $\nu_\circ$ as well. Therefore,

$$|\nu|(C) = \nu(C \cap P) - \nu(C \cap N)$$

$$= \nu_+(C \cap P) - \nu_-(C \cap N) + \nu_+(C \cap N) - \nu_-(C \cap N)$$

$$= |\nu_+|(C) + |\nu_-(C)$$.

Lemma 22.26. Let $\nu$ be a signed measure and $\mu$ be a positive measure on $(X, \mathcal{M})$ such that $\nu \ll \mu$ and $\nu \perp \mu$, then $\nu \equiv 0$.

Proof. Uniqueness.

Lemma 22.27 (Radon Nikodym Theorem for Signed Measures). Let $\nu$ be a $\sigma$-finite signed measure and $\mu$ be a $\sigma$-finite positive measure on $(X, \mathcal{M})$. Then $\nu$ has a unique Lebesgue decomposition $\nu = \nu_+ + \nu_-$ relative to $\mu$ and there exists a unique (modulo sets of $\mu$-measure 0) extended integrable function $\rho : X \to \mathbb{R}$ such that $d\nu_\circ = \rho \, d\mu$. Moreover, $\nu_\circ = 0$ if $\nu \ll \mu$, i.e. $d\nu = \rho \, d\mu$ if $\nu \ll \mu$.

Proof. Uniqueness. Is a direct consequence of Lemmas 22.10 and 22.11

Existence. Let $\nu = \nu_+ - \nu_-$ be the Jordan decomposition of $\nu$. Assume, without loss of generality, that $\nu_+(X) < \infty$, i.e. $\nu(A) < \infty$ for all $A \in \mathcal{M}$. By the Radon Nikodym Theorem 22.13 for positive measures there exist functions $f_\pm : X \to [0, \infty)$ and measures $\lambda_\pm$ such that $\nu_\pm = f_\pm + \lambda_\pm$ with $\lambda_\pm \perp \mu$. Since

$$\infty > \nu_+(X) = \mu_+(X) + \lambda_+(X),$$

$f_+ \in L^1(\mu)$ and $\lambda_+(X) < \infty$ so that $f = f_+ - f_-$ is an extended integrable function, $d\nu_\circ := f \, d\mu$ and $\nu_\circ = \lambda_+ - \lambda_-$ are signed measures. This finishes the existence proof since

$$\nu = \nu_+ - \nu_- = \mu_+ + \lambda_+ - (\mu_- + \lambda_-) = \nu_+ + \nu_-$$

and $\nu_\circ = (\lambda_+ - \lambda_-) \perp \mu$ by Lemma 22.28. For the final statement, if $\nu_\circ = 0$, then $d\nu = \rho \, d\mu$ and hence $\nu \ll \mu$. Conversely if $\nu \ll \mu$, then $d\nu = d\nu - \rho \, d\mu \ll \mu$, so by Lemma 22.16 $\nu_\circ = 0$. Alternatively just use the uniqueness of the Lebesgue decomposition to conclude $\nu_\circ = \nu$ and $\nu_\circ = 0$. Or more directly, choose $B \in \mathcal{M}$
such that $\mu(B^c) = 0$ and $B$ is a $\nu$–null set. Since $\nu \ll \mu$, $B^c$ is also a $\nu$–null set so that, for $A \in \mathcal{M}$,

$$\nu(A) = \nu(A \cap B) = \nu_\alpha(A \cap B) + \nu_\alpha(A \cap B) = \nu_\alpha(A \cap B).$$

**Notation 22.28** The function $f$ is called the Radon-Nikodym derivative of $\nu$ relative to $\mu$ and we will denote this function by $\frac{d\nu}{d\mu}$.

### 22.3 Complex Measures

Suppose that $\nu$ is a complex measure on $(X, \mathcal{M})$, let $\nu_r := \text{Re} \nu$, $\nu_i := \text{Im} \nu$ and $\mu := |\nu_r| + |\nu_i|$. Then $\mu$ is a finite positive measure on $\mathcal{M}$ such that $\nu_r \ll \mu$ and $\nu_i \ll \mu$. By the Radon-Nikodym Theorem 22.27, there exists real functions $h, k \in L^1(\mu)$ such that $d\nu_r = h \, d\mu$ and $d\nu_i = k \, d\mu$. So letting $g := h + ik \in L^1(\mu)$,

$$d\nu = (h + ik) \, d\mu = gd\mu$$

showing every complex measure may be written as in Eq. (22.1).

**Lemma 22.29.** Suppose that $\nu$ is a complex measure on $(X, \mathcal{M})$, and for $i = 1, 2$ let $\mu_i$ be a finite positive measure on $(X, \mathcal{M})$ such that $d\nu = g_i d\mu_i$ with $g_i \in L^1(\mu_i)$. Then

$$\int_X |g_1| \, d\mu_1 = \int_X |g_2| \, d\mu_2 \text{ for all } A \in \mathcal{M}.$$  

In particular, we may define a positive measure $|\nu|$ on $(X, \mathcal{M})$ by

$$|\nu|(A) = \int_A |g_1| \, d\mu_1 \text{ for all } A \in \mathcal{M}.$$  

The finite positive measure $|\nu|$ is called the **total variation measure** of $\nu$.

**Proof.** Let $\lambda = \mu_1 + \mu_2$ so that $\mu_i \ll \lambda$. Let $\rho_i = d\mu_i/d\lambda \geq 0$ and $h_i = \rho_i g_i$. Since

$$\nu(A) = \int_A g_i \, d\mu_i = \int_A g_i \rho_i \, d\lambda = \int_A h_i d\lambda \text{ for all } A \in \mathcal{M},$$

$h_1 = h_2$, $\lambda$ –a.e. Therefore

$$\int_A |g_1| \, d\mu_1 = \int_A |g_1| \, \rho_1 \, d\lambda = \int_A |h_1| \, d\lambda$$

$$= \int_A |h_2| \, d\lambda = \int_A |g_2| \, \rho_2 \, d\lambda = \int_A |g_2| \, d\mu_2.$$  

**Definition 22.30.** Given a complex measure $\nu$, let $\nu_r = \text{Re} \nu$ and $\nu_i = \text{Im} \nu$ so that $\nu_r$ and $\nu_i$ are finite signed measures such that

$$\nu(A) = \nu_r(A) + i\nu_i(A) \text{ for all } A \in \mathcal{M}.$$  

Let $L^1(\nu) := L^1(\nu_r) \cap L^1(\nu_i)$ and for $f \in L^1(\nu)$ define

$$\int_X f \, d\nu := \int_X f \, d\nu_r + i \int_X f \, d\nu_i.$$  

**Example 22.31.** Suppose that $\mu$ is a positive measure on $(X, \mathcal{M})$, $g \in L^1(\mu)$ and $\nu(A) = \int_A g \, d\mu$ as in Example 22.4, then $L^1(\nu) = L^1(|g| \, d\mu)$ and for $f \in L^1(\nu)$

$$\int_X f \, d\nu = \int_X f \, g \, d\mu.$$  

To check Eq. (22.14), notice that $d\nu_r = \text{Re} \, g \, d\mu$ and $d\nu_i = \text{Im} \, g \, d\mu$ so that (using Lemma 22.24)

$$L^1(\nu) = L^1(\text{Re} \, g \, d\mu) \cap L^1(\text{Im} \, g \, d\mu) = L^1(|g| \, d\mu).$$  

If $f \in L^1(\nu)$, then

$$\int_X f \, d\nu := \int_X f \, \text{Re} \, g \, d\mu + i \int_X f \, \text{Im} \, g \, d\mu = \int_X f \, g \, d\mu.$$  

**Remark 22.32.** Suppose that $\nu$ is a complex measure on $(X, \mathcal{M})$ such that $d\nu = gd\mu$ and as above $d|\nu| = |g| \, d\mu$. Letting

$$\rho := \text{sgn}(\rho) := \begin{cases} \frac{\rho}{|\rho|} & \text{if } |\rho| \neq 0 \\ 1 & \text{if } |\rho| = 0 \end{cases}$$

we see that

$$d\nu = gd\mu = \rho |g| \, d\mu = \rho d|\nu|$$

and $|\rho| = 1$ and $\rho$ is uniquely defined modulo $|\nu|$ – null sets. We will denote $\rho$ by $d\rho/d|\nu|$ . With this notation, it follows from Example 22.31 that $L^1(\nu) := L^1(|\nu|)$ and for $f \in L^1(\nu)$,

$$\int_X f \, d\nu = \int_X f \, \frac{d\rho}{d|\nu|} \, d|\nu|.$$  

We now give a number of methods for computing the total variation, $|\nu|$, of a complex or signed measure $\nu$. 
Proposition 22.33 (Total Variation). Suppose \( A \subset 2^X \) is an algebra, \( M = \sigma(A), \nu \) is a complex (or a signed measure which is \( \sigma \) – finite on \( A \)) on \((X, M)\) and for \( E \in M \) let

\[
\mu_0(E) = \sup \left\{ \sum_{1}^{n} |\nu(E_j)| : E_j \in A_E \ni E_i \cap E_j = \delta_{ij} E_i, \ n, 1, 2, \ldots \right\} \\
\mu_1(E) = \sup \left\{ \sum_{1}^{n} |\nu(E_j)| : E_j \in M_E \ni E_i \cap E_j = \delta_{ij} E_i, \ n, 1, 2, \ldots \right\} \\
\mu_2(E) = \sup \left\{ \sum_{1}^{\infty} |\nu(E_j)| : E_j \in M_E \ni E_i \cap E_j = \delta_{ij} E_i \right\} \\
\mu_3(E) = \sup \left\{ \int_E f d\nu : f \text{ is measurable with } |f| \leq 1 \right\} \\
\mu_4(E) = \sup \left\{ \int_E f d\nu : f \in S_f(A, |\nu|) \text{ with } |f| \leq 1 \right\} .
\]

then \( \mu_0 = \mu_1 = \mu_2 = \mu_3 = \mu_4 = |\nu| \).

**Proof.** Let \( \rho = d\nu/d|\nu| \) and recall that \( |\rho| = 1, |\nu| – \text{a.e.} \)

**Step 1.** \( \mu_4 \leq |\nu| = \mu_3 \). If \( f \) is measurable with \( |f| \leq 1 \) then

\[
\int_E f d\nu = \int_E f \rho d|\nu| \leq \int_E |f| d|\nu| \leq \int_E 1 d|\nu| = |\nu|(E)
\]

from which we conclude that \( \mu_4 \leq \mu_3 \leq |\nu| \). Taking \( f = \bar{\rho} \) above shows

\[
\int_E f d\nu = \int_E \bar{\rho} \rho d|\nu| = \int_E 1 d|\nu| = |\nu|(E)
\]

which shows that \( |\nu| \leq \mu_3 \) and hence \( |\nu| = \mu_3 \).

**Step 2.** \( \mu_4 \geq |\nu| \). Let \( X_m \in A \) be chosen so that \( |\nu|(X_m) \leq \infty \) and \( X_m \uparrow X \) as \( m \to \infty \). By Theorem 19.15 (or Remark 48.4 or Corollary 49.44 below), there exists \( \rho_n \in S_f(A, \mu) \) such that \( \rho_n \to \rho 1_{X_m} \) in \( L^1(|\nu|) \) and each \( \rho_n \) may be written in the form

\[
\rho_n = \sum_{k=1}^{N} z_k 1_{A_k} \tag{22.15)
\]

where \( z_k \in \mathbb{C} \) and \( A_k \in A \) and \( A_k \cap A_j = \emptyset \) if \( k \neq j \). I claim that we may assume that \( |z_k| \leq 1 \) in Eq. (22.15) for if \( |z_k| > 1 \) and \( x \in A_k \),

\[
|\rho(x) - z_k| \geq |\rho(x) - |z_k|^{-1} z_k| .
\]

This is evident from Figure 22.1 and formally follows from the fact that

\[
\frac{d}{dt} |\rho(x) - t|z_k|^{-1} z_k|^2 = 2 \left[ t - \text{Re}(|z_k|^{-1} z_k \bar{\rho}(x)) \right] \geq 0
\]

when \( t \geq 1 \).

![Fig. 22.1. Sliding points to the unit circle.](image)

Therefore if we define

\[
w_k := \begin{cases} |z_k|^{-1} z_k & \text{if } |z_k| > 1 \\ z_k & \text{if } |z_k| \leq 1 \end{cases}
\]

and \( \tilde{\rho}_n = \sum_{k=1}^{N} w_k 1_{A_k} \) then

\[
|\rho(x) - \rho_n(x)| \geq |\rho(x) - \tilde{\rho}_n(x)|
\]

and therefore \( \tilde{\rho}_n \to \rho 1_{X_m} \) in \( L^1(|\nu|) \). So we now assume that \( \rho_n \) is as in Eq. 22.15 with \( |z_k| \leq 1 \). Now

\[
\left| \int_E \tilde{\rho}_n d\nu - \int_E \bar{\rho} 1_{X_m} d\nu \right| \leq \left| \int_E (\tilde{\rho}_n d\nu - \bar{\rho} 1_{X_m}) \rho d|\nu| \right| \leq \int_E |\tilde{\rho}_n - \bar{\rho} 1_{X_m}| d|\nu| \to 0 \text{ as } n \to \infty
\]

and hence

\[
\mu_4(E) \geq \left| \int_E \bar{\rho} 1_{X_m} d\nu \right| = |\nu|(E \cap X_m) \text{ for all } m.
\]

Letting \( m \uparrow \infty \) in this equation shows \( \mu_4 \geq |\nu| \) which combined with step 1 shows \( \mu_3 = \mu_4 = |\nu| \).

**Proof. Step 3.** \( \mu_0 = \mu_1 = \mu_2 = |\nu| \). Clearly \( \mu_0 \leq \mu_1 \leq \mu_2 \). Suppose \( \{E_j\}_{j=1}^{\infty} \subset M_E \) be a collection of pairwise disjoint sets, then
Since this equation holds for all \( f \), Exercise 22.2.

The following results will be needed in Section 23.4 below.

**Theorem 22.34 (Radon Nikodym Theorem for Complex Measures).** Let \( \nu \) be a complex measure and \( \mu \) be a \( \sigma \)-finite positive measure on \((X, \mathcal{M})\). Then \( \nu \) has a unique Lebesgue decomposition \( \nu = \nu_a + \nu_s \) relative to \( \mu \) and there exists a unique element \( \rho \in L^1(\mu) \) such that \( d\nu_a = \rho d\mu \). Moreover, \( \nu_s = 0 \) iff \( \nu \ll \mu \), i.e. \( d\nu = d\rho d\mu \) iff \( \nu \ll \mu \).

**Proof.** Uniqueness. Is a direct consequence of Lemmas 22.10 and 22.11.

**Existence.** Let \( g : X \to S^1 \subset \mathbb{C} \) be a function such that \( d\nu = gd|\nu| \). By Theorem 22.13, there exists \( h \in L^1(\mu) \) and a positive measure \( |\nu|_s \) such that \( |\nu|_s \perp \mu \) and \( d|\nu| = hd\mu + d|\nu|_s \). Hence we have \( d\nu = d\rho d\mu + d\nu_s \) with \( \rho := gh \in L^1(\mu) \) and \( d\nu_s := gd|\nu|_s \). This finishes the proof since, as is easily verified, \( \nu_s \perp \mu \).

**22.4 Absolute Continuity on an Algebra**

The following results will be needed in Section 23.4 below.

**Exercise 22.1.** Let \( \nu = \nu' + i\nu^i \) be a complex measure on a measurable space, \((X, \mathcal{M})\), then \( |\nu|' \leq |\nu|, |\nu|^i \leq |\nu| \) and \( |\nu|' \leq |\nu|^i + |\nu|^i \).

**Exercise 22.2.** Let \( \nu \) be a signed measure on a measurable space, \((X, \mathcal{M})\). If \( A \in \mathcal{M} \) is set such that there exists \( M < \infty \) such that \( |\nu(B)| \leq M \) for all \( B \in \mathcal{M}_A = \{ C \cap A : C \in \mathcal{M} \} \), then \( |\nu|(A) \leq 2M \). If \( \nu \) is complex measure with \( A \in \mathcal{M} \) and \( M < \infty \) as above, then \( |\nu|(A) \leq 4M \).

**Lemma 22.35.** Let \( \nu \) be a complex or a signed measure on \((X, \mathcal{M})\). Then \( A \in \mathcal{M} \) is a \( \nu \)-null set iff \( |\nu|(A) = 0 \). In particular if \( \mu \) is a positive measure on \((X, \mathcal{M})\), \( \nu \ll \mu \) iff \( |\nu| \ll \mu \).

**Proof.** In all cases we have \( |\nu(A)| \leq |\nu|(A) \) for all \( A \in \mathcal{M} \) which clearly shows that \( |\nu|(A) = 0 \) implies \( A \) is a \( \nu \)-null set. Conversely if \( A \) is a \( \nu \)-null set, then, by definition, \( |\nu|_{|\mathcal{M}_A|} = 0 \) so by Proposition 22.23

\[
|\nu|(A) = \sup \left\{ \sum_{j=1}^{\infty} |\nu(E_j)| : E_j \in \mathcal{M}_A \ni E_i \cap E_j = \delta_i j \right\} = 0.
\]

since \( E_j \subset A \) implies \( \mu(E_j) = 0 \) and hence \( \nu(E_j) = 0 \).

**Alternative Proofs** that \( A \) is \( \nu \)-null implies \( |\nu|(A) = 0 \).

1. **Suppose** \( \nu \) is a signed measure and \( \{ P, N = P^0 \} \subset \mathcal{M} \) is a Hahn decomposition for \( \nu \). Then

\[
|\nu|(A) = |\nu(A \cap P) - \nu(A \cap N)| = 0.
\]

Now suppose that \( \nu \) is a complex measure. Then \( A \) is a null set for both \( \nu_r := \text{Re}\nu \) and \( \nu_i := \text{Im}\nu \). Therefore \( |\nu|(A) \leq |\nu_r|(A) + |\nu_i|(A) = 0 \).

2. Here is another proof in the complex case. Let \( \rho = \frac{d\nu}{d\mu} \), then by assumption of \( A \) being \( \nu \)-null,

\[
0 = \rho(B) = \int_B \rho d|\nu| \text{ for all } B \in \mathcal{M}_A.
\]

This shows that \( \rho 1_A = 0 \), \( |\nu| - a.e. \) and hence

\[
|\nu|(A) = \int_A |\rho| d|\nu| = \int_X 1_A |\rho| d|\nu| = 0.
\]

**Theorem 22.36 (\( \epsilon - \delta \) Definition of Absolute Continuity).** Let \( \nu \) be a complex measure and \( \mu \) be a positive measure on \((X, \mathcal{M})\). Then \( \nu \ll \mu \) iff for all \( \epsilon > 0 \) there exists a \( \delta > 0 \) such that \( |\nu(A)| < \epsilon \) whenever \( A \in \mathcal{M} \) and \( \mu(A) < \delta \).

**Proof.** \( \Longleftarrow \) If \( \mu(A) = 0 \) then \( |\nu(A)| < \epsilon \) for all \( \epsilon > 0 \) which shows that \( \nu(A) = 0 \), i.e. \( \nu \ll \mu \).

\( \Longrightarrow \) Since \( \nu \ll \mu \) iff \( |\nu| \ll \mu \) and \( |\nu|(A) \leq |\nu|(A) \) for all \( A \in \mathcal{M} \), it suffices to assume \( \nu \geq 0 \) with \( \nu(X) < \infty \). Suppose for the sake of contradiction there exists \( \epsilon > 0 \) and \( A \in \mathcal{M} \) such that \( \nu(A_n) \geq \epsilon > 0 \) while \( \mu(A_n) \leq \frac{1}{n^2} \). Let

\[
A = \{ A_n \text{ i.o.} \} = \bigcup_{N=1}^{\infty} \bigcup_{n \geq N} A_n
\]

so that
\[ \mu(A) = \lim_{N \to \infty} \mu(\bigcup_{n \geq N} A_n) \leq \lim_{N \to \infty} \sum_{n=N}^{\infty} \mu(A_n) \leq \lim_{N \to \infty} 2^{-(N-1)} = 0. \]

On the other hand,
\[ \nu(A) = \lim_{N \to \infty} \nu(\bigcup_{n \geq N} A_n) \geq \lim_{n \to \infty} \inf \nu(A_n) \geq \varepsilon > 0 \]
showing that \( \nu \) is not absolutely continuous relative to \( \mu \). \( \blacksquare \)

**Corollary 22.37.** Let \( \mu \) be a positive measure on \( (X, \mathcal{M}) \) and \( f \in L^1(d\mu) \). Then for all \( \varepsilon > 0 \) there exists \( \delta > 0 \) such that \[ \int_A f \, d\mu < \varepsilon \text{ for all } A \in \mathcal{M} \text{ such that } \mu(A) < \delta. \]

**Proof.** Apply theorem 22.36 to the signed measure \( \nu(A) = \int_A f \, d\mu \) for all \( A \in \mathcal{M} \).

**Alternative proof.** If the statement in the corollary were false, there would exist \( \varepsilon > 0 \) and \( A_n \in \mathcal{M} \) such that \( \mu(A_n) \downarrow 0 \) while \[ \left| \int_{A_n} f \, d\mu \right| \geq \varepsilon \text{ for all } n. \]
On the other hand \[ |1_{A_n} f| \leq |f| \in L^1(\mu) \text{ and } 1_{A_n} f \overset{d\mu}{\to} 0 \text{ as } n \to \infty \]
and so by the dominated convergence theorem in Corollary 18.26, we may conclude,
\[ \lim_{n \to \infty} \int_{A_n} f \, d\mu = \lim_{n \to \infty} \int_X 1_{A_n} f \, d\mu = 0 \]
which leads to the desired contradiction. \( \blacksquare \)

**Theorem 22.38 (Absolute Continuity on an Algebra).** Let \( \nu \) be a complex measure and \( \mu \) be a positive measure on \( (X, \mathcal{M}) \). Suppose that \( A \subset \mathcal{M} \) is an algebra such that \( \sigma(A) = \mathcal{M} \) and that \( \mu \) is \( \sigma \)-finite on \( A \). Then \( \nu \ll \mu \) iff for all \( \varepsilon > 0 \) there exists a \( \delta > 0 \) such that \( |\nu(A)| < \varepsilon \) for all \( A \in \mathcal{A} \) which satisfy \( \mu(A) < \delta \).

**Proof.** (\( \Rightarrow \)) This implication is a consequence of Theorem 22.36.

(\( \Leftarrow \)) If \( |\nu(A)| < \varepsilon \) for all \( A \in \mathcal{A} \) with \( \mu(A) < \delta \), then by Exercise 22.2, \( |\nu(A)| < 4\varepsilon \) for all \( A \in \mathcal{A} \) with \( \mu(A) < \delta \). Because of this argument, we may now replace \( \mu \) by \( |\nu| \) and hence we may assume that \( \nu \) is a positive finite measure.

Let \( \varepsilon > 0 \) and \( \delta > 0 \) be such that \( \nu(A) < \varepsilon \) for all \( A \in \mathcal{A} \) with \( \mu(A) < \delta \). Suppose that \( B \in \mathcal{M} \) with \( \mu(B) < \delta \) and \( \alpha \in (0, \delta - \mu(B)) \). By Corollary 19.18 there exists \( A \in \mathcal{A} \) such that
\[ \mu(A \Delta B) + \nu(A \Delta B) = (\mu + \nu)(A \Delta B) < \alpha. \]
In particular it follows that \( \mu(A) \leq \mu(B) + \mu(A \Delta B) < \delta \) and hence by assumption \( \nu(A) < \varepsilon \). Therefore,
\[ \nu(B) \leq \nu(A) + \nu(A \Delta B) < \varepsilon + \alpha \]
and letting \( \alpha \downarrow 0 \) in this inequality shows \( \nu(B) \leq \varepsilon \).

**Alternative Proof.** Let \( \varepsilon > 0 \) and \( \delta > 0 \) be such that \( \nu(A) < \varepsilon \) for all \( A \in \mathcal{A} \) with \( \mu(A) < \delta \). Suppose that \( B \in \mathcal{M} \) with \( \mu(B) < \delta \). Use the regularity Theorem 19.18 below (or see Theorem 19.9 or Corollary 19.14) to find \( A \in \mathcal{A} \) such that \( \mu(A) < \delta \). Write \( A = \bigcup_n A_n \) with \( A_n \in \mathcal{A} \). By replacing \( A_n \) by \( \bigcup_{n=1}^N A_j \) if necessary we may assume that \( A_n \) is increasing in \( n \). Then \( \mu(A_n) \leq \mu(A) < \delta \) for each \( n \) and hence by assumption \( \nu(A_n) < \varepsilon \). Since \( B \subset A = \bigcup_n A_n \) it follows that \( \nu(B) \leq \nu(A) = \lim_{n \to \infty} \nu(A_n) \leq \varepsilon \). Thus we have shown that \( \nu(B) \leq \varepsilon \) for all \( B \in \mathcal{M} \) such that \( \mu(B) < \delta \). \( \blacksquare \)

### 22.5 Exercises

**Exercise 22.3.** Prove Theorem 22.14 for \( p \in [1, 2] \) by directly applying the Riesz theorem to \( \varphi|L^2(\mu) \).

**Exercise 22.4.** Show \( |\nu| \) be defined as in Eq. 22.7 is a positive measure. Here is an outline.

1. Show
\[ |\nu|(A) + |\nu|(B) \leq |\nu|(A \cup B). \tag{22.16} \]
when \( A, B \) are disjoint sets in \( \mathcal{M} \).
2. If \( A = \bigcap_{n=1}^\infty A_n \) with \( A_n \in \mathcal{M} \) then
\[ |\nu|(A) \leq \sum_{n=1}^\infty |\nu|(A_n). \tag{22.17} \]
3. From Eqs. 22.16 and 22.17 it follows that \( |\nu| \) is finitely additive, and hence
\[ |\nu|(A) = \sum_{n=1}^N |\nu|(A_n) + |\nu|(\cup_{n>N} A_n) \geq \sum_{n=1}^N |\nu|(A_n). \]
Letting \( N \to \infty \) in this inequality shows \( |\nu|(A) \geq \sum_{n=1}^\infty |\nu|(A_n) \) which combined with Eq. 22.17 shows \( |\nu| \) is countably additive.

**Exercise 22.5.** Suppose \( X \) is a set, \( A \subset 2^X \) is an algebra, and \( \nu : A \to \mathbb{C} \) is a finitely additive measure. For any \( A \in \mathcal{A} \), let
\[ |\nu|(A) := \sup \left\{ \sum_{i=1}^n |\nu(A_i)| : A = \bigcup_{i=1}^n A_i \text{ with } A_i \in \mathcal{A} \text{ and } n \in \mathbb{N} \right\}. \]
Exercise 22.6. Suppose that \( \{ \nu_n \} \) are complex measures on a measurable space, \((X, \mathcal{M})\).

1. If \( \sum_{n=1}^{\infty} |\nu_n|(A) < \infty \), then \( \nu := \sum_{n=1}^{\infty} \nu_n \) is a complex measure.
2. If there is a finite positive measure, \( \mu : \mathcal{M} \to [0, \infty) \) such that \( |\nu_n|(A) \leq \mu(A) \) for all \( A \in \mathcal{M} \) and \( \nu(A) := \lim_{n \to \infty} \nu_n(A) \) exists for all \( A \in \mathcal{M} \), then \( \nu \) is also a complex measure.

Exercise 22.7. Suppose \( \mu_i, \nu_i \) are finitely additive measures on measurable spaces, \((X_i, \mathcal{M}_i)\), for \( i = 1, 2 \). If \( \nu_i \ll \mu_i \) for \( i = 1, 2 \) then \( \nu_1 \otimes \nu_2 \ll \mu_1 \otimes \mu_2 \) and in fact

\[
\frac{d(\nu_1 \otimes \nu_2)}{d(\mu_1 \otimes \mu_2)}(x_1, x_2) = \rho_1 \otimes \rho_2(x_1, x_2) := \rho_1(x_1)\rho_2(x_2)
\]

where \( \rho_i := d\nu_i/d\mu_i \) for \( i = 1, 2 \).

Exercise 22.8. Let \( X = [0, 1] \), \( \mathcal{M} := \mathcal{B}_{[0,1]} \), \( m \) be Lebesgue measure and \( \mu \) be counting measure on \( X \). Show

1. \( m \ll \mu \) yet there is not function \( \rho \) such that \( dm = \rho d\mu \).
2. Counting measure \( \mu \) has no Lebesgue decomposition relative to \( m \).

Exercise 22.9. Suppose that \( \nu \) is a signed or complex measure on \((X, \mathcal{M})\) and \( A_n \in \mathcal{M} \) such that either \( A_n \uparrow A \) or \( A_n \downarrow A \) and \( \nu(A_1) \in \mathbb{R} \), then show

\( \nu(A) = \lim_{n \to \infty} \nu(A_n) \).

Exercise 22.10. Let \((X, \mathcal{M})\) be a measurable space, \( \nu : \mathcal{M} \to [-\infty, \infty) \) be a signed measure, and \( \nu = \nu_+ - \nu_- \) be a Jordan decomposition of \( \nu \). If \( \nu := \alpha - \beta \) with \( \alpha \) and \( \beta \) being positive measures and \( \alpha(X) < \infty \), show \( \nu_+ \leq \alpha \) and \( \nu_- \leq \beta \). Us this result to prove the uniqueness of Jordan decompositions stated in Theorem 22.19.

Exercise 22.11. Let \( \nu_1 \) and \( \nu_2 \) be two signed measures on \((X, \mathcal{M})\) which are assumed to be valued in \([-\infty, \infty)\). Show, \( |\nu_1 + \nu_2| \leq |\nu_1| + |\nu_2| \). Hint: use Exercise 22.10 along with the observation that \( \nu_1 + \nu_2 = (\nu_1^+ + \nu_2^+) - (\nu_1^- + \nu_2^-) \), where \( \nu_i^\pm := (\nu_i)^\pm \).

Exercise 22.13. Show Theorem 22.36 may fail if \( \nu \) is not finite. (For a hint, see problem 3.10 on p. 92 of Folland.)

Exercise 22.15. Folland 3.15 on p. 92.

Exercise 22.16. If \( \nu \) is a complex measure on \((X, \mathcal{M})\) such that \( |\nu|(X) = \nu(X) \), then \( \nu = |\nu| \).

Exercise 22.17. Suppose \( \nu \) is a complex or a signed measure on a measurable space, \((X, \mathcal{M})\). Show \( A \in \mathcal{M} \) is a \( \nu \)-null set iff \( |\nu|(A) = 0 \). Use this to conclude that if \( \mu \) is a positive measure, then \( \nu \perp \mu \) iff \( |\nu| \perp \mu \).
Lebesgue Differentiation and the Fundamental Theorem of Calculus

BRUCE: replace $\mathbb{R}^n$ by $\mathbb{R}^d$ in this section?

**Notation 23.1** In this chapter, let $\mathcal{B} = \mathcal{B}_{2^n}$ denote the Borel $\sigma$-algebra on $\mathbb{R}^n$ and $m$ be Lebesgue measure on $\mathbb{R}^n$. If $V$ is an open subset of $\mathbb{R}^n$, let $L^1_{\text{loc}}(V) := L^1_{\text{loc}}(V, m)$ and simply write $L^1_{\text{loc}}$ for $L^1_{\text{loc}}(\mathbb{R}^n)$. We will also write $|A|$ for $m(A)$ when $A \in \mathcal{B}$.

**Definition 23.2.** A collection of measurable sets $\{E\}_{r>0} \subset \mathcal{B}$ is said to shrink nicely to $x \in \mathbb{R}^n$ if (i) $E_r \subset B(x, r)$ for all $r > 0$ and (ii) there exists $\alpha > 0$ such that $m(E_r) \geq \alpha m(B(x, r))$. We will abbreviate this by writing $E_r \downarrow \{x\}$ nicely. (Notice that it is not required that $x \in E_r$ for any $r > 0$).

The main result of this chapter is the following theorem.

**Theorem 23.3.** Suppose that $\nu$ is a complex measure on $(\mathbb{R}^n, \mathcal{B})$, then there exists $g \in L^1(\mathbb{R}^n, m)$ and a complex measure $\nu_s$ such that $\nu_s \perp m, d\nu = gdm + d\nu_s$, and for $m$-a.e. $x$

$$g(x) = \lim_{r \downarrow 0} \frac{\nu(E_r)}{m(E_r)}$$

(23.1)

for any collection of $\{E_r\}_{r>0} \subset \mathcal{B}$ which shrink nicely to $\{x\}$. (Eq. (23.1) holds for all $x \in \mathcal{L}(g)$ — the Lebesgue set of $g$, see Definition 23.12 and Theorem 23.13 below.)

**Proof.** The existence of $g$ and $\nu_s$ such that $\nu_s \perp m$ and $d\nu = gdm + d\nu_s$ is a consequence of the Radon-Nikodym Theorem [22.34]. Since

$$\frac{\nu(E_r)}{m(E_r)} = \frac{1}{m(E_r)} \int_{E_r} g(x) dm(x) + \frac{\nu_s(E_r)}{m(E_r)}$$

Eq. (23.1) is a consequence of Theorem 23.14 and Corollary 23.16 below.  

The rest of this chapter will be devoted to filling in the details of the proof of this theorem.

**23.1 A Covering Lemma and Averaging Operators**

**Lemma 23.4 (Covering Lemma).** Let $\mathcal{E}$ be a collection of open balls in $\mathbb{R}^n$ and $U = \cup_{B \in \mathcal{E}} B$. If $c < m(U)$, then there exists disjoint balls $B_1, \ldots, B_k \in \mathcal{E}$ such that $c < 3^n \sum_{j=1}^k m(B_j)$.

**Proof.** Choose a compact set $K \subset U$ such that $m(K) > c$ and then let $\mathcal{E}_1 \subset \mathcal{E}$ be a finite subcover of $K$. Choose $B_1 \in \mathcal{E}_1$ to be a ball with largest diameter in $\mathcal{E}_1$. Let $\mathcal{E}_2 = \{A \in \mathcal{E}_1 : A \cap B_1 = \emptyset\}$. If $\mathcal{E}_2$ is not empty, choose $B_2 \in \mathcal{E}_2$ to be a ball with largest diameter in $\mathcal{E}_2$. Similarly let $\mathcal{E}_3 = \{A \in \mathcal{E}_2 : A \cap B_2 = \emptyset\}$ and if $\mathcal{E}_3$ is not empty, choose $B_3 \in \mathcal{E}_3$ to be a ball with largest diameter in $\mathcal{E}_3$. Continue choosing $B_i \in \mathcal{E}$ for $i = 1, 2, \ldots, k$ this way until $\mathcal{E}_{k+1}$ is empty, see Figure 23.1 below. If $B = B(x_0, r) \subset \mathbb{R}^n$, let $B^* = B(x_0, 3r) \subset \mathbb{R}^n$, that is $B^*$ is the ball concentric with $B$ which has three times the radius of $B$. We will now show $K \subset \cup_{i=1}^k B_i^*$. For each $A \in \mathcal{E}_i$ there exists a first $i$ such that $B_i \cap A \neq \emptyset$. In this case $\text{diam}(A) \leq \text{diam}(B_i)$ and $A \subset B_i^*$. Therefore $A \subset \cup_{i=1}^k B_i^*$ and hence $K \subset \cup \{A : A \in \mathcal{E}_1\} \subset \cup_{i=1}^k B_i^*$. Hence by sub-additivity,

$$c < m(K) \leq \sum_{i=1}^k m(B_i^*) \leq 3^n \sum_{i=1}^k m(B_i).$$

**Definition 23.5.** For $f \in L^1_{\text{loc}}, x \in \mathbb{R}^n$ and $r > 0$ let

$$(A_r f)(x) = \frac{1}{|B(x, r)|} \int_{B(x, r)} f dm$$

(23.2)

*Fig. 23.1. Picking out the large disjoint balls via the “greedy algorithm.”*
Lemma 23.6. Let \( f \in L^1_{loc} \), then for each \( x \in \mathbb{R}^n \), \((0, \infty) \ni r \to (A_r f)(x) \in \mathbb{C} \) is continuous and for each \( r > 0 \), \( \mathbb{R}^n \ni x \to (A_r f)(x) \in \mathbb{C} \) is measurable.

Proof. Recall that \(|B(x,r)| = m(E_1)r^n\) which is continuous in \( r \). Also \( \lim_{r \to r_0} 1_{B(x,r)}(y) = 1_{B(x,r_0)}(y) \) if \( |y| \neq r_0 \) and since \( m(\{ y : |y| = r_0 \}) = 0 \) (you prove!), \( \lim_{r \to r_0} 1_{B(x,r)}(y) = 1_{B(x,r_0)}(y) \) for \( m \)-a.e. \( y \). So by the dominated convergence theorem,

\[
\lim_{r \to r_0} \int_{B(x,r)} f \, dm = \int_{B(x,r_0)} f \, dm
\]

and therefore

\[
(A_r f)(x) = \frac{1}{m(E_1)r^n} \int_{B(x,r)} f \, dm
\]

is continuous in \( r \). Let \( g_r(x,y) := 1_{B(x,r)}(y) = 1_{|x-y| < r} \). Then \( g_r \) is \( B \otimes B \) measurable (for example write it as a limit of continuous functions or just notice that \( F : \mathbb{R}^n \times \mathbb{R}^n \to \mathbb{R} \) defined by \( F(x,y) := |x - y| \) is continuous) and so that by Fubini’s theorem

\[
x \to \int_{B(x,r)} f \, dm = \int_{B(x,r)} g_r(x,y) f(y) dm(y)
\]

is \( B \) measurable and hence so is \( x \to (A_r f)(x) \).

23.2 Maximal Functions

Definition 23.7. For \( f \in L^1(m) \), the Hardy - Littlewood maximal function \( Hf \) is defined by

\[
(Hf)(x) = \sup_{r > 0} A_r |f|(x).
\]

Lemma 23.6 allows us to write

\[
(Hf)(x) = \sup_{r \in \mathbb{Q}, r > 0} A_r |f|(x)
\]

from which it follows that \( Hf \) is measurable.

Theorem 23.8 (Maximal Inequality). If \( f \in L^1(m) \) and \( \alpha > 0 \), then

\[
m(Hf > \alpha) \leq \frac{3n}{\alpha} \| f \|_{L^1}.
\]

(Remark: this theorem extends to \( f \in L^1(m; X) \) where \( X \) is a separable Banach space – just replace \(||\cdot|||\) in the definition and proofs by \(||\cdot|||_X \).)

This should be compared with Chebyshev’s inequality which states that

\[
m( |f| > \alpha ) \leq \frac{\| f \|_{L^1}}{\alpha}.
\]

Proof. Let \( E_\alpha := \{ Hf > \alpha \} \). For all \( x \in E_\alpha \) there exists \( r_x \) such that \( A_{r_x} |f|(x) > \alpha \), i.e.

\[
|B_{r_x}(x)| < \frac{1}{\alpha} \int_{B_{r_x}(x)} |f| \, dm.
\]

Since \( E_\alpha \subset \cup_{x \in E_\alpha} B_{r_x}(x) \), if \( c < m(E_\alpha) \leq m(\cup_{x \in E_\alpha} B_{r_x}(x)) \) then, using Lemma 23.4, there exists \( x_1, \ldots, x_k \in E_\alpha \) and disjoint balls \( B_i = B_{x_i}(r_{x_i}) \) for \( i = 1, 2, \ldots, k \) such that

\[
c < \sum_{i=1}^{k} 3^n |B_i| < \sum_{i=1}^{k} \frac{3^n}{\alpha} \int_{B_i} |f| \, dm \leq \frac{3^n}{\alpha} \int_{\mathbb{R}^n} |f| \, dm = \frac{3^n}{\alpha} \| f \|_{L^1}.
\]

This shows that \( c < 3^n \alpha^{-1} \| f \|_{L^1} \) for all \( c < m(E_\alpha) \) which proves \( m(E_\alpha) \leq 3^n \alpha^{-1} \| f \|_{L^1} \).

Theorem 23.9. If \( f \in L^1_{loc} \) then \( \lim_{r \downarrow 0} (A_r f)(x) = f(x) \) for \( m \)-a.e. \( x \in \mathbb{R}^n \).

Proof. With out loss of generality we may assume \( f \in L^1(m) \). We now begin with the special case where \( f = g \in L^1(m) \) is also continuous. In this case we find:

\[
|(A_r g)(x) - g(x)| \leq \frac{1}{|B(x,r)|} \int_{B(x,r)} |g(y) - g(x)| dm(y)
\]

\[
\leq \sup_{y \in B(x,r)} |g(y) - g(x)| \to 0 \text{ as } r \to 0.
\]

In fact we have shown that \( (A_r g)(x) \to g(x) \) as \( r \to 0 \) uniformly for \( x \) in compact subsets of \( \mathbb{R}^n \). For general \( f \in L^1(m) \),

\[
|A_r f(x) - f(x)| \leq |A_r f(x) - A_r g(x)| + |A_r g(x) - g(x)| + |g(x) - f(x)|
\]

\[
= |A_r (f-g)(x)| + |A_r g(x) - g(x)| + |g(x) - f(x)|
\]

\[
\leq H(f-g)(x) + |A_r g(x) - g(x)| + |g(x) - f(x)|
\]

and therefore,

\[
\lim_{r \downarrow 0} A_r f(x) - f(x) \leq H(f-g)(x) + |g(x) - f(x)|.
\]

So if \( \alpha > 0 \), then

\[
E_\alpha := \{ \lim_{r \downarrow 0} |A_r f(x) - f(x)| > \alpha \} \subset \{ H(f-g) > \frac{\alpha}{2} \} \cup \{ |g-f| > \frac{\alpha}{2} \}.
\]
and thus
\[
m(E_n) \leq m \left( H(f - g) > \frac{\alpha}{2} \right) + m \left( |g - f| > \frac{\alpha}{2} \right) \\
\leq \frac{3^n}{\alpha/2} \|f - g\|_{L^1} + \frac{1}{\alpha/2} \|f - g\|_{L^1} \\
\leq 2(3^n + 1)\alpha^{-1} \|f - g\|_{L^1},
\]
where in the second inequality we have used the Maximal inequality (Theorem 23.8) and Chebyshev’s inequality. Since this is true for all continuous \( g \in C(\mathbb{R}^n) \cap L^1(m) \) and this set is dense in \( L^1(m) \), we may make \( \|f - g\|_{L^1} \) as small as we please. This shows that
\[
m \left( \left\{ x : \lim_{r \downarrow 0} |A_r f(x) - f(x)| > 0 \right\} \right) = m(\bigcup_{n=1}^{\infty} E_{1/n}) \leq \sum_{n=1}^{\infty} m(E_{1/n}) = 0.
\]

**Remark 23.10.** Theorem 23.9 also holds for \( f \in L^1(m; X) \) where \( X \) is a separable Banach space. The only point is to observe that \( C_c(\mathbb{R}^n; X) \) are still dense in \( L^1(m; X) \). To prove we use the fact that \( X \)-valued \( L^1 \)-simple functions are dense in \( L^1(m; X) \) and so it suffices to show that \( 1_A \cdot x \) may be approximated by \( g \in C_c(\mathbb{R}^n; X) \) for all \( A \in B_{\mathbb{R}^d} \) with \( m(A) < \infty \) and \( x \in X \). But this is easy to do by taking \( g = \varphi \cdot x \) where \( \|\varphi - 1_A\|_{C(\mathbb{R}^n, \mathbb{R})} \) is small and \( \varphi \in C_c(\mathbb{R}^n, \mathbb{R}) \).

**Corollary 23.11.** If \( du = gdm \) with \( g \in L^1_{\text{loc}} \) then
\[
\mu(B(x, r)) \quad |B(x, r)| = A_r g(x) \rightarrow g(x) \quad \text{for } m \text{-a.e. } x.
\]

### 23.3 Lebesgue Set

**Definition 23.12.** For \( f \in L^1_{\text{loc}}(m) \), the **Lebesgue set** of \( f \) is
\[
\mathcal{L}(f) := \left\{ x \in \mathbb{R}^n : \lim_{r \downarrow 0} \int_{B(x, r)} |f(y) - f(x)| dy = 0 \right\}
\]
\[
= \left\{ x \in \mathbb{R}^n : \lim_{r \downarrow 0} \left( A_r |f(\cdot) - f(x)| \right)(x) = 0 \right\}.
\]
More generally, if \( p \in [1, \infty) \) and \( f \in L^p_{\text{loc}}(m) \), let
\[
\mathcal{L}_p(f) := \left\{ x \in \mathbb{R}^n : \lim_{r \downarrow 0} \int_{B(x, r)} |f(y) - f(x)|^p dy = 0 \right\}
\]

**Theorem 23.13.** Suppose \( 1 \leq p < \infty \) and \( f \in L^p_{\text{loc}}(m) \), then \( m(\mathbb{R}^d \setminus \mathcal{L}_p(f)) = 0 \). (This result also holds for \( f \in L^p_{\text{loc}}(m; X) \) where \( X \) is a separable Banach space. One need only replace \( \mathbb{Q} + i\mathbb{Q} \) by as countable dense subset of \( X \) and \( |\cdot| \) by \( \|\cdot\|_X \) in the proof below.)

**Proof.** For \( w \in \mathbb{C} \) define \( g_w(x) = |f(x) - w|^p \) and
\[
E_w := \left\{ x : \lim_{r \downarrow 0} (A_r g_w)(x) \neq g_w(x) \right\}
\]
and further let
\[
E = \bigcup_{w \in \mathbb{Q} + i\mathbb{Q}} E_w.
\]
Then by Theorem 23.9 \( m(E_w) = 0 \) for all \( w \in \mathbb{C} \) and therefore \( m(E) = 0 \). By definition of \( E \), if \( x \notin E \) then
\[
\lim_{r \downarrow 0} (A_r |f(\cdot) - w|^p)(x) = |f(x) - w|^p
\]
for all \( w \in \mathbb{Q} + i\mathbb{Q} \). Letting \( q := \frac{p}{p-1} \) (so that \( p/q = p - 1 \)) we have
\[
|f(\cdot) - f(x)|^p \leq (|f(\cdot) - w| + |w - f(x)|)^p \\
\leq 2^p q (|f(\cdot) - w|^p + |w - f(x)|^p) = 2^{p-1} (|f(\cdot) - w|^p + |w - f(x)|^p)
\]
and hence for \( x \notin E \),
\[
\lim_{r \downarrow 0} (A_r |f(\cdot) - f(x)|^p)(x) \leq 2^{p-1} (A_r |f(\cdot) - w|^p)(x) + 2^{p-1} |w - f(x)|^p = 2^p |f(x) - w|^p.
\]
Since this is true for all \( w \in \mathbb{Q} + i\mathbb{Q} \), we see that
\[
\lim_{r \downarrow 0} (A_r |f(\cdot) - f(x)|^p)(x) = 0 \quad \text{for all } x \notin E,
\]
i.e. \( E^c \subset \mathcal{L}_p(f) \) or equivalently \( (\mathcal{L}_p(f))^c \subset E \). So \( m(\mathbb{R}^d \setminus \mathcal{L}_p(f)) \leq m(E) = 0 \).

**Theorem 23.14 (Lebesgue Differentiation Theorem).** If \( f \in L^p_{\text{loc}} \) and \( x \in \mathcal{L}_p(f) \) (so in particular for \( m \)-a.e. \( x \)), then
\[
\lim_{r \downarrow 0} \frac{1}{m(E_r)} \int_{E_r} |f(y) - f(x)|^p dy = 0
\]
and
\[
\lim_{r \downarrow 0} \frac{1}{m(E_r)} \int_{E_r} f(y) dy = f(x)
\]
when \( E_r \downarrow \{x\} \) nicely, see Definition 23.2.
Proof. For \( x \in \mathcal{L}_p(f) \), by Hölder’s inequality (Theorem 18.2) or Jensen’s inequality (Theorem 18.10), we have

\[
\left| \frac{1}{m(E_r)} \int_{E_r} f(y)dy - f(x) \right|^p = \left| \frac{1}{m(E_r)} \int_{E_r} (f(y) - f(x))dy \right|^p \\
\leq \frac{1}{m(E_r)} \int_{E_r} |f(y) - f(x)|^pdy \\
\leq \frac{1}{\alpha m(B(x,r))} \int_{B(x,r)} |f(y) - f(x)|^pdy
\]

which tends to zero as \( r \downarrow 0 \) by Theorem 23.13. In the second inequality we have used the fact that \( m(B(x,r) \setminus B(x,r)) = 0 \).

\[\text{Lemma 23.15.} \text{ Suppose } \lambda \text{ is positive } K-\text{finite measure on } B := B_{\mathbb{R}^n} \text{ such that } \lambda \perp m. \text{ Then for } m-\text{a.e. } x, \]

\[\lim_{r \downarrow 0} \frac{\lambda(B(x,r))}{m(B(x,r))} = 0.\]

Proof. Let \( A \in B \) such that \( \lambda(A) = 0 \) and \( m(A^c) = 0 \). By the regularity theorem (see Theorem 27.16 Corollary 49.44 or Exercise 46.4), for all \( \varepsilon > 0 \) there exists an open set \( V_\varepsilon \subset \mathbb{R}^n \) such that \( A \subset V_\varepsilon \) and \( \lambda(V_\varepsilon) < \varepsilon \). For the rest of this argument, we will assume \( m \) has been extended to the Lebesgue measurable sets, \( \mathcal{L} := B_{\mathbb{R}^m} \).

Let \( F_k := \left\{ x \in A : \lim_{r \downarrow 0} \frac{\lambda(B(x,r))}{m(B(x,r))} > \frac{1}{k} \right\} \)

the for \( x \in F_k \) choose \( r_x > 0 \) such that \( B_x(r_x) \subset V_\varepsilon \) (see Figure 23.2) and \( m(B_x(r_x)) \) tends to zero as \( r_x \downarrow 0 \), i.e.

\[m(B(x,r_x)) < k\lambda(B(x,r_x)).\]

Let \( E = \{ (B(x,r_x)) \}_{x \in F_k} \) and \( U := \bigcup_{x \in F_k} B(x,r_x) \subset V_\varepsilon \). Heuristically if all the balls in \( E \) were disjoint and \( E \) were countable, then

\[m(F_k) \leq \sum_{x \in F_k} m(B(x,r_x)) < k \sum_{x \in F_k} \lambda(B(x,r_x)) \]

\[= k\lambda(U) \leq k\lambda(V_\varepsilon) \leq k\varepsilon.
\]

Since \( \varepsilon > 0 \) is arbitrary this would imply that \( F_k \in \mathcal{L} \) and \( m(F_k) = 0 \). To fix the above argument, suppose that \( c < m(U) \) and use the covering lemma to find disjoint balls \( B_1, \ldots, B_N \in E \) such that

\[c < 3^n \sum_{i=1}^{N} m(B_i) < k3^n \sum_{i=1}^{N} \lambda(B_i) \leq k3^n \lambda(U) \leq k3^n \varepsilon.
\]

Since \( c < m(U) \) is arbitrary we learn that \( m(U) \leq k3^n \varepsilon \). This argument shows open sets \( U_\varepsilon \) such that \( F_k \subset U_\varepsilon \) and \( m(U_\varepsilon) \leq k3^n \varepsilon \) for all \( \varepsilon > 0 \). Therefore \( F_k \subset G := \bigcap_{n=1}^{\infty} U_{1/n} \in B \) with \( m(G) = 0 \) which shows \( F_k \in \mathcal{L} \) and \( m(F_k) = 0 \).

Since \( F_\infty := \left\{ x \in A : \lim_{r \downarrow 0} \frac{\lambda(B(x,r))}{m(B(x,r))} > 0 \right\} = \bigcup_{k=1}^{\infty} F_k \in \mathcal{L} \), it also follows that \( F_\infty \in \mathcal{L} \) and \( m(F_\infty) = 0 \). Since

\[\left\{ x \in \mathbb{R}^n : \lim_{r \downarrow 0} \frac{\lambda(B(x,r))}{m(B(x,r))} > 0 \right\} \subset F_\infty \cup A^c \]

and \( m(A^c) = 0 \), we have shown

\[m \left( \left\{ x \in \mathbb{R}^n : \lim_{r \downarrow 0} \frac{\lambda(B(x,r))}{m(B(x,r))} > 0 \right\} \right) = 0.
\]

\[\text{Corollary 23.16.} \text{ Let } \lambda \text{ be a complex or a } K-\text{finite signed measure (i.e. } \nu(K) \in \mathbb{R} \text{ for all } K \subset \subset \mathbb{R}^n) \text{ such that } \lambda \perp m. \text{ Then for } m-\text{a.e. } x,
\]

\[\lim_{r \downarrow 0} \frac{\lambda(E_r)}{m(E_r)} = 0
\]

whenever \( E_r \downarrow \{ x \} \) nicely.
Proof. By Exercise \ref{exercise:22.17}, \( \lambda \perp m \) implies \( |\lambda| \perp m \). Hence the result follows from Lemma \ref{lemma:23.15} and the inequalities,
\[
\frac{|\lambda(E_r)|}{m(E_r)} \leq \frac{|\lambda| (E_r)}{m(B(x,r))} \leq \frac{|\lambda| (B(x,2r))}{m(B(x,2r))}.
\]

\[\square\]

23.4 The Fundamental Theorem of Calculus

In this section we will restrict the results above to the one dimensional setting. The following notation will be in force for the rest of this chapter. (BRUCE: make sure this notation agrees with the notation in Notation \ref{notation:23.21}).

Notation 23.17 Let
\begin{enumerate}
\item \( m \) be one dimensional Lebesgue measure on \( \mathcal{B} := \mathcal{B}_\mathbb{R} \),
\item \( \alpha, \beta \) be numbers in \( \mathbb{R} \) such that \( -\infty \leq \alpha < \beta \leq \infty \),
\item \( \mathcal{A} = A_{[\alpha, \beta]} \) be the algebra generated by sets of the form \( (a, b] \cap [\alpha, \beta] \) with \( -\infty \leq a < b \leq \infty \),
\item \( \mathcal{A}^b \) denote those sets in \( \mathcal{A} \) which are bounded,
\item and \( \mathcal{B}_{[\alpha, \beta]} \) be the Borel \( \sigma \) – algebra on \( [\alpha, \beta] \cap \mathbb{R} \).
\end{enumerate}

Notation 23.18 Given a function \( F : \mathbb{R} \to \mathbb{R} \) or \( F : \mathbb{R} \to \mathbb{C} \), let \( F(x) = \lim_{y \searrow x} F(y) \), \( F(x) = \lim_{y \nearrow x} F(y) \) and \( F(\pm \infty) = \lim_{x \to \pm \infty} F(x) \) whenever the limits exist. Notice that if \( F \) is a monotone functions then \( F(\pm \infty) \) exist for all \( x \).

23.4.1 Increasing Functions

Theorem 23.19 (Monotone functions). Let \( F : \mathbb{R} \to \mathbb{R} \) be increasing and define \( G(x) = F(x+) \). Then:
\begin{enumerate}
\item The function \( G \) is increasing and right continuous.
\item For \( x \in \mathbb{R} \), \( G(x) = \lim_{y \searrow x} F(y) \).
\item The set of discontinuities of \( F \), \( \{ x \in \mathbb{R} : F(x+) > F(x-) \} \), is countable. Moreover for each \( N > 0 \),
\[
\sum_{x \in (-N,N)} |F(x+)-F(x-)| \leq F(N)-F(-N) < \infty. \tag{23.3}
\]
\item There exists a unique measure, \( \nu_G \) on \( \mathcal{B} = \mathcal{B}_\mathbb{R} \) such that
\[
\nu_G((a,b]) = G(b)-G(a) \text{ for all } a < b.
\]
\item For \( m-a.e. \), \( F'(x) \) and \( G'(x) \) exists and \( F'(x) = G'(x) \). (Notice that \( F'(x) \) and \( G'(x) \) are non-negative when they exist.)
\item The function \( F'(x) = G'(x) \) is in \( L_{\text{loc}}^1(m) \) and there exists a unique positive measure \( \nu_s \) on \( (\mathbb{R}, \mathcal{B}_\mathbb{R}) \) such that
\[
F(b+)-F(a+) = \int_a^b F'dm + \nu_s((a,b]) \text{ for all } -\infty < a < b < \infty.
\]
\end{enumerate}

Furthermore, the measure \( \nu_s \) is singular relative to \( m \) and \( F \in L^1(\mathbb{R}, m) \) if \( F \) is bounded.

Proof.
\begin{enumerate}
\item The following observation shows \( G \) is increasing: if \( x < y \) then
\[
F(x-) \leq F(x) \leq F(x+) = G(x) \leq F(y-) \leq F(y) \leq F(y+) = G(y).
\]
\item Since \( G \) is increasing, \( G(x) \leq G(x+) \). If \( y > x \) then \( G(x+) \leq F(y) \) and hence \( G(x+) \leq F(x+) = G(x) \), i.e. \( G(x+) = G(x) \) which is to say \( G \) is right continuous. (For another proof, see Eq. (27.28) of Theorem 27.29 below.)
\item Since \( G(x) \leq F(y)-F(x) \) for all \( y > x \), it follows that
\[
G(x) \leq \lim_{y \nearrow x} F(y-) \leq \lim_{y \nearrow x} F(y) = G(x)
\]
showing \( G(x) = \lim_{y \nearrow x} F(y-) \).
\item By Eq. (23.4), if \( x \neq y \) then
\[
(F(x), F(x+)] \cap (F(y)-, F(y+)] = \emptyset.
\]
Therefore, \( \{(F(x), F(x+)]\}_{x \in \mathbb{R}} \) are disjoint possible empty intervals in \( \mathbb{R} \).
\begin{align*}
\prod_{x \in \alpha} (F(x), F(x+)] & \subset (F(-\infty), F(+\infty)] \text{ and therefore,} \\
\sum_{x \in \alpha} [F(x+)-F(x-)] & \leq F(\infty)-F(-\infty) < \infty.
\end{align*}
Since this is true for all \( \alpha \subset_f (\mathbb{R}, \mathbb{N}) \), Eq. (23.3) holds. Eq. (23.3) shows \( \Gamma_N := \{ x \in (N, N)| F(x+) - F(x-) > 0 \} \) is countable and hence so is \( \Gamma := \{ x \in \mathbb{R}| F(x+) - F(x-) > 0 \} = \bigcup_{N=1}^{\infty} \Gamma_N \).
4. Item 4. is a direct consequence of Theorem 8.33 (or Theorem 27.26 below). Notice that \( \nu_G \) is a finite measure when \( F \) and hence \( G \) is bounded.

5. Theorem 23.3 now asserts that \( \nu_G \) decomposes as:

\[
d\nu_G = g \, dm + d\nu_s,
\]

where \( \nu_s \perp m, g \in L^1_{\text{loc}}(\mathbb{R}, m) \) with \( g \in L^1(\mathbb{R}, m) \) if \( F \) is bounded. Moreover Theorem 23.3 implies, for \( m \)-a.e. \( x \),

\[
g(x) = \lim_{r \downarrow 0} \frac{\nu_G(x, x+r]}{m((x, x+r]}) = \lim_{r \downarrow 0} \frac{G(x+r) - G(x)}{r} = \frac{d}{dx} G(x)
\]

and

\[
g(x) = \lim_{r \downarrow 0} \frac{\nu_G((x-r, x])}{m((x-r, x])} = \lim_{r \downarrow 0} \frac{G(x) - G(x-r)}{r}
\]

\[
= \lim_{r \downarrow 0} \frac{G(x-r) - G(x)}{-r} = \frac{d}{dx} G(x)
\]

exist and are equal for \( m \)-a.e. \( x \), i.e. \( G'(x) = g(x) \) exists for \( m \)-a.e. \( x \).

For \( x \in \mathbb{R} \), let

\[
H(x) := G(x) - F(x) = F(x+) - F(x) \geq 0.
\]

Since \( F(x) = G(x) - H(x) \), the proof of 5. will be complete once we show \( H'(x) = 0 \) for \( m \)-a.e. \( x \). From Item 3.,

\[
A := \{ x \in \mathbb{R} : F(x+) > F(x) \} \subset \{ x \in \mathbb{R} : F(x+) > F(x-) \}
\]

is a countable set and

\[
\sum_{x \in (-N, N)} H(x) = \sum_{x \in (-N, N)} (F(x+) - F(x)) \leq \sum_{x \in (-N, N)} (F(x+) - F(x-)) < \infty
\]

for all \( N < \infty \). Therefore \( \lambda := \sum_{x \in \mathbb{R}} H(x) \delta_x \) (i.e. \( \lambda(A) := \sum_{x \in A} H(x) \) for all \( A \in \mathcal{B}_R \)) defines a Radon measure on \( \mathcal{B}_R \). Since \( \lambda(A^c) = 0 \) and \( \lambda(A) = 0 \), the measure \( \lambda \perp m \). By Corollary 23.10 for \( m \)-a.e. \( x \),

\[
\frac{|H(x+r) - H(x)|}{r} \leq \frac{|H(x+r)| + |H(x)|}{|r|} \leq \frac{H(x+r) + H(x) - H(x-r)}{|r|} \leq 2 \lambda \max\{|x-r, x+r|\} \frac{1}{2} |r|
\]

and the last term goes to zero as \( r \to 0 \) because \( \{[x-r, x+r] \} \to 0 \) and \( m([x-r, x+r]) = 2|r| \). Hence we conclude for \( m \)-a.e. \( x \) that \( H'(x) = 0 \).

6. From Theorem 23.3 item 5. and Eqs. (23.5) and (23.6), \( F' = G' \in L^1_{\text{loc}}(m) \) and \( d\nu_G = F' \, dm + d\nu_s \) where \( \nu_s \) is a positive measure such that \( \nu_s \perp m \). Applying this equation to an interval of the form \( (a, b] \) gives

\[
F(b+) - F(a+) = \nu_G((a, b]) = \int_a^b F' \, dm + \nu_s((a, b]).
\]

The uniqueness of \( \nu_s \) such that this equation holds is a consequence of Theorem 45.43. As we have already mentioned, when \( F \) is bounded then \( F' \in L^1(\mathbb{R}, m) \). This can also be seen directly by letting \( a \to -\infty \) and \( b \to +\infty \) in Eq. (23.7).

Example 23.20. Let \( C \subset [0, 1] \) denote the Cantor set constructed as follows. Let \( C_1 = [0, 1] \setminus (1/3, 2/3) \), \( C_2 := C_1 \setminus ([1/9, 2/9] \cup [7/9, 8/9]) \), etc., so that we keep removing the middle thirds at each stage in the construction. Letting \( C_n := [0, 1] \), we have \( m(C_{n+1}) = \frac{2}{3} m(C_n) \) for \( n \geq 0 \) and hence \( m(C_n) = (2/3)^n \to 0 \) as \( n \to \infty \). We now let

\[
C := \cap_{n=1}^\infty C_n = \{ x = \sum_{j=0}^\infty a_j 3^{-j} : a_j \in \{0, 2\} \}
\]

and since \( C \subset C \) it follows that \( m(C) = \lim_{n \to \infty} m(C_n) = 0 \). Associated to this set is the so called Cantor function \( F(x) := \lim_{n \to \infty} f_n(x) \) where the \( \{f_n\}_{n=1}^\infty \) are continuous non-decreasing functions such that \( f_n(0) = 0 \), \( f_n(1) = 1 \) with the \( f_n \) pictured in Figure 23.3 below. From the pictures one sees that \( \{f_n\} \) are uniformly Cauchy, hence there exists \( F \in C([0, 1]) \) such that \( F(x) := \lim_{n \to \infty} f_n(x) \). The function \( F \) has the following properties,

1. \( F \) is continuous and non-decreasing,
2. \( F'(x) = 0 \) for \( m \)-a.e. \( x \in [0, 1] \) because \( F \) is flat on all of the middle third open intervals used to construct the Cantor set \( C \) and the total measure of these intervals is 1 as proved above.
3. The measure on \( \mathcal{B}_{[0,1]} \) associated to \( F \), namely \( \nu([0,1]) = F(b) \), is singular relative to Lebesgue measure and \( \nu\{x\} = 0 \) for all \( x \in [0, 1] \). Notice that \( \nu([0,1]) = 1 \). In particular, the function \( F \) certainly does not satisfy the fundamental theorem of calculus despite the fact that \( F'(x) = 0 \) for a.e. \( x \).
4. There are in fact many known examples of continuous increasing functions whose derivative is zero almost everywhere, see [17][19][29] and the references therein and also see Problem 3.5.40 on p. 109 of Pollard for a simple example. Regarding the fact that this behavior is “typical” among the continuous increasing functions, see [32].
For Definition 23.22. A bra generated by the sets, \( \{ A \} \subseteq \mathbb{R} \). We further let note the closure of \( X \) throughout this section.

Our next goal is to prove an analogue of Theorem 23.19 for complex valued \( F \). Let \( \alpha, \beta \in \mathbb{R} \) with \( \alpha < \beta \) be fixed. The following notation will be used throughout this section.

**Notation 23.21** Let \( (X, \mathcal{B}) \) denote one of the following four measure spaces: \((\mathbb{R}, B_\mathbb{R})\), \(((-\infty, \beta], B_{(-\infty, \beta)}])\), \((\infty, \alpha), B_{(\infty, \alpha)}\)) or \((\alpha, \beta], B_{(\alpha, \beta)}\) and let \( \bar{X} \) denote the closure of \( X \) in \( \mathbb{R} \) and \( X_\infty \) denote the closure of \( X \) in \( \mathbb{R} := [-\infty, \infty] \). We further let \( \mathcal{A} \) denote the algebra of half open intervals in \( X \), i.e. the algebra generated by the sets, \( \{ [a, b] \cap X : -\infty \leq a \leq b \leq \infty \} \). Also let \( A_b \) be those \( A \in \mathcal{A} \) which are bounded.

**Definition 23.22.** For \(-\infty \leq a < b \leq \infty \), a partition \( \mathbb{P} \) of \( [a, b] \cap X \) is a finite subset of \( [a, b] \cap X \) such that \( [a, b] \cap X \subset \mathbb{P} \). For \( x \in [\min \mathbb{P}, \max \mathbb{P}] \), let

\[
\begin{align*}
\nu\left([a, b]\right) &= \sup_{\mathbb{P}} \sum_{x \in \mathbb{P}} |\nu(x, x_+) - \nu(x, x_-)|
\end{align*}
\]

\( x_+ = \min \{ y \in \mathbb{P} : y > x \} \wedge \max \mathbb{P} \)

where \( \min \emptyset := \infty \).

For example, if \( X = (\alpha, \infty) \), then a partition of \( \bar{X} = [\alpha, \infty) \) is a finite subset, \( \mathbb{P} \), of \( [\alpha, \infty) \) such that \( \alpha \leq a < b < \infty \), then a partition of \( [a, b] \) is a finite subset, \( \mathbb{P} \), of \( [a, b] \) such that \( a, b \in \mathbb{P} \), see Figure 23.4.

**Proposition 23.23.** Suppose \( \nu \) is a complex measure on \( (X, \mathcal{B}) \) and \( F : \bar{X} \to \mathbb{C} \) is a function

\[
\nu([a, b]) = F(b) - F(a)
\]

for all \( a, b \in \bar{X} \) with \( a < b \). (For example one may let \( F(x) := \nu((-\infty, x] \cap X) \) )

Then

1. \( F : \bar{X} \to \mathbb{C} \) is a right continuous function,
2. For all \( a, b \in \bar{X} \) with \( a < b \),

\[
|\nu|[a, b] = \sup_{\mathbb{P}} \sum_{x \in \mathbb{P}} |\nu(x, x_+) - \nu(x, x_-)| = \sup_{\mathbb{P}} \sum_{x \in \mathbb{P}} |F(x_+) - F(x)|
\]

where supremum is over all partitions \( \mathbb{P} \) of \( [a, b] \).

3. If \( \inf X = -\infty \) then Eq. (23.8) remains valid for \( a = -\infty \) and moreover,

\[
|\nu|((-\infty, b]) = \lim_{a \to -\infty} |\nu|[a, b].
\]

Similar statements hold in case \( \sup X = +\infty \) in which case we may take \( b = \infty \) above. In particular if \( X = \mathbb{R} \), then

\[
|\nu|([a, b]) = \sup_{\mathbb{P}} \left\{ \sum_{x \in \mathbb{P}} |F(x_+) - F(x)| : \mathbb{P} \text{ is a partition of } \mathbb{R} \right\}
\]

\[
= \lim_{a \to -\infty} \sup_{b \to \infty} \left\{ \sum_{x \in \mathbb{P}} |F(x_+) - F(x)| : \mathbb{P} \text{ is a partition of } [a, b] \right\}.
\]
4. \( \nu \ll m \) on \( X \) iff for all \( \varepsilon > 0 \) there exists \( \delta > 0 \) such that
\[
\sum_{i=1}^{n} |\nu((a_i, b_i])| = \sum_{i=1}^{n} |F(b_i) - F(a_i)| < \varepsilon
\] (23.10)
whenever \( \{a_i, b_i]\}_{i=1}^{n} \) are disjoint subintervals of \( X \) such that \( \sum_{i=1}^{n} (b_i - a_i) < \delta \).

Proof. 1. The right continuity of \( F \) is a consequence of the continuity of \( \nu \) under decreasing limits of sets.

2 and 3. When \( a, b \in X \), Eq. (23.8) follows from Proposition 22.33 and the fact that \( B = \sigma(A) \). The verification of item 3. is left for Exercise 23.1.4.

Equation (23.10) is a consequence of Theorem 22.38 and the following remarks:

a) \( \{a_i, b_i]\cap X\}_{i=1}^{n} \) are disjoint intervals iff \( \{a_i, b_i]\cap X\}_{i=1}^{n} \) are disjoint intervals,

b) \( m(X \cap (\bigcup_{i=1}^{n} (a_i, b_i)]) \leq \sum_{i=1}^{n} (b_i - a_i) \), and

c) the general element \( A \in \mathcal{A}_b \) is of the form \( A = X \cap (\bigcup_{i=1}^{n} (a_i, b_i]) \).

Exercise 23.1. Prove Item 3. of Proposition 23.23.

Definition 23.24 (Total variation of a function). The total variation of a function \( F: \bar{X} \to \mathbb{C} \) on \( (a, b] \cap X \subset \bar{X} \) (\( b = \infty \) is allowed here) is defined by
\[
T_F((a, b] \cap X) = \sup_{P} \sum_{x \in P} |F(x_+) - F(x)|
\]
where supremum is over all partitions \( P \) of \([a, b] \cap X \). Also let
\[
T_F(b) := T_F((\inf X, b)) \text{ for all } b \in X.
\]
The function \( F \) is said to have bounded variation on \( (a, b] \cap X \) if \( T_F((a, b] \cap X) < \infty \) and \( F \) is said to be of bounded variation, and we write \( F \in BV(X) \), if \( T_F(X) < \infty \).

Definition 23.25 (Absolute continuity). A function \( F: \bar{X} \to \mathbb{C} \) is absolutely continuous if for all \( \varepsilon > 0 \) there exists \( \delta > 0 \) such that
\[
\sum_{i=1}^{n} |F(b_i) - F(a_i)| < \varepsilon
\] (23.11)
whenever \( \{a_i, b_i]\}_{i=1}^{n} \) are disjoint subintervals of \( X \) such that \( \sum_{i=1}^{n} (b_i - a_i) < \delta \).

Exercise 23.2. Let \( F, G: \bar{X} \to \mathbb{C} \) be and \( \lambda \in \mathbb{C} \) be given. Show

1. \( T_{F+G} \leq T_F + T_G \) and \( T_{\lambda F} = |\lambda| T_F \). Conclude from this that \( BV(X) \) is a vector space.

2. \( T_{Re F} \leq T_F, T_{Im F} \leq T_F \), and \( T_F \leq T_{Re F} + T_{Im F} \). In particular \( F \in BV(X) \) iff \( Re F \) and \( Im F \) are in \( BV(X) \).

3. If \( F: X \to \mathbb{C} \) is absolutely continuous then \( F: \bar{X} \to \mathbb{C} \) is continuous and in fact is uniformly continuous.

Lemma 23.26 (Examples). Let \( F: \bar{X} \to \mathbb{F} \) be given, where \( \mathbb{F} \) is either \( \mathbb{R} \) of \( \mathbb{C} \).

1. If \( F: \bar{X} \to \mathbb{R} \) is a monotone function, then \( T_F((a, b]) = |F(b) - F(a)| \) for all \( a, b \in \bar{X} \) with \( a < b \). So \( F \in BV(X) \) iff \( F \) is bounded (which will be the case if \( X = [\alpha, \beta] \)).

2. If \( F: [\alpha, \beta] \to \mathbb{C} \) is absolutely continuous then \( F \in BV([\alpha, \beta]) \).

3. If \( F \in C([\alpha, \beta] \to \mathbb{R}) \), \( F' \) is differentiable for all \( x \in (\alpha, \beta) \), and \( \sup_{x \in (\alpha, \beta)} |F'(x)| = M < \infty \), then \( F \) is absolutely continuous and \( T_F((a, b]) \leq M(b - a) \forall \alpha \leq a < b \leq \beta \).

4. Let \( f \in L^1(X, m) \) and set
\[
F(x) = \int_{(-\infty, x] \cap \bar{X}} f \, dm \text{ for all } x \in \bar{X}.
\] (23.12)
Then \( F: \bar{X} \to \mathbb{C} \) is absolutely continuous.

Proof. 1. If \( F \) is monotone increasing and \( \mathbb{P} \) is a partition of \( (a, b] \) then
\[
\sum_{x \in \mathbb{P}} |F(x_+) - F(x)| = \sum_{x \in \mathbb{P}} (F(x_+) - F(x)) = F(b) - F(a)
\]
so that \( T_F((a, b]) = F(b) - F(a) \). Similarly, one shows
\[
T_F((a, b]) = F(a) - F(b) = |F(b) - F(a)|
\]
if \( F \) is monotone decreasing. Also note that \( F \in BV(\mathbb{R}) \) iff \( |F(\infty) - F(-\infty)| < \infty \), where \( F(\pm \infty) = \lim_{x \to \pm \infty} F(x) \).

2 It is proved in Natanson or in Rudin that this is also true if \( F \in C([\alpha, \beta]) \) such that \( F'(x) \) exists for all \( x \in (\alpha, \beta) \) and \( F' \in L^1([\alpha, \beta], m) \).
2. Since $F$ is absolutely continuous, there exists $\delta > 0$ such that whenever $a, b \in X$ with $a < b$ and $b - a < \delta$, then
\[
\sum_{x \in \mathcal{P}} |F(x_{+}) - F(x)| \leq 1
\]
for all partitions, $\mathcal{P}$, of $[a, b]$. This shows that $T_F((a, b]) \leq 1$ for all $a < b$ with $b - a < \delta$. Thus using Eq. (23.13), it follows that $T_F((a, b]) \leq N < \infty$ provided $N \in \mathbb{N}$ is chosen so that $b - a < N\delta$.

3. Suppose that $\{(a_i, b_i)\}_{i=1}^{n}$ are disjoint subintervals of $(a, b)$, then by the mean value theorem,
\[
\sum_{i=1}^{n} |F(b_i) - F(a_i)| \leq \sum_{i=1}^{n} |F'(c_i)| (b_i - a_i) \leq M \cdot m(\bigcup_{i=1}^{n} (a_i, b_i))
\]
\[
\leq M \sum_{i=1}^{n} (b_i - a_i) \leq M(b - a)
\]
form which it easily follows that $F$ is absolutely continuous. Moreover we may conclude that $T_F((a, b]) \leq M(b - a)$.

4. Let $\nu$ be the positive measure $d\nu = |f| \, dm$ on $(a, b)$. Again let $\{(a_i, b_i)\}_{i=1}^{n}$ be disjoint subintervals of $(a, b)$, then
\[
\sum_{i=1}^{n} |F(b_i) - F(a_i)| = \sum_{i=1}^{n} \left| \int_{(a_i, b_i]} f \, dm \right|
\]
\[
\leq \sum_{i=1}^{n} \int_{(a_i, b_i]} |f| \, dm
\]
\[
= \int_{\bigcup_{i=1}^{n} (a_i, b_i]} |f| \, dm = \nu(\bigcup_{i=1}^{n} (a_i, b_i)).
\] (23.13)

Since $\nu$ is absolutely continuous relative to $m$, by Theorem 22.36 (or Corollary 22.37 or Theorem 22.38), for all $\varepsilon > 0$ there exist $\delta > 0$ such that $\nu(A) < \varepsilon$ if $m(A) < \delta$. Applying this result with $A = \bigcup_{i=1}^{n} (a_i, b_i)$, it follows from Eq. (23.13) that $F$ satisfies the definition of being absolutely continuous. Furthermore, Eq. (23.13) also may be used to show
\[
T_F((a, b]) \leq \int_{(a, b]} |f| \, dm.
\]

Example 23.27 (See I. P. Natanson, “Theory of functions of a real variable,” p.269.) In each of the two examples below, $f \in C([-1, 1])$.

1. Let $f(x) = |x|^{3/2} \sin \frac{1}{x}$ with $f(0) = 0$, then $f$ is everywhere differentiable but $f'$ is not bounded near zero. However, $f'$ is in $L^1([-1, 1])$.

2. Let $f(x) = x^2 \cos \frac{2}{x^2}$ with $f(0) = 0$, then $f$ is everywhere differentiable but $f' \notin L^1(-\varepsilon, \varepsilon)$ for any $\varepsilon \in (0, 1)$. Indeed, if $0 \notin (\alpha, \beta)$ then
\[
\int_{\alpha}^{\beta} f'(x) \, dx = f(\beta) - f(\alpha) = \beta^2 \cos \frac{\pi}{\beta^2} - \alpha^2 \cos \frac{\pi}{\alpha^2}.
\]

Now take $\alpha_n := \sqrt{\frac{2}{4n+1}}$ and $\beta_n = 1/\sqrt{2n}$. Then
\[
\int_{\alpha_n}^{\beta_n} f'(x) \, dx = \frac{2}{4n+1} \cos \frac{\pi(4n+1)}{2} - \frac{1}{2n} \cos 2n\pi = \frac{1}{2n}
\]
and noting that $\{(\alpha_n, \beta_n)\}_{n=1}^{\infty}$ are all disjoint, we find $\int_{0}^{\varepsilon} |f'(x)| \, dx = \infty$.

**Theorem 23.28.** Let $F : \mathbb{R} \to \mathbb{C}$ be any function.

1. For $a < b < c$,
\[
T_F((a, c]) = T_F((a, b]) + T_F((b, c]).
\] (23.14)

Letting $a = \alpha$ in this expression implies
\[
T_F(c) = T_F(b) + T_F((b, c])
\] (23.15)
and in particular $T_F$ is monotone increasing.

2. Now suppose $F : \mathbb{R} \to \mathbb{R}$ and $F \in BV(\mathbb{R})$. Then the functions $F_{\pm} := \left( T_F \pm F \right)/2$ are bounded and increasing functions.

3. A function $F : \mathbb{R} \to \mathbb{R}$ is in $BV$ iff $F = F_{+} - F_{-}$ where $F_{\pm}$ are bounded increasing functions. In particular if $F \in BV(\mathbb{R})$, then $F(a) := \lim_{y \uparrow a} F(y)$ exists for all $a \in \mathbb{R}$.

4. (Optional) If $F \in BV(\mathbb{R})$ and $a \in \mathbb{R}$, then
\[
T_F(a) - T_F(a-) \leq \limsup_{y \downarrow a} |F(y) - F(a)|.
\] (23.16)

**Proof.**

1. (Item 1. is a special case of Exercise 22.5.) Nevertheless we will give a proof here.) By the triangle inequality, if $\mathcal{P}$ and $\mathcal{P}'$ are partition of $[a, c]$ such that $\mathcal{P} \subset \mathcal{P}'$, then
\[
\sum_{x \in \mathcal{P}} |F(x_{+}) - F(x)| \leq \sum_{x \in \mathcal{P}'} |F(x_{+}) - F(x)|.
\]
So if $\mathcal{P}$ is a partition of $[a, c]$, then $\mathcal{P} \subset \mathcal{P}' := \mathcal{P} \cup \{b\}$ implies
23. Lebesgue Differentiation and the Fundamental Theorem of Calculus

\[ \sum_{x \in P} |F(x_+ - F(x))| \leq \sum_{x \in P} |F(x_+ - F(x))| \]

\[ = \sum_{x \in P \cap [a,b]} |F(x_+ - F(x)| + \sum_{x \in P \cap (b,c]} |F(x_+ - F(x)| \]

\[ \leq T_F((a,b]) + T_F((b,c]). \]

Thus we see that

\[ T_F((a,c]) \leq T_F((a,b]) + T_F((b,c]). \]

Similarly if \( P_1 \) is a partition of \( [a,b] \) and \( P_2 \) is a partition of \( [b,c] \), then \( P = P_1 \cup P_2 \) is a partition of \( [a,c] \) and

\[ \sum_{x \in P_1} |F(x_+) - F(x)| + \sum_{x \in P_2} |F(x_+) - F(x)| = \sum_{x \in P} |F(x_+) - F(x)| \leq T_F((a,c]). \]

From this we conclude

\[ T_F((a,b]) + T_F((b,c]) \leq T_F((a,c]) \]

which finishes the proof of Eqs. \( (23.14) \) and \( (23.15) \).

2. By Item 1., for all \( a < b \),

\[ T_F(b) - T_F(a) = T_F((a,b]) \geq |F(b) - F(a)| \]

and therefore

\[ T_F(b) + F(b) \geq T_F(a) + F(a) \]

which shows that \( F \) is increasing. Moreover from Eq. \( (23.16) \), for \( b > 0 \) and \( a \leq 0 \),

\[ |F(b)| = |F(b) - F(0)| + |F(0)| \leq T_F(0,b] + |F(0)| \]

\[ \leq T_F(0,\infty) + |F(0)| \]

and similarly

\[ |F(a)| = |F(0)| + T_F(-\infty,0) \]

which shows that \( F \) is bounded by \( |F(0)| + T_F(\mathbb{R}) \). Therefore the functions, \( F_+ \) and \( F_- \) are bounded as well.

3. By Exercise \( 23.3 \) if \( F = F_+ - F_- \), then

\[ T_F((a,b]) \leq T_{F_+}((a,b]) + T_{F_-}((a,b]) \]

\[ = |F_+(b) - F_+(a)| + |F_-(b) - F_-(a)| \]

which is bounded showing that \( F \in BV \). Conversely if \( F \) is bounded variation, then \( F = F_+ - F_- \) where \( F_\pm \) are defined as in Item 1.

4. Choose some \( b > a \). Then for any \( \varepsilon > 0 \) we may choose a partition \( P \) of \( [a,b] \) such that

\[ T_F(b) - T_F(a) = T_F((a,b]) \leq \sum_{x \in P} |F(x_+ - F(x)| + \varepsilon. \]

Let \( y \in (a,a+) \), then

\[ \sum_{x \in P} |F(x_+ - F(x)| + \varepsilon \leq \sum_{x \in P \cup \{y\}} |F(x_+ - F(x)| + \varepsilon \]

\[ = |F(y) - F(a)| + \sum_{x \in P \cup \{y\}} |F(x_+ - F(x)| + \varepsilon \]

\[ \leq |F(y) - F(a)| + T_F((y,b]) + \varepsilon. \]

Combining Eqs. \( (23.18) \) and \( (23.19) \) shows

\[ T_F((a,b]) = T_F(b) - T_F(a) \leq |F(y) - F(a)| + T_F((y,b]) + \varepsilon \]

or equivalently that

\[ T_F(y) - T_F(a) = T_F((a,y]) \leq |F(y) - F(a)| + \varepsilon. \]

Since \( y \in (a,a+) \) is arbitrary we conclude that

\[ T_F(a+) - T_F(a) = \lim inf \frac{T_F(y) - T_F(a)}{y - a} \leq \lim inf \frac{|F(y) - F(a)| + \varepsilon}{y - a}. \]

Since \( \varepsilon > 0 \) is arbitrary this proves Eq. \( (23.16) \).

\[ \]

**Theorem 23.29 (Bounded variation functions).** Suppose \( F : \mathbb{R} \to \mathbb{C} \) is in \( BV(X) \), then

1. \( F(x+) := \lim_{y \searrow x} F(y) \) and \( F(x-) := \lim_{y \nearrow x} F(y) \) exist for all \( x \in \mathbb{X} \). By convention, if \( X \subset (a,\infty) \) then \( F(a-) = F(a) \) and if \( X \subset (-\infty,b) \) then \( F(b+) := F(b) \). Let \( G(x) := F(x+) \) and \( G(\pm\infty) = F(\pm\infty) \) where appropriate.

2. If \( \inf X = -\infty \), then \( F(-\infty) := \lim_{x \to -\infty} F(x) \) exists and if \( \sup X = +\infty \) then \( F(\infty) := \lim_{x \to \infty} F(x) \) exists.

3. The set of points of discontinuity, \( \{x \in X : \text{ lim}_{y \to x} F(y) \neq F(x)\} \), of \( F \) is at most countable and in particular \( G(x) = F(x+) \) for all but a countable number \( x \in X \).

4. For \( m - a.e. \) \( x \), \( F'(x) \) and \( G'(x) \) exist and \( F'(x) = G'(x) \).
5. The function $G$ is right continuous on $X$. Moreover, there exists a unique complex measure, $\nu = \nu_F$, on $(X, \mathcal{B})$ such that, for all $a, b \in X$ with $a < b$,

$$\nu((a, b]) = G(b) - G(a) = F(b+) - F(a+).$$  \hspace{1cm} (23.20)

6. $F' \in L^1(X, m)$ and the Lebesgue decomposition of $\nu$ may be written as

$$d\nu_F = F'dm + d\nu_s$$  \hspace{1cm} (23.21)

where $\nu_s$ is a measure singular to $m$. In particular,

$$G(b) - G(a) = F(b+) - F(a+) = \int_a^b F' dm + \nu_s((a, b])$$  \hspace{1cm} (23.22)

whenever $a, b \in X$ with $a < b$.

7. $\nu_s = 0$ iff $G$ is absolutely continuous\footnote{We can not say that $F$ is absolutely continuous here as can be seen by taking $F(x) = 1_{(0)}(x)$.} on $X$.

**Proof.** If $X \not= \mathbb{R}$, extend $F$ to all of $\mathbb{R}$ by requiring $F$ be constant on each of the connected components of $\mathbb{R} \setminus X^o$. For example if $X = [a, \beta]$, extend $F$ to $\mathbb{R}$ by setting $F(x) := F(\alpha)$ for $x \leq \alpha$ and $F(x) = F(\beta)$ for $x \geq \beta$. With this extension it is easily seen that $T_F(\mathbb{R}) = T_F(X)$ and $T_F(x)$ is constant on the connected components of $\mathbb{R} \setminus X^o$. Thus we may now assume $X = \mathbb{R}$ and $T_F(\mathbb{R}) < \infty$. Moreover, by considering the real and imaginary parts of $F$ separately we may assume $F$ is real valued. So we now assume $X = \mathbb{R}$ and $F : \mathbb{R} \to \mathbb{R}$ in $BV := BV(\mathbb{R})$.

1. – 4. By Theorem 23.28, the functions $F_\pm := (T_F \pm F)/2$ are bounded and increasing functions. Since $F = F_+ - F_-$, items 1. – 4. are now easy consequences of Theorem 23.19 applies to $F_+$ and $F_-$.\footnote{This is the content of Exercise 17.21. For completeness let me sketch the proof here. For $x \in V$, let $a_x := \inf \{a : (a, x) \in V\}$ and $b_x := \sup \{b : (x, b) \in V\}$. Since $V$ is open, $a_x < x < b_x$ and it is easily seen that $J_x := (a_x, b_x) \subset V$. Moreover if $y \in V$ and $J_x \cap J_y \not= \emptyset$, then $J_x = J_y$. The collection, $\{J_x : x \in V\}$, is at most countable since we may label each $J \in \{J_x : x \in V\}$ by choosing a rational number $r \in J$. Letting $J_n = : n < N$, with $N = \infty$ allowed, be an enumeration of $\{J_x : x \in V\}$, we have $V = \bigcup_{n < N} J_n$, as desired.}

5. Let $G_+(x) := F_+(x)$ and $G_+(\infty) = F_+(\infty)$ and $G_-(\infty) = F_-(\infty)$, then

$$G(x) = F(x) = G_+(x) - G_-(x)$$

and as in Theorem 8.33 (or Theorems 23.19-27.26), there exists unique positive finite measures, $\nu_\pm$, such that

$$\nu_\pm((a, b]) = G_\pm(b) - G_\pm(a)$$

for all $a < b$.

Then $\nu := \nu_+ - \nu_-$ is a finite signed measure with the property that

$$\nu((a, b]) = G(b) - G(a) = F(b+) - F(a+)$$

for all $a < b$.

We will prove the uniqueness of the measure $\nu$ below.

6. Since $\nu_\pm$ have Lebesgue decompositions given by

$$d\nu_\pm = F'_\pm dm + d(\nu_\pm)$$

with $F'_\pm \in L^1(m)$ and $(\nu_\pm)_\perp m$, it follows that

$$d\nu = (F'_+ - F'_-) dm + d\nu_s = F'dm + d\nu_s$$

with $F' = F'_+ - F'_-$ (m-a.e.), $F' \in L^1(\mathbb{R}, m)$ and $\nu_s \perp m$, where

$$\nu_s := (\nu_+)_\perp - (\nu_-)_\perp.$$

7. This is a consequence of Theorems 22.27 (or 22.34) and 22.38. Alternatively, if $\nu_0 = 0$ then $G$ is absolutely continuous from Eq. (23.22) and item 4. of Lemma 23.26. For the converse direction assume that $G$ is absolutely continuous and $A \in \mathcal{B}_\mathbb{R}$ such that $m(A) = 0$. By regularity of $m$ and $|\nu|$ we can find a decreasing sequence of open sets $\{U_j\}_{j=1}^\infty$ such that $m(U_j \setminus A) \to 0$ and $|\nu|(U_j \setminus A) \to 0$ as $j \to \infty$ and therefore $m(U_j) \to m(A) = 0$ as $j \to \infty$ and

$$|\nu(U_j) - \nu(A)| = |\nu(U_j \setminus A)| \leq |\nu|(U_j \setminus A) \to 0 \text{ as } j \to \infty.$$
follows that $|\nu| + \nu$ and $|\tilde{\nu}| + \tilde{\nu}$ are finite positive measure on $B$ such that, for all $a < b$,

$$
(|\nu| + \nu)((a, b]) = |\nu|(a, b]) + (G(b) - G(a))
= |\tilde{\nu}|((a, b]) + (G(b) - G(a))
= (|\tilde{\nu}| + \tilde{\nu})((a, b]) .
$$

Hence another application of Theorem 15.43 shows

$$
|\nu| + \nu = |\tilde{\nu}| + \tilde{\nu} = |\nu| + \tilde{\nu} \text{ on } B,
$$

and hence $\nu = \tilde{\nu}$ on $B$.

**Alternative proofs of uniqueness of $\nu$.** The uniqueness may be proved by any number of other means. For example one may apply the multiplicative system Theorem 11.2 as follows. Let $-\infty < \alpha < \beta < \infty$ be given and take $H$ to be the collection of bounded real measurable functions on $(\alpha, \beta)$ such that

$$
\int_{(\alpha, \beta)} f d\nu = \int_{(\alpha, \beta)} f d\tilde{\nu} \text{ and } M \text{ being the multiplicative system,}
$$

$$
M := \{1_{(\alpha, \beta)} : \alpha \leq a < b \leq \beta\}.
$$

Then it follows from Theorem 11.2 that $\int_{(\alpha, \beta)} f d\nu = \int_{(\alpha, \beta)} f d\tilde{\nu}$ for all bounded measurable functions on $(\alpha, \beta)$ so that $\nu = \tilde{\nu}$ on $B_{(\alpha, \beta)}$. As simple limiting argument then shows that $\nu = \tilde{\nu}$ on $B_{\mathbb{R}}$.

Alternatively one could apply the monotone class Theorem (Lemma 46.3) with $C := \{A \in B : \nu(A) = \tilde{\nu}(A)\}$ and $A$ the algebra of half open intervals. Or one could use the $\pi - \lambda$ Theorem 46.5 with $D := \{A \in B : \nu(A) = \tilde{\nu}(A)\}$ and $C := \{(a, b] : a, b \in \mathbb{R} \text{ with } a < b\}$.

**Corollary 23.30.** If $F \in BV(X)$ then $\nu_F \perp m$ iff $F' = 0 \text{ } m$ a.e.

**Proof.** This is a consequence of Eq. (23.21) and the uniqueness of the Lebesgue decomposition. In more detail, if $F'(x) = 0$ for $m$ a.e. $x$, then by Eq. (23.21), $\nu_F = \nu_s \perp m$. If $\nu_F \perp m$, then by Eq. (23.21), $F'dm = d\nu_F - d\nu_s \perp dm$ and by Lemma 22.8 $F'dm = 0$, i.e. $F' = 0$ m-a.e.

**Corollary 23.31.** Let $F : \tilde{X} \rightarrow \mathbb{C}$ be a right continuous function in $BV(X)$, $\nu_F$ be the associated complex measure and

$$
d\nu_F = F'dm + d\nu_s \tag{23.24}
$$

be the its Lebesgue decomposition. Then the following are equivalent,

1. $F$ is absolutely continuous,
2. $\nu_F \ll m$,
3. $\nu_s = 0$, and
4. for all $a, b \in X$ with $a < b$,

$$
F(b) - F(a) = \int_a^b F'(x)dm(x) . \tag{23.25}
$$

**Proof.** The equivalence of 1. and 2. was established in Proposition 23.23 and the equivalence of 2. and 3. is trivial. (If $\nu_F \ll m$, then $d\nu_s = d\nu_F - F'dm \ll dm$ which implies, by Lemma 22.26 that $\nu_s = 0$.) If $\nu_F \ll m$ and $G(x) := F(x+)$, then the identity,

$$
F(b) - F(a) = F(b+) - F(a-) = \int_a^b F'(x)dm(x),
$$

implies $F$ is continuous.

(The equivalence of 4. and 1., 2., and 3.) If $F$ is absolutely continuous, then $\nu_s = 0$ and Eq. (23.25) follows from Eq. (23.24). Conversely let

$$
\rho(A) := \int_A F'(x)dm(x) \text{ for all } A \in B.
$$

Recall by the Radon - Nikodym theorem that $\int_{\tilde{X}} |F'(x)| dm(x) < \infty$ so that $\rho$ is a complex measure on $B$. So if Eq. (23.25) holds, then $\rho = \nu_F$ on the algebra generated by half open intervals. Therefore $\rho = \nu_F$ as in the uniqueness part of the proof of Theorem 23.29. Therefore $d\nu_F = F'dm \ll dm$.

**Theorem 23.32 (The fundamental theorem of calculus).** Suppose that $F : [\alpha, \beta] \rightarrow \mathbb{C}$ is a measurable function. Then the following are equivalent:

1. $F$ is absolutely continuous on $[\alpha, \beta]$.
2. There exists $f \in L^1((\alpha, \beta), dm)$ such that

$$
F(x) - F(\alpha) = \int_{\alpha}^x f dm \forall x \in [\alpha, \beta] \tag{23.26}
$$

3. $F'$ exists a.e., $F' \in L^1([\alpha, \beta], dm)$ and

$$
F(x) - F(\alpha) = \int_{\alpha}^x F'(x)dm \forall x \in [\alpha, \beta] . \tag{23.27}
$$

**Proof.** 1. $\implies$ 3. If $F$ is absolutely continuous then $F \in BV([\alpha, \beta])$ and $F$ is continuous on $[\alpha, \beta]$. Hence Eq. (23.27) holds by Corollary 23.31. The assertion 3. $\implies$ 2. is trivial and we have already seen in Lemma 23.26 that 2. implies 1.
Corollary 23.33 (Integration by parts). Suppose \(-\infty < \alpha < \beta < \infty\) and \(F, G : [\alpha, \beta] \to \mathbb{C}\) are two absolutely continuous functions. Then
\[
\int_{\alpha}^{\beta} F'Gdm = -\int_{\alpha}^{\beta} FG'dm + FG|_{\alpha}^{\beta}.
\]

**Proof.** Suppose that \(\{(a_i, b_i)\}_{i=1}^{n}\) is a sequence of disjoint intervals in \([\alpha, \beta]\), then
\[
\sum_{i=1}^{n} |F(b_i)G(b_i) - F(a_i)G(a_i)| \\
\leq \sum_{i=1}^{n} |F(b_i)||G(b_i) - G(a_i)| + \sum_{i=1}^{n} |F(b_i) - F(a_i)||G(a_i)| \\
\leq \|F\|_{\infty} \sum_{i=1}^{n} |G(b_i) - G(a_i)| + \|G\|_{\infty} \sum_{i=1}^{n} |F(b_i) - F(a_i)|.
\]
From this inequality, one easily deduces the absolutely continuity of the product \(FG\) from the absolutely continuity of \(F\) and \(G\). Therefore,
\[
FG|_{\alpha}^{\beta} = \int_{\alpha}^{\beta} (FG)'dm = \int_{\alpha}^{\beta} (F'G + FG')dm.
\]

23.4.3 Alternative method to Proving Theorem 23.29

For simplicity assume that \(\alpha = -\infty, \beta = \infty, F \in BV\),
\[
\mathcal{A}^b := \{A \in \mathcal{A} : A \text{ is bounded}\},
\]
and \(\mathcal{S}_c(A)\) denote simple functions of the form \(f = \sum_{i=1}^{n} \lambda_i 1_{A_i}\) with \(A_i \in \mathcal{A}^b\).
Let \(\nu^b = \nu^b_F\) be the finitely additive set function on such that \(\nu^b((a, b]) = F(b) - F(a)\) for all \(-\infty < a < b < \infty\). As in the case of an increasing function \(F\) (see Lemma 23.28 and the text preceding it) we may define a linear functional,
\[
I_F : \mathcal{S}_c(A) \to \mathbb{C}, \text{ by } I_F(f) = \sum_{\lambda \in \mathcal{C}} \lambda \nu^b(f = \lambda).
\]
If we write \(f = \sum_{i=1}^{N} \lambda_i 1_{(a_i, b_i]}\) with \(\{(a_i, b_i)\}_{i=1}^{N}\) pairwise disjoint subsets of \(\mathcal{A}^b\) inside \((a, b]\) we learn
\[
|I_F(f)| = \sum_{i=1}^{N} |\lambda_i| |F(b_i) - F(a_i)| \leq \|f\|_{\infty} T_F((a, b]).
\]
In the usual way this estimate allows us to extend \(I_F\) to the those compactly supported functions, \(\mathcal{S}_c(A)\), in the closure of \(\mathcal{S}_c(A)\). As usual we will still denote the extension of \(I_F\) to \(\mathcal{S}_c(A)\) by \(I_F\) and recall that \(\mathcal{S}_c(A)\) contains \(C_c(\mathbb{R}, \mathbb{C})\). The estimate in Eq. (23.28) still holds for this extension and in particular we have
\[
|I(f)| \leq T_F(\infty) \cdot \|f\|_{\infty} \text{ for all } f \in C_c(\mathbb{R}, \mathbb{C}).
\]
Therefore \(I\) extends uniquely by continuity to an element of \(C_0(\mathbb{R}, \mathbb{C})^*\). So by appealing to the complex Riesz Theorem (Corollary 49.70) there exists a unique complex measure \(\nu = \nu_F\) such that
\[
I_F(f) = \int_{\mathbb{R}} fd\nu \text{ for all } f \in C_c(\mathbb{R}). \quad (23.29)
\]
This leads to the following theorem.

**Theorem 23.34.** To each function \(F \in BV\) there exists a unique measure \(\nu = \nu_F\) on \((\mathbb{R}, \mathcal{B}_\mathbb{R})\) such that Eq. (23.29) holds. Moreover, \(F(x+) = \lim_{y \downarrow x} F(y)\) exists for all \(x \in \mathbb{R}\) and the measure \(\nu\) satisfies
\[
\nu((a, b]) = F(b) - F(a) \text{ for all } -\infty < a < b < \infty.
\]

**Remark 23.35.** By applying Theorem 23.34 to the function \(x \to F(-x)\) one shows every \(F \in BV\) has left hand limits as well, i.e. \(F(x-) = \lim_{y \uparrow x} F(y)\) exists for all \(x \in \mathbb{R}\).

**Proof.** We must still prove \(F(x+)\) exists for all \(x \in \mathbb{R}\) and Eq. (23.30) holds. To prove let \(\psi_b\) and \(\varphi_\varepsilon\) be the functions shown in Figure 23.5 below. The reader should check that \(\psi_b \in \mathcal{S}_c(A)\). Notice that
\[
I_F(\psi_{b+\varepsilon}) = I_F(\psi_{b+1}) = I_F(\psi_{a+1}) + F(b + \varepsilon) - F(a)
\]
and since \(\|\varphi_\varepsilon - \psi_{b+\varepsilon}\|_{\infty} = 1\),
\[
|I(\varphi_\varepsilon) - I_F(\psi_{b+\varepsilon})| \leq |I(F(\varphi_\varepsilon - \psi_{b+\varepsilon})| + T_F((b + \varepsilon, b + 2\varepsilon])| = T_F((b + 2\varepsilon) - T_F(b + \varepsilon),
\]
which implies \(O(\varepsilon) = I(\varphi_\varepsilon) - I_F(\psi_{b+\varepsilon}) \to 0\) as \(\varepsilon \downarrow 0\) because \(T_F\) is monotonic. Therefore,
\[
I(\varphi_\varepsilon) = I_F(\psi_{b+\varepsilon}) + I(\varphi_\varepsilon) - I_F(\psi_{b+\varepsilon}) = I_F(\psi_a) + F(b + \varepsilon) - F(a) + O(\varepsilon). \quad (23.31)
\]
Because \(\varphi_\varepsilon\) converges boundedly to \(\psi_b\) as \(\varepsilon \downarrow 0\), the dominated convergence theorem implies
So we may let

Then there exists a complex measure

Subtracting the last two equations proves Eq. (23.30).

Similarly this equation holds with

Given Theorem 23.34 we may now prove Theorem 23.29 in the

Remark 23.36. Given Theorem [23.34] we may now prove Theorem [23.29] in the

23.5 The connection of Weak and pointwise derivatives

Theorem 23.37. Suppose Let \( \Omega \subset \mathbb{R} \) be an open interval and \( f \in L^1_{\text{loc}}(\Omega) \). Then there exists a complex measure \( \mu \) on \( \mathcal{B}_\Omega \) such that

\[
- \langle f, \varphi' \rangle = \mu(\varphi) := \int_\Omega \varphi d\mu \text{ for all } \varphi \in C^\infty_c(\Omega) \tag{23.32}
\]

iff there exists a right continuous function \( F \) of bounded variation such that

\( F = f \) a.e. In this case \( \mu = \mu_F \), i.e. \( \mu((a,b)) = F(b) - F(a) \) for all \( -\infty < a < b < \infty \).

Proof. Suppose \( f = F \) a.e. where \( F \) is as above and let \( \mu = \mu_F \) be the

associated measure on \( \mathcal{B}_\Omega \). Let \( G(t) = F(t) - F(-\infty) = \mu((\infty, t]) \), then using

Fubini’s theorem and the fundamental theorem of calculus,

\[
-\langle f, \varphi' \rangle = -\langle F, \varphi' \rangle = -\int_\Omega \varphi'(t) \left[ \int_\Omega 1_{(-\infty, t]}(s)d\mu(s) \right] dt
\]

\[
= -\int_\Omega \int_\Omega \varphi'(t)1_{(-\infty, t]}(s)dtd\mu(s) = \int_\Omega \varphi(s)d\mu(s) = \mu(\varphi).
\]

Conversely if Eq. (23.32) holds for some measure \( \mu \), let \( F(t) := \mu((-\infty, t]) \) then

working backwards from above,

\[
-\langle f, \varphi' \rangle = \mu(\varphi) = \int_\Omega \varphi(s)d\mu(s) = -\int_\Omega \int_\Omega \varphi'(t)1_{(-\infty, t]}(s)dtd\mu(s)
\]

\[
= -\int_\Omega \varphi'(t)F(t)dt.
\]

This shows \( \partial^w(f - F) = 0 \) and therefore by Proposition 32.25 \( f = F + c \) a.e.

for some constant \( c \in \mathbb{C} \). Since \( F + c \) is right continuous with bounded variation,

the proof is complete. \( \square \)

Proposition 23.38. Let \( \Omega \subset \mathbb{R} \) be an open interval and \( f \in L^1_{\text{loc}}(\Omega) \). Then

\( \partial^w f \) exists in \( L^1_{\text{loc}}(\Omega) \) iff \( f \) has a continuous version \( \tilde{f} \) which is absolutely continuous

on all compact subintervals of \( \Omega \). Moreover, \( \partial^w f = \tilde{f}' \) a.e., where \( \tilde{f}'(x) \)

is the usual pointwise derivative.

Proof. If \( f \) is locally absolutely continuous and \( \varphi \in C^\infty_c(\Omega) \) with \( \text{supp}(\varphi) \subset [a, b] \subset \Omega \), then by integration by parts, Corollary 23.33

\[
\int_\Omega f' \varphi dm = \int_a^b f' \varphi dm = -\int_a^b f \varphi' dm + f \varphi|_a^b = -\int_\Omega f \varphi' dm.
\]

This shows \( \partial^w f \) exists and \( \partial^w f = f' \in L^1_{\text{loc}}(\Omega) \). Now suppose that \( \partial^w f \) exists in \( L^1_{\text{loc}}(\Omega) \) and \( a \in \Omega \). Define \( F \in C(\Omega) \) by \( F(x) := \int_a^x \partial^w f(y)dy \). Then \( F \)

is absolutely continuous on compacts and therefore by fundamental theorem of calculus for absolutely continuous functions (Theorem 23.32), \( F'(x) \) exists and

is equal to \( \partial^w f(x) \) for a.e. \( x \in \Omega \). Moreover, by the first part of the argument,
$\partial^w F$ exists and $\partial^w F = \partial^w f$, and so by Proposition 32.25 there is a constant $c$ such that

$$f(x) := F(x) + c = f(x)$$

for a.e. $x \in \Omega$.

Definition 33.39. Let $X$ and $Y$ be metric spaces. A function $u : X \to Y$ is said to be Lipschitz if there exists $C < \infty$ such that

$$d^Y(u(x), u(x')) \leq Cd^X(x, x') \text{ for all } x, x' \in X$$

and said to be locally Lipschitz if for all compact subsets $K \subset X$ there exists $C_{K} < \infty$ such that

$$d^Y(u(x), u(x')) \leq C_K d^X(x, x') \text{ for all } x, x' \in K.$$
and consequently
\[ \|u_n - u\|_\infty \leq \|u - u_n\|_\infty \leq 2K/m \to 0 \text{ as } m \to \infty. \]

Therefore, \( u_n \) converges uniformly to a continuous function \( \tilde{u} \).

The next theorem is from Chapter 1. of Maz'ja [18].

**Theorem 23.41.** Let \( p \geq 1 \) and \( \Omega \) be an open subset of \( \mathbb{R}^d \), \( x \in \mathbb{R}^d \) be written as \( x = (y, t) \in \mathbb{R}^{d-1} \times \mathbb{R}, \)

\[ Y := \{ y \in \mathbb{R}^{d-1} : ((y, x) \in \Omega) \implies \text{false} \} \]

and \( u \in L^p(\Omega) \). Then \( \partial_y u \) exists weakly in \( L^p(\Omega) \) iff there is a version \( \tilde{u} \) of \( u \) such that for a.e. \( y \in \Omega \) the function \( t \to \tilde{u}(y, t) \) is absolutely continuous, \( \partial_t \tilde{u}(y, t) = \frac{\partial \tilde{u}(y, t)}{\partial t} \) a.e., and \( \| \frac{\partial \tilde{u}}{\partial t} \|_{L^p(\Omega)} < \infty. \)

**Proof.** For the proof of Theorem 23.41 it suffices to consider the case where \( \Omega = (0, 1)^d \). Write \( x \in \Omega \) as \( x = (y, t) \in Y \times (0, 1)^d \times (0, 1) \) and \( \partial_u \) for the weak derivative \( \partial_y u \). By assumption

\[ \int_0^1 \| \partial_t u(y, t) \| dt = 1 \leq \| \partial_y u \|_1 < \infty \]

and so by Fubini’s theorem there exists a set of full measure, \( Y_0 \subset Y \), such that

\[ \int_0^1 \| \partial_t u(y, t) \| dt < \infty \text{ for } y \in Y_0. \]

So for \( y \in Y_0 \), the function \( v(y, t) := \int_0^t \partial_t u(y, t) d\tau \) is well defined and absolutely continuous in \( t \) with \( \frac{dv}{dt}(y, t) = \partial_t u(y, t) \) for a.e. \( t \in (0, 1) \). Let \( \xi \in C_c^\infty(\tilde{U}) \) and \( \eta \in C_c^\infty((0, 1)) \), then integration by parts for absolutely functions implies

\[ \int_0^1 \int_0^1 v(y, t) \eta(t) dt = -\int_0^1 \int_0^t \frac{dv}{dt}(y, t) \eta(t) dt \text{ for all } y \in Y_0. \]

Multiplying both sides of this equation by \( \xi(y) \) and integrating in \( y \) shows

\[ \int_0^1 \int_0^1 v(y, t) \eta(t) \xi(y) dy dt = -\int_0^1 \int_0^t \frac{dv}{dt}(y, t) \eta(t) \xi(y) dy dt = -\int_0^1 \int_0^t \partial_t u(y, t) \eta(t) \xi(y) dy dt. \]

Using the definition of the weak derivative, this equation may be written as

\[ \int_\Omega u(x) \eta(t) \xi(y) dy dt = -\int_\Omega \partial_t u(x) \eta(t) \xi(y) dy dt \]

and comparing the last two equations shows

\[ \int_\Omega [v(x) - u(x)] \eta(t) \xi(y) dy dt = 0. \]

Since \( \xi \in C_c^\infty(\tilde{U}) \) is arbitrary, this implies there exists a set \( Y_1 \subset Y_0 \) of full measure such that

\[ \int_\Omega [v(y, t) - u(y, t)] \eta(t) dt = 0 \text{ for all } y \in Y_1 \]

from which we conclude, using Proposition 32.25 that \( u(y, t) = v(y, t) + C(y) \) for \( t \in J_y \) where \( m_{d-1}(J_y) = 1 \), here \( m_k \) denotes \( k \)-dimensional Lebesgue measure. In conclusion we have shown that

\[ u(y, t) = \tilde{u}(y, t) := \int_0^t \partial_t u(y, \tau) d\tau + C(y) \text{ for all } y \in Y_1 \text{ and } t \in J_y. \]

We can be more precise about the formula for \( \tilde{u}(y, t) \) by integrating both sides of Eq. (23.35) on \( t \) we learn

\[ C(y) = \int_0^1 dt \int_0^t \partial_t u(y, \tau) d\tau - \int_0^1 u(y, t) dt \]

and hence

\[ \tilde{u}(y, t) := \int_0^t \partial_t u(y, \tau) d\tau + \int_0^1 [(1 - t) \partial_t u(y, t) - u(y, t)] d\tau \]

which is well defined for \( y \in Y_0 \). For the converse suppose that such a \( \tilde{u} \) exists, then for \( \varphi \in C_c^\infty(\Omega) \),

\[ \int_\Omega u(y, t) \partial_t \varphi(y, t) dy dt = \int_\Omega \tilde{u}(y, t) \partial_t \varphi(y, t) dy dt = -\int_\Omega \frac{\partial \tilde{u}(y, t)}{\partial t} \varphi(y, t) dy dt. \]

wherin we have used integration by parts for absolutely continuous functions. From this equation we learn the weak derivative \( \partial_t u(y, t) \) exists and is given by \( \frac{\partial \tilde{u}(y, t)}{\partial t} \) a.e. \( \Box \)

Topological Spaces
Compactness

24.1 Local and \( \sigma \) – Compactness

Notation 24.1 If \( X \) is a topological space and \( Y \) is a normed space, let

\[
BC(X,Y) := \{ f \in C(X,Y) : \sup_{x \in X} \|f(x)\|_Y < \infty \}
\]

and

\[
C_c(X,Y) := \{ f \in C(X,Y) : \text{supp}(f) \text{ is compact} \}.
\]

If \( Y = \mathbb{R} \) or \( C \), we will simply write \( C(X,Y) \), \( BC(X,Y) \) and \( C_c(X,Y) \) for \( C(X,Y) \), \( BC(X,Y) \) and \( C_c(X,Y) \) respectively.

Remark 24.2. Let \( X \) be a topological space and \( Y \) be a Banach space. By combining Exercise 17.15 and Theorem 17.60, it follows that \( C_c(X,Y) \subset BC(X,Y) \).

Definition 24.3 (Local and \( \sigma \) – compactness). Let \( (X, \tau) \) be a topological space.

1. \((X, \tau)\) is locally compact if for all \( x \in X \) there exists an open neighborhood \( V \subset X \) such that \( V \) is compact. (Alternatively, in light of Definition 17.29 [also see Definition 13.5], this is equivalent to requiring that to each \( x \in X \) there exists a compact neighborhood \( N_x \) of \( x \).)
2. \((X, \tau)\) is \( \sigma \) – compact if there exists compact sets \( K_n \subset X \) such that \( X = \bigcup_{n=1}^{\infty} K_n \). (Notice that we may assume, by replacing \( K_n \) by \( K_1 \cup K_2 \cup \cdots \cup K_n \) if necessary, that \( K_n \uparrow X \).)

Example 24.4. Any open subset of \( U \subset \mathbb{R}^n \) is a locally compact and \( \sigma \) – compact metric space. The proof of local compactness is easy and is left to the reader. To see that \( U \) is \( \sigma \) – compact, for \( k \in \mathbb{N} \), let

\[
K_k := \{ x \in U : |x| < k \text{ and } d_{U,x}(x) \geq 1/k \}.
\]

Then \( K_k \) is a closed and bounded subset of \( \mathbb{R}^n \) and hence compact. Moreover \( K_k \uparrow U \) as \( k \to \infty \) since\(^1\)

\[
K_k \supset \{ x \in U : |x| < k \text{ and } d_{U,x}(x) > 1/k \} \uparrow U \text{ as } k \to \infty.
\]

Exercise 24.1. If \((X, \tau)\) is locally compact and second countable, then there is a countable basis \( \mathcal{B}_0 \) for the topology consisting of precompact open sets. Use this to show \((X, \tau)\) is \( \sigma \) – compact.

Exercise 24.2. Every separable locally compact metric space is \( \sigma \) – compact.

Exercise 24.3. Every \( \sigma \) – compact metric space is second countable (or equivalently separable), see Corollary 17.61.

Exercise 24.4. Suppose that \((X,d)\) is a metric space and \( U \subset X \) is an open subset.

1. If \( X \) is locally compact then \((U,d)\) is locally compact. 
2. If \( X \) is \( \sigma \) – compact then \((U,d)\) is \( \sigma \) – compact. **Hint:** Mimic Example 24.4 by replacing \( \{ x \in \mathbb{R}^n : |x| \leq k \} \) by compact sets \( X_k \cap C \subset X \) such that \( X_k \uparrow X \).

Lemma 24.5. Let \((X, \tau)\) be locally and \( \sigma \) – compact. Then there exists compact sets \( K_n \uparrow X \) such that \( K_n \subset K_{n+1} \subset K_{n+1} \) for all \( n \).

**Proof.** Suppose that \( C \subset X \) is a compact set. For each \( x \in C \) let \( V_x \subset X \) be an open neighborhood of \( x \) such that \( V_x \) is compact. Then \( C \subset \bigcup_{x \in C} V_x \) so there exists \( A \subset C \) such that

\[
C \subset \bigcup_{x \in A} V_x \subset \bigcup_{x \in A} V_x =: K.
\]

Then \( K \) is a compact set, being a finite union of compact subsets of \( X \), and \( C \subset \bigcup_{x \in A} V_x \subset K^o \). Now let \( C_n \subset X \) be compact sets such that \( C_n \uparrow X \) as \( n \to \infty \). Let \( K_1 = C_1 \) and then choose a compact set \( K_2 \) such that \( C_2 \subset K_2 \). Similarly, choose a compact set \( K_3 \) such that \( K_2 \cup C_3 \subset K_3 \) and continue inductively to find compact sets \( K_n \) such that \( K_n \cup C_{n+1} \subset K_{n+1} \) for all \( n \). Then \( \{ K_n \}_{n=1}^{\infty} \) is the desired sequence.

Remark 24.6. Lemma 24.5 may also be stated as saying there exists precompact open sets \( \{ G_n \}_{n=1}^{\infty} \) such that \( G_n \subset G_n \subset G_{n+1} \) for all \( n \) and \( G_n \uparrow X \) as \( n \to \infty \). Indeed if \( \{ G_n \}_{n=1}^{\infty} \) are as above, let \( K_n := G_n \) and if \( \{ K_n \}_{n=1}^{\infty} \) are as in Lemma 24.5 let \( G_n := K_n^o \).

Proposition 24.7. Suppose \( X \) is a locally compact metric space and \( U \subset C \) and \( K \subset C \). Then there exists \( V \subset X \) such that \( K \subset V \subset V \subset U \subset X \) and \( V \) is compact.
Proof. (This is done more generally in Proposition 25.7 below.) By local compactness of $X$, for each $x \in K$ there exists $\varepsilon_x > 0$ such that $B_x(\varepsilon_x)$ is compact and by shrinking $\varepsilon_x$ if necessary we may assume,

$$B_x(\varepsilon_x) \subset C_x(\varepsilon_x) \subset B_x(2\varepsilon_x) \subset U$$

for each $x \in K$. By compactness of $K$, there exists $A \subset K$ such that $K \subset \bigcup_{x \in A} B_x(\varepsilon_x) := V$. Notice that $V \subset \bigcup_{x \in A} B_x(\varepsilon_x) \subset U$ and $V$ is a closed subset of the compact set $\bigcup_{x \in A} B_x(\varepsilon_x)$ and hence compact as well. ■

**Definition 24.8.** Let $U$ be an open subset of a topological space $(X, \tau)$. We will write $f \prec U$ to mean a function $f \in C_c(X, [0, 1])$ such that $\text{supp}(f) := \{f \neq 0\} \subset U$.

**Lemma 24.9 (Urysohn’s Lemma for Metric Spaces).** Let $X$ be a locally compact metric space and $K \subset U \subset \alpha X$. Then there exists $f \prec U$ such that $f = 1$ on $K$. In particular, if $K$ is compact and $C$ is closed in $X$ such that $K \cap C = \emptyset$, there exists $f \in C_c([0, 1], X)$ such that $f = 1$ on $K$ and $f = 0$ on $C$.

**Proof.** Let $V$ be as in Proposition 24.7 and then use Lemma 13.15 to find a function $f \in C_c([0, 1], X)$ such that $f = 1$ on $K$ and $f = 0$ on $V^c$. Then $\text{supp}(f) \subset V \subset U$ and hence $f \prec U$. ■

### 24.2 Function Space Compactness Criteria

In this section, let $(X, \tau)$ be a topological space.

**Definition 24.10.** Let $\mathcal{F} \subset C(X)$.

1. $\mathcal{F}$ is equicontinuous at $x \in X$ iff for all $\varepsilon > 0$ there exists $U \in \tau_x$ such that $|f(y) - f(x)| < \varepsilon$ for all $y \in U$ and $f \in \mathcal{F}$.

2. $\mathcal{F}$ is equicontinuous if $\mathcal{F}$ is equicontinuous at all points $x \in X$.

3. $\mathcal{F}$ is pointwise bounded if $\text{sup}\{f(x) : f \in \mathcal{F}\} < \infty$ for all $x \in X$.

**Theorem 24.11 (Ascoli-Arzela Theorem).** Let $(X, \tau)$ be a compact topological space and $\mathcal{F} \subset C(X)$. Then $\mathcal{F}$ is precompact in $C(X)$ iff $\mathcal{F}$ is equicontinuous and point-wise bounded.

**Proof.** ($\Rightarrow$) Since $C(X) \subset \ell^\infty(X)$ is a complete metric space, we must show $\mathcal{F}$ is totally bounded. Let $\varepsilon > 0$ be given. By equicontinuity, for all $x \in X$, there exists $V_x \in \tau_x$ such that $|f(y) - f(x)| < \varepsilon/2$ if $y \in V_x$ and $f \in \mathcal{F}$. Since $X$ is compact we may choose $A \subset X$ such that $X = \bigcup_{x \in A} V_x$. We have now decomposed $X$ into “blocks” $\{V_x\}_{x \in A}$ such that each $f \in \mathcal{F}$ is constant to within $\varepsilon$ on $V_x$. Since $\text{sup}\{f(x) : x \in A \text{ and } f \in \mathcal{F}\} < \infty$, it is now evident that

$$M = \text{sup}\{f(x) : x \in X \text{ and } f \in \mathcal{F}\}$$

$$\leq \text{sup}\{f(x) : x \in A \text{ and } f \in \mathcal{F}\} + \varepsilon < \infty$$

Let $D := \{k\varepsilon/2 : k \in \mathbb{Z}\} \cap [-M, M]$. If $f \in \mathcal{F}$ and $\varphi \in \mathbb{D}^A$ (i.e. $\varphi : A \rightarrow D$ is a function) is chosen so that $|\varphi(x) - f(x)| \leq \varepsilon/2$ for all $x \in A$, then

$$|f(y) - \varphi(x)| \leq |f(y) - f(x)| + |f(x) - \varphi(x)| < \varepsilon \forall x \in A \text{ and } y \in V_x.$$

From this it follows that $\mathcal{F} = \bigcup \{\mathcal{F}_\varphi : \varphi \in \mathbb{D}^A\}$ where, for $\varphi \in \mathbb{D}^A$,

$$\mathcal{F}_\varphi := \{f \in \mathcal{F} : |f(y) - \varphi(x)| < \varepsilon \text{ for } y \in V_x \text{ and } x \in A\}.$$

Let $\Gamma := \{\varphi \in \mathbb{D}^A : \mathcal{F}_\varphi \neq \emptyset\}$ and for each $\varphi \in \Gamma$ choose $f_\varphi \in \mathcal{F}_\varphi \cap \mathcal{F}$. For $f \in \mathcal{F}_\varphi$, $x \in \Lambda$ and $y \in V_x$ we have

$$|f(y) - f_\varphi(y)| \leq |f(y) - \varphi(x)| + |\varphi(x) - f_\varphi(y)| < 2\varepsilon.$$ 

So $\|f - f_\varphi\|_\infty < 2\varepsilon$ for all $f \in \mathcal{F}_\varphi$ showing that $\mathcal{F}_\varphi \subset B_{f_\varphi}(2\varepsilon)$. Therefore,

$$\mathcal{F} = \bigcup_{\varphi \in \Gamma} \mathcal{F}_\varphi \subset \bigcup_{\varphi \in \Gamma} B_{f_\varphi}(2\varepsilon)$$

and because $\varepsilon > 0$ was arbitrary we have shown that $\mathcal{F}$ is totally bounded.

($\Leftarrow$) (*The rest of this proof may safely be skipped.* Since $\|f\|_\infty : C(X) \rightarrow [0, \infty]$ is a continuous function on $C(X)$ it is bounded on any compact subset $\mathcal{F} \subset C(X)$. This shows that $\text{sup}\{\|f\|_\infty : f \in \mathcal{F}\} < \infty$ which clearly implies that $\mathcal{F}$ is pointwise bounded. Suppose $\mathcal{F}$ were not equicontinuous at some point $x \in X$ that is to say there exists $\varepsilon > 0$ such that for all $V \in \tau_x$, $\text{sup} \{f(y) - f(x) : f \in \mathcal{F}\} > \varepsilon$. Equivalently said, to each $V \in \tau_x$ we may choose

---

2 One could also prove that $\mathcal{F}$ is pointwise bounded by considering the continuous evaluation maps $e_x : C(X) \rightarrow \mathbb{R}$ given by $e_x(f) = f(x)$ for all $x \in X$.

3 If $X$ is first countable we could finish the proof with the following argument. Let $\{V_n\}_{n=1}^\infty$ be a neighborhood base at $x$ such that $V_1 \supset V_2 \supset V_3 \supset \ldots$. By the assumption that $\mathcal{F}$ is not equicontinuous at $x$, there exist $f_n \in \mathcal{F}$ and $x_n \in V_n$ such that $|f_n(x_n) - f_n(x)| \geq \varepsilon \forall n$. Since $\mathcal{F}$ is a compact metric space by passing to a subsequence if necessary we may assume that $f_n$ converges uniformly to some $f \in \mathcal{F}$. Because $x_n \rightarrow x$ as $n \rightarrow \infty$ we learn that

$$\varepsilon \leq |f_n(x) - f_n(x_n)| \leq |f_n(x) - f(x)| + |f(x) - f(x_n)| + |f(x_n) - f_n(x_n)| \leq 2\|f_n - f\| + |f(x) - f(x_n)| \rightarrow 0 \text{ as } n \rightarrow \infty$$

which is a contradiction.
\[ f_V \in \mathcal{F} \text{ and } x_V \in V \ni |f_V(x) - f_V(x_V)| \geq \varepsilon. \] (24.1)

Set \( \mathcal{C}_V = \{f_W : W \in \tau_x \text{ and } W \subseteq V\}^{||\cdot||_\infty} \subseteq \mathcal{F} \) and notice for any \( V \subseteq \tau_x \) that
\[
\cap_{V \subseteq V} \mathcal{C}_V \supseteq \mathcal{C}_{\cap V} \neq \emptyset,
\]
so that \( \{\mathcal{C}_V\}_V \in \tau_x \subseteq \mathcal{F} \) has the finite intersection property. Since \( \mathcal{F} \) is compact, it follows that there exists some
\[
f \in \bigcap_{V \subseteq \tau_x} \mathcal{C}_V \neq \emptyset.
\]
Since \( f \) is continuous, there exists \( V \subseteq \tau_x \) such that \( |f(x) - f(y)| < \varepsilon/3 \) for all \( y \in V \). Because \( f \in \mathcal{C}_V \), there exists \( W \subseteq V \) such that \( ||f - f_W|| < \varepsilon/3 \). We now arrive at a contradiction;
\[
\begin{align*}
\varepsilon & \leq |f_W(x) - f_W(x_W)| \\
& \leq |f_W(x) - f(x)| + |f(x) - f(x_W)| + |f(x_W) - f_W(x_W)| \\
& < \varepsilon/3 + \varepsilon/3 + \varepsilon/3 = \varepsilon.
\end{align*}
\]

Alternate proof of the first part. For \( \varepsilon > 0 \) let \( \Lambda_\varepsilon \subseteq f X \) and \( \{V_x^\varepsilon\}_{x \in \Lambda_\varepsilon} \) be a finite open cover of \( X \) with the property; for all \( x \in X \) we have
\[
|f(y) - f(x)| < \varepsilon \forall y \in V_x \text{ and } f \in \mathcal{F}.
\]

Let \( D := \cup_{m=1}^\infty A_{1/m} \) = countable set and suppose that \( \{f_n\} \subseteq \mathcal{F} \) is a given sequence. Since \( \{f_n(x)\}_{n=1}^\infty \) is bounded in \( \mathbb{R} \) for all \( x \in D \), by Cantor’s diagonalization argument, we may choose a subsequence, \( g_k := f_{n_k} \) such that \( g_k(x) := \lim_{k \to \infty} g_k(x) \) exists for all \( x \in D \). To finish the proof we need only show \( \{g_k\} \) is uniformly Cauchy. To this end, observe that for \( y \in X \) and \( m \in \mathbb{N} \) we may choose an \( x \in A_{1/m} \) such that \( y \in V_x^m \) and therefore,
\[
|g_k(y) - g_l(y)| \leq |g_k(y) - g_k(x)| + |g_k(x) - g_l(x)| + |g_l(x) - g_l(y)| \\
\leq 2/m + |g_k(x) - g_l(x)|
\]
and therefore,\(^4\)
\[
\begin{align*}
|g_k(x) - g_l(x)| & \leq 2/m + |g_k(x) - g_l(x)| \\
& \leq 2/m + \max_{x \in A_{1/m}} |g_k(x) - g_l(x)|
\end{align*}
\]
which is a contradiction.

\( \|g_k - g_l\|_u \leq 2/m + \max_{x \in A_{1/m}} |g_k(x) - g_l(x)| \).

Passing to the limit as \( k, l \to \infty \) then shows
\[
\lim_{k,l \to \infty} \|g_k - g_l\|_u \leq 2/m \to 0 \text{ as } m \to \infty.
\]

Exercise 24.5. Give an alternative proof of the implication, (\( \Leftarrow \)), in Theorem 24.11 by showing every subsequence \( \{f_n : n \in \mathbb{N}\} \subseteq \mathcal{F} \) has a convergence subsequence.

Exercise 24.6. Suppose \( k \in C([0, 1]^2, \mathbb{R}) \) and for \( f \in C([0, 1], \mathbb{R}) \), let
\[
Kf(x) := \int_0^1 k(x, y) f(y) dy \text{ for all } x \in [0, 1].
\]

Show \( K \) is a compact operator on \( (C([0, 1], \mathbb{R}), ||\cdot||_\infty) \).

The following result is a corollary of Lemma 24.5 and Theorem 24.11.

Corollary 24.12 (Locally Compact Ascoli-Arzela Theorem). Let \((X, \tau)\) be a locally compact and \( \sigma \) - compact topological space and \( \{f_m\} \subseteq C(X) \) be a pointwise bounded sequence of functions such that \( \{f_m|K\} \) is equicontinuous for any compact subset \( K \subseteq X \). Then there exists a subsequence \( \{m_n\} \subseteq \mathbb{N} \) such that \( \{g_n := f_{m_n}\}_{n=1}^\infty \subseteq C(X) \) is a sequence which is uniformly convergent on compact subsets of \( X \).

Proof. Let \( \{K_n\}_{n=1}^\infty \) be the compact subsets of \( X \) constructed in Lemma 24.5. We may now apply Theorem 24.11 repeatedly to find a nested family of subsequences
\[
\{f_m\} \supset \{g_m\} \supset \{g_m^2\} \supset \{g_m^3\} \supset \ldots
\]
such that the sequence \( \{g_m^n\}_{m=1}^\infty \subseteq C(X) \) is uniformly convergent on \( K_n \). Using Cantor’s trick, define the subsequence \( \{h_n\} \subseteq \{f_m\} \) by \( h_n := g_{m_n}^n \). Then \( \{h_n\} \) is uniformly convergent on \( K_l \) for each \( l \in \mathbb{N} \). Now if \( K \subseteq X \) is an arbitrary compact set, there exists \( l < \infty \) such that \( K \subseteq K_l \subseteq K_l \) and therefore \( \{h_n\} \) is uniformly convergent on \( K \) as well.

Proposition 24.13. Let \( \Omega \subseteq \mathbb{R}^d \) such that \( \partial \Omega \) is compact and \( 0 \leq \alpha < \beta \leq 1 \). Then the inclusion map \( i : C^\beta(\partial \Omega) \to C^\alpha(\partial \Omega) \) is a compact operator. See Chapter 15 and Lemma 15.9 for the notation being used here.
Therefore, let \( \{u_n\}_{n=1}^{\infty} \subset C^\beta(\Omega) \) such that \( \|u_n\|_{C^\beta} \leq 1 \), i.e. \( \|u_n\|_{\infty} \leq 1 \) and

\[ |u_n(x) - u_n(y)| \leq |x - y|^\beta \]

for all \( x, y \in \Omega \).

By the Arzela-Ascoli Theorem [24.11], there exists a subsequence of \( \{u_n\}_{n=1}^{\infty} \) of \( \{u_n\}_{n=1}^{\infty} \) and \( u \in C^\alpha(\Omega) \) such that \( u_n \to u \) in \( C^\alpha \). Since

\[ |u(x) - u(y)| = \lim_{n \to \infty} |u_n(x) - u_n(y)| \leq |x - y|^\beta, \]

we have \( u \in C^\beta \) as well. Define \( g_n := u - u_n \in C^\beta \), then

\[ [g_n]_\beta + \|g_n\|_{C^\alpha} = \|g_n\|_{C^\beta} \leq 2 \]

and \( g_n \to 0 \) in \( C^\alpha \). To finish the proof we must show that \( g_n \to 0 \) in \( C^\alpha \). Given \( \delta > 0 \),

\[ [g_n]_\alpha = \sup_{x \neq y} \left| \frac{g_n(x) - g_n(y)}{|x - y|^\alpha} \right| \leq A_n + B_n \]

where

\[ A_n = \sup \left\{ \frac{|g_n(x) - g_n(y)|}{|x - y|^\alpha} : x \neq y \text{ and } |x - y| \leq \delta \right\} \]

\[ = \sup \left\{ \frac{|g_n(x) - g_n(y)|}{|x - y|^\beta} \cdot |x - y|^{\beta - \alpha} : x \neq y \text{ and } |x - y| \leq \delta \right\} \]

\[ \leq \delta^{\beta - \alpha} \cdot [g_n]_\beta \leq 2 \delta^{\beta - \alpha} \]

and

\[ B_n = \sup \left\{ \frac{|g_n(x) - g_n(y)|}{|x - y|^\alpha} : |x - y| > \delta \right\} \leq 2 \delta^{\alpha} \|g_n\|_{C^\alpha} \to 0 \text{ as } n \to \infty. \]

Therefore,

\[ \limsup_{n \to \infty} [g_n]_\alpha \leq \limsup_{n \to \infty} A_n + \limsup_{n \to \infty} B_n \leq 2 \delta^{\beta - \alpha} + 0 \to 0 \text{ as } \delta \downarrow 0. \]

This proposition generalizes to the following theorem which the reader is asked to prove in Exercise 24.15 below.

**Theorem 24.14.** Let \( \Omega \) be a precompact open subset of \( \mathbb{R}^d \), \( \alpha, \beta \in [0,1] \) and \( k, j \in \mathbb{N}_0 \). If \( j + \beta > k + \alpha \), then \( C^{j,\beta}(\Omega) \) is compactly contained in \( C^{k,\alpha}(\Omega) \).

### 24.3 Tychonoff’s Theorem

The goal of this section is to show that arbitrary products of compact spaces is still compact. Before going to the general case of an arbitrary number of factors let us start with only two factors.

**Proposition 24.15.** Suppose that \( X \) and \( Y \) are non-empty compact topological spaces, then \( X \times Y \) is compact in the product topology.

**Proof.** Let \( \mathcal{U} \) be an open cover of \( X \times Y \). Then for each \( (x, y) \in X \times Y \) there exist \( U \subseteq \mathcal{U} \) such that \( (x, y) \subseteq U \). By definition of the product topology, there also exist \( V_x \subseteq \pi_x^* \mathcal{U} \) and \( W_y \subseteq \pi_y^* \mathcal{U} \) such that \( V_x \times W_y \subseteq U \). Therefore \( \mathcal{V} := \{ V_x \times W_y : (x, y) \in X \times Y \} \) is also an open cover of \( X \times Y \). We will now show that \( \mathcal{V} \) has a finite sub-cover, say \( \mathcal{V}_0 \subseteq \mathcal{V} \). Assuming this is proved for the moment, this implies that \( \mathcal{U} \) also has a finite subcover because each \( V \in \mathcal{V}_0 \) is contained in some \( U \subseteq \mathcal{U} \).

So to complete the proof it suffices to show every cover \( \mathcal{V} \) of the form \( \mathcal{V} = \{ V_x \times W_y : \alpha \in A \} \) where \( V_x \subseteq \mathcal{U} \) and \( W_y \subseteq \mathcal{U} \) for all \( \alpha \in A \) has a finite subcover. Given \( x \in X \), let \( f_x : Y \to X \times Y \) be the map \( f_x(y) = (x, y) \) and notice that \( f_x \) is continuous since \( \pi_x \circ f_x(y) = x \) and \( \pi_y \circ f_x(y) = y \) are continuous maps. From this we conclude that \( \{ x \} \times Y = f_x(Y) \) is compact. Similarly, it follows that \( X \times \{ y \} \) is compact for all \( y \in Y \). Since \( \mathcal{V} \) is a cover of \( \{ x \} \times Y \), there exist \( \mathcal{V}_x \subseteq \mathcal{V} \) such that \( \{ x \} \times Y \subseteq \bigcup_{\alpha \in \mathcal{V}_x} (V_x \times W_\alpha) \) without loss of generality we may assume that \( \mathcal{V}_x \) is chosen so that \( x \in V_\alpha \) for all \( \alpha \in \mathcal{V}_x \). Let \( U_x := \bigcap_{\alpha \in \mathcal{V}_x} V_\alpha \subseteq X \), and notice that

\[ \bigcup_{\alpha \in \mathcal{V}_x} (V_x \times W_\alpha) \supset \bigcup_{\alpha \in \mathcal{V}_x} (U_x \times W_\alpha) = U_x \times Y, \]

see Figure 24.1 below. Since \( \{ U_x \}_{x \in X} \) is now an open cover of \( X \) and \( X \) is compact, there exists \( A \subseteq \subseteq X \) such that \( X = \bigcup_{x \in A} U_x \). The finite subcollection,
\[ V_0 := \{V_\alpha \times W_\alpha : \alpha \in \cup \in \Lambda F_\alpha \}, \text{ of } V \text{ is the desired finite subcover. Indeed using Eq. (24.2),} \]
\[ \cup V_0 = \cup_{x \in A} \cup_{\alpha \in F_x} (V_\alpha \times W_\alpha) \supset \cup_{x \in A} (U_x \times Y) = X \times Y. \]

The results of Exercises 17.36 and 17.35 prove Tychonoff’s Theorem for a countable product of compact metric spaces. We now state the general version of the theorem.

**Theorem 24.16 (Tychonoff’s Theorem).** Let \( \{X_\alpha\}_{\alpha \in A} \) be a collection of non-empty compact spaces. Then \( X := X_\alpha = 1 \uparrow X_\alpha \) is compact in the product space topology. (Compare with Exercise 17.36 which covers the special case of \( \text{Eq. (24.2)} \), mark 24.17 below should help the reader understand the strategy of the proof such that \( F \subset F \).

**Proof.** (The proof is taken from Loomis [10] which followed Bourbaki. Remark 24.17 below should help the reader understand the strategy of the proof to follow.) The proof requires a form of “induction” known as Zorn’s lemma which is equivalent to the axiom of choice, see Theorem ?? of Appendix ?? below.

For \( \alpha \in A \) let \( \pi_\alpha \) denote the projection map from \( X \) to \( X_\alpha \). Suppose that \( F \) is a family of closed subsets of \( X \) which has the finite intersection property, see Definition [17.56] By Proposition [17.57] the proof will be complete if we can show \( \cap F \neq \emptyset \).

The first step is to apply Zorn’s lemma to construct a maximal collection, \( F_0 \), of (not necessarily closed) subsets of \( X \) with the finite intersection property such that \( F \subset F_0 \). To do this, let \( \Gamma := \{G \subset 2^X : F \subset G\} \) equipped with the partial order, \( G_1 < G_2 \) if \( G_1 \subset G_2 \). If \( \Phi \) is a linearly ordered subset of \( \Gamma \), then \( \Phi := \cup \Phi \) is an upper bound for \( \Gamma \) which still has the finite intersection property as the reader should check. So by Zorn’s lemma, \( \Gamma \) has a maximal element \( F_0 \). The maximal \( F_0 \) has the following properties.

1. \( F_0 \) is closed under finite intersections. Indeed, if we let \( (F_0)_f \) denote the collection of all finite intersections of elements from \( F_0 \), then \( (F_0)_f \) has the finite intersection property and contains \( F_0 \). Since \( F_0 \) is maximal, this implies \( (F_0)_f = F_0 \).
2. If \( B \subset X \) and \( B \cap F \neq \emptyset \) for all \( F \in F_0 \) then \( B \in F_0 \). For if not \( F_0 \cup \{B\} \) would still satisfy the finite intersection property and would properly contain \( F_0 \) and this would violate the maximallity of \( F_0 \).
3. For each \( \alpha \in A \),
\[ \pi_\alpha(F_0) := \{\pi_\alpha(F) : F \in F_0\} \]
has the finite intersection property. Indeed, if \( \{F_i\}_{i=1}^n \subset F_0 \), then \( \cap_{i=1}^n \pi_\alpha(F_i) \supset \pi_\alpha(\cap_{i=1}^n F_i) \neq \emptyset \).

Since \( X_\alpha \) is compact, property 3. above along with Proposition [17.57] implies \( \cap_{F \in F_0} \pi_\alpha(F) \neq \emptyset \). Since this true for each \( \alpha \in A \), using the axiom of choice, there exists \( p \in X \) such that \( p_\alpha = \pi_\alpha(p) \in \cap_{F \in F_0} \pi_\alpha(F) \) for all \( \alpha \in A \). The proof will be completed by showing \( \cap F \neq \emptyset \) by showing \( p \in \cap F \).

Since \( C := \cap \{F : F \in F_0\} \subset \cap F \), it suffices to show \( p \in C \). Let \( U \) be an open neighborhood of \( p \) in \( X \). By the definition of the product topology (or item 2. of Proposition [17.25]), there exists \( A \subset A \) and open sets \( U_\alpha \subset X_\alpha \) for all \( \alpha \in A \) such that \( p \in \cap_{\alpha \in A} \pi^{-1}_\alpha(U_\alpha) \subset C \). Since \( p_\alpha = \pi_\alpha(p) \in \cap_{F \in F_0} \pi_\alpha(F) \) and \( p_\alpha \in U_\alpha \) for all \( \alpha \in A \), it follows that \( U \alpha \subset \cap \pi_\alpha(F) \neq \emptyset \) for all \( F \in F_0 \) and all \( \alpha \in A \). This then implies \( \pi^{-1}_\alpha(U_\alpha) \cap F \neq \emptyset \) for all \( F \in F_0 \) and all \( \alpha \in A \). By property 2. above we concluded that \( \pi^{-1}_\alpha(U_\alpha) \subset F_0 \) for all \( \alpha \in A \) and then by property 1. \( \cap_{\alpha \in A} \pi^{-1}_\alpha(U_\alpha) \subset F_0 \). In particular
\[ \emptyset \neq F \cap (\cap_{\alpha \in A} \pi^{-1}_\alpha(U_\alpha)) \subset C \cap U \text{ for all } F \in F_0 \]
which shows \( p \in F \) for each \( F \in F_0 \), i.e. \( p \in C \).

Remark 24.17. Consider the following simple example where \( X = [-1,1] \times [-1,1] \) and \( F = \{F_1, F_2\} \) as in Figure 24.2. Notice that \( \pi_1(F_1) \cap \pi_1(F_2) = [-1,1] \) for each \( i \) and so gives no help in trying to find the \( i \)-th coordinate of one of the two points in \( F_1 \cap F_2 \). This is why it is necessary to introduce the collection \( F_0 \) in the proof of Theorem 24.16. In this case one might take \( F_0 \) to be the collection of all subsets \( F \subset X \) such that \( p \in F \). We then have \( \cap_{F \in F_0} \pi_i(F) = \{p_i\} \), so the \( i \)-th coordinate of \( p \) may now be determined by observing the sets, \( \{\pi_i(F) : F \in F_0\} \).

### 24.4 Banach – Alaoglu’s Theorem

#### 24.4.1 Weak and Strong Topologies

**Definition 24.18.** Let \( X \) and \( Y \) be a normed vector spaces and \( L(X,Y) \) the normed space of bounded linear transformations from \( X \) to \( Y \).

1. The **weak topology** on \( X \) is the topology generated by \( X^* \), i.e. the smallest topology on \( X \) such that every element \( f \in X^* \) is continuous.
2. The **weak-∗ topology** on \( X^* \) is the topology generated by \( X \), i.e. the smallest topology on \( X^* \) such that the maps \( f \in X^* \to f(x) \in \mathbb{C} \) are continuous for all \( x \in X \).
3. The **strong operator topology** on \( L(X,Y) \) is the smallest topology such that \( T \in L(X,Y) \mapsto Tx \in Y \) is continuous for all \( x \in X \).

### Footnotes

[5] Here is where we use that \( F_0 \) is maximal among the collection of all, not just closed, sets having the finite intersection property and containing \( F \).
Fig. 24.2. Here \( \mathcal{F} = \{F_1, F_2\} \) where \( F_1 \) and \( F_2 \) are the two parabolic arcs and \( F_1 \cap F_2 = \{p, q\} \).

4. The **weak operator topology** on \( L(X,Y) \) is the smallest topology such that \( T \in L(X,Y) \rightarrow f(Tx) \in \mathbb{C} \) is continuous for all \( x \in X \) and \( f \in Y^* \).

Let us be a little more precise about the topologies described in the above definitions.

1. The **weak topology** has a neighborhood base at \( x_0 \in X \) consisting of sets of the form
   \[
   N := \bigcap_{i=1}^{n} \{x \in X : |f_i(x) - f_i(x_0)| < \varepsilon\}
   \]
   where \( f_i \in X^* \) and \( \varepsilon > 0 \).

2. The **weak-* topology** on \( X^* \) has a neighborhood base at \( f \in X^* \) consisting of sets of the form
   \[
   N := \bigcap_{i=1}^{n} \{g \in X^* : |f_i(x) - g(x)| < \varepsilon\}
   \]
   where \( x_i \in X \) and \( \varepsilon > 0 \).

3. The **strong operator topology** on \( L(X,Y) \) has a neighborhood base at \( T \in X^* \) consisting of sets of the form
   \[
   N := \bigcap_{i=1}^{n} \{S \in L(X,Y) : \|Sx_i - Tx_i\| < \varepsilon\}
   \]
   where \( x_i \in X \) and \( \varepsilon > 0 \).

4. The **weak operator topology** on \( L(X,Y) \) has a neighborhood base at \( T \in X^* \) consisting of sets of the form
   \[
   N := \bigcap_{i=1}^{n} \{S \in L(X,Y) : |f_i(Sx_i - Tx_i)| < \varepsilon\}
   \]
   where \( x_i \in X \), \( f_i \in X^* \) and \( \varepsilon > 0 \).

**Theorem 24.19 (Alaoglu’s Theorem).** If \( X \) is a normed space the closed unit ball,
\[
C^* := \{f \in X^* : \|f\| \leq 1\} \subset X^*,
\]
is weak-* compact. (Also see Theorem 24.30 and Proposition 32.16.)

**Proof.** For all \( x \in X \) let \( D_x = \{z \in \mathbb{C} : |z| \leq \|x\|\} \). Then \( D_x \subset \mathbb{C} \) is a compact set and so by Tychonoff’s Theorem \( \Omega := \prod_{x \in X} D_x \) is compact in the product topology. If \( f \in C^* \), \( |f(x)| \leq \|f\| \|x\| \leq \|x\| \) which implies that \( f(x) \in D_x \) for all \( x \in X \), i.e. \( C^* \subset \Omega \). The topology on \( C^* \) inherited from the weak-* topology on \( X^* \) is the same as that relative topology coming from the product topology on \( \Omega \). So to finish the proof it suffices to show \( C^* \) is a closed subset of the compact space \( \Omega \). To prove this let \( \pi_x(f) = f(x) \) be the projection maps. Then
\[
C^* = \{f \in \Omega : f \text{ is linear}\}
\]
\[
= \{f \in \Omega : f(x + cy) - f(x) - cf(y) = 0 \text{ for all } x, y \in X \text{ and } c \in \mathbb{C}\}
\]
\[
= \bigcap_{x,y \in X} \bigcap_{c \in \mathbb{C}} \{f \in \Omega : f(x + cy) - f(x) - cf(y) = 0\}
\]
\[
= \bigcap_{x,y \in X} \bigcap_{c \in \mathbb{C}} (\pi_x + c\pi_y)^{-1}(\{0\})
\]
which is closed because \( (\pi_x + c\pi_y)^{-1} : \Omega \rightarrow \mathbb{C} \) is continuous.

**Example 24.20 (Compactness does not imply sequential compactness).** (This example was taken from [9].) According to Theorem 14.16 \( \ell^\infty ([0,2\pi]) \cong \ell^1 ([0,2\pi])^* \). In this case the functions, \( f_n(\theta) := e^{int} \) are in the closed unit ball in \( \ell^\infty ([0,2\pi]) \). We are going to show that \( \{f_n\}_{n=1}^\infty \) does not have a weak-* convergent subsequence. For if it did, there would exist \( g_k := f_{nk} \) with \( n_k \uparrow \infty \) and \( f \in \ell^\infty ([0,2\pi]) \) such that
\[
\sum_\theta g_k(\theta) \psi(\theta) \rightarrow \sum_\theta f(\theta) \psi(\theta) \text{ for all } \psi \in \ell^1 ([0,2\pi]).
\]
Taking \( \psi = \delta_{\alpha,\beta} \) with \( \alpha \in [0,2\pi] \) we would infer that \( \lim_{k \rightarrow \infty} g_k(\alpha) = f(\alpha) \) for all \( \alpha \). In particular, it would follow that \( f : [0,2\pi] \rightarrow \mathbb{C} \) is a Borel measurable function such that \( |f(\alpha)| = 1 \) for all \( \alpha \). So by the dominated convergence theorem, it would follow that
\[
0 = \lim_{k \rightarrow \infty} \int_0^{2\pi} g_k(\alpha) e^{-ina} d\alpha = \int_0^{2\pi} f(\alpha) e^{-ina} d\alpha \text{ for all } n \in \mathbb{Z},
\]
wherein we have used \( \int_0^{2\pi} g_k(\alpha) e^{-ina} d\alpha = 0 \) for all \( k \) where \( n_k \neq n \) which eventually happens for \( k \) large. This then implies that \( f(\alpha) = 0 \) for \( m \) a.e. \( \alpha \) which contradicts the assertion that \( |f(\alpha)| = 1 \) for all \( \alpha \). See also Blue Rudin around p. 143.
There are a number of situations where the pathology in the above example does not happen. One is described in Theorem 24.24 below. The other is when $X$ is a reflexive Banach space.

**Theorem 24.21.** If $X$ is a reflexive Banach space, then weak and the weak-* topologies on $X^*$ are the same. Moreover, the closed unit ball in $X^*$ is weak-* (= weakly) sequentially compact. In particular this result holds for $L^p$-spaces with $1 < p < \infty$.

**Proof.** Since $X^{**} = \hat{X}$, it follows that the weak-* topology on $X^*$ is the same as the weak topology on $X^*$. (See Theorem 31.13 below where it is shown that $X$ is reflexive iff $X^*$ is reflexive.) Hence the unit ball in $X^*$ is also weakly compact. The Eberlein-Smulian Theorem 24.23 now guarantees that the unit ball in $X^*$ is also weakly sequentially compact. See problem 28c on p. 86 of Rudin’s functional analysis and the note on p. 376. For a short proof, see Whitley [31] and Henry B. Cohen [1].

**Lemma 24.22.** If $X$ is a separable Banach space, there exists a countable subset, $\{\varphi_n\}_{n=1}^\infty$ contained in the unit ball in $X^*$ such that if $x \in X$ and $\varphi_n(x) = 0$ for all $n$ then $x = 0$. Moreover if $K \subset X$ is a weakly compact set, then for $x, y \in K$,

$$d(x, y) := \sum_{n=1}^\infty \frac{1}{2^n} |\varphi_n(x - y)|$$

(24.3)

is a metric on $K$ which induces the weak topology on $K$.

**Proof.** Let $\{x_n\}_{n=1}^\infty$ be a countable dense subset in the unit sphere in $X$. By the Hahn Banach Theorem 31.4 (or Corollary 31.5 below), there exists $\varphi_n \in X^*$ with $\|\varphi_n\| = 1$ such that $\varphi_n(x_n) = 1$. Notice that for $x \in X$, we have

$$\sup_n |\varphi_n(x)| = \|x\| \sup_n \frac{\varphi_n(x)}{\|x\|} \leq \|x\|.$$

Moreover we may choose $x_{nk}$ such that $x_{nk} \to \frac{x}{\|x\|} = y$. Since and

$$\varphi_{nk}(y) = \varphi_{nk}(x_{nk}) + \varphi_{nk}(x_{nk} - y) = 1 + \varphi_{nk}(x_{nk} - y)$$

and $|\varphi_{nk}(x_{nk} - y)| \leq \|x_{nk} - y\| \to 0$ as $k \to \infty$, it follows that in fact $\sup_n |\varphi_n(x)| = \|x\|$ and hence $\{\varphi_n\}_{n=1}^\infty$ has the desired properties.

If $K \subset X$ is a weakly compact set, then $\varphi(K)$ is compact for all $\varphi \in X^*$ and in particular,

$$\sup_{x \in K} |\hat{\varphi}(\varphi)| = \sup_{x \in K} |\varphi(x)| < \infty \text{ for all } \varphi \in X^*.$$

By the uniform boundedness principle,

$$\sup_{x \in K} \|x\| = \sup_{x \in K} \|\hat{x}\|_{X^*} < \infty$$

which is to say $K$ is norm bounded.

The function $d$ is easily seen to be a metric on $X$. Moreover if $B$ is any norm bounded subset of $X$, $d|_{B \times B}$ is the uniform limit of continuous functions relative to the product of the weak topologies on $B$. Therefore $d|_{B \times B}$ is weak product topology continuous. In particular, any open $d$-ball in $B$ is a weakly open subset of $B$.

By the previous paragraph, it follows that $id : (K, \tau_w) \to (K, \tau_d)$ is a continuous bijective map. Since $(K, \tau_w)$ is compact and closed subsets of compact sets are compact, it follows that $id$ takes closed sets to compact subsets of $(K, \tau_d)$ which are necessarily closed since $(K, \tau_d)$ is Hausdorff. Therefore $id$ is a homeomorphism of topological spaces as was to be proved.

**Theorem 24.23 (Eberlein-Smulian Theorem).** For a Banach space $X$ with the weak topology, a subset $A \subset X$ is weakly precompact iff it is weakly countably compact iff it is weakly sequentially compact.

**Proof.** The direction of most interest to us is fairly easy. Namely suppose that $A \subset X$ weakly precompact and $\{a_n\}_{n=1}^\infty$ is a sequence in $A$, we will show that $\{a_n\}_{n=1}^\infty$ has a weakly convergent subsequence. Let $Y := \text{span}\{\{a_n\}_{n=1}^\infty\} \subset X$. By the Hahn Banach Theorem 31.4 (or Corollary 31.5 below), $Y$ is also weakly closed. Therefore $\hat{A} \cap Y = \hat{A} \cap Y$ (see Lemma 17.32) is compact as well. Since $Y$ is separable, $\hat{A} \cap Y$ is metrizable by Lemma 24.22 and therefore compactness implies completeness and sequential compactness. Hence there exists an $a \in \hat{A} \cap Y = \hat{A} \cap Y$ and a convergent subsequence $a_{nk} = a_{nk} \to a$ in $\hat{A} \cap Y = \hat{A} \cap Y$. Thus for every $\varphi \in X^*$, we have $\varphi(a_{nk}) \to \varphi(a)$ and in particular for every $\varphi \in X^*$, $\varphi|_Y \in Y^*$ and hence $\varphi(a_{nk}) \to \varphi(a)$. This shows $a_{nk} \to a$ relative to the weak topology on $X$.

**Theorem 24.24 (Alaoglu’s Theorem for separable spaces).** Suppose that $X$ is a separable Banach space, $C^* := \{f : X \to \mathbb{R} : \|f\| \leq 1\}$ is the closed unit ball in $X^*$ and $\{x_n\}_{n=1}^\infty$ is an countable dense subset of $C := \{x \in X : \|x\| \leq 1\}$. Then

$$\rho(f, g) := \sum_{n=1}^\infty \frac{1}{2^n} |f(x_n) - g(x_n)|$$

(24.4)

defines a metric on $C^*$ which is compatible with the weak topology on $C^*$, $\tau_{C^*} := (\tau_w)|_C = \{V \cap C : V \in \tau_w\}$. Moreover $(C^*, \rho)$ is a compact metric space.

**Proof.** The routine check that $\rho$ is a metric is left to the reader. Let $\tau_p$ be the topology on $C^*$ induced by $\rho$. For any $g \in X^*$ and $n \in \mathbb{N}$, the map $f \in X^* \to (f(x_n) - g(x_n)) \in C$ is $\tau_w$-continuous and since the sum in Eq. 24.4 is uniformly convergent for $f \in C^*$, it follows that $f \to \rho(f, g)$ is $\tau_{C^*}$-
continuous. This implies the open balls relative to \( \rho \) are contained in \( \tau_{C^*} \) and therefore \( \tau_{\rho} \subset \tau_{C^*} \).

We now wish to prove \( \tau_{C^*} \subset \tau_{\rho} \). Since \( \tau_{C^*} \) is the topology generated by \( \{ \hat{x} |_{C^*} : x \in C \} \), it suffices to show \( \hat{x} \) is \( \tau_{\rho} \)– continuous for all \( x \in C \). But given \( x \in C \) there exists a subsequence \( y_k := x_{n_k} \) of \( \{ x_n \}_{n=1}^{\infty} \) such that such that \( x = \lim_{k \to \infty} y_k \). Since

\[
\sup_{f \in C^*} |\hat{x}(f) - \hat{y}_k(f)| = \sup_{f \in C^*} |f(x - y_k)| \leq \|x - y_k\| \to 0 \text{ as } k \to \infty,
\]

\( \hat{y}_k \to \hat{x} \) uniformly on \( C^* \) and using \( \hat{y}_k \) is \( \tau_{\rho} \)– continuous for all \( k \) (as is easily checked) we learn \( \hat{x} \) is also \( \tau_{\rho} \) continuous. Hence \( \tau_{C^*} = \tau(\hat{x} |_{C^*} : x \in X) \subset \tau_{\rho} \).

The compactness assertion follows from Theorem 24.19. The compactness assertion may also be verified directly using: 1) sequential compactness is equivalent to compactness for metric spaces and 2) a Cantor’s diagonalization argument as in the proof of Theorem 24.30 (See Proposition 32.16 below.)

### 24.5 Weak Convergence in Hilbert Spaces

Suppose \( H \) is an infinite dimensional Hilbert space and \( \{ x_n \}_{n=1}^{\infty} \) is an orthonormal subset of \( H \). Then, by Eq. 16.1, \( \| x_n - x_m \| = 2 \) for all \( m \neq n \) and in particular, \( \{ x_n \}_{n=1}^{\infty} \) has no convergent subsequences. From this we conclude that \( C := \{ x \in H : \| x \| \leq 1 \} \), the closed unit ball in \( H \), is not compact. To overcome this problems it is sometimes useful to introduce a weaker topology on \( X \) having the property that \( C \) is compact.

**Definition 24.25.** Let \( (X, \| \cdot \|) \) be a Banach space and \( X^* \) be its continuous dual. The weak topology, \( \tau_w \), on \( X \) is the topology generated by \( X^* \). If \( \{ x_n \}_{n=1}^{\infty} \subset X \) is a sequence we will write \( x_n \xrightarrow{w} x \) as \( n \to \infty \) to mean that \( x_n \to x \) in the weak topology.

Because \( \tau_{\rho} = \tau(X^*) \subset \tau_{\| \cdot \|} := \tau(\{ \| x - \cdot \| : x \in X \}) \), it is harder for a function \( f : X \to \mathbb{F} \) to be continuous in the \( \tau_{\rho} \)– topology than in the norm topology, \( \tau_{\| \cdot \|} \). In particular if \( \varphi : X \to \mathbb{F} \) is a linear functional which is \( \tau_{\rho} \)– continuous, then \( \varphi \) is \( \tau_{\| \cdot \|} \)– continuous and hence \( \varphi \in X^* \).

**Exercise 24.7.** Show the vector space operations of \( X \) are continuous in the weak topology, i.e. show:

1. \( (x, y) \in X \times X \to x + y \in X \) is \( (\tau_{\rho} \otimes \tau_{\rho}, \tau_{\rho}) \)– continuous and
2. \( (\lambda, x) \in \mathbb{F} \times X \to \lambda x \in X \) is \( (\tau_{\rho} \otimes \tau_{\rho}, \tau_{\rho}) \)– continuous.

**Proposition 24.26.** Let \( \{ x_n \}_{n=1}^{\infty} \subset X \) be a sequence, then \( x_n \xrightarrow{w} x \in X \) as \( n \to \infty \) iff \( \varphi(x) = \lim_{n \to \infty} \varphi(x_n) \) for all \( \varphi \in X^* \).

**Proof.** By definition of \( \tau_w \), we have \( x_n \xrightarrow{w} x \in X \) iff for all \( I \subset X^* \) and \( \varepsilon > 0 \) there exists an \( N \in \mathbb{N} \) such that \( |\varphi(x) - \varphi(x_n)| < \varepsilon \) for all \( n \geq N \) and \( \varphi \in I \). This later condition is easily seen to be equivalent to \( \varphi(x) = \lim_{n \to \infty} \varphi(x_n) \) for all \( \varphi \in X^* \).

The topological space \( (X, \tau_w) \) is still Hausdorff as follows from the Hahn Banach Theorem, see Theorem 31.10 below. For the moment we will concentrate on the special case where \( X = H \) is a Hilbert space in which case \( H^* = \{ \varphi := \langle \cdot | z \rangle : z \in H \} \), see Theorem 16.15. If \( x, y \in H \) and \( z := y - x \neq 0 \), then

\[
0 < \varepsilon := \| z \|^2 = \varphi_z(z) = \varphi_z(y) - \varphi_z(x).
\]

Thus

\[
V_x := \{ w \in H : |\varphi_z(x) - \varphi_z(w)| < \varepsilon/2 \} \text{ and } V_y := \{ w \in H : |\varphi_z(y) - \varphi_z(w)| < \varepsilon/2 \}
\]

are disjoint sets from \( \tau_w \) which contain \( x \) and \( y \) respectively. This shows that \( (H, \tau_w) \) is a Hausdorff space. In particular, this shows that weak limits are unique if they exist.

**Remark 24.27.** Suppose that \( H \) is an infinite dimensional Hilbert space \( \{ x_n \}_{n=1}^{\infty} \) is an orthonormal subset of \( H \). Then Bessel’s inequality (Proposition 16.18) implies \( x_n \xrightarrow{w} 0 \in H \) as \( n \to \infty \). This points out the fact that if \( x_n \xrightarrow{w} x \in H \) as \( n \to \infty \), it is no longer necessarily true that \( \| x \| = \lim_{n \to \infty} \| x_n \| \). However we do always have \( \| x \| \leq \liminf_{n \to \infty} \| x_n \| \) because,

\[
\| x \| = \lim_{n \to \infty} \langle x_n | x \rangle = \liminf_{n \to \infty} \| x_n \| \| x \| = \| x \| \liminf_{n \to \infty} \| x_n \|.
\]

**Proposition 24.28.** Let \( H \) be a Hilbert space, \( \beta \subset H \) be an orthonormal basis for \( H \) and \( \{ x_n \}_{n=1}^{\infty} \subset H \) be a bounded sequence, then the following are equivalent:

1. \( x_n \xrightarrow{w} x \in H \) as \( n \to \infty \).
2. \( \langle x | y \rangle = \lim_{n \to \infty} \langle x_n | y \rangle \) for all \( y \in H \).
3. \( \langle x | y \rangle = \lim_{n \to \infty} \langle x_n | y \rangle \) for all \( y \in \beta \).

Moreover, if \( c_y := \lim_{n \to \infty} \langle x_n | y \rangle \) exists for all \( y \in \beta \), then \( \sum_{y \in \beta} |c_y|^2 < \infty \) and \( x_n \xrightarrow{w} x := \sum_{y \in \beta} c_y y \in H \) as \( n \to \infty \).

**Proof.** 1. \( \implies \) 2. This is a consequence of Theorem 16.15 and Proposition 24.26. 2. \( \implies \) 3. is trivial. 3. \( \implies \) 1. Let \( M := \sup_n \| x_n \| \) and \( H_0 \) denote the algebraic span of \( \beta \). Then for \( y \in H \) and \( z \in H_0 \),

\[
|\langle x - x_n | y \rangle| = |\langle x - x_n | y - z \rangle| \leq |\langle x - x_n | z \rangle| + 2M \| y - z \|.
\]
Passing to the limit in this equation implies \( \limsup_{n \to \infty} |\langle x - x_n | y \rangle| \leq 2M \|y - z\| \) which shows \( \limsup_{n \to \infty} |\langle x - x_n | y \rangle| = 0 \) since \( H_0 \) is dense in \( H \). To prove the last assertion, let \( \Gamma \subset \subset \beta \). Then by Bessel’s inequality (Proposition 16.15),

\[
\sum_{y \in \Gamma} |c_y|^2 = \lim_{n \to \infty} \sum_{y \in \Gamma} |\langle x_n | y \rangle|^2 \leq \liminf_{n \to \infty} \|x_n\|^2 \leq M^2.
\]

Since \( \Gamma \subset \subset \beta \) was arbitrary, we conclude that \( \sum_{y \in \beta} |c_y|^2 \leq M < \infty \) and hence we may define \( x := \sum_{y \in \beta} c_y y \). By construction we have

\[
\langle x | y \rangle = c_y = \lim_{n \to \infty} \langle x_n | y \rangle \text{ for all } y \in \beta
\]

and hence \( x_n \xrightarrow{w} x \in H \) as \( n \to \infty \) by what we have just proved.

**Theorem 24.29.** Suppose \( \{x_n\}_{n=1}^\infty \) is a bounded sequence in a Hilbert space, \( H \). Then there exists a subsequence \( y_k := x_{n_k} \) of \( \{x_n\}_{n=1}^\infty \) and \( x \in X \) such that \( y_k \xrightarrow{w} x \) as \( k \to \infty \).

**Proof.** This is a consequence of Proposition 24.28 and a Cantor’s diagonalization argument which is left to the reader, see Exercise 16.3.

**Theorem 24.30 (Alaoglu’s Theorem for Hilbert Spaces).** Suppose that \( H \) is a separable Hilbert space, \( C := \{x \in H : \|x\| \leq 1\} \) is the closed unit ball in \( H \) and \( \{e_n\}_{n=1}^\infty \) is an orthonormal basis for \( H \). Then

\[
\rho(x, y) := \sum_{n=1}^\infty \frac{1}{2^n} |\langle x - y | e_n \rangle| \quad \text{(24.5)}
\]

defines a metric on \( C \) which is compatible with the weak topology on \( C \), \( \tau_C := (\tau_w)_C = \{V \cap C : V \in \tau_w\} \). Moreover \( (C, \rho) \) is a compact metric space. (This theorem will be extended to Banach spaces, see Theorems 24.13 and 24.24 below.)

**Proof.** The routine check that \( \rho \) is a metric is left to the reader. Let \( \tau_p \) be the topology on \( C \) induced by \( \rho \). For any \( y \in H \) and \( n \in \mathbb{N} \), the map \( x \to \rho(x, y) \) is \( \tau_w \) continuous and since the sum in Eq. (24.5) is uniformly convergent for \( x, y \in C \), it follows that \( x \to \rho(x, y) \) is \( \tau_C \) - continuous. This implies the open balls relative to \( \rho \) are contained in \( \tau_C \) and therefore \( \tau_p \subset \tau_C \). For the converse inclusion, let \( z \in H, x \to \varphi_z(x) = \langle x | z \rangle \) be an element of \( H^* \), and for \( N \in \mathbb{N} \) let \( z_N := \sum_{n=1}^N \langle z | e_n \rangle e_n \). Then \( \varphi_{z_N} = \sum_{n=1}^N \langle z | e_n \rangle \varphi_{e_n} \) is \( \rho \) continuous, being a finite linear combination of the \( \varphi_{e_n} \) which are easily seen to be \( \rho \) - continuous. Because \( z_N \xrightarrow{w} z \) as \( N \to \infty \) it follows that

\[
\sup_{x \in C} |\varphi_z(x) - \varphi_{z_N}(x)| = \|z - z_N\| \to 0 \text{ as } N \to \infty.
\]

Therefore \( \varphi_z \) is \( \rho \) - continuous as well and hence \( \tau_C = \tau(\varphi_z : z \in H) \subset \tau_p \). The last assertion follows directly from Theorem 24.29 and the fact that sequential compactness is equivalent to compactness for metric spaces.

The next theorem give an elementary argument to show that bounded sets in a Hilbert space are always weakly sequentially compact.

**Theorem 24.31.** Suppose \( \{x_n\}_{n=1}^\infty \) is a bounded sequence in \( H \) (i.e. \( C := \sup_n \|x_n\| < \infty \)), then there exists a subsequence, \( y_k := x_{n_k} \) and \( x \in H \) such that \( \lim_{k \to \infty} \langle y_k | h \rangle = \langle x | h \rangle \) for all \( h \in H \). We say that \( y_k \to x \) weakly in this case.

**Proof.** Let \( H_0 := \overline{\text{span}}(x_k : k \in \mathbb{N}) \). Then \( H_0 \) is a closed separable Hilbert subspace of \( H \) and \( x_k \xrightarrow{k \to \infty} \{x_k\} \subset H_0 \). Let \( \{h_n\}_{n=1}^\infty \) be a countable dense subset of \( H_0 \). Since \( |\langle x_k | h_n \rangle| \leq \|x_k\| \|h_n\| \leq C \|h_n\| < \infty \), the sequence, \( \{\langle x_k | h_n \rangle\}_{k=1}^\infty \subset C \), is bounded and hence has a convergent subsequence for all \( n \in \mathbb{N} \). By the Cantor’s diagonalization argument we can find a sub-sequence, \( y_k := x_{n_k} \), of \( \{x_n\} \) such that \( \lim_{k \to \infty} \langle y_k | h_n \rangle \) exists for all \( n \in \mathbb{N} \).

We now show \( \varphi(z) := \lim_{k \to \infty} \langle y_k | z \rangle \) exists for all \( z \in H_0 \). Indeed, for any \( k, l, n \in \mathbb{N} \), we have

\[
|\langle y_k | z \rangle - \langle y_l | z \rangle| = |\langle y_k - y_l | z \rangle| \leq \|y_k - y_l\| \|h_n\| + |\langle y_k - y_l | h_n \rangle| \leq \|y_k - y_l\| + 2C \|z - h_n\|.
\]

Letting \( k, l \to \infty \) in this estimate then shows

\[
\limsup_{k, l \to \infty} |\langle y_k | z \rangle - \langle y_l | z \rangle| \leq 2C \|z - h_n\|.
\]

Since we may choose \( n \in \mathbb{N} \) such that \( \|z - h_n\| \) is as small as we please, we may conclude that \( \limsup_{k \to \infty} |\langle y_k | z \rangle - \langle y_l | z \rangle| \), i.e. \( \varphi(z) := \lim_{k \to \infty} \langle y_k | z \rangle \) exists.

The function, \( \tilde{\varphi}(z) = \lim_{k \to \infty} \langle z | y_k \rangle \) is a bounded linear functional on \( H \) because

\[
|\tilde{\varphi}(z)| = \liminf_{k \to \infty} |\langle z | y_k \rangle| \leq C \|z\|.
\]

Therefore by the Riesz Theorem 16.15 there exists \( x \in H_0 \) such that \( \tilde{\varphi}(z) = \langle z | x \rangle \) for all \( z \in H_0 \). Thus, for \( x \in H_0 \) we have shown

\[
\lim_{k \to \infty} \langle y_k | z \rangle = \langle x | z \rangle \text{ for all } z \in H_0.
\]

To finish the proof we need only observe that Eq. (24.6) is valid for all \( z \in H \). Indeed if \( z \in H \), then \( z = z_0 + z_1 \) where \( z_0 = P_{H_0} z \in H_0 \) and \( z_1 = z - P_{H_0} z \in H_0 \). Since \( y_k, x \in H_0 \), we have

\[
\lim_{k \to \infty} \langle y_k | z \rangle = \lim_{k \to \infty} \langle y_k | z_0 \rangle = \langle x | z_0 \rangle = \langle x | z \rangle \text{ for all } z \in H.
\]
24.6 Exercises

Exercise 24.9. Let $C$ be a closed proper subset of $\mathbb{R}^n$ and $x \in \mathbb{R}^n \setminus C$. Show there exists a $y \in C$ such that $d(x, y) = d_C(x)$.

Exercise 24.10. Let $F = \mathbb{R}$ in this problem and $A \subset \ell^2(\mathbb{N})$ be defined by

$$A = \{ x \in \ell^2(\mathbb{N}) : x(n) \geq 1 + 1/n \text{ for some } n \in \mathbb{N} \} = \bigcup_{n=1}^{\infty} \{ x \in \ell^2(\mathbb{N}) : x(n) \geq 1 + 1/n \}.$$

Show $A$ is a closed subset of $\ell^2(\mathbb{N})$ with the property that $d_A(0) = 1$ while there is no $y \in A$ such that $d(0, y) = 1$. (Remember that in general an infinite union of closed sets need not be closed.)

Exercise 24.11. Let $p \in [1, \infty]$ and $X$ be an infinite set. Show directly, without using Theorem 17.68 the closed unit ball in $\ell^p(X)$ is not compact.

24.6.1 Ascoli-Arzela Theorem Problems

Exercise 24.12. Let $(X, \tau)$ be a compact topological space and $F := \{ f_n \}_{n=1}^{\infty} \subset C(X)$ is a sequence of functions which are equicontinuous and pointwise convergent. Show $f(x) := \lim_{n \to \infty} f_n(x)$ is continuous and that $\lim_{n \to \infty} \| f - f_n \|_X = 0$, i.e. $f_n \to f$ uniformly as $n \to \infty$.

Exercise 24.13. Let $T \in (0, \infty)$ and $F \subset C([0, T])$ be a family of functions such that:

1. $\dot{f}(t)$ exists for all $t \in (0, T)$ and $f \in F$.
2. $\sup_{f \in F} |f(0)| < \infty$ and $\sup_{f \in F} \| f \|_{C(0, T)} < \infty$.
3. $M := \sup_{f \in F} \sup_{t \in (0, T)} |\dot{f}(t)| < \infty$.

Show $F$ is precompact in the Banach space $C([0, T])$ equipped with the norm $\| f \|_{C(0, T)} = \sup_{t \in [0, T]} |f(t)|$.

Exercise 24.14 (Peano’s Existence Theorem). Suppose $Z : \mathbb{R} \times \mathbb{R}^d \to \mathbb{R}^d$ is a bounded continuous function. Then for each $T < \infty$ there exists a solution to the differential equation

$$\dot{x}(t) = Z(t, x(t)) \text{ for } -T < t < T \text{ with } x(0) = x_0.$$  \hfill (24.7)

Do this by filling in the following outline for the proof.

6 Using Corollary 24.12 we may in fact allow $T = \infty$.

1. Given $\varepsilon > 0$, show there exists a unique function $x_\varepsilon \in C([-\varepsilon, \infty) \to \mathbb{R}^d)$ such that $x_\varepsilon(t) := x_0$ for $-\varepsilon \leq t \leq 0$ and

$$x_\varepsilon(t) = x_0 + \int_{0}^{t} Z(\tau, x_\varepsilon(\tau - \varepsilon))d\tau \text{ for all } t \geq 0. \quad (24.8)$$

Here

$$\int_{0}^{t} Z(\tau, x_\varepsilon(\tau - \varepsilon))d\tau = \left( \int_{0}^{t} Z_1(\tau, x_\varepsilon(\tau - \varepsilon))d\tau, \ldots, \int_{0}^{t} Z_d(\tau, x_\varepsilon(\tau - \varepsilon))d\tau \right)$$

where $Z = (Z_1, \ldots, Z_d)$ and the integrals are either the Lebesgue or the Riemann integral since they are equal on continuous functions. Hint: For $t \in [0, \varepsilon]$, it follows from Eq. (24.8) that

$$x_\varepsilon(t) = x_0 + \int_{0}^{t} Z(\tau, x_\varepsilon(\tau))d\tau.$$

Now that $x_\varepsilon(t)$ is known for $t \in [-\varepsilon, \varepsilon]$ it can be found by integration for $t \in [-\varepsilon, 2\varepsilon]$. The process can be repeated.

2. Then use Exercise 24.13 to show there exists $\{ x_k \}_{k=1}^{\infty} \subset (0, \infty)$ such that $\lim_{k \to \infty} x_k = 0$ and $x_{x_k}$ converges to some $x \in C([0, T])$ with respect to the sup-norm: $\| x \|_X = \sup_{t \in [0, T]} |x(t)|$. Also show for this sequence that

$$\lim_{k \to \infty} \sup_{\varepsilon_k \leq \varepsilon \leq T} |x_{x_k}(\tau - x_k) - x(\tau)| = 0.$$

3. Pass to the limit (with justification) in Eq. (24.8) with $\varepsilon$ replaced by $x_k$ to show $x$ satisfies

$$x(t) = x_0 + \int_{0}^{t} Z(\tau, x(\tau))d\tau \forall \ t \in [0, T].$$

4. Conclude from this that $\dot{x}(t)$ exists for $t \in (0, T)$ and that $x$ solves Eq. (24.7).

5. Apply what you have just proved to the ODE,

$$\dot{y}(t) = -Z(-t, y(t)) \text{ for } 0 \leq t < T \text{ with } y(0) = x_0.$$

Then extend $x(t)$ above to $(-T, T)$ by setting $x(t) = y(-t)$ if $t \in (-T, 0)$. Show $x$ so defined solves Eq. (24.7) for $t \in (-T, T)$.

Exercise 24.15. Prove Theorem 24.14 Hint: First prove $C^{1,\alpha}(\bar{\Omega}) \subset C^{1,\alpha}(\Omega)$ is compact if $0 \leq \alpha < \beta \leq 1$. Then use Lemma 29.11 repeatedly to handle all of the other cases.
Locally Compact Hausdorff Spaces

In this section $X$ will always be a topological space with topology $\tau$. We are now interested in restrictions on $\tau$ in order to insure there are “plenty” of continuous functions. One such restriction is to assume $\tau = \tau_d$ – is the topology induced from a metric on $X$. For example the results in Lemma 13.15 and Theorem 14.4 above shows that metric spaces have lots of continuous functions. We are now interested in restrictions on $X$. We will start out with the notion of a Hausdorff topology. The following example shows a pathology which occurs when there are not enough open sets in a topological space.

**Example 25.1.** As in Example [17.36] let

$$ X := \{1, 2, 3\} \text{ with } \tau := \{X, \emptyset, \{1, 2\}, \{2, 3\}, \{2\}\}. $$

Example [17.36] shows limits need not be unique in this space and moreover it is easy to verify that the only continuous functions, $f : Y \to \mathbb{R}$, are necessarily constant.

**Definition 25.2 (Hausdorff Topology).** A topological space, $(X, \tau)$, is **Hausdorff** if for each pair of distinct points, $x, y \in X$, there exists disjoint open neighborhoods, $U$ and $V$ of $x$ and $y$ respectively. (Metric spaces are typical examples of Hausdorff spaces.)

**Remark 25.3.** When $\tau$ is Hausdorff the “pathologies” appearing in Example 25.1 do not occur. Indeed if $x_n \to x \in X$ and $y \in X \setminus \{x\}$ we may choose $V \in \tau_x$ and $W \in \tau_y$ such that $V \cap W = \emptyset$. Then $x_n \in V$ a.a. implies $x_n \notin W$ for all but a finite number of $n$ and hence $x_n \to y$, so limits are unique.

**Proposition 25.4.** Let $(X_\alpha, \tau_\alpha)$ be Hausdorff topological spaces. Then the product space $X_A = \prod_{\alpha \in A} X_\alpha$ equipped with the product topology is Hausdorff.

**Proof.** Let $x, y \in X_A$ be distinct points. Then there exists $\alpha \in A$ such that $\pi_\alpha(x) = x_\alpha \neq y_\alpha = \pi_\alpha(y)$. Since $X_\alpha$ is Hausdorff, there exists disjoint open sets $U, V \subseteq X_\alpha$, such $\pi_\alpha(x) \in U$ and $\pi_\alpha(y) \in V$. Then $\pi_\alpha^{-1}(U)$ and $\pi_\alpha^{-1}(V)$ are disjoint open sets in $X_A$ containing $x$ and $y$ respectively.

**Proposition 25.5.** Suppose that $(X, \tau)$ is a Hausdorff space, $K \subseteq X$ and $x \in K^c$. Then there exists $U, V \in \tau$ such that $U \cap V = \emptyset, x \in U$ and $K \subseteq V$. In particular $K$ is closed. (So compact subsets of Hausdorff topological spaces are closed.)

**Proof.** Because $X$ is Hausdorff, for all $y \in K$ there exists $V_y \in \tau_y$ such that $V_y \cap U_y = \emptyset$. The cover $\{V_y\}_{y \in K}$ of $K$ has a finite subcover $\{V_y\}_{y \in \Lambda}$ for some $\Lambda \subseteq K$. Let $V = \bigcup_{y \in \Lambda} V_y$ and $U = \bigcap_{y \in \Lambda} U_y$, then $U, V \in \tau$ satisfy $x \in U, K \subseteq V$ and $U \cap V = \emptyset$. This shows that $K^c$ is open and hence that $K$ is closed. Suppose that $K$ and $F$ are two disjoint compact subsets of $X$. For each $x \in F$ there exists disjoint open sets $U_x$ and $V_x$ such that $K \subseteq V_x$ and $x \in U_x$. Since $\{U_x\}_{x \in F}$ is an open cover of $F$, there exists a finite subset $\Lambda$ of $F$ such that $F \subseteq \bigcup_{x \in \Lambda} U_x$. The proof is completed by defining $V := \bigcap_{x \in \Lambda} V_x$.

**Exercise 25.2.** Let $(X, \tau)$ and $(Y, \tau_Y)$ be topological spaces.

1. Show $\tau$ is Hausdorff iff $\Delta := \{(x, x) : x \in X\}$ is a closed set in $X \times X$ equipped with the product topology $\tau \otimes \tau$.

2. Suppose $\tau$ is Hausdorff and $f, g : Y \to X$ are continuous maps. If $\{f = g\}^Y = \emptyset$ then $f = g$. **Hint:** make use of the map $f \times g : Y \to X \times X$ defined by $(f \times g)(y) = (f(y), g(y))$.

**Exercise 25.3.** Give an example of a topological space which has a non-closed compact subset.

**Proposition 25.6.** Suppose that $X$ is a compact topological space, $Y$ is a Hausdorff topological space, and $f : X \to Y$ is a continuous bijection then $f$ is a homeomorphism, i.e. $f^{-1} : Y \to X$ is continuous as well.

**Proof.** Since closed subsets of compact sets are compact, continuous images of compact subsets are compact and compact subsets of Hausdorff spaces are closed, it follows that $(f^{-1})^{-1}(C) = f(C)$ is closed in $X$ for all closed subsets $C$ of $X$. Thus $f^{-1}$ is continuous.
The next two results show that locally compact Hausdorff spaces have plenty of open sets and plenty of continuous functions.

**Proposition 25.7.** Suppose $X$ is a locally compact Hausdorff space and $U \subset X$ and $K \subset U$. Then there exists $V \subset X$ such that $K \subset V \subset \overline{V} \subset U \subset X$ and $\overline{V}$ is compact. (Compare with Proposition 24.7 above.)

**Proof.** By local compactness, for all $x \in K$, there exists $U_x \in \tau_x$ such that $\overline{U}_x$ is compact. Since $K$ is compact, there exists $A \subset K$ such that $\{U_x\}_{x \in A}$ is a cover of $K$. The set $O = U \cap (\cup_{x \in A}U_x)$ is an open set such that $K \subset O \subset U$ and $O$ is precompact since $\overline{O}$ is a closed subset of the compact set $\cup_{x \in A} \overline{U}_x$. (Compare with Proposition 24.7 above.) So by replacing $U$ by $O$ if necessary, we may assume that $\overline{U}$ is compact. Since $\overline{U}$ is compact and the proof is complete.

**Definition 24.8** such that $f = 1$ on $K$. In particular, if $K$ is compact and $C$ is closed in $X$ such that $K \cap C = \emptyset$, there exists $f \in C_c(X, [0, 1])$ such that $f = 1$ on $K$ and $f = 0$ on $C$.

**Proof.** For notational ease later it is more convenient to construct $g := 1 - f$ rather than $f$. To motivate the proof, suppose $g \in C(X, [0, 1])$ such that $g = 0$ on $K$ and $g = 1$ on $U'$. For $r > 0$, let $U_r = (g < r)$. Then for $0 < r < s \leq 1$, $U_r \subset \{g \leq r\} \subset U_s$ and since $\{g \leq r\}$ is closed this implies

$$K \subset U_r \subset \bigcup_{r \in \mathbb{D}} \{g \leq r\} \subset U_s \subset U.$$

Therefore associated to the function $g$ is the collection open sets $\{U_r\}_{r > 0} \subset \tau$ with the property that $K \subset U_r \subset \bigcup_{r \in \mathbb{D}} \{g \leq r\} \subset \bigcup_{r \in \mathbb{D}} U_r \subset X$ if $r > 1$. Finally let us notice that we may recover the function $g(\cdot)$ from the sequence $\{U_r\}_{r > 0}$ by the formula

$$g(x) = \inf\{r > 0 : x \in U_r\}.$$  \hspace{1cm} (25.1)\]

The idea of the proof to follow is to turn these remarks around and define $g$ by Eq. (25.1).

**Step 1. (Construction of the $U_r$)** Let

$$\mathbb{D} := \{k2^{-n} : k = 1, 2, \ldots, 2^{-n}, n = 1, 2, \ldots\}$$

be the dyadic rationals in $(0, 1]$. Use Proposition 25.7 to find a precompact open set $U_1$ such that $K \subset U_1 \subset \overline{U}_1 \subset U$. Apply Proposition 25.7 again to construct an open set $U_{1/2}$ such that

$$K \subset U_{1/2} \subset \overline{U}_{1/2} \subset U_1$$

and similarly use Proposition 25.7 to find open sets $U_{1/2}, U_{3/4} \subset X$ such that

$$K \subset U_{1/4} \subset \overline{U}_{1/4} \subset U_{1/2} \subset U_{3/4} \subset \overline{U}_{3/4} \subset U_1.$$

Likewise there exists open set $U_{1/8}, U_{3/8}, U_{5/8}, U_{7/8}$ such that

$$K \subset U_{1/8} \subset \overline{U}_{1/8} \subset U_{1/4} \subset U_{3/8} \subset \overline{U}_{3/8} \subset U_{1/2} \subset \overline{U}_{1/2} \subset U_{5/8} \subset \overline{U}_{5/8} \subset U_{3/4} \subset \overline{U}_{3/4} \subset U_{7/8} \subset U_{7/8} \subset U_1.$$

Continuing this way inductively, one shows there exists precompact open sets $\{U_r\}_{r \in \mathbb{D}} \subset \tau$ such that

$$K \subset U_r \subset \overline{U}_r \subset U_s \subset U_1 \subset U$$

for all $r, s \subset \mathbb{D}$ with $0 < r < s \leq 1$.

**Step 2.** Let $U_r := X$ if $r > 1$ and define

\begin{figure}[h]
\centering
\includegraphics[width=\textwidth]{figure25.1.png}
\caption{The construction of $V$.}
\end{figure}
Theorem 25.9 (Locally Compact Tietz Extension Theorem). Let \((X, \tau)\) be a locally compact Hausdorff space, \(K \subset X\), \(f \in C(K, \mathbb{R})\), \(a = \min f(K)\) and \(b = \max f(K)\). Then there exists \(F \in C(X, [a, b])\) such that \(F|_K = f\). Moreover given \(c \in [a, b]\), \(F\) can be chosen so that \(\text{supp}(F - c) = \{F \neq c\} \subset U\).

The proof of this theorem is similar to Theorem 14.4 and will be left to the reader, see Exercise 25.6.

25.1 Locally compact form of Urysohn’s Metrization Theorem

Definition 25.10 (Polish spaces). A Polish space is a separable topological space \((X, \tau)\) which admits a complete metric, \(\rho\), such that \(\tau = \tau_\rho\).

Notation 25.11 Let \(Q := [0, 1]^N\) denote the (infinite dimensional) unit cube in \(\mathbb{R}^N\). For \(a, b \in Q\) let

\[
d(a, b) := \sum_{n=1}^{\infty} \frac{1}{2^n} |a_n - b_n|.
\] (25.2)

The metric introduced in Exercise 17.36 would be defined, in this context, as \(d(a, b) := \sum_{n=1}^{\infty} \frac{|a_n - b_n|}{1 + |a_n - b_n|}\). Since \(1 \leq 1 + |a_n - b_n| \leq 2\), it follows that \(d \leq d \leq 2d\). So the metrics \(d\) and \(\tilde{d}\) are equivalent and in particular the topologies induced by \(d\) and \(\tilde{d}\) are the same. By Exercises 17.35, the \(d – \text{topology on } Q\) is the same as the product topology and by Tychonoff’s Theorem 24.16 or by Exercise 17.36 \((Q, d)\) is a compact metric space.

Theorem 25.12. To every separable metric space \((X, \rho)\), there exists a continuous injective map \(G : X \to Q\) such that \(G : X \to G(X) \subset Q\) is a homeomorphism. Moreover if the metric, \(\rho\), is also complete, then \(G(X)\) is a \(G_\delta\) –set, i.e. the \(G(X)\) is the countable intersection of open subsets of \((Q, d)\). In short, any separable metrizable space \(X\) is homeomorphic to a subset of \((Q, d)\) and if \(X\) is a Polish space then \(X\) is homeomorphic to a \(G_\delta\) –subset of \((Q, d)\).

Proof. (See Rogers and Williams [23], Theorem 82.5 on p. 106.) By replacing \(\rho\) by \(\frac{\rho}{\sqrt{d}}\) if necessary, we may assume that \(0 \leq \rho < 1\). Let \(D = \{a_n\}_{n=1}^{\infty}\) be a countable dense subset of \(X\) and define

\[
G(x) = (\rho(x, a_1), \rho(x, a_2), \rho(x, a_3), \ldots) \in Q
\]

and

\[
\gamma(x, y) = d(G(x), G(y)) = \sum_{n=1}^{\infty} \frac{1}{2^n} |\rho(x, a_n) - \rho(y, a_n)|
\]

for \(x, y \in X\). To prove the first assertion, we must show \(G\) is injective and \(\gamma\) is a metric on \(X\) which is compatible with the topology determined by \(\rho\).
If $G(x) = G(y)$, then $\rho(x, a) = \rho(y, a)$ for all $a \in D$. Since $D$ is a dense subset of $X$, we may choose $\alpha_k \in D$ such that

$$0 = \lim_{k \to \infty} \rho(\alpha_k, x) = \lim_{k \to \infty} \rho(y, \alpha_k) = \rho(y, x)$$

and therefore $x = y$. A simple argument using the dominated convergence theorem shows $y \to \gamma(x, y)$ is $\rho$-continuous, i.e. $\gamma(x, y)$ is small if $\rho(x, y)$ is small. Conversely,

$$\rho(x, y) \leq \rho(x, a_n) + \rho(y, a_n) - \rho(x, a_n) = 2\rho(x, a_n) + \rho(y, a_n) - \rho(x, a_n) \leq 2\rho(x, a_n) + 2^{n}\gamma(x, y).$$

Hence if $\varepsilon > 0$ is given, we may choose $n$ so that $2\rho(x, a_n) < \varepsilon/2$ and so if $\gamma(x, y) < 2^{-(n+1)}\varepsilon$, it will follow that $\rho(x, y) < \varepsilon$. This shows $\tau_{\gamma} = \tau_{\rho}$. Since $G : (X, \gamma) \to (Q, d)$ is isometric, $G$ is a homeomorphism.

Now suppose that $(X, \rho)$ is a complete metric space. Let $S := G(X)$ and $\sigma$ be the metric on $S$ defined by $\sigma(G(x), G(y)) = \rho(x, y)$ for all $x, y \in X$. Then $(S, \sigma)$ is a complete metric (being the isometric image of a complete metric space) and by what we have just proved, $\tau_{\sigma} = \tau_{\rho}$. Consequently, if $u \in S$ and $\varepsilon > 0$ is given, we may find $\delta'(\varepsilon)$ such that $B_{\delta'}(u) \subset B_{\delta'}(u \varepsilon)$. Taking $\delta(\varepsilon) = \min(\delta'(\varepsilon), \varepsilon)$, we have $\text{diam}_{\sigma}(B_{\delta'(\varepsilon)}(u)) < \varepsilon$ and $\text{diam}_{\sigma}(B_{\delta}(u \varepsilon)) < \varepsilon$ where

$$\text{diam}_{\sigma}(A) := \{\sup_{u, v} \sigma(u, v) : u, v \in A\} \quad \text{and} \quad \text{diam}_{\sigma}(A) := \{\sup_{u, v} \sigma(u, v) : u, v \in A\}. $$

Let $\bar{S}$ denote the closure of $S$ inside of $(Q, d)$ and for each $n \in \mathbb{N}$ let

$$N_n := \{N \in \tau_d : \text{diam}_d(N \cap S < 1/n\}$$

and let $\mathcal{N}_n := \{N \in \tau_d : \text{diam}_d(N \cap S) < 1/n\}$. From the previous paragraph, it follows that $S \subset U_n$ and therefore $S \subset \bar{S} \cap (\bigcap_{n=1}^{\infty} U_n)$. Conversely if $u \in S \cap (\bigcap_{n=1}^{\infty} U_n)$ and $n \in \mathbb{N}$, there exists $N_n \in \mathcal{N}_n$ such that $u \in N_n$. Moreover, since $N_1 \cap \cdots \cap N_n$ is an open neighborhood of $u \in S$, there exists $u_n \in N_1 \cap \cdots \cap N_n \cap S$ for each $n \in \mathbb{N}$. Since $N_n$, we have $\lim_{n \to \infty} d(u, u_n) = 0$ and $\sigma(u_n, u_n) \leq \max(n^{-1}, 2^{-n}) \to 0$ as $m, n \to \infty$. Since $(S, \sigma)$ is complete, it follows that $\{u_n\}_{n=1}^{\infty}$ is convergent in $(S, \sigma)$ to some element $\nu_0 \in S$. Since $S$ has the same topology as $(S, \sigma)$, it follows that $\text{diam}_{\sigma}(u_n, u_0) \to 0$ as well and thus that $u = u_0 \in S$. We have now shown, $S = \bar{S} \cap (\bigcap_{n=1}^{\infty} U_n).$ This completes the proof because we may write $\bar{S} = (\bigcap_{n=1}^{\infty} S_{1/n})$ where $S_{1/n} := \{u \in Q : d(u, S) < 1/n\}$ and therefore, $S = (\bigcap_{n=1}^{\infty} U_n) \cap (\bigcup_{n=1}^{\infty} S_{1/n})$ is a $G_\delta$ set.

Theorem 25.13 (Urysohn Metricization Theorem for LCH’s). Every second countable locally compact Hausdorff space, $(X, \tau)$, is metrizable, i.e. there is a metric $\rho$ on $X$ such that $\tau = \tau_{\rho}$. Moreover, $\rho$ may be chosen so that $X$ is isometric to a subset $Q_0 \subset Q$ equipped with the metric $d$ in Eq. (25.2). In this metric $X$ is totally bounded and hence the completion of $X$ (which is isometric to $Q_0 \subset Q$) is compact. (Also see Theorem 25.13.)

Proof. Let $\mathcal{B}$ be a countable base for $\tau$ and set

$$\Gamma := \{(U, V) \in \mathcal{B} \times \mathcal{B} \mid U \subset V \text{ and } U \text{ is compact}\}.$$ 

To each $O \in \tau$ and $x \in O$ there exist $(U, V) \in \Gamma$ such that $x \in U \subset V \subset O$. Indeed, since $\mathcal{B}$ is a base for $\tau$, there exists $V \in \mathcal{B}$ such that $x \in U \subset V$ and $\tau$ is compact $(V, \sigma) \in \Gamma$. In particular, this shows that $\mathcal{B}':= \{U \in \mathcal{B} : (U, V) \in \Gamma \text{ for some } V \in \mathcal{B}\}$ is a basic $\tau$. If $x \in \mathcal{B}$ is finite, then $\mathcal{B}'$ is finite and $\tau$ only has a finite number of elements as well. Since $(X, \tau)$ is Hausdorff, it follows that $X$ is a finite set. Letting $\{x_n\}_{n=1}^{\infty}$ be an enumeration of $X$, define $T : X \to \mathbb{Q}$ by $T(x_n) = e_n$ for $n = 1, 2, \ldots, N$, where $e_n = (0, 0, \ldots, 0, 1, 0, \ldots)$, with the 1 occurring in the $n$th position. Then $\rho(x, y) := d(T(x), T(y))$ for $x, y \in X$ is the desired metric.

So we may now assume that $\Gamma$ is an infinite set and let $\{U_n, V_n\}_{n=1}^{\infty}$ be an enumeration of $\Gamma$. By Urysohn’s Lemma, there exists $f_{U,V} \in C(X, [0, 1])$ such that $f_{U,V} = 0$ on $\bar{U}$ and $f_{U,V} = 1$ on $V$. Let $F := \{f_{U,V} \mid (U, V) \in \Gamma\}$ and set $f_n := f_{u_n, V_n} - \text{an enumeration of } F$. We will now show that

$$\rho(x, y) := \sum_{n=1}^{\infty} \frac{1}{2^n} |f_n(x) - f_n(y)|$$

is the desired metric on $X$. The proof will involve a number of steps.

1. ($\rho$ is a metric on $X$.) It is routine to show $\rho$ satisfies the triangle inequality and $\rho$ is symmetric. If $x, y \in X$ are distinct points then there exists $(U_{n_0}, V_{n_0}) \in \Gamma$ such that $x \in U_{n_0}$ and $V_{n_0} \subset O := \{y\}$. Since $f_{n_0}(x) = 0$ and $f_{n_0}(y) = 1$, it follows that $\rho(x, y) \geq 2^{-n_0} > 0$.

2. (Let $\tau_0 = \tau(f_n : n \in \mathbb{N})$, then $\tau = \tau_0 = \tau_{\rho}$.) As usual we have $\tau_0 \subset \tau$. Since, for each $x \in X$, $y \to \rho(x, y)$ is $\tau_0 - \text{continuous (being the uniformly convergent sum of continuous functions), it follows that } B_{\varepsilon}(x) := \{y \in X : \rho(x, y) < \varepsilon\} \subset \tau_0$ for all $x \in X$ and $\varepsilon > 0$. Thus $\tau_0 \subset \tau_0$. Suppose that $O \in \tau$ and $x \in O$. Let $(U_{n_0}, V_{n_0}) \in \Gamma$ be such that $x \in U_{n_0}$ and $V_{n_0} \subset O$. Then $f_{n_0}(x) = 0$ and $f_{n_0}(y) = 1$ on $O^c$. Therefore if $y \in X$ and $f_{n_0}(y) < 1$, then $y \in O$ so $x \in \{f_{n_0} < 1\} \subset O$. This shows that $O$ may be written as a union of elements from $\tau_0$ and therefore $O \in \tau_0$. So $\tau_0 \subset \tau_0$ and hence $\tau_0 = \tau_0$. Moreover, if $y \in B_x(2^{-n_0})$ then $2^{-n_0} \rho(x, y) \geq 2^{-n_0} f_{n_0}(y)$ and therefore $x \in B_x(2^{-n_0}) \subset \{f_{n_0} < 1\} \subset O$. This shows $O$ is $\rho$-open and hence $\tau_0 \subset \tau \subset \tau_{\rho}$. 

\[ \]
3. (X is isometric to some $Q_0 \subset Q$.) Let $T : X \rightarrow Q$ be defined by $T(x) = (f_1(x), f_2(x), \ldots, f_n(x), \ldots)$. Then $T$ is an isometry by the very definitions of $d$ and $\rho$ and therefore $X$ is isometric to $Q_0 := T(X)$. Since $Q_0$ is a subset of the compact metric space $(Q, d)$, $Q_0$ is totally bounded and therefore $X$ is totally bounded.

BRUCE: Add Stone Chech Compactification results.

## 25.2 Partitions of Unity

### Definition 25.14.

Let $(X, \tau)$ be a topological space and $X_0 \subset X$ be a set. A collection of sets $\{B_\alpha\}_{\alpha \in A} \subset 2^X$ is **locally finite** on $X_0$ if for all $x \in X_0$, there is an open neighborhood $N_x \in \tau$ of $x$ such that $\#\{\alpha \in A : B_\alpha \cap N_x \neq \emptyset\} < \infty$.

### Definition 25.15.

Suppose that $U$ is an open cover of $X_0 \subset X$. A collection $\{\varphi_\alpha\}_{\alpha \in A} \subset C(X, [0,1])$ $(N = \infty$ is allowed here) is a **partition of unity** on $X_0$ subordinate to the cover $U$ if:

1. for all $\alpha$ there is a $U \in U$ such that $\text{supp}(\varphi_\alpha) \subset U$,
2. the collection of sets, $\{\text{supp}(\varphi_\alpha)\}_{\alpha \in A}$, is locally finite on $X$, and
3. $\sum_{\alpha \in A} \varphi_\alpha = 1$ on $X_0$.

Notice by item 2. that, for each $x \in X$, there is a neighborhood $N_x$ such that $\Lambda := \{\alpha \in A : \text{supp}(\varphi_\alpha) \cap N_x \neq \emptyset\}$ is a finite set. Therefore, $\sum_{\alpha \in A} \varphi_\alpha |_{N_x} = \sum_{\alpha \in A} \varphi_\alpha |_{N_x}$ which shows the sum $\sum_{\alpha \in A} \varphi_\alpha$ is well defined and defines a continuous function on $N_x$ and therefore on $X$ since continuity is a local property. We will summarize these last comments by saying the sum, $\sum_{\alpha \in A} \varphi_\alpha$, is **locally finite**.

### Proposition 25.16 (Partitions of Unity: The Compact Case).

Suppose that $X$ is a locally compact Hausdorff space, $K \subset X$ is a compact set and $U = \{U_j\}_{j=1}^n$ is an open cover of $K$. Then there exists a partition of unity $\{h_j\}_{j=1}^n$ of $K$ such that $h_j \prec U_j$ for all $j = 1, 2, \ldots, n$.

**Proof.** For all $x \in K$ choose a precompact open neighborhood, $V_x$, of $x$ such that $\overline{V}_x \subset U_j$. Since $K$ is compact, there exists a finite subset, $A$, of $K$ such that $K \subset \bigcup_{x \in A} V_x$. Let

$$F_j = \bigcup \{V_x : x \in A \text{ and } \overline{V}_x \subset U_j\}.$$  

Then $F_j$ is compact, $F_j \subset U_j$ for all $j$, and $K \subset \bigcup_{j=1}^n F_j$. By Urysohn’s Lemma there exists $f_j \prec U_j$ such that $f_j = 1$ on $F_j$ for $j = 1, 2, \ldots, n$ and by convention let $f_{n+1} \equiv 1$. We will now give two methods to finish the proof.

**Method 1.** Let $h_1 = f_1, h_2 = f_2(1 - h_1) = f_2(1 - f_1)$,

$$h_3 = f_3(1 - h_1 - h_2) = f_3(1 - f_1 - (1 - f_1)f_2) = f_3(1 - f_1)(1 - f_2)$$

and continue on inductively to define

$$h_k = (1 - h_1 - \cdots - h_{k-1})f_k = f_k \prod_{j=1}^{k-1} (1 - f_j) \forall k = 2, 3, \ldots, n \quad (25.3)$$

and to show

$$h_{n+1} = (1 - h_1 - \cdots - h_n) \cdot 1 = 1 \prod_{j=1}^{n} (1 - f_j). \quad (25.4)$$

From these equations it clearly follows that $h_j \in C_c(X, [0,1])$ and that $\text{supp}(h_j) \subset \text{supp}(f_j) \subset U_j$, i.e. $h_j \prec U_j$. Since $\prod_{j=1}^{n} (1 - f_j) = 0$ on $K$, $\sum_{j=1}^{n} h_j = 1$ on $K$ and $\{h_j\}_{j=1}^n$ is the desired partition of unity.

**Method 2.** Let $g := \sum_{j=1}^{n} f_j \in C_c(X)$. Then $g \geq 1$ on $K$ and hence $K \subset \{g > \frac{1}{2}\}$. Choose $\varphi \in C_c(X, [0,1])$ such that $\varphi = 1$ on $K$ and $\text{supp}(\varphi) \subset \{g > \frac{1}{2}\}$ and define $f_0 := 1 - \varphi$. Then $f_0 = 0$ on $K$, $f_0 = 1$ if $g \leq \frac{1}{2}$ and therefore,

$$f_0 + f_1 + \cdots + f_n = f_0 + g > 0$$

on $X$. The desired partition of unity may be constructed as

$$h_j(x) = \frac{f_j(x)}{f_0(x) + \cdots + f_n(x)}.$$ 

Indeed $\text{supp}(h_j) = \text{supp}(f_j) \subset U_j, h_j \in C_c(X, [0,1])$ and on $K$,

$$h_1 + \cdots + h_n = \frac{f_1 + \cdots + f_n}{f_0 + f_1 + \cdots + f_n} = \frac{f_1 + \cdots + f_n}{f_1 + \cdots + f_n} = 1.$$ 

\[
\text{\bf Proposition 25.17.} \text{ Let } (X, \tau) \text{ be a locally compact and } \sigma \text{- compact Hausdorff space. Suppose that } U \subseteq \tau \text{ is an open cover of } X. \text{ Then we may construct two locally finite open covers } V = \{V_1\}_{i=1}^N \text{ and } W = \{W_i\}_{i=1}^N \text{ of } X \text{ (} N = \infty \text{ is allowed here) such that:} \\
\begin{enumerate}
  \item $W_i \subset \overline{W}_i \subset V_i \subset \overline{V}_i$ and $\overline{V}_i$ is compact for all $i$.
\end{enumerate}
\]
2. For each $i$ there exist $U \in \mathcal{U}$ such that $V_i \subset U$.

**Proof.** By Remark 24.6 there exists an open cover of $G = \{G_n\}_{n=1}^\infty$ of $X$ such that $G_n \subset G_{n+1}$. Then $X = \bigcup_{k=1}^\infty (G_k \setminus G_{k-1})$, where by convention $G_1 = G_0 = \emptyset$. For the moment fix $k \geq 1$. Then there exists a partition of unity of $X$, subordinate to the cover $\{G_k\}_{k=1}^\infty$ and by another application of Proposition 25.7, there exists an open neighborhood $N_x$ of $x$ such that $\bar{N}_x \subset U_x \cap (G_{k+1} \setminus G_k)$, see Figure 25.3 below. Since $\{N_x\}_{x \in G_k \setminus G_{k-1}}$ is an open cover of the compact set $G_k \setminus G_{k-1}$, there exist a finite subset $\Gamma_k \subset \{N_x\}_{x \in G_k \setminus G_{k-1}}$ which also covers $G_k \setminus G_{k-1}$.

By construction, for each $W \in \Gamma_k$, there is an $U \in \mathcal{U}$ such that $W \subset U \cap (G_{k+1} \setminus G_{k-1})$ and by another application of Proposition 25.7 there exists an open set $W_k$ such that $W \subset W_k \subset U \cap (G_{k+1} \setminus G_{k-2})$. We now choose and enumeration $\{W_i\}_{i=1}^\infty$ of the countable open cover, $\bigcup_{k=1}^\infty \Gamma_k$, of $X$ and define $V_i = W_i$. Then the collection $\{W_i\}_{i=1}^\infty$ and $\{V_i\}_{i=1}^\infty$ are easily checked to satisfy all the conclusions of the proposition. In particular notice that for each $k$; $V_i \setminus G_k \neq \emptyset$ for only a finite number of $i$’s.

**Theorem 25.18 (Partitions of Unity for $\sigma$ – Compact LCH Spaces).** Let $(X, \tau)$ be locally compact, $\sigma$ – compact and Hausdorff and let $U \subset \tau$ be an open cover of $X$. Then there exists a partition of unity of $\{h_i\}_{i=1}^\infty, (N = \infty$ is allowed here) subordinate to the cover $U$ such that $\text{supp}(h_i)$ is compact for all $i$.

**Proof.** Let $\mathcal{V} = \{V_i\}_{i=1}^N$ and $\mathcal{W} = \{W_i\}_{i=1}^N$ be open covers of $X$ with the properties described in Proposition 25.17. By Urysohn’s Lemma 25.8 there exists $f_i : V_i$ such that $f_i = 1$ on $W_i$ for each $i$. As in the proof of Proposition 25.16, there are two methods to finish the proof.

**Method 1.** Define $h_i = f_i$, $h_j$ by Eq. (25.3) for all other $j$. Then as in Eq (25.4), for all $n < N + 1,

$$1 - \sum_{j=1}^\infty h_j = \lim_{n \to \infty} \left( f_n \prod_{j=1}^n (1 - f_j) \right) = 0$$

since for $x \in X$, $f_j(x) = 1$ for some $j$. As in the proof of Proposition 25.16, it is easily checked that $\{h_i\}_{i=1}^N$ is the desired partition of unity.

**Method 2.** Let $f := \sum_{i=1}^N f_i$, a locally finite sum, so that $f \in C(X)$. Since $\{W_i\}_{i=1}^\infty$ is a cover of $X$, $f \geq 1$ on $X$ so that $1/f \in C(X)$ as well. The functions $h_i := f_i/f$ for $i = 1, 2, \ldots, N$ give the desired partition of unity. ■

**Lemma 25.19.** Let $(X, \tau)$ be a locally compact Hausdorff space.

1. A subset $E \subset X$ is closed iff $E \cap K$ is closed for all $K \subset X$.
2. Let $\{C_a\}_{a \in A}$ be a locally finite collection of closed subsets of $X$, then $C = \cup_{a \in A} C_a$ is closed in $X$. (Recall that in general closed sets are only closed under finite unions.)

**Proof.** 1. Since compact subsets of Hausdorff spaces are closed, $E \cap K$ is closed if $E$ is closed and $K$ is compact. Now suppose that $E \cap K$ is closed for all compact subsets $K \subset X$ and let $x \in E^c$. Since $X$ is locally compact, there exists a precompact open neighborhood, $V$, of $x$. By assumption $E \cap V$ is closed so $x \in (E \cap V)^c = \text{an open subset of } X$. By Proposition 25.7 there exists an open set $U$ such that $x \in U \subset \bar{U} \subset (E \cap V)^c$, see Figure 25.4. Let $W := U \cap V$. Since

$$W \cap E = U \cap V \cap E \subset U \cap V \cap E = \emptyset,$$

and $W$ is an open neighborhood of $x$ and $x \in E^c$ was arbitrary, we have shown $E^c$ is open hence $E$ is closed.

2. Let $K$ be a compact subset of $X$ and for each $x \in K$ let $x$ be an open neighborhood of $x$ such that $\# \{C_a \subset A : C_a \cap N_x \neq \emptyset \} < \infty$. Since $K$ is compact, there exists a finite subset $A \subset K$ such that $K \subset \cup_{a \in A} C_a$. Letting $A_0 := \{ a \in A : C_a \cap K \neq \emptyset \},$ then

\[1\] If $X$ were a metric space we could finish the proof as follows. If there does not exist an open neighborhood of $x$ which is disjoint from $E$, then there would exists $x_n \in E$ such that $x_n \to x$. Since $E \cap V$ is closed and $x_n \in E \cap V$ for all large $n$, it follows (see Exercise 13.4) that $x \in E \cap V$ and in particular that $x \in E$. But we chose $x \in E^c$.\]
Corollary 25.20. Let \((X, \tau)\) be a locally compact and \(\sigma\)–compact Hausdorff space and \(A, B\) be disjoint closed subsets of \(X\). Then there exists \(f \in C(X, [0, 1])\) such that \(f = 1\) on \(A\) and \(f = 0\) on \(B\). In fact \(f\) can be chosen so that \(\text{supp}(f) \subset B^c\).

Proof. Let \(U_1 = A^c\) and \(U_2 = B^c\), then \(\{U_1, U_2\}\) is an open cover of \(X\). By Corollary 25.20 there exists \(h_1, h_2 \in C(X, [0, 1])\) such that \(\text{supp}(h_i) \subset U_i\) for \(i = 1, 2\) and \(h_1 + h_2 = 1\) on \(X\). The function \(f = h_2\) satisfies the desired properties.

25.3 \(C_0(X)\) and the Alexanderov Compactification

Definition 25.22. Let \((X, \tau)\) be a topological space. A continuous function \(f : X \to \mathbb{C}\) is said to vanish at infinity if \(\{|f| \geq \varepsilon\}\) is compact in \(X\) for all \(\varepsilon > 0\). The functions, \(f \in C(X)\), vanishing at infinity will be denoted by \(C_0(X)\). (Notice that \(C_0(X) = C(X)\) whenever \(X\) is compact.)

Proposition 25.23. Let \(X\) be a topological space, \(BC(X)\) be the space of bounded continuous functions on \(X\) with the supremum norm topology. Then

1. \(C_0(X)\) is a closed subspace of \(BC(X)\).
2. If we further assume that \(X\) is a locally compact Hausdorff space, then \(C_0(X) = \overline{C_c(X)}\).

Proof.

1. If \(f \in C_0(X)\), \(K_1 := \{|f| \geq 1\}\) is a compact subset of \(X\) and therefore \(f(K_1)\) is a compact and hence bounded subset of \(\mathbb{C}\) and so \(M := \sup_{x \in K_1} |f(x)| < \infty\). Therefore \(\|f\|_{\infty} \leq M < 1 < \infty\) showing \(f \in BC(X)\). Now suppose \(f_n \in C_0(X)\) and \(f_n \to f\) in \(BC(X)\). Let \(\varepsilon > 0\) be given and choose \(n\) sufficiently large so that \(\|f - f_n\|_{\infty} \leq \varepsilon/2\). Since

\[ |f| \leq |f_n| + |f - f_n| \leq |f_n| + \|f - f_n\|_{\infty} \leq |f_n| + \varepsilon/2, \]

\[ \{|f| \geq \varepsilon\} \subset \{|f_n| + \varepsilon/2 \geq \varepsilon\} = \{|f_n| \geq \varepsilon/2\}. \]

Because \(\{|f| \geq \varepsilon\}\) is a closed subset of the compact set \(\{|f_n| \geq \varepsilon/2\}\), \(\{|f| \geq \varepsilon\}\) is compact and we have shown \(f \in C_0(X)\).
2. Since $C_0(X)$ is a closed subspace of $BC(X)$ and $C_c(X) \subset C_0(X)$, we always have $C_c(X) \subset C_0(X)$. Now suppose that $f \in C_0(X)$ and let $K_n := \{ |f| \geq \frac{1}{n} \} \subset X$. By Lemma 25.8 we may choose $\varphi_n \in C_c(X, [0, 1])$ such that $\varphi_n \equiv 1$ on $K_n$. Define $f_n := \varphi_n f \in C_c(X)$. Then

$$\|f - f_n\|_u = \|(1 - \varphi_n) f\|_\infty \leq \frac{1}{n} \to 0 \text{ as } n \to \infty.$$ 

This shows that $f \in C_c(X)$. [\[ Proposition 25.24 (Alexanderov Compactification). Suppose that $(X, \tau)$ is a non-compact locally compact Hausdorff space. Let $X^* = X \cup \{\infty\}$, where $\{\infty\}$ is a new symbol not in $X$. The collection of sets,

$$\tau^* = \tau \cup \{ X^* \setminus K : K \subset X \} \subset 2^{X^*},$$

is a topology on $X^*$ and $(X^*, \tau^*)$ is a compact Hausdorff space. Moreover $f \in C(X)$ extends continuously to $X^*$ iff $f = g + c$ with $g \in C_0(X)$ and $c \in \mathbb{C}$ in which case the extension is given by $f(\infty) = c$.

[Proof. 1. $(\tau^*)$ is a topology.] Let $F := \{ F \subset X^* : X^* \setminus F \in \tau^* \}$, i.e. $F \in F$ iff $F$ is a compact subset of $X$ or $F = F_0 \cup \{\infty\}$ with $F_0$ being a closed subset of $X$. Since the finite union of compact (closed) subsets is compact (closed), it is easily seen that $F$ is closed under finite unions. Because arbitrary intersections of closed subsets of $X$ are closed and closed subsets of compact subsets of $X$ are compact, it is also easily checked that $F$ is closed under arbitrary intersections. Therefore $F$ satisfies the axioms of the closed subsets associated to a topology and hence $\tau^*$ is a topology.

2. $(X^*, \tau^*)$ is a Hausdorff space. It suffices to show any point $x \in X$ can be separated from $\infty$. To do this use Proposition 25.7 to find an open precompact neighborhood, $U$, of $x$. Then $U$ and $V := X^\ast \setminus U$ are disjoint open subsets of $X^\ast$ such that $x \in U$ and $\infty \in V$.

3. $(X^*, \tau^*)$ is compact. Suppose that $U \subset \tau^*$ is an open cover of $X^\ast$. Since $U$ covers $\infty$, there exists a compact set $K \subset X$ such that $X^\ast \setminus K \subset U$. Clearly $X$ is covered by $U_0 := \{ V \setminus \{\infty\} : V \in U \}$ and by the definition $(\tau^*)$ (or using $(X^*, \tau^*)$ is Hausdorff), $U_0$ is an open cover of $X$. In particular $U_0$ is an open cover of $K$ and since $K$ is compact there exists a finite subcover of $X^\ast$.]

4. (Continuous functions on $C(X^\ast)$ statements.) Let $i : X \to X^\ast$ be the inclusion map. Then $i$ is continuous and open, i.e. $i(V)$ is open in $X^\ast$ for all $V$ open in $X$. If $f \in C(X^\ast)$, then $\|g(x) - f(\infty)\| = \|f \circ i - f(\infty)\|$ is continuous on $X$. Moreover, for all $\varepsilon > 0$ there exists an open neighborhood $V \in \tau^*$ of $\infty$ such that $|g(x) - f(\infty)| < \varepsilon$ for all $x \in V$.

Since $V$ is an open neighborhood of $\infty$, there exists a compact subset, $K \subset X$, such that $V = X^\ast \setminus K$. By the previous equation we see that $\{ x \in X : \|g(x) - f(\infty)\| < \varepsilon \} \subset K$ and we have shown $g$ vanishes at $\infty$.

Conversely if $g \in C_0(X)$, extend $g$ to $X^\ast$ by setting $g(\infty) = 0$. Given $\varepsilon > 0$, the set $K = \{ g \geq \varepsilon \}$ is compact, hence $X^\ast \setminus K$ is open in $X^\ast$. Since $g(\infty) \in K \subset (-\varepsilon, \varepsilon)$ we have shown that $g$ is continuous at $\infty$. Since $g$ is also continuous at all points in $X$ it follows that $g$ is continuous on $X^\ast$. Now it $f = g + c$ with $c \in \mathbb{C}$ and $g \in C_0(X)$, it follows by what we just proved that defining $f(\infty) = c$ extends $f$ to a continuous function on $X^\ast$.

Example 25.25. Let $X$ be an uncountable set and $\tau$ be the discrete topology on $X$. Let $(X^\ast = X \cup \{\infty\}, \tau^\ast)$ be the one point compactification of $X$. The smallest dense subset of $X^\ast$ is the uncountable set $X$. Hence $X^\ast$ is a compact but non-separable and hence non-metrizable space.

Exercise 25.4. Let $X := \{0, 1\}^\mathbb{R}$ and $\tau$ be the product topology on $X$ where $\{0, 1\}$ is equipped with the discrete topology. Show $(X, \tau)$ is separable. (Combining this with Exercise 17.3 and Tychonoff’s Theorem 24.16 we see that $(X, \tau)$ is compact and separable but not first countable.)

The next proposition gathers a number of results involving countability assumptions which have appeared in the exercises.

Proposition 25.26 (Summary). Let $(X, \tau)$ be a topological space.

1. If $(X, \tau)$ is second countable, then $(X, \tau)$ is separable; see Exercise 17.11.
2. If $(X, \tau)$ is separable and metrizable then $(X, \tau)$ is second countable; see Exercise 17.12.
3. If $(X, \tau)$ is locally compact and metrizable then $(X, \tau)$ is $\sigma$-compact iff $(X, \tau)$ is separable; see Exercises 24.3 and 24.4.
4. If $(X, \tau)$ is locally compact and second countable, then $(X, \tau)$ is $\sigma$-compact, see Exercise 24.4.
5. If $(X, \tau)$ is locally compact and metrizable, then $(X, \tau)$ is $\sigma$-compact iff $(X, \tau)$ is separable, see Exercises 24.4 and 24.5.
6. There exists spaces, $(X, \tau)$, which are both compact and separable but not first countable and in particular not metrizable, see Exercise 25.4.
25.4 Stone-Weierstrass Theorem

We now wish to generalize Theorem 25.30 to more general topological spaces. We will first need some definitions.

**Definition 25.27.** Let \( X \) be a topological space and \( A \subset C(X) = C(X, \mathbb{R}) \) or \( C(X, \mathbb{C}) \) be a collection of functions. Then

1. \( A \) is said to **separate points** if for all distinct points \( x, y \in X \) there exists \( f \in A \) such that \( f(x) \neq f(y) \).
2. \( A \) is an **algebra** if \( A \) is a vector subspace of \( C(X) \) which is closed under pointwise multiplication. (Note well: we do not assume \( f \) and \( g \) are distinct points of \( X \).
3. \( A \subset C(X, \mathbb{R}) \) is called a **lattice** if \( f \wedge g := \max(f, g) \) and \( f \vee g = \min(f, g) \) \( \in A \) for all \( f, g \in A \).
4. \( A \subset C(X, \mathbb{C}) \) is closed under conjugation if \( \overline{f} \in A \) whenever \( f \in A \).

**Remark 25.28.** If \( X \) is a topological space such that \( C(X, \mathbb{R}) \) separates points then \( X \) is Hausdorff. Indeed if \( x, y \in X \) and \( f \in C(X, \mathbb{R}) \) such that \( f(x) \neq f(y) \), then \( f^{-1}(J) \) and \( f^{-1}(I) \) are disjoint open sets containing \( x \) and \( y \) respectively when \( I \) and \( J \) are disjoint intervals containing \( f(x) \) and \( f(y) \) respectively.

**Lemma 25.29.** If \( A \) is a closed subalgebra of \( BC(X, \mathbb{R}) \) then \(|f| \in A \) for all \( f \in A \) and \( A \) is a lattice.

**Proof.** Let \( f \in A \) and \( M = \sup_{x \in X} |f(x)| \). Using Theorem 25.30 or Exercise 4.9 there are polynomials \( p_n(t) \) such that

\[
\lim_{n \to \infty} \sup_{|t| \leq M} |t| - p_n(t) = 0.
\]

By replacing \( p_n \) by \( p_n - p_n(0) \) if necessary we may assume that \( p_n(0) = 0 \). Since \( A \) is an algebra, it follows that \( f_n = p_n(f) \in A \) and \(|f| \in A \), because \(|f| \) is the uniform limit of the \( f_n \)'s. Since

\[
f \wedge g = \frac{1}{2} (f + g + |f - g|) \quad \text{and} \quad f \vee g = \frac{1}{2} (f + g - |f - g|),
\]

we have shown \( A \) is a lattice. \( \blacksquare \)

**Lemma 25.30.** Let \( A \subset C(X, \mathbb{R}) \) be an algebra which separates points and suppose \( x \) and \( y \) are distinct points of \( X \). If there exists such that \( f, g \in A \) such that

\[
f(x) \neq 0 \quad \text{and} \quad g(y) \neq 0,
\]

then

\[
V := \{(f(x), f(y)) : f \in A\} = \mathbb{R}^2.
\]

**Proof.** It is clear that \( V \) is a non-zero subspace of \( \mathbb{R}^2 \) if \( V = \text{span}(a, b) \) for some \( (a, b) \in \mathbb{R}^2 \) which, necessarily by Eq. 25.5, satisfy \( a \neq 0 \neq b \). Since \( (a, b) = (f(x), f(y)) \) for some \( f \in A \) and \( f^2 \in A \), it follows that \((a^2, b^2) = (f^2(x), f^2(y)) \in V \) as well. Since \( \dim V = 1 \), \( (a, b) \) and \((a^2, b^2) \) are linearly dependent and therefore

\[
0 = \det \begin{pmatrix} a & b \\ a^2 & b^2 \end{pmatrix} = ab^2 - a^2b = ab(b - a)
\]

which implies that \( a = b \). But this the implies that \( f(x) = f(y) \) for all \( f \in A \), violating the assumption that \( A \) separates points. Therefore we conclude that \( \dim(V) = 2 \), i.e. \( V = \mathbb{R}^2 \).

**Theorem 25.31 (Stone-Weierstrass Theorem).** Suppose \( X \) is a locally compact Hausdorff space and \( A \subset C_0(X, \mathbb{R}) \) is a closed subalgebra which separates points. For \( x \in X \) let

\[
A_x := \{f(x) : f \in A\} \quad \text{and} \quad I_x = \{f \in C_0(X, \mathbb{R}) : f(x) = 0\}.
\]

Then either one of the following two cases hold.

1. \( A = C_0(X, \mathbb{R}) \) or
2. there exists a unique point \( x_0 \in X \) such that \( A_{x_0} = \{0\} \).

Moreover, case 1. holds iff \( A_x = \mathbb{R} \) for all \( x \in X \) and case 2. holds iff there exists a point \( x_0 \in X \) such that \( A_{x_0} = \{0\} \).

**Proof.** If there exists \( x_0 \) such that \( A_{x_0} = \{0\} \) \((x_0 \) is unique since \( A \) separates points) then \( A \subset I_{x_0} \). If such an \( x_0 \) exists let \( C = I_{x_0} \) and if \( A_x = \mathbb{R} \) for all \( x \), set \( C = C_0(X, \mathbb{R}) \). Let \( f \in C \) be given. By Lemma 25.30 for all \( x, y \in X \) such that \( x \neq y \) there exists \( g_{xy} \in A \) such that \( f = g_{xy} \) on \( \{x, y\} \). When \( X \) is compact the basic idea of the proof is contained in the following identity;

\[
f(z) = \inf_{x \in X} \sup_{y \in X} g_{xy}(z) \quad \text{for all} \quad z \in X.
\]

To prove this identity, let \( g_x := \sup_{y \in X} g_{xy} \) and notice that \( g_x \geq f \) since \( g_{xy}(y) = f(y) \) for all \( y \in X \). Moreover, \( g_x(x) = f(x) \) for all \( x \in X \) since \( g_{xy}(x) = f(x) \) for all \( x \). Therefore,

\[
\inf_{x \in X} \sup_{y \in X} g_{xy} = \inf_{x \in X} g_x = f.
\]

If \( A_{x_0} = \{0\} \) and \( x = x_0 \) or \( y = x_0 \), then \( g_{xy} \) exists merely by the fact that \( A \) separates points.
The rest of the proof is devoted to replacing the \( \inf \) and the \( \sup \) above by min and max over finite sets at the expense of Eq. (25.7) becoming only an approximate identity. We also have to modify Eq. (25.7) slightly to take care of the non-compact case.

**Claim.** Given \( \varepsilon > 0 \) and \( x \in X \) there exists \( g_x \in \mathcal{A} \) such that \( g_x(x) = f(x) \) and \( f < g_x + \varepsilon \) on \( X \).

To prove this, let \( V_y \) be an open neighborhood of \( y \) such that \( |f - g_{xy}| < \varepsilon \) on \( V_y \); in particular \( f < \varepsilon + g_{xy} \) on \( V_y \). Also let \( g_{x,\infty} \) be any fixed element in \( \mathcal{A} \) such that \( g_{x,\infty}(x) = f(x) \) and let

\[
K = \left\{ |f| \geq \frac{\varepsilon}{2} \right\} \cup \left\{ |g_{x,\infty}| \geq \frac{\varepsilon}{2} \right\}.
\]  

(25.8)

Since \( K \) is compact, there exists \( A \subset K \) such that \( K \subset \bigcup \{ V_y \} \). Define

\[
g_x(z) = \max\{g_{xy} : y \in A \cup \{\infty\}\}.
\]

Since

\[
f < \varepsilon + g_{xy} < \varepsilon + g_x \text{ on } V_y,
\]

for any \( y \in A \), and

\[
f < \varepsilon + g_{x,\infty} \leq g_x + \varepsilon \text{ on } K^c,
\]

\[
f < \varepsilon + g_x \text{ on } X \text{ and by construction } f(x) = g_x(x), \text{ see Figure 25.5.}
\]

This completes the proof of the claim.

![Fig. 25.5. Constructing the “dominating approximates,” \( g_x \) for each \( x \in X \).](image)

For each \( x \in X \), let \( U_x \) be a neighborhood of \( x \) such that \( |f - g_x| < \varepsilon \) on \( U_x \).

Choose

\[
\Gamma \subset F := \left\{ |f| \geq \frac{\varepsilon}{2} \right\} \cup \left\{ |g_{x,\infty}| \geq \frac{\varepsilon}{2} \right\}
\]

such that \( F \subset \bigcup_{x \in \Gamma} U_x \) (\( \Gamma \) exists since \( F \) is compact) and define

\[
g = \min\{g_x : x \in \Gamma \cup \{\infty\}\} \in \mathcal{A}.
\]

Then, for \( x \in F \), \( g_x < f + \varepsilon \) on \( U_x \) and hence \( g < f + \varepsilon \) on \( \bigcup_{x \in \Gamma} U_x \supset F \). Likewise,

\[
g \leq g_{x,\infty} < \varepsilon/2 < f + \varepsilon \text{ on } F^c.
\]

Therefore we have now shown,

\[
f < g + \varepsilon \text{ and } g < f + \varepsilon \text{ on } X,
\]

i.e. \( |f - g| < \varepsilon \) on \( X \). Since \( \varepsilon > 0 \) is arbitrary it follows that \( f \in \mathcal{A} = A \) and so \( \mathcal{A} = \mathbb{C} \).

**Corollary 25.32 (Complex Stone-Weierstrass Theorem).** Let \( X \) be a locally compact Hausdorff space. Suppose \( \mathcal{A} \subset C_0(X, \mathbb{C}) \) is closed in the uniform topology, separates points, and is closed under complex conjugation. Then either \( \mathcal{A} = C_0(X, \mathbb{C}) \) or

\[
\mathcal{A} = \mathcal{I}_{x_0}^\mathbb{C} := \{ f \in C_0(X, \mathbb{C}) : f(x_0) = 0 \}
\]

for some \( x_0 \in X \).

**Proof.** Since

\[
\text{Re } f = \frac{f + f^*}{2} \text{ and } \text{Im } f = \frac{f - f^*}{2i}.
\]

Re \( f \) and \( \text{Im } f \) are both in \( \mathcal{A} \). Therefore

\[
\mathcal{A}_{\mathbb{R}} = \{\text{Re } f, \text{Im } f : f \in \mathcal{A}\}
\]

is a real sub-algebra of \( C_0(X, \mathbb{R}) \) which separates points. Therefore either \( \mathcal{A}_{\mathbb{R}} = C_0(X, \mathbb{R}) \) or \( \mathcal{A}_{\mathbb{R}} = \mathcal{I}_{x_0} \cap C_0(X, \mathbb{R}) \) for some \( x_0 \) and hence \( \mathcal{A} = C_0(X, \mathbb{C}) \) or \( \mathcal{I}_{x_0}^\mathbb{C} \) respectively.

As an easy application, Theorem 25.31 and Corollary 25.32 imply Theorem 30.35 and Corollary 50.37 respectively. Here are a few more applications.

**Example 25.33.** Let \( f \in C([a, b]) \) be a positive function which is injective. Then functions of the form \( \sum_{k=1}^N a_k f^k \) with \( a_k \in \mathbb{C} \) and \( N \in \mathbb{N} \) are dense in \( C([a, b]) \). For example if \( a = 1 \) and \( b = 2 \), then one may take \( f(x) = x^\alpha \) for any \( \alpha \neq 0 \), or \( f(x) = e^x \), etc.
Exercise 25.5. Let \((X,d)\) be a separable compact metric space. Show that \(C(X)\) is also separable. \textbf{Hint:} Let \(E \subset X\) be a countable dense set and then consider the algebra, \(A \subset C(X)\), generated by \(\{d(x, \cdot)\}_{x \in E}\).

Example 25.34. Let \(X = [0, \infty)\), \(A > 0\) be fixed, \(A\) be the real algebra generated by \(t \rightarrow e^{-\lambda t}\). So the general element \(f \in A\) is of the form \(f(t) = p(e^{-\lambda t})\), where \(p(x)\) is a polynomial function in \(x\) with real coefficients. Since \(A \subset C_0(X, \mathbb{R})\) separates points and \(e^{-\lambda t} \in A\) is pointwise positive, \(A = C_0(X, \mathbb{R})\).

As an application of Example 25.34, suppose that \(g \in C_c(X, \mathbb{R})\) satisfies,

\[
\int_0^\infty g(t) e^{-\lambda t} dt = 0 \quad \text{for all } \lambda > 0.
\] (25.9)

(As a well that the integral in Eq. (25.9) is really over a finite interval since \(g\) is compactly supported.) Equation (25.9) along with linearity of the Riemann integral implies

\[
\int_0^\infty g(t) f(t) dt = 0 \quad \text{for all } f \in A.
\]

We may now choose \(f_n \in A\) such that \(f_n \to g\) uniformly and therefore, using the continuity of the Riemann integral under uniform convergence (see Proposition 50.5),

\[
0 = \lim_{n \to \infty} \int_0^\infty g(t) f_n(t) dt = \int_0^\infty g^2(t) dt.
\]

From this last equation it is easily deduced, using the continuity of \(g\), that \(g \equiv 0\). See Theorem 19.12 below, where this is done in greater generality.

25.5 *More on Separation Axioms: Normal Spaces

(This section may safely be omitted on first reading.)

Definition 25.35 (\(T_0 - T_2\) Separation Axioms). Let \((X, \tau)\) be a topological space. The topology \(\tau\) is said to be:

1. \(T_0\) if for \(x \neq y\) in \(X\) there exists \(V \in \tau\) such that \(x \in V\) and \(y \notin V\) or \(V\) such that \(y \in V\) but \(x \notin V\).
2. \(T_1\) if for every \(x, y \in X\) with \(x \neq y\) there exists \(V \in \tau\) such that \(x \in V\) and \(y \notin V\). Equivalently, \(\tau\) is \(T_1\) iff all one point subsets of \(X\) are closed.
3. \(T_2\) if it is Hausdorff.

Note \(T_2\) implies \(T_1\) which implies \(T_0\). The topology in Example 25.1 is \(T_0\) but not \(T_1\). If \(X\) is a finite set and \(\tau\) is a \(T_1\) topology on \(X\) then \(\tau = 2^X\). To prove this let \(x \in X\) be fixed. Then for every \(y \neq x\) in \(X\) there exists \(V_y \in \tau\) such that \(x \in V_y\) while \(y \notin V_y\). Thus \(\{x\} = \bigcap_{y \neq x} V_y \in \tau\) showing \(\tau\) contains all one point subsets of \(X\) and therefore all subsets of \(X\). So we have to look to infinite sets for an example of \(T_1\) topology which is not \(T_2\).

Example 25.36. Let \(X\) be any infinite set and let \(\tau = \{A \subset X : \#(A^c) < \infty\} \cup \{\emptyset\}\) – the so called cofinite topology. This topology is \(T_1\) because if \(x \neq y\) in \(X\), then \(V = \{x\}^c \in \tau\) with \(x \notin V\) while \(y \in V\). This topology however is not \(T_2\). Indeed if \(U, V \in \tau\) are open sets such that \(x \in U, y \in V\) and \(U \cap V = \emptyset\) then \(V \subset X^c\). But this implies \(\#(U) < \infty\) which is impossible unless \(U = \emptyset\) which is impossible since \(x \in U\).

The uniqueness of limits of sequences which occurs for Hausdorff topologies (see Remark 25.3) need not occur for \(T_1\) – spaces. For example, let \(X = \mathbb{N}\) and \(\tau\) be the cofinite topology on \(X\) as in Example 25.36. Then \(x_n = n\) is a sequence in \(X\) such that \(x_n \to x\) as \(n \to \infty\) for all \(x \in \mathbb{N}\). For the most part we will avoid these pathologies in the future by only considering Hausdorff topologies.

Definition 25.37 (Normal Spaces: \(T_4 - \text{Separation Axiom}\)). A topological space \((X, \tau)\) is said to be \textbf{normal} or \textbf{T4} if:

1. \(X\) is Hausdorff and
2. if for any two closed disjoint subsets \(A, B \subset X\) there exists disjoint open sets \(V, W \subset X\) such that \(A \subset V\) and \(B \subset W\).

Example 25.38. By Lemma 13.15 and Corollary 25.21 it follows that metric spaces and topological spaces which are locally compact, \(\sigma\) – compact and Hausdorff (in particular compact Hausdorff spaces) are normal. Indeed, in each case if \(A, B\) are disjoint closed subsets of \(X\), there exists \(f \in C(X, [0,1])\) such that \(f = 1\) on \(A\) and \(f = 0\) on \(B\). Now let \(U = \{f < \frac{1}{2}\}\) and \(V = \{f < \frac{1}{2}\}\).

Remark 25.39. A topological space, \((X, \tau)\), is normal iff for any \(C \subset W \subset X\) with \(C\) being closed and \(W\) being open there exists an open set \(U \subset_o X\) such that

\[ C \subset U \subset \bar{U} \subset W. \]

To prove this first suppose \(X\) is normal. Since \(W^c\) is closed and \(C \cap W^c = \emptyset\), there exists disjoint open sets \(U\) and \(V\) such that \(C \subset U\) and \(W^c \subset V\). Therefore \(C \subset V^c \subset W\) and since \(V^c\) is closed, \(C \subset U \subset \bar{U} \subset V^c \subset W\).

For the converse direction suppose \(A\) and \(B\) are disjoint closed subsets of \(X\). Then \(A \subset B^c\) and \(B^c\) is open, and so by assumption there exists \(U \subset_o X\) such that \(A \subset U \subset \bar{U} \subset B^c\) and by the same token there exists \(W \subset_o X\) such that \(\bar{U} \subset W \subset C \subset B^c\). Taking complements of the last expression implies
Let $V = \bar{W}^c \subset W^c \subset \bar{U}^c$.

Let $V = \bar{W}^c$. Then $A \subset U \subset_o X$, $B \subset V \subset_o X$ and $U \cap V \subset U \cap W^c = \emptyset$.

**Theorem 25.40 (Urysohn’s Lemma for Normal Spaces).** Let $X$ be a normal space. Assume $A, B$ are disjoint closed subsets of $X$. Then there exists $f \in C(X, [0, 1])$ such that $f = 0$ on $A$ and $f = 1$ on $B$.

**Proof.** To make the notation match Lemma 25.8, let $U = A^c$ and $K = B$. Then $K \subset U$ and it suffices to produce a function $f \in C(X, [0, 1])$ such that $f = 1$ on $K$ and $\text{supp}(f) \subset U$. The proof is now identical to that for Lemma 25.8 except we now use Remark 25.39 in place of Proposition 25.7.

**Theorem 25.41 (Tietze Extension Theorem).** Let $(X, \tau)$ be a normal space, $D$ be a closed subset of $X$, $-\infty < a < b < \infty$ and $f \in C(D, [a, b])$. Then there exists $F \in C(X, [a, b])$ such that $F|_D = f$.

**Proof.** The proof is identical to that of Theorem 14.4 except we now use Theorem 25.40 in place of Lemma 13.15.

**Corollary 25.42.** Suppose that $X$ is a normal topological space, $D \subset X$ is closed, $F \in C(D, \mathbb{R})$. Then there exists $F \in C(X)$ such that $F|_D = f$.

**Proof.** Let $g = \text{arctan}(f) \in C(D, (-\frac{\pi}{2}, \frac{\pi}{2}))$. Then by the Tietze extension theorem, there exists $G \in C(X, [-\frac{\pi}{2}, \frac{\pi}{2}])$ such that $G|_D = g$. Let $B := G^{-1}((-\frac{\pi}{2}, \frac{\pi}{2})) \subset X$, then $B \cap D = \emptyset$. By Urysohn’s lemma (Theorem 25.40) there exists $h \in C(X, [0, 1])$ such that $h \equiv 1$ on $D$ and $h \equiv 0$ on $B$ and in particular $hG \in C(D, (-\frac{\pi}{2}, \frac{\pi}{2}))$ and $(hG)|_D = g$. The function $F := \frac{\tan(hG)}{\sin(hG)} \in C(X)$ is an extension of $f$.

**Theorem 25.43 (Urysohn Metrization Theorem for Normal Spaces).** Every second countable normal space, $(X, \tau)$, is metrizable, i.e., there is a metric $\rho$ on $X$ such that $\tau = \tau_\rho$. Moreover, $\rho$ may be chosen so that $X$ is isometric to a subset $Q_0 \subset Q$ ($Q$ is as in Notation 25.17) equipped with the metric $d$ in Eq. (25.2). In this metric $X$ is totally bounded and hence the completion of $X$ (which is isometric to $Q_0 \subset Q$) is compact.

**Proof.** (The proof here will be very similar to the proof of Theorem 25.13.) Let $B$ be a countable base for $\tau$ and set

$$\Gamma := \{(U, V) \in B \times B \mid \bar{U} \subset V\}.$$

To each $O \in \tau$ and $x \in O$ there exist $(U, V) \in \Gamma$ such that $x \in U \subset V \subset O$. Indeed, since $B$ is a base for $\tau$, there exists $V \in B$ such that $x \in V \subset O$. Because $\{x\} \cap V^c = \emptyset$, there exists disjoint open sets $\bar{U}$ and $W$ such that $x \in \bar{U}, V^c \subset W$ and $\bar{U} \cap W = \emptyset$. Choose $U \in B$ such that $x \in U \subset \bar{U}$. Since $U \subset \bar{U} \subset W^c$,

$$\bigcup U \subset W^c \subset V$$

and hence $(U, V) \in \Gamma$. See Figure 25.6 below. In particular this shows that $B_0 := \{U \in B : (U, V) \in \Gamma \text{ for some } V \in B\}$ is still a base for $\tau$.

If $\Gamma$ is a finite set, the previous comment shows that $\tau$ only has a finite number of elements as well. Since $(X, \tau)$ is Hausdorff, it follows that $X$ is a finite set. Letting $\{x_n\}_{n=1}^N$ be an enumeration of $X$, define $T : X \to Q$ by $T(x_n) = e_n$ for $n = 1, 2, \ldots, N$ where $e_n = (0, 0, \ldots, 0, 1, 0, \ldots)$, with the 1 occurring in the $n$th spot. Then $\rho(x, y) := d(T(x), T(y))$ for $x, y \in X$ is the desired metric.

So we may now assume that $\Gamma$ is an infinite set and let $\{(U_n, V_n)\}_{n=1}^\infty$ be an enumeration of $\Gamma$. By Urysohn’s Lemma for normal spaces (Theorem 25.40) there exists $f_{U, V} \in C(X, [0, 1])$ such that $f_{U, V} = 0$ on $\bar{U}$ and $f_{U, V} = 1$ on $V$.

Let $\mathcal{F} := \{f_{U, V} : (U, V) \in \Gamma\}$ and set $f_n := f_{U_n, V_n} - \text{an enumeration of } \mathcal{F}$. The proof that

$$\rho(x, y) := \sum_{n=1}^\infty \frac{1}{2^n} |f_n(x) - f_n(y)|$$

is the desired metric on $X$ now follows exactly as the corresponding argument in the proof of Theorem 25.13.

**25.6 Exercises**

**Exercise 25.6.** Prove Theorem 25.9.

**Hints:**

1. By Proposition 25.7 there exists a precompact open set $V$ such that $K \subset V \subset \bar{V} \subset U$. Now suppose that $f : K \to [0, \alpha]$ is continuous with $\alpha \in (0, 1]$
and let $A := f^{-1}([0, \frac{1}{2}\alpha])$ and $B := f^{-1}([\frac{3}{4}\alpha, 1])$. Appeal to Lemma 25.8 to find a function $g \in C(X, [0, \alpha/3])$ such that $g = \alpha/3$ on $B$ and $\text{supp}(g) \subset V \setminus A$.

2. Now follow the argument in the proof of Theorem 14.4 to construct $F \in C(X, [a, b])$ such that $F|_K = f$.

3. For $c \in [a, b]$, choose $\varphi < U$ such that $\varphi = 1$ on $K$ and replace $F$ by $F_c := \varphi F + (1 - \varphi)c$.

**Exercise 25.7 (Sterographic Projection).** Let $X = \mathbb{R}^n$, $X^* := X \cup \{\infty\}$ be the one point compactification of $X$, $S^n := \{y \in \mathbb{R}^{n+1} : |y| = 1\}$ be the unit sphere in $\mathbb{R}^{n+1}$ and $N = (0, \ldots, 0, 1) \in \mathbb{R}^{n+1}$. Define $f : S^n \to X^*$ by $f(N) = \infty$, and for $y \in S^n \setminus \{N\}$ let $f(y) = b \in \mathbb{R}^n$ be the unique point such that $(b, 0)$ is on the line containing $N$ and $y$, see Figure 25.7 below. Find a formula for $f$ and show $f : S^n \to X^*$ is a homeomorphism. (So the one point compactification of $\mathbb{R}^n$ is homeomorphic to the $n$ sphere.)

![Fig. 25.7. Sterographic projection and the one point compactification of $\mathbb{R}^n$.](image)

**Exercise 25.11.** In this problem, suppose Theorem 25.31 has only been proved when $X$ is compact. Show that it is possible to prove Theorem 25.31 by using Proposition 25.24 to reduce the non-compact case to the compact case.

**Hints:**

1. If $\mathcal{A}_x = \mathbb{R}$ for all $x \in X$ let $X^* = X \cup \{\infty\}$ be the one point compactification of $X$.
2. If $\mathcal{A}_{x_0} = \{0\}$ for some $x_0 \in X$, let $Y := X \setminus \{x_0\}$ and $Y^* = Y \cup \{\infty\}$ be the one point compactification of $Y$.
3. For $f \in \mathcal{A}$ define $f(\infty) = 0$. In this way $\mathcal{A}$ may be considered to be a sub-algebra of $C(X^*, \mathbb{R})$ in case 1. or a sub-algebra of $C(Y^*, \mathbb{R})$ in case 2.

**Exercise 25.12.** Given a continuous function $f : \mathbb{R} \to \mathbb{C}$ which is $2\pi$ - periodic and $\varepsilon > 0$. Show there exists a trigonometric polynomial, $p(\theta) = \sum_{n=-N}^{N} \alpha_n e^{i\theta n}$, such that $|f(\theta) - P(\theta)| < \varepsilon$ for all $\theta \in \mathbb{R}$. **Hint:** show that there exists a unique function $F \in C(S^1)$ such that $f(\theta) = F(e^{i\theta})$ for all $\theta \in \mathbb{R}$.

**Remark 25.44.** Exercise 25.12 generalizes to $2\pi$ – periodic functions on $\mathbb{R}^d$, i.e. functions such that $f(\theta + 2\pi e_i) = f(\theta)$ for all $i = 1, 2, \ldots, d$ where $\{e_i\}_{i=1}^d$ is the standard basis for $\mathbb{R}^d$. A trigonometric polynomial $p(\theta)$ is a function of $\theta \in \mathbb{R}^d$ of the form

$$p(\theta) = \sum_{n \in I} \alpha_n e^{i\theta n}$$

where $I$ is a finite subset of $\mathbb{Z}^d$. The assertion is again that these trigonometric polynomials are dense in the $2\pi$ – periodic functions relative to the supremum norm.

**Exercise 25.8.** Let $(X, \tau)$ be a locally compact Hausdorff space. Show $(X, \tau)$ is separable iff $(X^*, \tau^*)$ is separable.

**Exercise 25.9.** Show by example that there exists a locally compact metric space $(X, d)$ such that the one point compactification, $(X^* := X \cup \{\infty\}, \tau^*)$, is not metrizable. **Hint:** use exercise 25.8

**Exercise 25.10.** Suppose $(X, d)$ is a locally compact and $\sigma$ – compact metric space. Show the one point compactification, $(X^* := X \cup \{\infty\}, \tau^*)$, is metrizable.

Page: 301  job: newanal  macro: svmobob.cls  date/time: 6-Jan-2012/17:01
**Baire Category Theorem**

**Definition 26.1.** Let \((X, \tau)\) be a topological space. A set \(E \subset X\) is said to be **nowhere dense** if \((\bar{E})^\circ = \emptyset\) i.e. \(E\) has empty interior.

Notice that \(E\) is nowhere dense is equivalent to

\[
X = ((\bar{E})^\circ)^c = (\bar{E})^\circ = (E^c)^\circ.
\]

That is to say \(E\) is nowhere dense iff \(E^c\) has dense interior.

**26.1 Metric Space Baire Category Theorem**

**Theorem 26.2 (Baire Category Theorem).** Let \((X, \rho)\) be a complete metric space.

1. If \(\{V_n\}_{n=1}^\infty\) is a sequence of dense open sets, then \(G := \bigcap_{n=1}^\infty V_n\) is dense in \(X\).

2. If \(\{E_n\}_{n=1}^\infty\) is a sequence of nowhere dense sets, then \(\bigcup_{n=1}^\infty E_n \subset \bigcup_{n=1}^\infty \bar{E}_n \not\subset X\) and in particular \(X \neq \bigcup_{n=1}^\infty E_n\).

**Proof.**

1. We must show that \(G = X\) which is equivalent to showing that \(W \cap G \neq \emptyset\) for all non-empty open sets \(W \subset X\). Since \(V_1\) is dense, \(W \cap V_1 \neq \emptyset\) and hence there exists \(x_1 \in X\) and \(\epsilon_1 > 0\) such that

\[
\overline{B(x_1, \epsilon_1)} \subset W \cap V_1.
\]

Since \(V_2\) is dense, \(\overline{B(x_1, \epsilon_1)} \cap V_2 \neq \emptyset\) and hence there exists \(x_2 \in X\) and \(\epsilon_2 > 0\) such that

\[
\overline{B(x_2, \epsilon_2)} \subset \overline{B(x_1, \epsilon_1)} \cap V_2.
\]

Continuing this way inductively, we may choose \(\{x_n \in X \text{ and } \epsilon_n > 0\}_{n=1}^\infty\) such that

\[
\overline{B(x_n, \epsilon_n)} \subset \overline{B(x_{n-1}, \epsilon_{n-1})} \cap V_n \ orall n.
\]

Furthermore we can clearly do this construction in such a way that \(\epsilon_n \downarrow 0\) as \(n \uparrow \infty\). Hence \(\{x_n\}_{n=1}^\infty\) is Cauchy sequence and \(x = \lim_{n \to \infty} x_n\) exists in \(X\) since \(X\) is complete. Since \(\overline{B(x_n, \epsilon_n)}\) is closed, \(x \in \overline{B(x_n, \epsilon_n)} \subset V_n\) so that \(x \in V_n\) for all \(n\) and hence \(x \in G\). Moreover, \(x \in \overline{B(x_1, \epsilon_1)} \subset W \cap V_1\) implies \(x \in W\) and hence \(x \in W \cap G\) showing \(W \cap G \neq \emptyset\).

2. The second assertion is equivalently to showing

\[
\emptyset \neq \left(\bigcap_{n=1}^\infty \overline{E}_n\right)^\circ = \bigcap_{n=1}^\infty \overline{E}_n^\circ = \bigcap_{n=1}^\infty (E_n^c)^\circ.
\]

As we have observed, \(E_n\) is nowhere dense is equivalent to \((E_n^c)^\circ\) being a dense open set, hence by part 1), \(\bigcap_{n=1}^\infty (E_n^c)^\circ\) is dense in \(X\) and hence not empty.

**Example 26.3.** Suppose that \(X\) is a countable set and \(\rho\) is a metric on \(X\) for which no single point set is open. Then \((X, \rho)\) is not complete. Indeed we may assume \(X = \mathbb{N}\) and let \(E_n := \{n\} \subset \mathbb{N}\) for all \(n \in \mathbb{N}\). Then \(E_n\) is closed and by assumption it has empty interior. Since \(X = \bigcup_{n \in \mathbb{N}} E_n\), it follows from the Baire Category Theorem that \((X, \rho)\) can not be complete.

**26.2 Locally Compact Hausdorff Space Baire Category Theorem**

Here is another version of the Baire Category theorem when \(X\) is a locally compact Hausdorff space.

**Theorem 26.4.** Let \(X\) be a locally compact Hausdorff space.

1. If \(\{V_n\}_{n=1}^\infty\) is a sequence of dense open sets, then \(G := \bigcap_{n=1}^\infty V_n\) is dense in \(X\).

2. If \(\{E_n\}_{n=1}^\infty\) is a sequence of nowhere dense sets, then \(X \neq \bigcup_{n=1}^\infty E_n\).

**Proof.** As in the previous proof, the second assertion is a consequence of the first. To finish the proof, it suffices to show \(G \cap W \neq \emptyset\) for all open sets \(W \subset X\). Since \(V_1\) is dense, there exists \(x_1 \in V_1 \cap W\) and by Proposition there exists \(U_1 \subset X\) such that \(x_1 \in U_1 \subset \overline{U_1} \subset V_1 \cap W\) with \(U_1\) being compact. Similarly, there exists a non-empty open set \(U_2\) such that \(U_2 \subset U_2 \subset U_1 \cap V_2\). Working inductively, we may find non-empty open sets \(\{U_k\}_{k=1}^\infty\) such that \(U_k \subset
Definition 26.5. A subset $E \subset X$ is meager or of the first category if $E = \bigcup_{n=1}^{\infty} E_n$ where each $E_n$ is nowhere dense. And a set $R \subset X$ is called residual if $R^c$ is meager.

Remarks 26.6. For those readers that already know some measure theory may want to think of meager as being the topological analogue of sets of measure 0 and residual as being the topological analogue of sets of full measure. (This analogy should not be taken too seriously, see Exercise 15.19.)

1. $R$ is residual iff $R$ contains a countable intersection of dense open sets. Indeed if $R$ is a residual set, then there exists nowhere dense sets $\{E_n\}$ such that

$$R^c = \bigcup_{n=1}^{\infty} E_n \subset \bigcup_{n=1}^{\infty} E_n^c.$$ 

Taking complements of this equation shows that

$$\bigcap_{n=1}^{\infty} E_n^c \subset R,$$

i.e. $R$ contains a set of the form $\bigcap_{n=1}^{\infty} V_n$ with each $V_n (= E_n^c)$ being an open dense subset of $X$.

Conversely, if $\bigcap_{n=1}^{\infty} V_n \subset R$ with each $V_n$ being an open dense subset of $X$, then $R^c \subset \bigcup_{n=1}^{\infty} V_n^c$ and hence $R^c = \bigcup_{n=1}^{\infty} E_n$ where each $E_n = R^c \cap V_n^c$, is a nowhere dense subset of $X$.

2. A countable union of meager sets is meager and any subset of a meager set is meager.

3. A countable intersection of residual sets is residual.

Remarks 26.7. The Baire Category Theorems may now be stated as follows. If $X$ is a complete metric space or $X$ is a locally compact Hausdorff space, then

1. all residual sets are dense in $X$ and
2. $X$ is not meager.

It should also be remarked that incomplete metric spaces may be meager. For example, let $X \subset C([0,1])$ be the subspace of polynomial functions on $[0,1]$ equipped with the supremum norm. Then $X = \bigcup_{n=1}^{\infty} E_n$ where $E_n \subset X$ denotes the subspace of polynomials of degree less than or equal to $n$. You are asked to show in Exercise 26.1 below that $E_n$ is nowhere dense for all $n$. Hence $X$ is meager and the empty set is residual in $X$.

Here is an application of Theorem 26.2

Theorem 26.8. Let $\mathcal{N} \subset C([0,1], \mathbb{R})$ be the set of nowhere differentiable functions. (Here a function $f$ is said to be differentiable at 0 if $f'(|0|) := \lim_{t \to 0} \frac{f(t) - f(0)}{t}$ exists and at 1 if $f'(1) := \lim_{t \to 1} \frac{f(t) - f(1)}{t}$ exists.) Then $\mathcal{N}$ is a residual set so the “generic” continuous functions is nowhere differentiable.

Proof. If $f \notin \mathcal{N}$, then $f'(x_0)$ exists for some $x_0 \in [0,1]$ and by the definition of the derivative and compactness of $[0,1]$, there exists $n \in \mathbb{N}$ such that $|f(x) - f(x_0)| \leq n|x - x_0| \ \forall \ x \in [0,1]$. Thus if we define $E_n := \{f \in C([0,1]) : \exists x_0 \in [0,1] \exists (f(x) - f(x_0)) \leq n|x - x_0| \ \forall \ x \in [0,1]\}$, then we have just shown $\mathcal{N}^c \subset E := \bigcup_{n=1}^{\infty} E_n$. So to finish the proof it suffices to show (for each $n$) $E_n$ is a closed subset of $C([0,1], \mathbb{R})$ with empty interior.

1. To prove $E_n$ is closed, let $\{f_m\}_{m=1}^{\infty} \subset E_n$ be a sequence of functions such that there exists $f \in C([0,1], \mathbb{R})$ such that $\|f - f_m\|_\infty \to 0$ as $m \to \infty$. Since $f_m \in E_n$, there exists $x_m \in [0,1]$ such that

$$|f_m(x) - f_m(x_m)| \leq n|x - x_m| \ \forall \ x \in [0,1]. \ \ (26.1)$$

Since $[0,1]$ is a compact metric space, by passing to a subsequence if necessary, we may assume $x_0 = \lim_{m \to \infty} x_m \in [0,1]$ exists. Passing to the limit in Eq. (26.1), making use of the uniform convergence of $f_m \to f$ to show $\lim_{m \to \infty} f_m(x_m) = f(x_0)$, implies

$$|f(x) - f(x_0)| \leq n|x - x_0| \ \forall \ x \in [0,1]$$

and therefore that $f \notin E_n$. This shows $E_n$ is a closed subset of $C([0,1], \mathbb{R})$.

2. To finish the proof, we will show $E_0^c = \emptyset$ by showing for each $f \in E_n$ and $\varepsilon > 0$ given, there exists $g \in C([0,1], \mathbb{R}) \setminus E_n$ such that $\|f - g\|_\infty < \varepsilon$. We now construct $g$. Since $[0,1]$ is compact and $f$ is continuous there exists $N \in \mathbb{N}$ such that $|f(x) - f(y)| < \varepsilon/2$ whenever $|y - x| < 1/N$. Let $k$ denote the piecewise linear function on $[0,1]$ such that $k(\frac{m}{N}) = f(\frac{m}{N})$ for $m = 0, 1, \ldots, N$ and $k''(x) = 0$ for $x \notin \pi_N := \{m/N : m = 0, 1, \ldots, N\}$. Then it is easily seen that $\|f - k\|_\infty < \varepsilon$ and for $x \in (\frac{m}{N}, \frac{m+1}{N})$ that

$$|k'(x)| = \frac{|f(\frac{m+1}{N}) - f(\frac{m}{N})|}{N} < \frac{N\varepsilon}{2}.$$

We now make $k$ “rougher” by adding a small wiggly function $h$ which we define as follows. Let $M \in \mathbb{N}$ be chosen so that $4\varepsilon M > 2n$ and define $h$ uniquely by $h(\frac{m}{M}) = (-1)^m\varepsilon/2$ for $m = 0, 1, \ldots, M$ and $h''(x) = 0$ for $x \notin \pi_M$. Then $|h|_\infty < \varepsilon$ and $|k'(x)| = 4\varepsilon M > 2n$ for $x \notin \pi_M$. See Figure 26.1 below. Finally define $g := k + h$. Then

$$\|f - g\|_\infty \leq \|f - k\|_\infty + \|h\|_\infty < \varepsilon/2 + \varepsilon/2 = \varepsilon$$
It now follows from this last equation and the mean value theorem that for any $x \in [0, 1], \frac{|g(x) - g(x_0)|}{x - x_0} > n$
for all $x \in [0, 1]$ sufficiently close to $x_0$. This shows $g \notin E_n$ and so the proof is complete.

Here is an application of the Baire Category Theorem 26.4. For more applications along these lines, see [32] and the references therein.

**Proposition 26.9.** Suppose that $f : R \rightarrow R$ is a function such that $f'(x)$ exists for all $x \in R$. Let

$$U := \bigcup_{\varepsilon > 0} \left\{ x \in R : \sup_{|y| < \varepsilon} |f'(x + y)| < \infty \right\}.$$

Then $U$ is a dense open set. (It is not true that $U = R$ in general, see Example 23.27 below.)

**Proof.** It is easily seen from the definition of $U$ that $U$ is open. Let $W \subset R$ be an open subset of $R$. For $k \in N$, let

$$E_k := \left\{ x \in W : |f(y) - f(x)| \leq k |y - x| \text{ when } |y - x| \leq 1 \right\}$$

$$= \bigcap_{|z| \leq k^{-1}} \left\{ x \in W : |f(x + z) - f(x)| \leq k |z| \right\},$$

which is a closed subset of $R$ since $f$ is continuous. Moreover, if $x \in W$ and $M = |f'(x)|$, then

$$|f(y) - f(x)| = |f'(x)(y - x) + o(y - x)| \leq (M + 1)|y - x|$$

for $y$ close to $x$. (Here $o(y - x)$ denotes a function such that $\lim_{y \to x} o(y - x)/(y - x) = 0$. In particular, this shows that $x \in E_k$ for all $k$ sufficiently large. Therefore $W = \bigcup_{k=1}^\infty E_k$ and since $W$ is not meager by the Baire category Theorem 26.4, some $E_k$ has non-empty interior. That is there exists $x_0 \in E_k \subset W$ and $\varepsilon > 0$ such that

$$J := (x_0 - \varepsilon, x_0 + \varepsilon) \subset E_k \subset W.$$ 

For $x \in J$, we have $|f(x + z) - f(x)| \leq k |z|$ provided that $|z| \leq k^{-1}$ and therefore that $|f'(x)| \leq k$ for $x \in J$. Therefore $x_0 \in U \cap W$ showing $U$ is dense.

**Remark 26.10.** This proposition generalizes to functions $f : \mathbb{R}^n \rightarrow \mathbb{R}^m$ in an obvious way.

For our next application of Theorem 26.2, let $X := BC^\infty((-1, 1))$ denote the set of smooth functions $f$ on $(-1, 1)$ such that $f$ and all of its derivatives are bounded. In the metric

$$\rho(f, g) := \sum_{k=0}^\infty 2^{-k} \frac{\|f^{(k)} - g^{(k)}\|_\infty}{1 + \|f^{(k)} - g^{(k)}\|_\infty} \quad \text{for } f, g \in X,$$

$X$ becomes a complete metric space.

**Theorem 26.11.** Given an increasing sequence of positive numbers $\{M_n\}_{n=1}^\infty$, the set

$$F := \left\{ f \in X : \limsup_{n \to \infty} \frac{|f^{(n)}(0)|}{M_n} \geq 1 \right\}$$

is dense in $X$. In particular, there is a dense set of $f \in X$ such that the power series expansion of $f$ at 0 has zero radius of convergence.

**Proof.** Step 1. Let $n \in N$. Choose $g \in C^\infty((-1, 1))$ such that $\|g\|_\infty < 2^{-n}$ while $g'(0) = 2M_n$ and define

$$f_n(x) := \int_0^x dt_{n-1} \int_0^{t_{n-1}} dt_{n-2} \cdots \int_0^{t_2} dt_1 g(t_1).$$

Then for $k < n$,
Therefore, 
\[ g(x) = g'(x), \quad f^{(n)}(0) = 2M_n \text{ and } f^{(k)}_n \text{ satisfies} \]
\[ \|f^{(k)}_n\|_\infty \leq \frac{2^{-n}}{(n-1-k)} \leq 2^{-n} \text{ for } k < n. \]

Consequently,
\[
\rho(f_n, 0) = \sum_{k=0}^{n} 2^{-k} \frac{\|f^{(k)}_n\|_\infty}{1 + \|f^{(k)}_n\|_\infty} \\
\leq \sum_{k=0}^{n-1} 2^{-k+2^{-n}} + \sum_{k=n}^{\infty} 2^{-k} \cdot 1 \leq 2 \left(2^{-n} + 2^{-n}\right) = 4 \cdot 2^{-n}.
\]

Thus we have constructed \( f_n \in X \) such that \( \lim_{n \to \infty} \rho(f_n, 0) = 0 \) while \( f^{(n)}_n(0) = 2M_n \) for all \( n \).

**Step 2.** The set
\[ G_n := \cup_{m \geq n} \left\{ f \in X : \left| f^{(m)}(0) \right| > M_m \right\} \]
is a dense open subset of \( X \). The fact that \( G_n \) is open is clear. To see that \( G_n \) is dense, let \( g \in X \) be given and define \( g_m := g + \varepsilon_m f_m \) where \( \varepsilon_m := \text{sgn}(g^{(m)}(0)) \).

Then
\[
\left| g_m^{(m)}(0) \right| = \left| g^{(m)}(0) \right| + \left| f^{(m)}_m(0) \right| \geq 2M_m > M_m \text{ for all } m.
\]

Therefore, \( g_m \in G_n \) for all \( m \geq n \) and since
\[
\rho(g_m, g) = \rho(f_m, 0) \to 0 \text{ as } m \to \infty
\]
it follows that \( g \in G_n \).

**Step 3.** By the Baire Category theorem, \( \cap G_n \) is a dense subset of \( X \). This completes the proof of the first assertion since
\[
\mathcal{F} = \left\{ f \in X : \limsup_{n \to \infty} \frac{\left| f^{(n)}(0) \right|}{M_n} \geq 1 \right\} = \bigcap_{n=1}^{\infty} \left\{ f \in X : \frac{\left| f^{(n)}(0) \right|}{M_n} \geq 1 \text{ for some } n \geq m \right\} \supset \bigcap_{n=1}^{\infty} G_n.
\]

**Step 4.** Take \( M_n = (n!)^2 \) and recall that the power series expansion for \( f \) near 0 is given by \( \sum_{n=0}^{\infty} \frac{f^{(n)}(0)}{n!} x^n \). This series can not converge for any \( f \in \mathcal{F} \) and any \( x \neq 0 \) because
\[
\limsup_{n \to \infty} \frac{f^{(n)}(0)}{n!} x^n = \limsup_{n \to \infty} \frac{f^{(n)}(0)}{(n!)^2} n! x^n = \limsup_{n \to \infty} \frac{f^{(n)}(0)}{(n!)^2} n! - \limsup_{n \to \infty} n! |x^n| = \infty
\]
where we have used \( \lim_{n \to \infty} n! |x^n| = \infty \) and \( \limsup_{n \to \infty} \frac{f^{(n)}(0)}{(n!)^2} |x^n| \geq 1 \).

**Remark 26.12.** Given a sequence of real number \( \{a_n\}_{n=0}^{\infty} \) there always exists \( f \in X \) such that \( f^{(n)}(0) = a_n \). To construct such a function \( f \), let \( \varphi \in C_0^\infty(-1,1) \) be a function such that \( \varphi = 1 \) in a neighborhood of 0 and \( \varepsilon_n \in (0,1) \) be chosen so that \( \varepsilon_n \to 0 \) as \( n \to \infty \) and \( \sum_{n=0}^{\infty} |a_n| \varepsilon_n < \infty \). The desired function \( f \) can then be defined by
\[
f(x) = \sum_{n=0}^{\infty} \frac{a_n}{n!} x^n \varphi(x/\varepsilon_n) =: \sum_{n=0}^{\infty} g_n(x).
\]

The fact that \( f \) is well defined and continuous follows from the estimate:
\[
|g_n(x)| = \frac{a_n}{n!} x^n \varphi(x/\varepsilon_n) \leq \frac{\|\varphi\|_\infty}{n!} |a_n| \varepsilon_n^n
\]
and the assumption that \( \sum_{n=0}^{\infty} |a_n| \varepsilon_n^n < \infty \). The estimate
\[
|g'_n(x)| = \frac{a_n}{(n-1)!} x^{n-1} \varphi(x/\varepsilon_n) + \frac{a_n}{n!} x^n \varphi'(x/\varepsilon_n) \\
\leq \frac{\|\varphi\|_\infty}{(n-1)!} |a_n| \varepsilon_n^{n-1} + \frac{\|\varphi'\|_\infty}{n!} |a_n| \varepsilon_n^n
\]
and the assumption that \( \sum_{n=0}^{\infty} |a_n| \varepsilon_n^n < \infty \) shows \( f \in C^1(-1,1) \) and \( f'(x) = \sum_{n=0}^{\infty} g'_n(x) \). Similar arguments show \( f \in C^k(-1,1) \) and \( f^{(k)}(x) = \sum_{n=0}^{\infty} g^{(k)}_n(x) \) for all \( x \in (-1,1) \) and \( k \in \mathbb{N} \). This completes the proof since, using \( \varphi(x/\varepsilon_n) = 1 \) for \( x \) in a neighborhood of 0, \( g^{(k)}_n(0) = \delta_{k,n} a_k \) and hence
\[
f^{(k)}(0) = \sum_{n=0}^{\infty} g^{(k)}_n(0) = a_k.
\]

### 26.3 Exercises

**Exercise 26.1.** Let \((X, \|\cdot\|)\) be a normed space and \( E \subset X \) be a subspace.
1. If $E$ is closed and proper subspace of $X$ then $E$ is nowhere dense.
2. If $E$ is a proper finite dimensional subspace of $X$ then $E$ is nowhere dense.

**Exercise 26.2.** Now suppose that $(X, \|\cdot\|)$ is an infinite dimensional Banach space. Show that $X$ can not have a countable **algebraic** basis. More explicitly, there is no countable subset $S \subset X$ such that every element $x \in X$ may be written as a **finite** linear combination of elements from $S$. **Hint:** make use of Exercise [26.1](#) and the Baire category theorem.
Examples of Measures

In this chapter we are going to state a couple of construction theorems for measures. The proofs of these theorems will be deferred until the next chapter, also see Chapter 49. Our goal in this chapter is to apply these construction theorems to produce a fairly broad class of examples of measures.

27.1 The Riesz-Markov Theorem

Now suppose that $X$ is a locally compact Hausdorff space and $\mathcal{B} = \mathcal{B}_X$ is the Borel $\sigma$-algebra on $X$. Open subsets of $\mathbb{R}^d$ and locally compact separable metric spaces are examples of such spaces, see Section 24.1.

Definition 27.1. A linear functional $I$ on $C_c(X)$ is positive if $I(f) \geq 0$ for all $f \in C_c([0, \infty))$.

Proposition 27.2. If $I$ is a positive linear functional on $C_c(X)$ and $K$ is a compact subset of $X$, then there exists $C_K < \infty$ such that $|I(f)| \leq C_K \|f\|_\infty$ for all $f \in C_c(X)$ with $\text{supp}(f) \subset K$.

Proof. By Urysohn’s Lemma there exists $\varphi \in C_c([0, 1])$ such that $\varphi = 1$ on $K$. Then for all $f \in C_c(X, \mathbb{R})$ such that $\text{supp}(f) \subset K$, $|f| \leq \|f\|_\infty \varphi$ or equivalently $\|f\|_\infty \varphi \pm f \geq 0$. Hence $\|f\|_\infty I(\varphi) \pm I(f) \geq 0$ or equivalently which is to say $|I(f)| \leq \|f\|_\infty I(\varphi)$. Letting $C_K := I(\varphi)$, we have shown that $|I(f)| \leq C_K \|f\|_\infty$ for all $f \in C_c(X, \mathbb{R})$ with $\text{supp}(f) \subset K$. For general $f \in C_c(X, \mathbb{C})$ with $\text{supp}(f) \subset K$, choose $|\alpha| = 1$ such that $\alpha I(f) \geq 0$. Then

$$|I(f)| = \alpha I(f) = I(\alpha f) = I(\text{Re}(\alpha f)) \leq C_K \|\text{Re}(\alpha f)\|_\infty \leq C_K \|f\|_\infty.$$

Example 27.3. If $\mu$ is a $K$-finite measure on $X$, then

$$I_{\mu}(f) = \int_X f d\mu \quad \forall f \in C_c(X)$$

defines a positive linear functional on $C_c(X)$. In the future, we will often simply write $\mu(f)$ for $I_{\mu}(f)$.

The Riesz-Markov Theorem below asserts that every positive linear functional on $C_c(X)$ comes from a $K$-finite measure $\mu$.

Example 27.4. Let $X = \mathbb{R}$ and $\tau = \tau_d = 2^X$ be the discrete topology on $X$. Now let $\mu(A) = 0$ if $A$ is countable and $\mu(A) = \infty$ otherwise. Since $K \subset X$ is compact iff $\#(K) < \infty$, $\mu$ is a $K$-finite measure on $X$ and

$$I_{\mu}(f) = \int_X f d\mu = 0 \quad \forall f \in C_c(X).$$

This shows that the correspondence $\mu \rightarrow I_{\mu}$ from $K$-finite measures to positive linear functionals on $C_c(X)$ is not injective without further restriction.

Definition 27.5. Suppose that $\mu$ is a Borel measure on $X$ and $B \in \mathcal{B}_X$. We say $\mu$ is inner regular on $B$ if

$$\mu(B) = \sup \{\mu(K) : K \subset B\}$$

and $\mu$ is outer regular on $B$ if

$$\mu(B) = \inf \{\mu(U) : B \subset U \subset_\sigma X\}.$$

The measure $\mu$ is said to be a regular Borel measure on $X$, if it is both inner and outer regular on all Borel measurable subsets of $X$.

Definition 27.6. A measure $\mu : \mathcal{B}_X \rightarrow [0, \infty]$ is a Radon measure on $X$ if $\mu$ is a $K$-finite measure which is inner regular on all open subsets of $X$ and outer regular on all Borel subsets of $X$.

The measure in Example 27.4 is an example of a $K$-finite measure on $X$ which is not a Radon measure on $X$. BRUCE: Add exercise stating the sum of two radon measures is still a radon measure. It is not true for countable sums since this does not even preserve the $K$-finite condition.

Example 27.7. If the topology on a set, $X$, is the discrete topology, then a measure $\mu$ on $\mathcal{B}_X$ is a Radon measure iff $\mu$ is of the form

$$\mu = \sum_{x \in X} \mu_x \delta_x$$

(27.3)
where $\mu_x \in [0, \infty)$ for all $x \in X$. To verify this first notice that $B_X = \tau_X = 2^X$ and hence every measure on $B_X$ is necessarily outer regular on all subsets of $X$. The measure $\mu$ is $K$-finite if $\mu_x := \mu(\{x\}) < \infty$ for all $x \in X$. If $\mu$ is a Radon measure, then for $A \subset X$ we have, by inner regularity,

$$\mu(A) = \sup \{\mu(A) : A \subset A\} = \sup \left\{ \sum_{x \in A} \mu_x : A \subset A \right\} = \sum_{x \in A} \mu_x.$$ 

On the other hand if $\mu$ is given by Eq. \eqref{eq:27.3} and $A \subset X$, then

$$\mu(A) = \sum_{x \in A} \mu_x = \mu(A) = \sum_{x \in A} \mu_x : A \subset A \right\}$$

showing $\mu$ is inner regular on all (open) subsets of $X$.

Recall from Definition \eqref{eq:24.8} that if $U$ is an open subset of $X$, we write $f \prec U$ to mean that $f \in C_c(X, [0,1])$ with $\text{supp}(f) := \{f \neq 0\} \subset U$.

**Notation 27.8** Given a positive linear functional, $I$, on $C_c(X)$ define $\mu = \mu_I$ on $B_X$ by

$$\mu(U) = \sup \{I(f) : f \prec U\}$$

for all $U \subset X$ and then define

$$\mu(B) = \inf \{\mu(U) : B \subset U \text{ and } U \text{ is open}\}.$$ 

**Theorem 27.9** (Riesz-Markov Theorem). The map $\mu \to I_\mu$ taking Radon measures on $X$ to positive linear functionals on $C_c(X)$ is bijective. Moreover if $I$ is a positive linear functional on $C_c(X)$, the function $\mu := \mu_I$ defined in Notation 27.8 has the following properties.

1. $\mu$ is a Radon measure on $X$ and the map $I \to \mu_I$ is the inverse to the map $\mu \to I_\mu$.
2. For all compact subsets $K \subset X$,

$$\mu(K) = \inf \{I(f) : 1_K \leq f \prec X\}.$$ 

3. If $||I_\mu||$ denotes the dual norm of $I = I_\mu$ on $C_c(X, B)^*$, then $||I|| = \mu(X)$. In particular, the linear functional, $I_\mu$, is bounded if $\mu(X) < \infty$.

**Proof.** (Also see Theorem \eqref{eq:49.49} and related material about the Daniel integral.) The proof of the surjectivity of the map $\mu \to I_\mu$ and the assertion in item 1. is the content of Theorem \eqref{eq:27.11} below.

**Injectivity of $\mu \to I_\mu$.** Suppose that $\mu$ is a is a Radon measure on $X$. To each open subset $U \subset X$ let

$$\mu_0(U) := \sup \{I_\mu(f) : f \prec U\}.$$ 

It is evident that $\mu_0(U) \leq \mu(U)$ because $f \prec U$ implies $f \leq 1_U$. Given a compact subset $K \subset U$, Urysohn’s Lemma \eqref{eq:25.8} implies there exists $f \prec U$ such that $f = 1$ on $K$. Therefore,

$$\mu(K) \leq \int_X f \, d\mu \leq \mu_0(U) \leq \mu(U).$$ 

By assumption $\mu$ is inner regular on open sets, and therefore taking the supremum of Eq. \eqref{eq:27.8} over compact subsets, $K$, of $U$ shows

$$\mu(U) = \mu_0(U) = \sup \{I_\mu(f) : f \prec U\}.$$ 

If $\mu$ and $\nu$ are two Radon measures such that $I_\mu = I_\nu$. Then by Eq. \eqref{eq:27.9} if it follows that $\mu = \nu$ on all open sets. Then by outer regularity, $\mu = \nu$ on $B_X$ and this shows the map $\mu \to I_\mu$ is injective.

**Item 2.** Let $K \subset X$ be a compact set, then by monotonicity of the integral,

$$\mu(K) \leq \inf \{I_\mu(f) : f \in C_c(X) \text{ with } f \geq 1_K\}.$$ 

To prove the reverse inequality, choose, by outer regularity, $U \subset X$ such that $K \subset U$ and $\mu(U \setminus K) < \varepsilon$. By Urysohn’s Lemma \eqref{eq:25.8} there exists $f \prec U$ such that $f = 1$ on $K$ and hence,

$$I_\mu(f) = \int_X f \, d\mu = \mu(K) + \int_{U \setminus K} f \, d\mu \leq \mu(K) + \mu(U \setminus K) < \mu(K) + \varepsilon.$$ 

Consequently,

$$\inf \{I_\mu(f) : f \in C_c(X) \text{ with } f \geq 1_K\} < \mu(K) + \varepsilon$$

and because $\varepsilon > 0$ was arbitrary, the reverse inequality in Eq. \eqref{eq:27.10} holds and Eq. \eqref{eq:27.9} is verified.

**Item 3.** If $f \in C_c(X)$, then

$$||I_\mu|| := \int_X |f| \, d\mu = \int_{\text{supp}(f)} |f| \, d\mu \leq ||f||_{\infty} \mu(\text{supp}(f)) \leq ||f||_{\infty} \mu(X)$$

and thus $||I_\mu|| \leq \mu(X)$. For the reverse inequality let $K$ be a compact subset of $X$ and use Urysohn’s Lemma \eqref{eq:25.8} again to find a function $f \prec X$ such that $f = 1$ on $K$. By Eq. \eqref{eq:27.8} we have

$$\mu(K) \leq \int_X f \, d\mu = I_\mu(f) \leq ||I_\mu|| ||f||_{\infty} = ||I_\mu||.$$
which by the inner regularity of \( \mu \) on open sets implies
\[
\mu(X) = \sup \{ \mu(K) : K \subset X \} \leq \| I_\mu \|.
\]

**Example 27.10 (Discrete Version of Theorem 27.9).** Suppose \( X \) is a set, \( \tau = 2^X \) is the discrete topology on \( X \) and for \( x \in X \), let \( e_x \in C_0(X) \) be defined by \( e_x(y) = 1_{\{x\}}(y) \). Let \( I \) be positive linear functional on \( C_0(X) \) and define a Radon measure, \( \mu \), on \( X \) by
\[
\mu(A) := \sum_{x \in A} I(e_x) \quad \text{for all } A \subset X.
\]
Then for \( f \in C_c(X) \) (so \( f \) is a complex valued function on \( X \) supported on a finite set),
\[
\int_X f d\mu = \sum_{x \in X} f(x) I(e_x) = I \left( \sum_{x \in X} f(x) e_x \right) = I(f),
\]
so that \( I = I_\mu \). It is easy to see in this example that \( \mu \) defined above is the unique regular radon measure on \( X \) such that \( I = I_\mu \) while example Example 27.4 shows the uniqueness is lost if the regularity assumption is dropped.

### 27.2 Proof of the Riesz-Markov Theorem 27.9

This section is devoted to completing the proof of the Riesz-Markov Theorem 27.9.

**Theorem 27.11.** Suppose \( (X, \tau) \) is a locally compact Hausdorff space, \( I \) is a positive linear functional on \( C_0(X) \) and \( \mu := \mu_I \) be as in Notation 27.8. Then \( \mu \) is a Radon measure on \( X \) such that \( I = I_\mu \), i.e.
\[
I(f) = \int_X f d\mu \quad \text{for all } f \in C_c(X).
\]

**Proof.** Let \( \mu : \tau \to [0, \infty] \) be as in Eq. 27.4 and \( \mu^* : 2^X \to [0, \infty] \) be the associate outer measure as in Proposition 48.6. As we have seen in Lemma 48.8, \( \mu \) is sub-additive on \( \tau \) and
\[
\mu^*(E) = \inf \{ \mu(U) : E \subset U \subset \tau X \}.
\]
By Theorem 48.15, \( M := M(\mu^*) \) is a \( \sigma \)-algebra and \( \mu^*|_M \) is a measure on \( M \).

To show \( B_X \subset M \) it suffices to show \( U \in M \) for all \( U \in \tau \), i.e. we must show:
\[
\mu^*(E) \geq \mu^*(E \cap U) + \mu^*(E \setminus U) \tag{27.12}
\]
for every \( E \subset X \) such that \( \mu^*(E) < \infty \). First suppose \( E \) is open, in which case \( E \cap U \) and \( E \setminus U \) are open as well. Let \( f \prec E \cap U \) and \( K := \text{supp}(f) \). Then \( E \setminus U \subset E \setminus K \) and if \( g \prec E \setminus K \) then \( f + g \prec E \) (see Figure 27.1) and hence
\[
\mu^*(E) \geq I(f) + I(g).
\]
Taking the supremum of this inequality over \( g \prec E \setminus K \) shows
\[
\mu^*(E) \geq I(f) + \mu^*(E \setminus K) \geq I(f) + \mu^*(E \setminus U).
\]
Taking the supremum of this inequality over \( f \prec U \) shows Eq. (27.12) is valid for \( E \in \tau \).

![Fig. 27.1. Constructing a function \( g \) which approximates \( 1_{E\setminus U} \).](image)

For general \( E \subset X \), let \( V \in \tau \) with \( E \subset V \), then
\[
\mu^*(V) \geq \mu^*(V \cap U) + \mu^*(V \setminus U) \geq \mu^*(E \cap U) + \mu^*(E \setminus U)
\]
and taking the infimum of this inequality over such \( V \) shows Eq. (27.12) is valid for general \( E \subset X \). Thus \( U \in M \) for all \( U \in \tau \) and therefore \( B_X \subset M \).

Up to this point it has been shown that \( \mu = \mu^*|_{B_X} \) is a measure which, by very construction, is outer regular. We now verify that \( \mu \) satisfies Eq. 27.6, namely that \( \mu(K) = \nu(K) \) for all compact sets \( K \subset X \) where
\[
\nu(K) := \inf \{ I(f) : f \in C_c(X, [0, 1]) \ni f \geq 1_K \}.
\]
To do this let \( f \in C_c(X, [0, 1]) \) with \( f \geq 1_K \) and \( \varepsilon > 0 \) be given. Let \( U_\varepsilon := \{ f > 1 - \varepsilon \} \in \tau \) and \( g \prec U_\varepsilon \), then \( g \leq (1 - \varepsilon)^{-1} f \) and hence
Let $K$ be a finite sum since $f$ is a finite sum. It should be clear from Figure 27.2 that 

$$
\mu(K) \leq \nu(K) \leq I(f) \leq \mu(U).
$$

By the outer regularity of $\mu$, we have

$$
\mu(K) \leq \nu(K) \leq \inf\{\mu(U) : K \subset U \subset \nu X\} = \mu(K),
$$

i.e.,

$$
\mu(K) = \nu(K) = \inf\{I(f) : f \in C_c(X,[0,1]) \geq f \geq 1_{K}\}.
$$

This inequality clearly establishes that $\mu$ is $K$-finite and therefore $C_c(X,[0,\infty)) \subset L^1(\mu)$.

Next we will establish

$$
I(f) = I_\mu(f) := \int_X f d\mu
$$

for all $f \in C_c(X)$. By the linearity, it suffices to verify Eq. (27.14) holds for $f \in C_c(X,[0,\infty))$. To do this we will use the “layer cake method” to slice $f$ into thin pieces. Explicitly, fix an $\epsilon > 0$ and for all $n \in \mathbb{N}$ let

$$
f_n := \min\left(\max \left(f - \frac{n-1}{N}, 0\right), \frac{1}{N}\right),
$$

see Figure 27.2. It should be clear from Figure 27.2 that $f = \sum_{n=1}^\infty f_n$ with the sum actually being a finite sum since $f_n \equiv 0$ for all $n$ sufficiently large. Let $K_0 := \text{supp}(f)$ and $K_n := \{f \geq \frac{2}{N}\}$. Then (again see Figure 27.2) for all $n \in \mathbb{N},$

$$
1_{K_n} \leq N f_n \leq 1_{K_{n-1}},
$$

which upon integrating on $\mu$ gives

$$
\mu(K_n) \leq NI_\mu(f_n) \leq \mu(K_{n-1}).
$$

Moreover, if $U$ is any open set containing $K_{n-1}$, then $N f_n \prec U$ and so by Eq. (27.13) and the definition of $\mu$, we have

$$
\mu(K_n) \leq NI(f_n) \leq \mu(U).
$$

From the outer regularity of $\mu$, it follows from Eq. (27.17) that

$$
\mu(K_n) \leq NI(f_n) \leq \mu(K_{n-1}).
$$

As a consequence of Eqs. (27.16) and (27.18), we have

$$
N |I_\mu(f_n) - I(f_n)| \leq \mu(K_{n-1}) - \mu(K_n) = \mu(K_{n-1} \setminus K_n).
$$

Therefore

$$
|I_\mu(f) - I(f)| = \sum_{n=1}^\infty |I_\mu(f_n) - I(f_n)| \leq \sum_{n=1}^\infty |I_\mu(f_n) - I(f_n)| \leq \frac{1}{N} \sum_{n=1}^\infty \mu(K_{n-1} \setminus K_n) = \frac{1}{N} \mu(K_0) \to 0
$$

as $N \to \infty$ which establishes Eq. (27.14).

It now only remains to show $\mu$ is inner regular on open sets to complete the proof. If $U \in \tau$ and $\mu(U) < \infty$, then for any $\epsilon > 0$ there exists $f \prec U$ such that

$$
\mu(U) \leq I(f) + \epsilon = \int_X f d\mu + \epsilon \leq \mu(\text{supp}(f)) + \epsilon.
$$

Hence if $K = \text{supp}(f)$, we have $K \subset U$ and $\mu(U \setminus K) < \epsilon$ and this shows $\mu$ is inner regular on open sets with finite measure. Finally if $U \in \tau$ and $\mu(U) = \infty,$
there exists \( f_n \prec U \) such that \( I(f_n) \uparrow \infty \) as \( n \to \infty \). Then, letting \( K_n = \text{supp}(f_n) \), we have \( K_n \subset U \) and \( \mu(K_n) \geq I(f_n) \) and therefore \( \mu(K_n) \uparrow \mu(U) = \infty \).

### 27.2.1 Rudin’s Proof of the Riesz-Markov Theorem

**Proof.** As usual we let \( \mu : \tau \to [0, \infty] \) be as in Eq. (27.4) and by Lemma 48.8 we know that \( \mu \) is sub-additive on \( \tau \). We now define \( \mu : 2^X \to [0, \infty] \) by setting

\[
\mu(A) := \inf \{ \mu(V) : A \subset V \subset_\alpha X \}.
\]

I claim that \( \mu \) is the outer measure associated to \( \mu|_\tau \). Indeed, if \( A \subset V := \bigcup_i V_i \) with \( V_i \in \tau \),

\[
\mu(A) \leq \mu(V) \leq \sum_i \mu(V_i)
\]

from which it follows that \( \mu(A) \leq \mu|_\tau (A) \). The reverse inequality is trivial. It now follows by Proposition 48.6 that \( \mu \) is subadditive on \( 2^X \) as well. This is also easily proved directly since if \( A = \bigcup_i A_i \) and \( A_i \subset V_i \subset_\alpha X \), then \( A \subset V := \bigcup_i V_i \) so that

\[
\mu(A) \leq \mu(V) \leq \sum_i \mu(V_i).
\]

Since the \( V_i \in \tau \) is arbitrary subject to the restriction that \( A_i \subset V_i \), it follows that

\[
\mu(A) \leq \sum_i \mu(A_i).
\]

Now let

\[
\mathcal{M}_F := \{ A \in 2^X : \alpha > \mu(A) = \sup \{ \mu(K) : K \subset A \} \}
\]

be those sets \( A \) of \( X \) which are \( \mu \)-finite and are \( \mu \)-inner regular and let

\[
\mathcal{M} := \{ A \in 2^X : A \cap K \in \mathcal{M}_F \text{ for all } K \subset X \}
\]

be those sets which are locally \( \mu \)-inner regular.

1. Suppose \( K \subset X \) and choose \( f \prec X \) such that \( f = 1 \) on \( K \). For \( \alpha \in (0, 1) \), let \( V_\alpha := \{ f > \alpha \} \), then \( V_\alpha \in \tau \) and \( K \subset V_\alpha \). Hence if \( g \prec V_\alpha \), then we have \( \alpha g \leq f \) so that \( \alpha \mu(g) \leq I(f) \) which shows

\[
\mu(K) \leq \mu(V_\alpha) \leq \alpha^{-1} I(f).
\]

Letting \( \alpha \uparrow 1 \) in this last inequality shows that \( \mu(K) \leq I(f) < \infty \) which shows \( K \in \mathcal{M}_F \) and that

\[
\mu(K) \leq \inf \{ I(f) : 1_K \leq f \prec X \}.
\]

Given \( \varepsilon > 0 \), let \( V \in \tau \) be chosen so that \( K \subset V \) and \( \mu(V) < \mu(K) + \varepsilon \) and then choose \( f \) such that \( 1_K \leq f \prec V \). Then

\[
I(f) \leq \mu(V) < \mu(K) + \varepsilon
\]

from which it follows that

\[
\inf \{ I(f) : 1_K \leq f \prec X \} \leq \mu(K)
\]

and we have shown that

\[
\mu(K) = \inf \{ I(f) : 1_K \leq f \prec X \} < \infty.
\]

2. Now suppose that \( V \in \tau \) with \( \mu(V) < \infty \) and let \( \alpha \in (0, \mu(V)) \). Choose \( f \prec V \) such that \( \alpha \leq I(f) \leq \mu(V) \). Letting \( K = \text{supp}(f) \) and \( W \in \tau \) such that \( K \subset W \), we have \( f \prec W \) and therefore that \( I(f) \leq \mu(W) \). Since \( W \in \tau \) such that \( K \subset W \) was arbitrary, it follows that

\[
\alpha \leq I(f) \leq \inf \{ \mu(W) : K \subset W \subset_\alpha X \} = \mu(K).
\]

Since \( \alpha < \mu(V) \) was arbitrary, it follows that \( \mu(V) = \sup \{ \mu(K) : K \subset V \} \) and therefore that \( V \in \mathcal{M}_F \).

3. Suppose that \( K \) and \( F \) are pairwise disjoint compact subsets of \( X \) and choose \( 1_K + 1_F \leq f \prec X \) such that \( I(f) \leq \mu(K \cup F) + \varepsilon \). Let \( \alpha \in C_c(X, [0,1]) \) be chosen so that \( \alpha = 1 \) on \( K \) and \( \alpha = 0 \) on \( F \). Then \( 1_K \leq \alpha f \) and \( 1_F \leq (1 - \alpha) f \) so that

\[
\mu(K) + \mu(F) \leq I(\alpha f) + I((1 - \alpha) f) = I(f) \leq \mu(K \cup F) + \varepsilon \leq \mu(K) + \mu(F) + \varepsilon.
\]

Since \( \varepsilon > 0 \) was arbitrary, it follows that

\[
\mu(K) + \mu(F) = \mu(K \cup F).
\]

4. Now suppose that \( \{ A_i \}_{i=1}^\infty \) are pairwise disjoint members \( \mathcal{M}_F \) and let \( A := \bigcup_{i=1}^\infty A_i \). As we have already seen

\[
\mu(A) \leq \sum_{i=1}^\infty \mu(A_i)
\]

with equality if \( \mu(A) = \infty \). We now suppose that \( \mu(A) < \infty \). There exists \( K_i \subset A_i \) such that \( \mu(A_i) \leq \mu(K_i) + \varepsilon_i \) for any \( \varepsilon_i > 0 \). Thus

\[
\sum_{i=1}^N \mu(A_i) \leq \sum_{i=1}^N [\mu(K_i) + \varepsilon_i] = \mu \left( \bigcup_{i=1}^N K_i \right) + \sum_{i=1}^N \varepsilon_i \leq \mu(A) + \sum_{i=1}^\infty \varepsilon_i
\]

Page: 313 job: newanal macro: svmobob.cls date/time: 6-Jan-2012/17:01
and hence
\[ \sum_{i=1}^{\infty} \mu(A_i) = \lim_{N \to \infty} \sum_{i=1}^{N} \mu(A_i) \leq \mu(A) + \sum_{i=1}^{\infty} \varepsilon_i. \]

Since that \( \varepsilon_i > 0 \) were arbitrary, it follows that
\[ \sum_{i=1}^{\infty} \mu(A_i) \leq \mu(A) \]
and hence that
\[ \sum_{i=1}^{\infty} \mu(A_i) = \mu(A). \]

In particular if \( \mu(A) < \infty \), then \( A \in \mathcal{M}_F \) as well.

5. Suppose that \( A \in \mathcal{M}_F \) and \( K \) is compact and \( V \) is open so that \( K \subset A \subset V \) and \( \mu(V) - \mu(K) < \varepsilon \). We have already shown that \( K \) and \( V \setminus K \in \sigma \) are in \( \mathcal{M}_F \). Since \( V = K \cup (V \setminus K) \), it follows that \( \mu(V) = \mu(K) + \mu(V \setminus K) \), i.e. that
\[ \mu(V \setminus K) = \mu(V) - \mu(K). \]

6. We now show that \( \mathcal{M}_F \) is closed under finite unions, intersections and differences. Indeed if \( A_i \in \mathcal{M}_F \) we may choose \( K_i \subset A_i \subset V_i \) such that \( \mu(V_i \setminus K_i) < \varepsilon \) for \( i = 1,2 \). Then
\[ V_1 \setminus K_2 \subset (V_1 \setminus K_1) \cup (K_1 \setminus K_2), \]
\[ K_1 \setminus K_2 \subset (K_1 \setminus V_2) \cup (V_2 \setminus K_2), \]
and hence
\[ K_1 \setminus V_2 \subset A_1 \setminus A_2 \subset V_1 \setminus K_2 \subset (V_1 \setminus K_1) \cup (K_1 \setminus V_2) \cup (V_2 \setminus K_2). \]

and hence it follows that
\[ \mu(V_1 \setminus K_2) \leq 2\varepsilon + \mu((K_1 \setminus V_2)) \]
and since \( K_1 \setminus V_2 \) is compact we learn that \( A_1 \setminus A_2 \in \mathcal{M}_F \). Furthermore,
\[ A_1 \cup A_2 = (A_1 \setminus A_2) \cup A_2 \in \mathcal{M}_F \]
and
\[ A_1 \cap A_2 = A_1 \setminus (A_1 \setminus A_2) \in \mathcal{M}_F. \]

Alternatively,
\[ K_1 \cup K_2 \subset A_1 \cup A_2 \subset V_1 \cup V_2 \]
so that
\[ \mu(V_1 \cup V_2 \setminus (K_1 \cup K_2)) \leq \mu((V_1 \setminus K_1) \cup (V_2 \setminus K_2)) \leq \mu((V_1 \setminus K_1)) + \mu((V_2 \setminus K_2)) \leq 2\varepsilon \]
from which it follows that \( A_1 \cup A_2 \in \mathcal{M}_F \) etc.

7. \( \mathcal{M} \) is a \( \sigma \) - algebra which contains \( \mathcal{B}_X \). If \( A \in \mathcal{M} \) and \( K \) is compact then \( A \cap K \in \mathcal{M}_F \) and hence
\[ A^c \cap K = K \setminus A = K \setminus (A \cap K) \in \mathcal{M}_F. \]

Since \( K \) was arbitrary it follows that \( A \in \mathcal{M} \) and we have shown \( \mathcal{M} \) is stable under complementation. Now suppose that \( A = \bigcup A_i \) with \( A_i \in \mathcal{M} \) and \( K \) is compact. Then
\[ A \cap K = \bigcup_{i=1}^{\infty} (A_i \cap K) = \bigcup_{i=1}^{\infty} B_i \]
where
\[ B_i := (A_i \cap K) \setminus \bigcup_{j=1}^{i} (A_j \cap K) \in \mathcal{M}_F. \]

Since that \( B_i \in \mathcal{M}_F \) are pairwise disjoint, it follows that \( A \cap K \in \mathcal{M}_F \) as well and hence that \( A \in \mathcal{M} \).

Moreover if \( C \) is a closed set then \( C \cap K \) is compact and hence in \( \mathcal{M}_F \) for all compact sets \( K \). Thus \( \mathcal{M} \) is a \( \sigma \) algebra which contains all closed sets and therefore the contains the Borel \( \sigma \) - algebra.

8. We have \( \mathcal{M}_F = \{ A \in \mathcal{M} : \mu(A) < \infty \} \). As we have seen if \( A \in \mathcal{M}_F \) then \( A \cap K \in \mathcal{M}_F \) for all compact and hence it easily follows that \( \mathcal{M}_F \subset \mathcal{M} \). Conversely if \( A \in \mathcal{M} \) with \( \mu(A) < \infty \), then choose \( V \in \tau \) such that \( A \subset V \) and \( \mu(A) \cong \mu(V) < \infty \). Then choose \( K \subset V \) such that \( \mu(V \setminus K) \cong 0 \). Since \( K \cap A \in \mathcal{M}_F \) there exists a compact set \( H \) such that \( H \subset A \cap K \subset A \) such that \( \mu(A \cap K) \cong \mu(H) \). Since
\[ A \subset (A \cap K) \cup (A \setminus K) \subset (A \cap K) \cup (V \setminus K) \]

it follows that
\[ \mu(A) \leq \mu(A \cap K) + \mu(V \setminus K) \cong \mu(H) \]
which shows that \( A \) is inner regular and hence \( A \in \mathcal{M}_F \).

9. \( \mu \) is a measure on \( \mathcal{M} \). To see this suppose that \( A \) is the disjoint union of \( A_i \in \mathcal{M} \). If \( \mu(A) < \infty \), then \( A_i \in \mathcal{M}_F \) for all \( i \) and we know that \( \mu(A) = \sum_i \mu(A_i) \). Conversely, if \( \mu(A) = \infty \) then \( \infty = \mu(A) \leq \sum_i \mu(A_i) \) as desired.

10. The fact that \( I(f) = \int_X f d\mu \) for all \( f \in C_c (X) \) follows as in the previous proof.
27.2.2 Regularity Results For Radon Measures

**Proposition 27.12.** If \( \mu \) is a Radon measure on \( X \) then \( \mu \) is inner regular on all \( \sigma \)-finite Borel sets.

**Proof.** Suppose \( A \in \mathcal{B}_X \) and \( \mu(A) < \infty \) and \( \varepsilon > 0 \) is given. By outer regularity of \( \mu \), there exist an open set \( U \subseteq X \) such that \( A \subseteq U \) and \( \mu(U \setminus A) < \varepsilon \). By inner regularity on open sets, there exists a compact set \( F \subseteq U \) such that \( \mu(U \setminus F) < \varepsilon \). Again by outer regularity of \( \mu \), there exist \( V \subseteq X \) such that \( (U \setminus A) \subseteq V \) and \( \mu(V) < \varepsilon \). Then \( K := F \setminus V \) is compact set and

\[
K \subset F \setminus (U \setminus A) = F \cap (U \setminus A^c) = F \cap (U^c \cup A) = F \cap A,
\]

see Figure 27.3. Since,

\[
\mu(K) = \mu(F) - \mu(F \cap V) \approx \mu(U) \approx \mu(A),
\]

or more formally,

\[
\mu(K) = \mu(F) - \mu(F \cap V) \geq \mu(U) - \varepsilon - \mu(F \cap V) \\
\geq \mu(U) - 2\varepsilon \geq \mu(A) - 3\varepsilon,
\]

we see that \( \mu(A \setminus K) \leq 3\varepsilon \). This proves the proposition when \( \mu(A) < \infty \).

If \( \mu(A) = \infty \) and there exists \( A_n \uparrow A \) as \( n \to \infty \) with \( \mu(A_n) < \infty \). Then by the first part, there exist compact set \( K_n \) such that \( K_n \subseteq A_n \) and \( \mu(A_n \setminus K_n) < 1/n \) or equivalently \( \mu(K_n) > \mu(A_n) - 1/n \to \infty \) as \( n \to \infty \).

**Corollary 27.13.** Every \( \sigma \)-finite Radon measure, \( \mu \), is a regular Borel measure, i.e. \( \mu \) is both outer and inner regular on all Borel subsets.

**Notation 27.14** If \( (X, \tau) \) is a topological space, let \( F_\sigma \) denote the collection of sets formed by taking countable unions of closed sets and \( G_\delta = \tau_\delta \) denote the collection of sets formed by taking countable intersections of open sets.

**Proposition 27.15.** Suppose that \( \mu \) is a \( \sigma \)-finite Radon measure and \( B \in \mathcal{B} \). Then

1. For all \( \varepsilon > 0 \) there exists sets \( F \subset B \subset U \) with \( F \) closed, \( U \) open and \( \mu(U \setminus F) < \varepsilon \).
2. There exists \( A \in F_\sigma \) and \( C \in G_\delta \) such that \( A \subset B \subset C \) such that and \( \mu(C \setminus A) = 0 \).

**Proof.** 1. Let \( X_n \in \mathcal{B} \) such that \( X_n \uparrow X \) and \( \mu(X_n) < \infty \) and choose open set \( U_n \) such that \( B \cap X_n \subset U_n \) and \( \mu(U_n \setminus (B \cap X_n)) < \varepsilon 2^{-(n+1)} \). Then \( U := \bigcup_{n=1}^\infty U_n \) is an open set such that

\[
\mu(U \setminus B) \leq \sum_{n=1}^\infty \mu(U_n \setminus B) \leq \sum_{n=1}^\infty \mu(U_n \setminus (B \cap X_n)) < \frac{\varepsilon}{2}.
\]

Applying this same result to \( B^c \) allows us to find a closed set \( F \) such that \( B^c \subset F^c \) and

\[
\mu(B \setminus F) = \mu(F^c \setminus B^c) < \frac{\varepsilon}{2}.
\]

Thus \( F \subset B \subset U \) and \( \mu(U \setminus F) < \varepsilon \) as desired.

2. This a simple consequence of item 1.

**Theorem 27.16.** Let \( X \) be a locally compact Hausdorff space such that every open set \( V \subset X \) is \( \sigma \)-compact, i.e. there exists \( K_n \subset V \) such that \( V = \bigcup_n K_n \). Then any \( K \)-finite measure \( \nu \) on \( X \) is a Radon measure and in fact is a regular Borel measure. (The reader should check that if \( X \) is second countable, then open sets are \( \sigma \)-compact, see Exercise 24.1. In particular this condition holds for \( \mathbb{R}^n \) with the standard topology.)

**Proof.** By the Riesz-Markov Theorem 27.9 the positive linear functional,

\[
I(f) := \int_X f d\nu \text{ for all } f \in C_c(X),
\]

may be represented by a Radon measure \( \mu \) on \( (X, \mathcal{B}) \), i.e. such that \( I(f) = \int_A f d\mu \) for all \( f \in C_c(X) \). By Corollary 27.13 \( \mu \) is also a regular Borel measure on \( (X, \mathcal{B}) \). So to finish the proof it suffices to show \( \nu = \mu \). We will give two proofs of this statement.

**First Proof.** The same arguments used in the proof of Lemma 11.32 shows \( \sigma(C_c(X)) = \mathcal{B}_X \). Let \( K \) be a compact subset of \( X \) and use Urysohn’s Lemma
to find \( \varphi \prec X \) such that \( \varphi \geq 1_K \). By a simple application of the multiplicative system Theorem \([11.26]\) one shows
\[
\int_X \varphi f d\nu = \int_X \varphi f d\mu
\]
for all bounded \( B_X = \sigma(C_c(X)) \) measurable functions on \( X \). Taking \( f = 1_K \) then shows that \( \nu(K) = \mu(K) \) with \( K \subset X \). An application of Theorem \([45.43]\) implies \( \mu = \nu \) on \( \sigma \) algebra generated by the compact sets. This completes the proof, since, by assumption, this \( \sigma \) algebra contains all of the open sets and hence is the Borel \( \sigma \) algebra.

**Second Proof.** Since \( \mu \) is a Radon measure on \( X \), it follows from Eq. \((27.9)\), that
\[
\mu(U) = \sup \left\{ \int_X f d\mu : f \prec U \right\} = \sup \left\{ \int_X f d\nu : f \prec U \right\} \leq \nu(U) \quad (27.19)
\]
for all open subsets \( U \) of \( X \). For each compact subset \( K \subset U \), there exists, by Uryshon’s Lemma \([25.8]\) a function \( f \prec U \) such that \( f \geq 1_K \). Thus
\[
\nu(K) \leq \int_X f d\nu = \int_X f d\mu \leq \mu(U). \quad (27.20)
\]
Combining Eqs. \((27.19)\) and \((27.20)\) implies \( \nu(K) \leq \mu(U) \leq \nu(U) \). By assumption there exists compact sets, \( K_n \subset U \), such that \( K_n \uparrow U \) as \( n \to \infty \) and therefore by continuity of \( \nu \),
\[
\nu(U) = \lim_{n \to \infty} \nu(K_n) \leq \mu(U) \leq \nu(U).
\]
Hence we have shown, \( \nu(U) = \mu(U) \) for all \( U \in \tau \).

If \( B \in B = B_X \) and \( \varepsilon > 0 \), by Proposition \([27.15]\) there exists \( F \subset B \subset U \) such that \( F \) is closed, \( U \) open and \( \mu(U \setminus F) < \varepsilon \). Since \( U \setminus F \) is open, \( \nu(U \setminus F) = \mu(U \setminus F) < \varepsilon \) and therefore
\[
\nu(U) - \varepsilon \leq \nu(B) \leq \nu(U) \quad \text{and} \quad \mu(U) - \varepsilon \leq \mu(B) \leq \mu(U).
\]
Since \( \nu(U) = \mu(U) \), \( \nu(B) = \infty \) iff \( \mu(B) = \infty \) and if \( \nu(B) < \infty \) then \( |\nu(B) - \mu(B)| < \varepsilon \). Because \( \varepsilon > 0 \) is arbitrary, we may conclude that \( \nu(B) = \mu(B) \) for all \( B \in B \). \( \blacksquare \)

**Proposition 27.17 (Density of \( C_c(X) \) in \( L^p(\mu) \)).** If \( \mu \) is a Radon measure on \( X \), then \( C_c(X) \) is dense in \( L^p(\mu) \) for all \( 1 \leq p < \infty \).

**Proof.** Let \( \varepsilon > 0 \) and \( B \in B_X \) with \( \mu(B) < \infty \). By Proposition \([27.12]\) there exists \( K \subset B \subset U \subset X \) such that \( \mu(U \setminus K) < \varepsilon^p \) and by Uryshon’s Lemma \([25.8]\) there exists \( f \prec U \) such that \( f = 1 \) on \( K \). This function \( f \) satisfies
\[
\|f - 1_B\|_p = \int_X |f - 1_B| d\mu \leq \int_{U \setminus K} |f - 1_B| d\mu \leq \mu(U \setminus K) < \varepsilon^p.
\]
From this it easy to conclude that \( C_c(X) \) is dense in \( S_f(B, \mu) \) — the simple functions on \( X \) which are in \( L^1(\mu) \). Combining this with Lemma \([19.3]\) which asserts that \( S_f(B, \mu) \) is dense in \( L^p(\mu) \) completes the proof of the theorem. \( \blacksquare \)

**Theorem 27.18 (Lusin’s Theorem).** Suppose \( (X, \tau) \) is a locally compact Hausdorff space, \( B_X \) is the Borel \( \sigma \) algebra on \( X \), and \( \mu \) is a Radon measure on \( (X, B_X) \). Also let \( \varepsilon > 0 \) be given. If \( f : X \to \mathbb{C} \) is a measurable function such that \( \mu(f \neq 0) < \infty \), there exists a compact set \( K \subset \{ f \neq 0 \} \) such that \( f \mid K \) is continuous and \( \mu(\{ f \neq 0 \} \setminus K) < \varepsilon \). Moreover there exists \( \varphi \in C_c(X) \) such that \( \mu(f \neq \varphi) < \varepsilon \) and if \( f \) is bounded the function \( \varphi \) may be chosen so that
\[
\|\varphi\|_\infty \leq \|f\|_\infty := \sup_{x \in X} |f(x)|.
\]

**Proof.** Suppose first that \( f \) is bounded, in which case
\[
\int_X |f| d\nu \leq \|f\|_\infty \mu(f \neq 0) < \infty.
\]
By Proposition \([27.17]\) there exists \( f_n \in C_c(X) \) such that \( f_n \to f \) in \( L^1(\mu) \) as \( n \to \infty \). By passing to a subsequence if necessary, we may assume \( \|f - f_n\|_1 < \varepsilon n^{-1/2} - n \) and hence by Chebyshev’s inequality (Lemma \([45.5]\)),
\[
\mu(\{ |f - f_n| > n^{-1}\} < \varepsilon 2^{-n} \text{ for all } n.
\]
Let \( E := \bigcup_{n=1}^{\infty} \{ |f - f_n| > n^{-1}\} \), so that \( \mu(E) < \varepsilon \). On \( E^c \), \( |f - f_n| \leq 1/n \), i.e. \( f_n \to f \) uniformly on \( E^c \) and hence \( f|_{E^c} \) is continuous. By Proposition \([27.12]\) there exists a compact set \( K \) and open set \( V \) such that
\[
K \subset \{ f \neq 0 \} \setminus E \subset V
\]
such that \( \mu(V \setminus K) < \varepsilon \). Notice that
\[
\mu(\{ f \neq 0 \} \setminus K) = \mu(\{ f \neq 0 \} \setminus E) + \mu(\{ f \neq 0 \} \setminus K \cap E) \\
\leq \mu(V \setminus K) + \mu(E) < 2\varepsilon.
\]
By the Tietze extension Theorem \([25.9]\) there exists \( F \in C(X) \) such that \( f = F|_K \). By Urysohn’s Lemma \([25.8]\) there exists \( \psi \prec V \) such that \( \psi = 1 \) on \( K \). So letting \( \varphi = \psi F \in C_c(X) \), we have \( \varphi = f \) on \( K \), \( \|\varphi\|_\infty \leq \|f\|_\infty \) and
since \( \{ \varphi \neq f \} \subset E \cup (V \setminus K) \), \( \mu (\varphi \neq f) < 3\varepsilon \). This proves the assertions in the theorem when \( f \) is bounded.

Suppose that \( f : X \to \mathbb{C} \) is (possibly) unbounded and \( \varepsilon > 0 \) is given. Then \( B_N := \{ 0 < |f| \leq N \} \uparrow \{ f \neq 0 \} \) as \( N \to \infty \) and therefore for all \( N \) sufficiently large,

\[
\mu (\{ f \neq 0 \} \setminus B_N) < \varepsilon / 3.
\]

Since \( \mu \) is a Radon measure, Proposition 27.12 guarantee’s there is a compact set \( C \subset \{ f \neq 0 \} \) such that \( \mu (\{ f \neq 0 \} \setminus C) < \varepsilon / 3 \). Therefore,

\[
\mu (\{ f \neq 0 \} \setminus (B_N \cap C)) < 2\varepsilon / 3.
\]

We may now apply the bounded case already proved to the function \( 1_{B_N \cap C} f \) to find a compact subset \( K \) and an open set \( V \) such that \( K \subset V \);

\[
K \subset \{ 1_{B_N \cap C} f \neq 0 \} = B_N \cap C \cap \{ f \neq 0 \}
\]

such that \( \mu (\{ B_N \cap C \setminus \{ f \neq 0 \} \} \setminus K) < \varepsilon / 3 \) and \( \varphi \in C_c (X) \) such that \( \varphi = 1_{B_N \cap C} f \) on \( K \). This completes the proof, since

\[
\mu (\{ f \neq 0 \} \setminus K) \leq \mu ((B_N \cap C \setminus \{ f \neq 0 \}) \setminus K) + \mu (\{ f \neq 0 \} \setminus (B_N \cap C)) < \varepsilon
\]

which implies \( \mu (f \neq \varphi) < \varepsilon \).

Example 27.19. To illustrate Theorem 27.18 suppose that \( X = (0, 1) \), \( \mu = m \) is Lebesgue measure and \( f = 1_{(0,1) \cap \mathbb{Q}} \). Then Lusin’s theorem asserts for any \( \varepsilon > 0 \) there exists a compact set \( K \subset (0, 1) \) such that \( m((0,1) \setminus K) < \varepsilon \) and \( f|_K \) is continuous. To see this directly, let \( \{ r_n \}_{n=1}^\infty \) be an enumeration of the rationals in \( (0, 1) \),

\[
J_n = (r_n - \varepsilon 2^{-n}, r_n + \varepsilon 2^{-n}) \cap (0, 1) \quad \text{and} \quad W = \bigcup_{n=1}^\infty J_n.
\]

Then \( W \) is an open subset of \( X \) and \( \mu (W) < \varepsilon \). Therefore \( K_n := [1/n, 1 - 1/n] \setminus W \) is a compact subset of \( X \) and \( m(X \setminus K_n) \leq \varepsilon n + \mu (W) \). Taking \( n \) sufficiently large we have \( m(X \setminus K_n) < \varepsilon \) and \( f|_{K_n} \equiv 0 \) which is of course continuous.

The following result is a slight generalization of Lemma 19.11:

**Corollary 27.20.** Let \( (X, \tau) \) be a locally compact Hausdorff space, \( \mu : \mathcal{B}_X \to [0, \infty] \) be a Radon measure on \( X \) and \( h \in L^1_{\text{loc}} (\mu) \). If

\[
\int_X f h d\mu = 0 \quad \text{for all} \quad f \in C_c (X)
\]

then \( 1_K h = 0 \) for \( \mu \) – a.e. for every compact subset \( K \subset X \). (BRUCE: either show \( h = 0 \) a.e. or give a counterexample. Also, either prove or give a counterexample to the question to the statement the \( d\nu = \rho d\mu \) is a Radon measure if \( \rho \geq 0 \) and in \( L^1_{\text{loc}} (\mu). \))

**Proof.** By considering the real and imaginary parts of \( h \) we may assume without loss of generality that \( h \) is real valued. Let \( K \) be a compact subset of \( X \). Then \( 1_K \text{sgn}(h) \in L^1 (\mu) \) and by Proposition 27.17 there exists \( f_n \in C_c (X) \) such that \( \lim_{n \to \infty} \| f_n - 1_K \text{sgn}(h) \|_{L^1 (\mu)} = 0 \). Let \( \varphi \in C_c (X, [0, 1]) \) such that \( \varphi = 1 \) on \( K \) and \( g_n = \varphi \min (-1, \max (1, f_n)) \). Since

\[
|g_n - 1_K \text{sgn}(h)| \leq |f_n - 1_K \text{sgn}(h) |
\]

we have found \( g_n \in C_c (X, \mathbb{R}) \) such that \( |g_n| \leq 1_{\text{supp}(\varphi)} \) and \( g_n \to 1_K \text{sgn}(h) \) in \( L^1 (\mu) \). By passing to a sub-sequence if necessary we may assume the convergence happens \( \mu \) – almost everywhere. Using Eq. (27.21) and the dominated convergence theorem (the dominating function is \( |h| 1_{\text{supp}(\varphi)} \)) we conclude that

\[
0 = \lim_{n \to \infty} \int_X g_n h d\mu = \int_X 1_K \text{sgn}(h) h d\mu = \int_X |h| d\mu
\]

which shows \( h (x) = 0 \) for \( \mu \) – a.e. \( x \in K \).

**27.2.3 The dual of \( C_0 (X) \)**

**Definition 27.21.** Let \( (X, \tau) \) be a locally compact Hausdorff space and \( \mathcal{B} = \sigma (\tau) \) be the Borel \( \sigma \) – algebra. A **signed Radon measure** \( \mu \) on \( \mathcal{B} \) is a signed measure \( \mu \) on \( \mathcal{B} \) such that the measures, \( \mu_\pm \), in the Jordan decomposition of \( \mu \) are Radon measures. A **complex Radon measure** \( \mu \) on \( \mathcal{B} \) such that \( \text{Re} \mu \) and \( \text{Im} \mu \) are signed radon measures.

**Example 27.22.** Every complex measure \( \mu \) on \( B_{\mathbb{R},d} \) is a Radon measure. BRUCE: add some more examples and perhaps some exercises here.

BRUCE: Compare and combine with results from Section 49.10.

**Proposition 27.23.** Suppose \( (X, \tau) \) is a topological space and \( I \in C_0 (X, \mathbb{R})^* \). Then we may write \( I = I_+ - I_- \) where \( I_\pm \in C_0 (X, \mathbb{R})^* \) are positive linear functionals.

**Proof.** For \( f \in C_0 (X, [0, \infty)) \), let

\[
I_+ (f) := \sup \{ I(g) : g \in C_0 (X, [0, \infty)) \text{ and } g \leq f \}
\]

and notice that \( |I_+ (f)| \leq \| I \| \| f \| \). If \( c > 0 \), then \( I_+ (cf) = cI_+ (f) \). Suppose that \( f_1, f_2 \in C_0 (X, [0, \infty)) \) and \( g_i \in C_0 (X, [0, \infty)) \) such that \( g_i \leq f_i \), then \( g_1 + g_2 \leq f_1 + f_2 \) so that

\[
I(g_1) + I(g_2) = I(g_1 + g_2) \leq I_+ (f_1 + f_2)
\]

and therefore
Moreover, if \( f \in C_0(X, \mathbb{R}) \) and \( g \leq f_1 + f_2 \), let \( g_1 = \min(f_1, g) \), so that
\[
0 \leq g_2 := g - g_1 \leq f_1 - g_1 + f_2 \leq f_2.
\]
Hence \( I(g) = I(g_1) + I(g_2) \leq I(f_1) + I(f_2) \) for all such \( g \) and therefore,
\[
I(f_1 + f_2) \leq I(f_1) + I(f_2).
\]
(27.23)
Combining Eqs. (27.22) and (27.23) shows that \( I_+(f_1 + f_2) = I_+(f_1) + I_+(f_2) \).

The above proof works for functionals on linear spaces of \( X \), \( \lambda \)
\[
\| \lambda \| = 1
\]
(27.23)
for all bounded functions on \( X \), \( \lambda \). Moreover, if \( f = f_+ - f_- \) if \( f = h - g \) with \( h, g \in C_0(X, \mathbb{R}) \), then \( g + f_+ = h + f_- \) and therefore,
\[
I(f) = I(h) - I(g).
\]
so that \( I(cf) = cI_+(f) \) for all \( c \in \mathbb{R} \). Also,
\[
I(f + g) = I(f_+ + g_+ - f_- - g_-) = I(f_+ + g_+) - I(f_- + g_-)
\]
\[
= I(f_+) + I(g_+) - I(f_-) - I(g_-)
\]
\[
= I(f) + I(g).
\]
Therefore \( I_+ \) is linear. Moreover,
\[
|I(f)| \leq \max(|I_+(f_+)|, |I_+(f_-)|) \leq \| I \| \max(|f_+|, |f_-|) = \| I \| \| f \|
\]
which shows that \( \| I_+ \| \leq \| I \| \). Let \( I_- = I - I \in C_0(X, \mathbb{R})^* \), then for \( f \geq 0 \),
\[
I_-(f) = I_+(f) - I(f) \geq 0
\]
by definition of \( I_+ \), so \( I_- \geq 0 \) as well.

Exercise 27.1. Suppose that \( \mu \) is a signed Radon measure and \( I = I_\mu \). Let \( \mu_+ \) and \( \mu_- \) be the Radon measures associated to \( I_\pm \) with \( I_\pm \) being constructed as in the proof of Proposition 27.23. Show that \( \mu = \mu_+ - \mu_- \) is the Jordan decomposition of \( \mu \).

Theorem 27.25. Let \( X \) be a locally compact Hausdorff space, \( M(X) \) be the space of complex Radon measures on \( X \) and \( \mu \in M(X) \) let \( \| \mu \| = |\mu|(X) \). Then the map
\[
\mu \in M(X) \rightarrow I_\mu \in C_0(X)^*
\]
is an isometric isomorphism. Here again \( I_\mu(f) := \int_X f \, d\mu \).

Proof. To show that the map \( M(X) \rightarrow C_0(X)^* \) is surjective, let \( \mu \in C_0(X)^* \) and then write \( I = I^c + iI^m \) be the decomposition into real and imaginary parts. Then further decompose these into there plus and minus parts so
\[
I = I^c_+ - I^c_- + i(iI^m_+ - iI^m_-)
\]
and let \( \mu^c_+ \) and \( \mu^m_+ \) be the corresponding positive Radon measures associated to \( I^c_+ \) and \( I^m_- \). Then \( I = I_\mu \) where
\[
\mu = \mu^c_+ - \mu^c_- + i(i\mu^m_+ - \mu^m_-).
\]
To finish the proof it suffices to show \( \| I_\mu \|_{C_0(X)^*} = |\mu| = |\mu|(X) \). We have
\[
\| I_\mu \|_{C_0(X)^*} = \sup \left\{ \left( \int_X f \, d\mu \right) : f \in C_0(X) \land \| f \|_\infty \leq 1 \right\}
\]
\[
\leq \sup \left\{ \left( \int_X f \, d\mu \right) : f \text{ measurable and } \| f \|_\infty \leq 1 \right\} = |\mu|.
\]
To prove the opposite inequality, write \( d\mu = qd|\mu| \) with \( q \) a complex measurable function such that \( |q| = 1 \). By Proposition 27.17 there exist \( f_n \in C_c(X) \) such that \( f_n \rightarrow g \) in \( L^1(|\mu|) \) as \( n \rightarrow \infty \). Let \( \varphi \in C_c(X) \) be the continuous function defined by \( \varphi(z) = z \) if \( |z| \leq 1 \) and \( \varphi(z) = z/|z| \) if \( |z| \geq 1 \). Then \( g|\mu| \leq 1 \) and \( g \rightarrow g \) in \( L^1(\mu) \). Thus
\[
\| I_\mu \|_{C_0(X)^*} = \sup \left\{ \left( \int_X f \, d\mu \right) : f \in C_0(X) \land \| f \|_\infty \leq 1 \right\} = |\mu|.
\]
Exercise 27.2. Let \( (X, \tau) \) be a compact Hausdorff space which supports a positive measure \( \nu \) on \( \mathcal{B} = \sigma(\tau) \) such that \( \nu(X) \neq \sum_{x \in X} \nu(\{x\}) \), i.e. \( \nu \) is a not a counting type measure. (Example \( X = [0, 1] \).) Then \( C(X) \) is not reflexive. Hint: recall that \( C(X)^* \) is isomorphic to the space of complex Radon measures on \( (X, \mathcal{B}) \). Using this isomorphism, define \( \lambda \in C(X)^* \).
\[ \lambda(\mu) = \sum_{x \in X} \mu(\{x\}) \]

and then show \( \lambda \neq \hat{f} \) for any \( f \in C(X) \).

### 27.3 Classifying Radon Measures on \( \mathbb{R} \)

Throughout this section, let \( X = \mathbb{R} \), \( \mathcal{E} \) be the elementary class
\[ \mathcal{E} = \{(a, b) \cap \mathbb{R} : -\infty \leq a \leq b \leq \infty\}, \quad (27.24) \]
and \( A = \mathcal{A}(\mathcal{E}) \) be the algebra formed by taking finite disjoint unions of elements from \( \mathcal{E} \), see Proposition 27.12. The aim of this section is to prove Theorem 43.31 which we restate here for convenience.

**Theorem 27.26.** The collection of \( K \)-finite measure on \( (\mathbb{R}, \mathcal{B}_\mathbb{R}) \) are in one to one correspondence with a right continuous non-decreasing functions, \( F : \mathbb{R} \to \mathbb{R} \), with \( F(0) = 0 \). The correspondence is as follows. If \( F \) is a right continuous non-decreasing function \( F : \mathbb{R} \to \mathbb{R} \), then there exists a unique measure, \( \mu_F \), on \( \mathcal{B}_\mathbb{R} \) such that
\[ \mu_F([a, b]) = F(b) - F(a) \quad -\infty < a \leq b < \infty \]
and this measure may be defined by
\[ \mu_F(A) = \inf \left\{ \sum_{i=1}^{\infty} (F(b_i) - F(a_i)) : A \subset \bigcup_{i=1}^{\infty} (a_i, b_i) \right\} \]
\[ = \inf \left\{ \sum_{i=1}^{\infty} (F(b_i) - F(a_i)) : A \subset \bigcup_{i=1}^{\infty} (a_i, b_i) \right\} \quad (27.25) \]
for all \( A \in \mathcal{B}_\mathbb{R} \). Conversely if \( \mu \) is \( K \)-finite measure on \( (\mathbb{R}, \mathcal{B}_\mathbb{R}) \), then
\[ F(x) := \begin{cases} -\mu(\{x, 0\}) & \text{if } x \leq 0 \\ \mu(\{0, x\}) & \text{if } x \geq 0 \end{cases} \quad (27.26) \]
is a right continuous non-decreasing function and this map is the inverse to the map, \( F \to \mu_F \).

There are three aspects to this theorem: namely the existence of the map \( F \to \mu_F \), the surjectivity of the map and the injectivity of this map. Assuming the map \( F \to \mu_F \) exists, the surjectivity follows from Eq. (27.26) and the injectivity is an easy consequence of Theorem 45.43. The rest of this section is devoted to giving two proofs for the existence of the map \( F \to \mu_F \).

**Exercise 27.3.** Show by direct means any measure \( \mu = \mu_F \) satisfying Eq. (27.25) is outer regular on all Borel sets. **Hint:** it suffices to show if \( B := \bigcap_{i=1}^{\infty} (a_i, b_i) \), then there exists \( V \subset \mathbb{R} \) such that \( \mu(V \setminus B) \) is as small as you please.

### 27.3.1 Classifying Radon Measures on \( \mathbb{R} \) using Theorem 43.49

**Corollary 27.27.** The map \( F \to \mu_F \) in Theorem 27.26 exists.

**Proof.** This is simply a combination of Proposition 43.34 and Theorem 43.49.

### 27.3.2 Classifying Radon Measures on \( \mathbb{R} \) using the Riesz-Markov Theorem 27.9

**Notation 27.28** Given an increasing function \( F : \mathbb{R} \to \mathbb{R} \), let \( F(x-) = \lim_{y \to x} F(y) \), \( F(x+) = \lim_{y \to x} F(y) \) and \( F(\pm \infty) = \lim_{x \to \pm \infty} F(x) \in \mathbb{R} \). Since \( F \) is increasing all of these limits exists.

**Theorem 27.29.** If \( F : \mathbb{R} \to \mathbb{R} \) is an increasing function (not necessarily right continuous), there exists a unique measure \( \mu = \mu_F \) on \( \mathcal{B}_\mathbb{R} \) such that
\[ \int_{-\infty}^{\infty} fdF = \int_{\mathbb{R}} fd\mu \quad \text{for all } f \in C_c(\mathbb{R}, \mathbb{R}), \quad (27.27) \]
where \( \int_{-\infty}^{\infty} fdF \) is as in Lemma 43.28 above. This measure may also be characterized as the unique measure on \( \mathcal{B}_\mathbb{R} \) such that
\[ \mu((a, b]) = F(b+) - F(a+) \quad \text{for all } -\infty < a < b < \infty. \quad (27.28) \]

Moreover, if \( A \in \mathcal{B}_\mathbb{R} \) then
\[ \mu_F(A) = \inf \left\{ \sum_{i=1}^{\infty} (F(b_i) - F(a_i)) : A \subset \bigcup_{i=1}^{\infty} (a_i, b_i) \right\} \]
\[ = \inf \left\{ \sum_{i=1}^{\infty} (F(b_i) - F(a_i)) : A \subset \bigcup_{i=1}^{\infty} (a_i, b_i) \right\} \quad (27.29) \]

**Proof.** An application of the Riesz-Markov Theorem 27.9 implies there exists a unique measure \( \mu \) on \( \mathcal{B}_\mathbb{R} \) such Eq. (27.27) is valid. Let \(-\infty < a < b < \infty, \ varepsilon > 0 \) be small and \( \varphi_\varepsilon(x) \) be the function defined in Figure 27.4 i.e. \( \varphi_\varepsilon \) is one on \([a+2\varepsilon, b+\varepsilon]\), linearly interpolates to zero on \([b+\varepsilon, b+2\varepsilon]\) and on \([a+\varepsilon, a+2\varepsilon]\) and is zero on \([a+b+2\varepsilon]\). Since \( \varphi_\varepsilon \to 1_{(a,b]} \) it follows by the dominated convergence theorem that
\[ \mu((a, b]) = \lim_{\varepsilon \to 0} \int_{\mathbb{R}} \varphi_\varepsilon d\mu = \lim_{\varepsilon \to 0} \int_{\mathbb{R}} \varphi_\varepsilon dF. \quad (27.30) \]

On the other hand we have
Corollary 27.30. The map $F \rightarrow \mu_F$ is a one to one correspondence between right continuous non-decreasing functions $F$ such that $F(0) = 0$ and Radon (same as $K$ - finite) measures on $(\mathbb{R}, \mathcal{B}_\mathbb{R})$.

27.4 Kolmogorov’s Existence of Measure on Products Spaces

Throughout this section, let $\{(X_\alpha, \tau_\alpha)\}_{\alpha \in A}$ be second countable locally compact Hausdorff spaces and let $X := \prod_{\alpha \in A} X_\alpha$ be equipped with the product topology, $\tau := \otimes_{\alpha \in A} \tau_\alpha$. More generally for $A \subset A$, let $X_A := \prod_{\alpha \in A} X_\alpha$ and $\tau_A := \otimes_{\alpha \in A} \tau_\alpha$ and $A \subset \Gamma \subset A$, let $\pi_{A,F} : X_\Gamma \rightarrow X_A$ be the projection map; $\pi_{A,F}(x) = x|_A$ for $x \in X_\Gamma$. We will simply write $\pi_A$ for $\pi_{A, A} : X \rightarrow X_A$. (Notice that if $A$ is a finite subset of $A$ then $(X_A, \tau_A)$ is still second countable as the reader should verify.) Let $\mathcal{M} = \otimes_{\alpha \in A} \mathcal{B}_\alpha$ be the product $\sigma$ – algebra on $X = X_A$ and $\mathcal{B}_A = \sigma(\tau_A)$ be the Borel $\sigma$ – algebra on $X_A$.

Theorem 27.31 (Kolmogorov’s Existence Theorem). Suppose \{\mu_\alpha : A \subset A \} are probability measures on $(X_A, \mathcal{B}_A)$ satisfying the following compatibility condition:

- $(\pi_{A,F})_* \mu_F = \mu_A$ whenever $A \subset \Gamma \subset A$.

Then there exists a unique probability measure, $\mu$, on $(X, \mathcal{M})$ such that $(\pi_A)_* \mu = \mu_A$ whenever $A \subset A$. Recall, see Exercise 45.8 that the condition $(\pi_A)_* \mu = \mu_A$ is equivalent to the statement:

$$\int_X F(\pi_A(x)) d\mu(x) = \int_{X_A} F(y) d\mu_A(y)$$ (27.33)

for all $A \subset A$ and $F : X_A \rightarrow \mathbb{R}$ bounded a measurable.

We will first prove the theorem in the following special case. The full proof will be given after Exercise 27.4 below.

Theorem 27.32. Theorem 27.31 holds under the additional assumption that each of the spaces, $\{(X_\alpha, \tau_\alpha)\}_{\alpha \in A}$, are compact second countable and Hausdorff and $A$ is countable.

Proof. Recall from Theorem 17.6 that the Borel $\sigma$ – algebra, $\mathcal{B}_A = \sigma(\tau_A)$, and the product $\sigma$ – algebra, $\otimes_{\alpha \in A} \mathcal{B}_\alpha$, are the same for any $A \subset A$. By Tychonoff’s Theorem 24.16 and Proposition 25.4, $X$ and $X_A$ for any $A \subset A$ are still compact Hausdorff spaces which are second countable if $A$ is finite. By the Stone Weierstrass Theorem 25.31...
\[ D := \{ f \in C(X) : f = F \circ \pi_A \text{ with } F \in C(X_A) \text{ and } A \subseteq A \} \]

is a dense subspace of \( C(X) \). For \( f = F \circ \pi_A \in D \), let

\[ I(f) = \int_{X_A} F \circ \pi_A(x) \, d\mu_A(x). \tag{27.34} \]

Let us verify that \( I \) is well defined. Suppose that \( f \) may also be expressed as \( f = F' \circ \pi_{A'} \) with \( A' \subseteq A \) and \( F' \in C(X_{A'}) \). Let \( \Gamma := A \cup A' \) and define \( G \in C(X_{\Gamma}) \) by \( G := F \circ \pi_{A,F} \). Hence, using Exercise 45.8

\[ \int_{X_{\Gamma}} G \, d\mu_F = \int_{X_{\Gamma}} F \circ \pi_{A,F} \, d\mu_F = \int_{X_A} F \, d(\pi_{A,F} \, \mu_F) = \int_{X_A} F \, d\mu_A \]

wherein we have used the compatibility condition in the last equality. Similarly, using \( G = F' \circ \pi_{A',F} \) (as the reader should verify), one shows

\[ \int_{X_{\Gamma}} G \, d\mu_F = \int_{X_{A'}} F' \, d\mu_{A'} \]

which shows \( I \) in Eq. (27.34) is well defined.

Since \( |I(f)| \leq ||f||_\infty \), the B.L.T. Theorem 50.4 allows us to extend \( I \) to a continuous linear functional, \( \hat{I} \), on \( C(X) \). Because \( I \) was positive on \( D \), it is easy to check that \( \hat{I} \) is still positive on \( C(X) \). So by the Riesz-Markov Theorem 27.9 there exists a Radon measure on \( B = M \) such that \( \hat{I}(f) = \int f \, d\mu \) for all \( f \in C(X) \). By the definition of \( \hat{I} \) in no follows that

\[ \int X_A F (\pi_A)_* \, d\mu = \int X_A F \circ \pi_A \, d\mu = \int X_A F \, d\mu_A \]

for all \( F \in C(X_A) \) and \( A \subseteq A \). Since \( X_A \) is a second countable locally compact Hausdorff space, this identity implies, see Theorem 19.8, that \((\pi_A)_* \mu = \mu_A \). The uniqueness assertion of the theorem follows from the fact that the measure \( \mu \) is determined uniquely by its values on the algebra \( A := \bigcup_{A \subseteq A} \pi_A^{-1}(B_{X_A}) \) which generates \( B = M \), see Theorem 45.43. \[ \square \]

Exercise 27.4. Let \((Y, \tau)\) be a locally compact Hausdorff space and \((Y^* = Y \cup \{\infty\}, \tau^*)\) be the one point compactification of \(Y\). Then

\[ B_{Y^*} := \sigma(\tau^*) = \{ A \subset Y^* : A \cap Y \in B_Y = \sigma(\tau) \} \]

or equivalently put

\[ B_{Y^*} = B_Y \cup \{ A \cup \{\infty\} : A \in B_Y \}. \]

Also shows that \((Y^* = Y \cup \{\infty\}, \tau^*)\) is second countable if \((Y, \tau)\) was second countable.

Proof. Proof of Theorem 27.31

Case 1; \(A\) is a countable. Let \((X_\alpha^* = X_\alpha \cup \{\infty_\alpha\}, \tau_\alpha)\) be the one point compactification of \((X_\alpha, \tau_\alpha)\). For \(A \subseteq A\), let \(X_A^* := \prod_{\alpha \in A} X_\alpha^*\) equipped with the product topology and Borel \(\sigma\) - algebra, \(B_A^*\). Since \(A\) is at most countable, the set,

\[ X_A := \bigcap_{\alpha \in A} \{ \pi_\alpha = \infty_\alpha \}, \]

is a measurable subset of \(X_A^*\). Therefore for each \(A \subseteq A\), we may extend \(\mu_A\) to a measure, \(\bar{\mu}_A\), on \((X_A^*, B_A^*)\) using the formula,

\[ \bar{\mu}_A(B) = \mu_A(B \cap X_A) \text{ for all } B \in X_A^*. \]

An application of Theorem 27.32 shows there exists a unique probability measure, \(\bar{\mu}\), on \(X^* \setminus X = \bigcup_{\alpha \in A} \{ \pi_\alpha = \infty_\alpha \}\) and \(\bar{\mu}_\alpha(\{\pi_\alpha = \infty_\alpha\}) = \bar{\mu}_\alpha(\{\infty_\alpha\}) = 0\), it follows that \(\bar{\mu}(X^* \setminus X) = 0\). Hence \(\mu := \bar{\mu}|_{B_X}\) is a probability measure on \((X, B_X)\). Finally if \(B \in B_X \subset B_{X^*}\),

\[ \mu_A(B) = \bar{\mu}_A(B) = (\pi_A)_* \bar{\mu}(B) = \bar{\mu}(\pi_A^{-1}(B)) = \bar{\mu}(\pi_A^{-1}(B) \cap X) = \mu(\pi_A^{-1}(B)) \]

which shows \(\mu\) is the required probability measure on \(B_X\).

Case 2; \(A\) is uncountable. By case 1, for each countable or finite subset \(\Gamma \subseteq A\) there is a measure \(\mu_\Gamma\) on \((X_\Gamma, B_\Gamma)\) such that \((\pi_{A,\Gamma})_* \mu_\Gamma = \mu_A\) for all \(A \subseteq A\). By Exercise 11.9

\[ M = \bigcup \{ \pi_{A,\Gamma}^{-1}(B_\Gamma) : \Gamma \text{ is a countable subset of } A \}, \]

i.e. every \(B \in M\) may be written in the form \(B = \pi_{A,\Gamma}^{-1}(C)\) for some countable subset, \(\Gamma \subseteq A\), and \(C \in B_\Gamma\). For such a \(B\) we define \(\mu(B) := \mu_\Gamma(C)\). It is left to the reader to check that \(\mu\) is well defined and that \(\mu\) is a measure on \(M\).
(Keep in mind the countable union of countable sets is countable.) If $\Lambda \subset A$ and $C \in \mathcal{B}_A$, then

$$[(\pi_{\Lambda})_* \mu](C) = \mu(\pi_{\Lambda}^{-1}(C)) := \mu_{\Lambda}(C),$$

i.e. $(\pi_{\Lambda})_* \mu = \mu_{\Lambda}$ as desired. \hfill \blacksquare

**Corollary 27.33.** Suppose that $\{\mu_{\alpha}\}_{\alpha \in A}$ are probability measure on $(X_{\alpha}, \mathcal{B}_{\alpha})$ for all $\alpha \in A$ and if $\Lambda \subset A$ let $\mu_{\Lambda} := \otimes_{\alpha \in \Lambda} \mu_{\alpha}$ be the product measure on $(X_{\Lambda}, \mathcal{B}_{\Lambda} = \otimes_{\alpha \in \Lambda} \mathcal{B}_{\alpha})$. Then there exists a unique probability measure, $\mu$, on $(X, \mathcal{M})$ such that $(\pi_{\Lambda})_* \mu = \mu_{\Lambda}$ for all $\Lambda \subset A$. (It is possible to remove the topology from this corollary, see Theorem [49.67](#) below.)

**Exercise 27.5.** Prove Corollary [27.33](#) by showing the measures $\mu_{\Lambda} := \otimes_{\alpha \in \Lambda} \mu_{\alpha}$ satisfy the compatibility condition in Theorem [27.31](#).

*** Beginning of WORK material. ***

**Lemma 27.34 (Is this true? I am not so sure.).** Suppose $\Lambda \subset A$ and $\mu$ is Radon measure on $(X, \tau)$. Then $(\pi_{\Lambda})_* \mu := \mu \circ \pi_{\Lambda}^{-1}$ is a Radon measure on $(X_{\Lambda}, \tau_{\Lambda})$.

**Proof.** Let $Y := X_{\Lambda}, Z := X_{A^c}$ and $\pi : Y \times Z \to Y$ be the canonical projection map. We equip $Y \times Z$ with the product topology. The mapping $\varphi = (\pi_{\Lambda}, \pi_{A^c}) : X \to Y \times Z$ is easily seen to be continuous and bijective and therefore a homeomorphism by Proposition [25.6](#). Because of this observation it suffices to prove; if $\nu := \varphi_* \mu$ is a Radon probability measure on $Y \times Z$ then $\pi_* \nu$ is a Radon probability measure on $Y$.

**Outer regularity.** Suppose that $B \in \mathcal{B}_Y$ and $U$ is an open subset in $X \times Y$ such that $B \times Z = \pi_{\Lambda}^{-1}(B) \subset U$. Letting then

$$\inf \{ \pi_* \nu(U) : B \subset U \in \tau_Y \} = \inf \{ \nu(\pi_{\Lambda}^{-1}(U)) : B \subset U \in \tau_Y \}$$

and $U$ is an open subset of $Y$ is outer regular on all Borel sets and inner regular on all open subsets of $Y$. \hfill \blacksquare

*** End of WORK material. ***
Probability Measures on Lusin Spaces

Definition 28.1 (Lusin spaces). A Lusin space is a topological space \((X, \tau)\) which is homeomorphic to a Borel subset of a compact metric space.

Example 28.2. By Theorem 25.12, every Polish (i.e. complete separable metric space) is a Lusin space. Moreover, any Borel subset of Lusin space is again a Lusin space.

Definition 28.3. Two measurable spaces, \((X, \mathcal{M})\) and \((Y, \mathcal{N})\) are said to be isomorphic if there exists a bijective map \(f : X \to Y\) such that \(f(\mathcal{M}) = \mathcal{N}\) and \(f^{-1}(\mathcal{N}) = \mathcal{M}\), i.e. both \(f\) and \(f^{-1}\) are measurable.

28.1 Weak Convergence Results

The following is an application of theorem 17.60 characterizing compact sets in metric spaces. (BRUCE: add Helly’s selection principle here.)

Proposition 28.4. Suppose that \((X, \rho)\) is a complete separable metric space and \(\mu\) is a probability measure on \(\mathcal{B} = \sigma(\tau_\rho)\). Then for all \(\varepsilon > 0\), there exists \(K_\varepsilon \subseteq X\) such that \(\mu(K_\varepsilon) \geq 1 - \varepsilon\).

Proof. Let \(\{x_k\}_{k=1}^\infty\) be a countable dense subset of \(X\). Then \(X = \bigcup_k C_{x_k}(1/n)\) for all \(n \in \mathbb{N}\). Hence by continuity of \(\mu\), there exists, for all \(n \in \mathbb{N}\), \(N_n < \infty\) such that \(\mu(F_n) \geq 1 - \varepsilon 2^{-n}\) where \(F_n := \bigcup_k C_{x_k}(1/n)\). Let \(K := \bigcap_{n=1}^\infty F_n\) then

\[
\mu(X \setminus K) = \mu(\bigcup_{n=1}^\infty F_n^c) \\
\leq \sum_{n=1}^\infty \mu(F_n^c) = \sum_{n=1}^\infty (1 - \mu(F_n)) \leq \sum_{n=1}^\infty \varepsilon 2^{-n} = \varepsilon
\]

so that \(\mu(K) \geq 1 - \varepsilon\). Moreover \(K\) is compact since \(K\) is closed and totally bounded; \(K \subseteq F_n\) for all \(n\) and each \(F_n\) is \(1/n\) – bounded.

Definition 28.5. A sequence of probability measures \(\{P_n\}_{n=1}^\infty\) is said to converge to a probability \(P\) if for every \(f \in BC(X)\), \(P_n(f) \to P(f)\). This is actually weak-* convergence when viewing \(P_n \in BC(X)^*\).

Proposition 28.6. The following are equivalent:

1. \(P_n \overset{\text{w}^*}{\to} P\) as \(n \to \infty\)
2. \(P_n(f) \to P(f)\) for every \(f \in BC(X)\) which is uniformly continuous.
3. \(\limsup_{n \to \infty} P_n(F) \leq P(F)\) for all \(F \subseteq X\).
4. \(\liminf_{n \to \infty} P_n(G) \geq P(G)\) for all \(G \subseteq X\).
5. \(\liminf_{n \to \infty} P_n(A) = P(A)\) for all \(A \in \mathcal{B}\) such that \(P(\text{bd}(A)) = 0\).

Proof. 1. \(\implies\) 2. is obvious. For 2. \(\implies\) 3., let \(\varphi(t) := \begin{cases} 1 & \text{if } t \leq 0 \\ 1 - t & \text{if } 0 \leq t \leq 1 \\ 0 & \text{if } t \geq 1 \end{cases} \quad (28.1)\)

and let \(f_n(x) := \varphi(n\rho(x, F))\). Then \(f_n \in BC(X, [0, 1])\) is uniformly continuous, \(0 \leq 1_F \leq f_n\) for all \(n\) and \(f_n \downarrow 1_F\) as \(n \to \infty\). Passing to the limit \(n \to \infty\) in the equation

\[
0 \leq P_n(F) - P_n(f_m)
\]

gives

\[
0 \leq \limsup_{n \to \infty} P_n(F) \leq P(f_m)
\]

and then letting \(m \to \infty\) in this inequality implies item 3. 3. \(\iff\) 4. Assuming item 3., let \(F = G^c\), then

\[
1 - \liminf_{n \to \infty} P_n(G) = \limsup_{n \to \infty} (1 - P_n(G)) = \limsup_{n \to \infty} P_n(G^c) \leq P(G^c) = 1 - P(G)
\]

which implies 4. Similarly 4. \(\implies\) 3. 3. \(\iff\) 5. Recall that \(\text{bd}(A) = A \setminus A^o\), so if \(P(\text{bd}(A)) = 0\) and 3. (and hence also 4. holds) we have

\[
\limsup_{n \to \infty} P_n(A) \leq \limsup_{n \to \infty} P_n(\bar{A}) \leq P(\bar{A}) = P(A)
\]

\[
\liminf_{n \to \infty} P_n(A) \geq \liminf_{n \to \infty} P_n(A^o) \geq P(A^o) = P(A)
\]

from which it follows that \(\lim_{n \to \infty} P_n(A) = P(A)\). Conversely, let \(F \subset X\) and set \(F_\delta := \{x \in X : \rho(x, F) \leq \delta\}\). Then
To finish the proof we will now show \( 3 \) and in particular the set \( \Lambda \) defined as

\[
\Lambda_k := \{ \frac{i-1}{k} \leq f < \frac{i}{k} \}.
\]

Let \( m \to \infty \) this equation to conclude \( P(F) \geq \limsup_{n \to \infty} P_n(F) \) as desired. To finish the proof we will now show 3. \( \implies 1 \). By an affine change of variables it suffices to consider \( f \in C(X,(0,1)) \) in which case we have

\[
\sum_{i=1}^{k} \frac{i-1}{k} \{ \frac{i-1}{k} \leq f < \frac{i}{k} \} \leq \sum_{i=1}^{k} \frac{i}{k} \{ \frac{i-1}{k} \leq f < \frac{i}{k} \}. \tag{28.2}
\]

Let \( F_i := \{ \frac{i}{k} \leq f \} \) and notice that \( F_k = \emptyset \), then we for any probability \( P \) that

\[
\sum_{i=1}^{k} \frac{i-1}{k} [P(F_{i-1}) - P(F_i)] \leq P(f) \leq \sum_{i=1}^{k} \frac{i}{k} [P(F_{i-1}) - P(F_i)]. \tag{28.3}
\]

Now

\[
\sum_{i=1}^{k} \frac{i-1}{k} [P(F_{i-1}) - P(F_i)] = \sum_{i=1}^{k} \frac{i-1}{k} P(F_{i-1}) - \sum_{i=1}^{k} \frac{i-1}{k} P(F_i) = \sum_{i=1}^{k-1} \frac{i}{k} P(F_i) - \sum_{i=1}^{k} \frac{i-1}{k} P(F_i) = \frac{1}{k} \sum_{i=1}^{k-1} P(F_i)
\]

and

\[
\sum_{i=1}^{k} \frac{i}{k} [P(F_{i-1}) - P(F_i)] = \sum_{i=1}^{k} \frac{i-1}{k} P(F_{i-1}) - \sum_{i=1}^{k} \frac{i-1}{k} P(F_i) + \frac{1}{k} \sum_{i=1}^{k} P(F_i) = \sum_{i=1}^{k-1} P(F_i) + \frac{1}{k}
\]

so that Eq. (28.3) becomes,

\[
\frac{1}{k} \sum_{i=1}^{k-1} P(F_i) \leq P(f) \leq \frac{1}{k} \sum_{i=1}^{k-1} P(F_i) + 1/k.
\]

Using this equation with \( P = P_n \) and then with \( P = P \) we find

\[
\limsup_{n \to \infty} P_n(f) \leq \limsup_{n \to \infty} \left[ \frac{1}{k} \sum_{i=1}^{k-1} P_n(F_i) + 1/k \right] \leq \frac{1}{k} \sum_{i=1}^{k-1} P(F_i) + 1/k \leq P(f) + 1/k.
\]

Since \( k \) is arbitrary,

\[
\limsup_{n \to \infty} P_n(f) \leq P(f).
\]

This inequality also hold for \( 1 - f \) and this implies \( \liminf_{n \to \infty} P_n(f) \geq P(f) \) and hence \( \lim_{n \to \infty} P_n(f) = P(f) \) as claimed.

**Definition 28.7.** Let \( X \) be a topological space. A collection of probability measures \( \Lambda \) on \((X,B_X)\) is said to be tight if for every \( \varepsilon > 0 \) there exists a compact set \( K_\varepsilon \in B_X \) such that \( P(K_\varepsilon) \geq 1 - \varepsilon \) for all \( P \in \Lambda \).

**Theorem 28.8.** Suppose \( X \) is a separable metrizable space and \( \Lambda = \{ P_n \}_{n=1}^{\infty} \) is a tight sequence of probability measures on \( B_X \). Then there exists a subsequence \( \{ P_{n_k} \}_{k=1}^{\infty} \) which is weakly convergent to a probability measure \( P \) on \( B_X \).

**Proof.** First suppose that \( X \) is compact. In this case \( C(X) \) is a Banach space which is separable by the Stone – Weierstrass theorem, see Exercise 25.5. By the Riesz theorem, Corollary 49.70, we know that \( C(X)^* \) is in one to one correspondence with complex measure on \((X,B_X)\). We have also seen that \( C(X)^* \) is metrizable and the unit ball in \( C(X)^* \) is weak - * compact, see Theorem 24.24. Hence there exists a subsequence \( \{ P_{n_k} \}_{k=1}^{\infty} \) which is weak - * convergent to a probability measure \( P \) on \( X \). Alternatively, use the Cantor’s diagonalization procedure on a countable dense set \( \Gamma \subset C(X) \) so find \( \{ P_{n_k} \}_{k=1}^{\infty} \) such that \( \Lambda(f) := \lim_k P_{n_k}(f) \) exists for all \( f \in \Gamma \). Then for \( g \in C(X) \) and \( f \in \Gamma \), we have

\[
|P_{n_k}(g) - P_{n_l}(g)| \leq |P_{n_k}(g) - P_{n_k}(f)| + |P_{n_k}(f) - P_{n_l}(f)| + |P_{n_l}(f) - P_{n_l}(g)| \leq 2 \|g - f\|_\infty + |P_{n_k}(f) - P_{n_l}(f)|
\]
which shows
\[ \lim_{k,l \to \infty} \sup |P_{nk}(g) - P_{nl}(g)| \leq 2 \|g - f\|_\infty. \]

Letting \( f \in A \) tend to \( g \) in \( C(X) \) shows \( \limsup_{k,l \to \infty} |P_{nk}(g) - P_{nl}(g)| = 0 \) and hence \( A(g) := \lim_{k \to \infty} P_{nk}(g) \) for all \( g \in C(X) \). It is now clear that \( A(g) \geq 0 \) for all \( g \geq 0 \) so that \( A \) is a positive linear functional on \( X \) and thus there is a probability measure \( P \) such that \( A(g) = P(g) \).

**General case.** By Theorem 25.12 we may assume that \( X \) is a subset of a compact metric space which we will denote by \( \bar{X} \). We now extend \( P_n \) to \( \bar{X} \) by setting \( \hat{P}_n(A) := \hat{P}_n(A \cap X) \) for all \( A \in B_X \). By what we have just proved, there is a subsequence \( \hat{P}_k := P_{nk} \) such that \( \hat{P}_k \) converges weakly to a probability measure \( \hat{P} \) on \( \bar{X} \). The main thing we now have to prove is that “\( \hat{P}(X) = 1 \)” this is where the tightness assumption is going to be used. Given \( \varepsilon > 0 \), let \( K_\varepsilon \subset X \) be a compact set such that \( \hat{P}_n(K_\varepsilon) \geq 1 - \varepsilon \) for all \( n \). Since \( K_\varepsilon \) is compact in \( X \) it is compact in \( \bar{X} \) as well and in particular a closed subset of \( \bar{X} \). Therefore by Proposition 28.6
\[ \hat{P}(K_\varepsilon) \geq \limsup_{k \to \infty} \hat{P}_k(K_\varepsilon) = 1 - \varepsilon. \]

Since \( \varepsilon > 0 \) is arbitrary, this shows with \( X_0 := \bigcup_{n=1}^\infty K_1/n \) satisfies \( \hat{P}(X_0) = 1 \).

Because \( X_0 \subset B_X \), we may view \( \hat{P} \) as a measure on \( B_X \) by letting \( \hat{P}(A) := \hat{P}(A \cap X_0) \) for all \( A \in B_X \). Given a closed subset \( F \subset X \), choose \( \hat{F} \subset \bar{X} \) such that \( F = \hat{F} \cap X \).

Then
\[ \lim_{k \to \infty} \sup \hat{P}_k(F) = \lim_{k \to \infty} \sup \hat{P}_k(\hat{F}) \leq \hat{P}(\hat{F} \cap X_0) = \hat{P}(F), \]

which shows \( \hat{P}_k \overset{w}{\to} \hat{P} \).

---

28.4 Exercises

**Exercise 28.1.** Let \( E \in B_\mathbb{R} \) with \( m(E) > 0 \). Then for any \( \alpha \in (0,1) \) there exists a bounded open interval \( J \subset \mathbb{R} \) such that \( m(E \cap J) \geq \alpha m(J) \).

Hints: 1. Reduce to the case where \( m(E) \in (0, \infty) \). 2. Approximate \( E \) from the outside by an open set \( V \subset \mathbb{R} \). 3. Make use of Exercise [17.21] which states that \( V \) may be written as a disjoint union of open intervals.

**Exercise 28.2.** Let \( F : \mathbb{R} \to \mathbb{R} \) be a right continuous increasing function and \( \mu = \mu_F \) be as in Theorem 27.26.

For \( a < b \), find the values of \( \mu \{ \{a\} \} \), \( \mu \{ \{a, b\} \} \), \( \mu \{ \{(a, b]\} \) in terms of the function \( F \).

**Exercise 28.3.** Suppose that \( F \in C^1(\mathbb{R}) \) is an increasing function and \( \mu_F \) is the unique Borel measure on \( \mathbb{R} \) such that \( \mu_F(\{a, b\}) = F(b) - F(a) \) for all \( a < b \).

Show that \( d\mu_F = \rho dm \) for some function \( \rho \geq 0 \). Find \( \rho \) explicitly in terms of \( F \).

**Exercise 28.4.** Suppose that \( F(x) = e^{1_x \geq 3 + \pi 1_x \geq 7} \) and \( \mu_F \) is the the unique Borel measure on \( \mathbb{R} \) such that \( \mu_F(\{a, b\}) = F(b) - F(a) \) for all \( a < b \). Give an explicit description of the measure \( \mu_F \).

**Exercise 28.5.** Let \( (X, \tau) \) be a locally compact Hausdorff space and \( I : C_0(X, \mathbb{R}) \to \mathbb{R} \) be a positive linear functional. Show \( I \) is necessarily bounded, i.e. there exists a \( C < \infty \) such that \( |I(f)| \leq C \langle |f| \rangle_\infty \) for all \( f \in C_0(X, \mathbb{R}) \).

**Outline.** (BRUCE: see Nate’s proof below and then rewrite this outline to make the problem much easier and to handle more general circumstances.)

1. By the Riesz-Markov Theorem 27.9, there exists a unique Radon measure \( \mu \) on \( (X, B_X) \) such that \( \mu(f) := \int_X fd\mu = I(f) \) for all \( f \in C_c(X, \mathbb{R}) \).
2. Show that if \( \mu(X) = \infty \), then there exists a function \( f \in C_0([0, \infty)) \) such that \( \infty = \mu(f) \leq I(f) \) contradicting the assumption that \( I \) is real valued.
3. By item 2, \( \mu(X) < \infty \) and therefore \( C_0(X, \mathbb{R}) \subset L^1(\mu) \) and \( \mu : C_0(X, \mathbb{R}) \to \mathbb{R} \) is a well defined positive linear functional. Let \( J(f) := I(f) - \mu(f) \) which by item 1. is a positive linear functional such that \( J \mid_{C_c(X, \mathbb{R})} = 0 \). Show that any positive linear functional, \( J \), on \( C_0(X, \mathbb{R}) \) satisfying these properties must necessarily be zero. Thus \( I(f) = \mu(f) \) and \( \|I\| = \mu(X) < \infty \) as claimed.

**Exercise 28.6.** BRUCE (Drop this exercise or move somewhere else, it is already proved in the notes in more general terms.) Suppose that \( I : C^\infty(\mathbb{R}, \mathbb{R}) \to \mathbb{R} \) is a positive linear functional. Show

\[ \text{(See also the Lebesgue differentiation Theorem 23.14 from which one may prove the more stronger form of this theorem, namely for } m\text{-a.e. } x \in E \text{ there exists } r_n(x) > 0 \text{ such that } m(E \cap (x-r_n(x), x+r_n(x))) \geq \alpha m((x-r_n(x), x+r_n(x))) \text{ for all } r \leq r_n(x)\).\]
1. For each compact subset $K \subseteq \mathbb{R}$ there exists a constant $C_K < \infty$ such that
$$|I(f)| \leq C_K \|f\|_{\infty}$$
whenever $\text{supp}(f) \subseteq K$.

2. Show there exists a unique Radon measure $\mu$ on $\mathcal{B}_{\mathbb{R}}$ (the Borel $\sigma$–algebra on $\mathbb{R}$) such that $I(f) = \int_{\mathbb{R}} f \, d\mu$ for all $f \in C_c^\infty(\mathbb{R}, \mathbb{R})$.

### 28.4.1 The Laws of Large Number Exercises

For the rest of the problems of this section, let $\nu$ be a probability measure on $\mathcal{B}_{\mathbb{R}}$ such that
$$\int_{\mathbb{R}} |x| \, d\nu(x) < \infty.$$  

By Corollary 2.7.33 there exists a unique measure $\mu$ on $(X := \mathbb{R}^N, \mathcal{B} := \bigotimes_{n=1}^\infty \mathcal{B}_{\mathbb{R}})$ such that
$$\int_{X} f(x_1, x_2, \ldots, x_N) \, d\mu(x) = \int_{\mathbb{R}^N} f(x_1, x_2, \ldots, x_N) \, d\nu(x_1) \ldots d\nu(x_N) \quad (28.4)$$
for all $N \in \mathbb{N}$ and bounded measurable functions $f : \mathbb{R}^N \to \mathbb{R}$, i.e. $\mu = \bigotimes_{n=1}^\infty \mu_n$ with $\mu_n = \nu$ for every $n$. We will also use the following notation:

$$S_n(x) := \frac{1}{n} \sum_{k=1}^n x_k \quad \text{for} \ x \in X,$$
$$m := \int_{\mathbb{R}} x \, d\nu(x)$$
$$\sigma^2 := \int_{\mathbb{R}} (x - m)^2 \, d\nu(x) = \int_{\mathbb{R}} x^2 \, d\nu(x) - m^2,$$
$$\gamma := \int_{\mathbb{R}} (x - m)^4 \, d\nu(x).$$

As is customary, $m$ is said to be the mean or average of $\nu$ and $\sigma^2$ is the variance of $\nu$.

### Exercise 28.7 (Weak Law of Large Numbers). Assume $\sigma^2 < \infty$. Show
$$\int_X S_n \, d\mu = m.$$ 

$$\|S_n - m\|_2^2 = \int_X (S_n - m)^2 \, d\mu = \frac{\sigma^2}{n},$$

and $\mu(|S_n - m| > \varepsilon) \leq \frac{\sigma^2}{n \varepsilon^2}$ for all $\varepsilon > 0$ and $n \in \mathbb{N}$.

### Exercise 28.8 (A simple form of the Strong Law of Large Numbers). Suppose now that $\gamma := \int_{\mathbb{R}} (x - m)^4 \, d\nu(x) < \infty$. Show for all $\varepsilon > 0$ and $n \in \mathbb{N}$ that
$$\|S_n - m\|_4^4 = \int_X (S_n - m)^4 \, d\mu = \frac{1}{n^4} (n \gamma + 3n(n-1)\sigma^4)$$
$$= \frac{1}{n^2} \left[n^{-1} \gamma + 3 \left(1 - n^{-1}\right) \sigma^4\right]$$
and
$$\mu(|S_n - m| > \varepsilon) \leq \frac{n^{-1} \gamma + 3 \left(1 - n^{-1}\right) \sigma^4}{\varepsilon^4 n^2}.$$ 

Conclude from the last estimate and the first Borel Cantelli Lemma 45.8 that $\lim_{n \to \infty} S_n(x) = m$ for $\mu$–a.e. $x \in X$.

### Exercise 28.9. Suppose $\gamma := \int_{\mathbb{R}} (x - m)^4 \, d\nu(x) < \infty$ and $m = \int_{\mathbb{R}} (x - m) \, d\nu(x) \neq 0$. For $\lambda > 0$ let $T_\lambda : \mathbb{R}^N \to \mathbb{R}^N$ be defined by $T_\lambda(x) = (\lambda x_1, \lambda x_2, \ldots, \lambda x_n, \ldots)$, $\mu_\lambda = \mu \circ T_\lambda^{-1}$ and

$$X_\lambda := \left\{ x \in \mathbb{R}^N : \lim_{n \to \infty} \frac{1}{n} \sum_{j=1}^n x_j = \lambda \right\}.$$  

Show
$$\mu_\lambda(X_\lambda') = \delta_{\lambda, \lambda'} = \left\{ \begin{array}{ll} 1 & \text{if } \lambda = \lambda' \\ 0 & \text{if } \lambda \neq \lambda' \end{array} \right.$$

and use this to show if $\lambda \neq 1$, then $d\mu_\lambda \neq \rho \, d\mu$ for any measurable function $\rho : \mathbb{R}^N \to [0, \infty]$.

Further Hilbert and Banach Space Techniques
Some Spectral Theory

For this section let $H$ and $K$ be two Hilbert spaces over $\mathbb{C}$.

**Exercise 29.1.** Suppose $A : H \to H$ is a bounded self-adjoint operator. Show:

1. If $\lambda$ is an eigenvalue of $A$, i.e. $Ax = \lambda x$ for some $x \in H \setminus \{0\}$, then $\lambda \in \mathbb{R}$.
2. If $\lambda$ and $\mu$ are two distinct eigenvalues of $A$ with eigenvectors $x$ and $y$ respectively, then $x \perp y$.

Unlike in finite dimensions, it is possible that an operator on a complex Hilbert space may have no eigenvalues, see Example 29.6 and Lemma 29.7 below for a couple of examples. For this reason it is useful to generalize the notion of an eigenvalue as follows.

**Definition 29.1.** Suppose $H$ is a Banach space over $\mathbb{F}$ ($\mathbb{F} = \mathbb{R}$ or $\mathbb{C}$) and $A \in \mathcal{L}(X)$. We say $\lambda \in \mathbb{F}$ is in the **spectrum** of $A$ if $A - \lambda I$ does not have a bounded\(^1\) inverse. The **spectrum** will be denoted by $\sigma(A) \subset \mathbb{F}$. The **resolvent set** for $A$ is $\rho(A) := \mathbb{F} \setminus \sigma(A)$.

**Remark 29.2.** If $\lambda$ is an eigenvalue of $A$, then $A - \lambda I$ is not injective and hence not invertible. Therefore any eigenvalue of $A$ is in the spectrum of $A$. If $H$ is a Hilbert space and $A \in \mathcal{L}(H)$, it follows from item 5. of Proposition 16.16 that $\lambda \in \sigma(A)$ iff $\bar{\lambda} \in \sigma(A^*)$, i.e.

$$
\sigma(A^*) = \{ \bar{\lambda} : \lambda \in \sigma(A) \}.
$$

**Exercise 29.2.** Suppose $X$ is a complex Banach space and $A \in \mathcal{GL}(X)$. Show

$$
\sigma(A^{-1}) = \sigma(A)^{-1} := \{ \lambda^{-1} : \lambda \in \sigma(A) \}.
$$

If we further assume $A$ is both invertible and isometric, i.e. $\|Ax\| = \|x\|$ for all $x \in X$, then show

$$
\sigma(A) \subset S^1 := \{ z \in \mathbb{C} : |z| = 1 \}.
$$

**Hint:** working formally,

$$
(A^{-1} - \lambda^{-1})^{-1} = \frac{1}{x - \lambda} = \frac{1}{\lambda - A} = \frac{A}{A - \lambda}.
$$

\(^1\) It will follow by the open mapping Theorem 31.20 or the closed graph Theorem 31.23 that the word bounded may be omitted from this definition.

from which you might expect that $(A^{-1} - \lambda^{-1})^{-1} = -\lambda A (A-\lambda)^{-1}$ if $\lambda \in \rho(A)$.

**Exercise 29.3.** Suppose $X$ is a Banach space and $A \in \mathcal{L}(X)$. Use Corollary 14.22 to show $\sigma(A)$ is a closed subset of $\{ \lambda \in \mathbb{F} : |\lambda| \leq \|A\| := \|A\|_{\mathcal{L}(X)} \}$.

**Lemma 29.3.** Suppose that $A \in \mathcal{L}(H)$ is a normal operator, i.e. $0 = [A, A^*] := AA^* - A^*A$. Then $\lambda \in \sigma(A)$ iff

$$
\inf_{\|\psi\|=1} \| (A - \lambda I) \psi \| = 0. \tag{29.1}
$$

In other words, $\lambda \in \sigma(A)$ iff there is an “approximate sequence of eigenvectors” for $(A, \lambda)$, i.e. there exists $\psi_n \in H$ such that $\|\psi_n\| = 1$ and $A \psi_n - \lambda \psi_n \to 0$ as $n \to \infty$.

**Proof.** By replacing $A$ by $A - \lambda I$ we may assume that $\lambda = 0$. If $0 \not\in \sigma(A)$, then

$$
\inf_{\|\psi\|=1} \| A \psi \| \geq \inf_{\|\psi\|=1} \frac{\| A \psi \|}{\|\psi\|} = \inf_{\|\psi\|=1} \frac{\|\psi\|}{\|A^{-1}\|} = 1/\|A^{-1}\| > 0.
$$

Now suppose that $\inf_{\|\psi\|=1} \| A \psi \| = \varepsilon > 0$ or equivalently we have

$$
\| A \psi \| \geq \varepsilon \|\psi\|
$$

for all $\psi \in H$. Because $A$ is normal,

$$
\| A \psi \|^2 = \langle A \psi | A \psi \rangle = \langle A^* A \psi | \psi \rangle = \langle AA^* \psi | \psi \rangle = \langle A^* A^* \psi | \psi \rangle = \| A^* \psi \|^2.
$$

Therefore we also have

$$
\| A^* \psi \| = \| A \psi \| \geq \varepsilon \|\psi\| \quad \forall \psi \in H. \tag{29.2}
$$

This shows in particular that $A$ and $A^*$ are injective, $\text{Ran}(A)$ is closed and hence by Lemma 16.17

$$
\text{Ran}(A) = \overline{\text{Ran}(A)} = \text{Nul}(A^*)^\perp = \{0\}^\perp = H.
$$

Therefore $A$ is algebraically invertible and the inverse is bounded by Eq. (29.2).
Lemma 29.4. Suppose that $A \in L(H)$ is self-adjoint (i.e. $A = A^*$) then

$$\sigma(A) \subset [-\|A\|_o, \|A\|_o] \subset \mathbb{R}.$$  

Proof. Writing $\lambda = \alpha + i\beta$ with $\alpha, \beta \in \mathbb{R}$, then

$$\|(A + \alpha + i\beta) \psi\|^2 = \|(A + \alpha) \psi\|^2 + |\beta|^2 \|\psi\|^2 + 2 \text{Re}((A + \alpha) \psi, i\beta \psi)$$

$$= \|(A + \alpha) \psi\|^2 + |\beta|^2 \|\psi\|^2$$  \hfill (29.3)

wherein we have used

$$\text{Re}[i\beta((A + \alpha) \psi, \psi)] = \beta \text{Im}((A + \alpha) \psi, \psi) = 0$$

since

$$(A + \alpha) \psi, \psi = (\psi, (A + \alpha) \psi) = ((A + \alpha) \psi, \psi).$$

Eq. (29.3) along with Lemma 29.3 shows that $\lambda \notin \sigma(A)$ if $\beta \neq 0$, i.e. $\sigma(A) \subset \mathbb{R}$. The fact that $\sigma(A)$ is now contained in $[-\|A\|_o, \|A\|_o]$ is a consequence of Exercise 29.2.

Remark 29.5. It is not true that $\sigma(A) \subset \mathbb{R}$ implies $A = A^*$. For example let $A = \begin{pmatrix} 0 & 1 \\ 0 & 0 \end{pmatrix}$ on $H = \mathbb{C}^2$, then $\sigma(A) = \{0\}$ yet $A \neq A^*$.

Example 29.6. Let $S \in L(H)$ be a (necessarily) normal operator. The proof of Lemma 29.3 gives $\lambda \in \sigma(S)$ if Eq. (29.1) holds. However the converse is not always valid unless $S$ is normal. For example, let $S : \ell^2 \to \ell^2$ be the shift, $S(\omega_1, \omega_2, \ldots) = (0, \omega_1, \omega_2, \ldots)$. Then for any $\lambda \in D := \{z \in \mathbb{C} : |z| < 1\}$,

$$\|S - \lambda\| = \|S\| - |\lambda| \|\psi\|$$

and so there does not exists an approximate sequence of eigenvectors for $(S, \lambda)$. However, as we will now show, $\sigma(S) = \overline{D}$.

To prove this it suffices to show by Remark 29.2 and Exercise 29.2 that $D \subset \sigma(S^*)$. For if this is the case then $\overline{D} \subset \sigma(S^*) \subset \overline{D}$ and hence $\sigma(S) = \overline{D}$ since $\overline{D}$ is invariant under complex conjugation.

A simple computation shows,

$$S^*(\omega_1, \omega_2, \ldots) = (\bar{\omega}_2, \omega_3, \ldots)$$

and $\omega = (\omega_1, \omega_2, \ldots)$ is an eigenvector for $S^*$ with eigenvalue $\lambda \in \mathbb{C}$ iff

$$0 = (S^* - \lambda I) (\omega_1, \omega_2, \ldots) = (\bar{\omega}_2 - \lambda \omega_1, \omega_3 - \lambda \omega_2, \ldots).$$

Solving this equation shows

$$\omega_2 = \lambda \omega_1, \omega_3 = \lambda \omega_2 = \lambda^2 \omega_1, \ldots, \omega_n = \lambda^{n-1} \omega_1, \ldots.$$

Hence if $\lambda \in D$, we may let $\omega_1 = 1$ above to find

$$S^*(1, \lambda, \lambda^2, \ldots) = (\lambda, 1, \lambda^2, \ldots)$$

where $(1, \lambda, \lambda^2, \ldots) \in \ell^2$. Thus we have shown $\lambda$ is an eigenvalue for $S^*$ for all $\lambda \in D$ and hence $D \subset \sigma(S^*)$.

Lemma 29.7. Let $H = \ell^2(\mathbb{Z})$ and let $A : H \to H$ be defined by

$$Af(k) = i(f(k+1) - f(k-1))$$

for all $k \in \mathbb{Z}$.

Then:

1. $A$ is a bounded self-adjoint operator.
2. $A$ has no eigenvalues.
3. $\sigma(A) = [-2, 2]$.

Proof. For another (simpler) proof of this lemma, see Exercise 30.9 below. 1. Since

$$\|Af\|_2 \leq \|f(\cdot + 1)\|_2 + \|f(\cdot - 1)\|_2 = 2\|f\|_2,$$

$$\|A\|_{op} \leq 2 < \infty.$$  Moreover, for $f, g \in \ell^2(\mathbb{Z})$,

$$\langle Af | g \rangle = \sum_k i(f(k+1) - f(k-1)) \bar{g}(k)$$

$$= \sum_k i f(k) \bar{g}(k) - \sum_k i f(k) \bar{g}(k+1)$$

$$= \sum_k f(k) \bar{A}g(k) = \langle f | Ag \rangle,$$

which shows $A = A^*$. 2. From Lemma 29.4 we know that $\sigma(A) \subset [-2, 2]$. If $\lambda \in [-2, 2]$ and $f \in H$ satisfies $Af = \lambda f$, then

$$f(k+1) = -i\lambda f(k) + f(k-1)$$

for all $k \in \mathbb{Z}$.  \hfill (29.4)

This is a second order difference equations which can be solved analogously to second order ordinary differential equations. The idea is to start by looking for a solution of the form $f(k) = \alpha^k$. Then Eq. (29.4) becomes, $\alpha^{k+1} = -i\lambda \alpha^k + \alpha^{k-1}$ or equivalently that

$$\alpha^2 + i\alpha - 1 = 0.$$  \hfill (29.4)

So we will have a solution if $\alpha \in \{\alpha_\pm\}$ where
\[
\alpha_\pm = \frac{-i\lambda \pm \sqrt{4 - \lambda^2}}{2}.
\]

For \(|\lambda| \neq 2\), there are two distinct roots and the general solution to Eq. \((29.4)\) is of the form
\[
f(k) = c_+\alpha^k_+ + c_-\alpha^k_-
\]
for some constants \(c_\pm \in \mathbb{C}\) and \(|\lambda| = 2\), the general solution has the form
\[
f(k) = c\alpha^k + d\alpha^k
\]
Since in all cases, \(|\alpha\pm| = \frac{1}{2}(\lambda^2 + 4 - \lambda^2) = 1\), it follows that neither of these functions, \(f\), will be in \(L^2(\mathbb{Z})\) unless they are identically zero. This shows that \(A\) has no eigenvalues.

3. The above argument suggests a method for constructing approximate eigenfunctions. Namely, let \(\lambda \in [-2,2]\) and define \(f_n(k) := 1_{|k| \leq n}\alpha^k\) where \(\alpha = \alpha_-\). Then a simple computation shows
\[
\lim_{n \to \infty} \frac{||(A - \lambda I)f_n||^2}{||f_n||^2} = 0
\]
and therefore \(\lambda \in \sigma(A)\).

**Exercise 29.4.** Verify Eq. \((29.7)\). Also show by explicit computations that
\[
\lim_{n \to \infty} \frac{||(A - \lambda I)f_n||^2}{||f_n||^2} \neq 0
\]
if \(\lambda \notin [-2,2]\).

The next couple of results will be needed for the next section.

**Theorem 29.8 (Rayleigh quotient).** Suppose \(T \in L(H) := L(H,H)\) is a bounded self-adjoint operator, then
\[
||T|| = \sup_{f \neq 0} \frac{|\langle f|Tf\rangle|}{||f||^2}.
\]
Moreover if there exists a non-zero element \(f \in H\) such that
\[
\frac{|\langle Tf|f\rangle|}{||f||^2} = ||T||,
\]
then \(f\) is an eigenvector of \(T\) with \(Tf = \lambda f\) and \(\lambda \in \{\pm ||T||\}\).

**Proof.** Let
\[
M := \sup_{f \neq 0} \frac{|\langle f|Tf\rangle|}{||f||^2}.
\]
We wish to show \(M = ||T||\). Since
\[
|\langle f|Tf\rangle| \leq ||f||||Tf|| \leq ||T||||f||^2,
\]
we see \(M \leq ||T||\). Conversely let \(f, g \in H\) and compute
\[
\langle f + g|T(f + g)\rangle - \langle f - g|T(f - g)\rangle
\]
\[
= \langle f|Tg\rangle + \langle g|Tf\rangle + \langle f|Tg\rangle + \langle g|Tf\rangle
\]
\[
= 2\langle f|Tg\rangle + \langle g|f\rangle = 2\langle f|Tg\rangle + \langle f|Tg\rangle
\]
\[
= 4\text{Re}\langle f|Tg\rangle.
\]
Therefore, if \(||f|| = ||g|| = 1\), it follows that
\[
|\text{Re}\langle f|Tg\rangle| \leq \frac{M}{4} \left\{ ||f + g||^2 + ||f - g||^2 \right\} = \frac{M}{4} \left\{ 2||f||^2 + 2||g||^2 \right\} = M.
\]
By replacing \(f\) be \(e^{i\theta}f\) where \(\theta\) is chosen so that \(e^{i\theta}\langle f|Tg\rangle\) is real, we find
\[
|\langle f|Tg\rangle| \leq M\text{ for all } ||f|| = ||g|| = 1.
\]
Hence
\[
||T|| = \sup_{||f|| = ||g|| = 1} |\langle f|Tg\rangle| \leq M.
\]
If \(f \in H \setminus \{0\}\) and \(||T|| = |\langle Tf|f\rangle|/||f||^2\) then, using Schwarz’s inequality,
\[
||T|| = \left| \frac{|\langle Tf|f\rangle|}{||f||^2} \right| \leq \frac{||Tf||}{||f||} \leq ||T||.
\]
This implies \(|\langle Tf|f\rangle| = ||Tf||||f||\) and forces equality in Schwarz’s inequality. So by Theorem \(16.2\) \(Tf\) and \(f\) are linearly dependent, i.e. \(Tf = \lambda f\) for some \(\lambda \in \mathbb{C}\). Substituting this into \((29.8)\) shows that \(|\lambda| = ||T||\). Since \(T\) is self-adjoint,
\[
\lambda||f||^2 = |\langle Tf|f\rangle| = |\langle f|Tf\rangle| = |\langle f|\lambda f\rangle| = \bar{\lambda} |\langle f|f\rangle| = \bar{\lambda}||f||^2,
\]
which implies that \(\lambda \in \mathbb{R}\) and therefore, \(\lambda \in \{\pm ||T||\}\).

**29.1 Compact Operators**

**Definition 29.9.** Let \(A : X \to Y\) be a bounded operator between two Banach spaces. Then \(A\) is compact if \(A[B_X(0, 1)]\) is precompact in \(Y\) or equivalently for any \(\{x_n\}_n \subset X\) such that \(||x_n|| \leq 1\) for all \(n\) the sequence \(y_n := Ax_n \in Y\) has a convergent subsequence.
bounded set and so by the compactness of set \( \mathbb{Z} \), subset of \( \mathbb{C} \) as \( k \to \infty \). By Fatou’s Lemma 4.12:

\[
\sum_{n=1}^{\infty} |\tilde{x}(n)|^2 = \lim_{k \to \infty} \inf |\tilde{x}_k(n)|^2 \leq \lim_{k \to \infty} \inf \sum_{n=1}^{\infty} |\tilde{x}_k(n)|^2 \leq 1,
\]

which shows \( \tilde{x} \in \ell^2 \).

Let \( \lambda_M = \max_{n \geq M} |\lambda_n| \). Then

\[
\|A\tilde{x}_k - A\tilde{x}\|^2 = \sum_{n=1}^{\infty} |\lambda_n|^2 |\tilde{x}_k(n) - \tilde{x}(n)|^2 \\
\quad \leq \sum_{n=1}^{M} |\lambda_n|^2 |\tilde{x}_k(n) - \tilde{x}(n)|^2 + |\lambda_M|^2 \sum_{n=M+1}^{\infty} |\tilde{x}_k(n) - \tilde{x}(n)|^2 \\
\quad \leq \sum_{n=1}^{M} |\lambda_n|^2 |\tilde{x}_k(n) - \tilde{x}(n)|^2 + |\lambda_M|^2 \|\tilde{x}_k - \tilde{x}\|^2 \\
\quad \leq \sum_{n=1}^{\infty} |\lambda_n|^2 |\tilde{x}_k(n) - \tilde{x}(n)|^2 + 4|\lambda_M|^2.
\]

Passing to the limit in this inequality then implies

\[
\limsup_{k \to \infty} \|A\tilde{x}_k - A\tilde{x}\|^2 \leq 4|\lambda_M|^2 \to 0 \text{ as } M \to \infty
\]

and this completes the proof that \( A \) is a compact operator.

**Lemma 29.11.** If \( X \xrightarrow{A} Y \xleftarrow{B} Z \) are bounded operators such that either \( A \) or \( B \) is compact then the composition \( BA : X \to Z \) is also compact.

**Proof.** Let \( B(\mathbb{X},0,1) \) be the open unit ball in \( X \). If \( A \) is compact and \( B \) is bounded, then \( BA(B(\mathbb{X},0,1)) \subset B(\mathbb{ABX},0,1) \) which is compact since the image of compact sets under continuous maps are compact. Hence we conclude that \( BA(B(\mathbb{X},0,1)) \) is compact, being the closed subset of the compact set \( B(\mathbb{ABX},0,1) \). If \( A \) is continuous and \( B \) is compact, then \( A(B(\mathbb{X},0,1)) \) is a bounded set and so by the compactness of \( B \), \( BA(B(\mathbb{X},0,1)) \) is a precompact subset of \( Z \), i.e. \( BA \) is compact.

**29.1.1 Compact Operators on a Hilbert Space**

In this section let \( H \) and \( B \) be Hilbert spaces and \( U := \{x \in H : \|x\| < 1\} \) be the unit ball in \( H \). Recall from Definition 29.9 (BRUCE: forward reference. Think about correct placement of this section.) that a bounded operator, \( K : H \to B \), is compact if \( K(U) \) is compact in \( B \). Equivalently, for all bounded sequences \( \{x_n\}_{n=1}^{\infty} \subset H \), the sequence \( \{Kx_n\}_{n=1}^{\infty} \) has a convergent subsequence in \( B \).

Because of Theorem 17.68 if \( \dim(H) = \infty \) and \( K : H \to B \) is invertible, then \( K \) is not compact.

**Definition 29.12.** \( K : H \to B \) is said to have finite rank if \( \text{Ran}(K) \subset B \) is finite dimensional.

The following result is a simple consequence of Corollaries 17.66 and 17.67.

**Corollary 29.13.** If \( K : H \to B \) is a finite rank operator, then \( K \) is compact. In particular if either \( \dim(H) < \infty \) or \( \dim(B) < \infty \) then any bounded operator \( K : H \to B \) is finite rank and hence compact.

**Lemma 29.14.** Let \( K := K(H,B) \) denote the compact operators from \( H \) to \( B \). Then \( K(H,B) \) is a norm closed subspace of \( L(H,B) \).

**Proof.** The fact that \( K \) is a vector subspace of \( L(H,B) \) will be left to the reader. To finish the proof, we must show that \( K \in L(H,B) \) is compact if there exists \( K_n \in K(H,B) \) such that \( \lim_{n \to \infty} \|K_n - K\|_{op} = 0 \).

**First Proof.** Given \( \varepsilon > 0 \), choose \( N = N(\varepsilon) \) such that \( \|K_N - K\| < \varepsilon \). Using the fact that \( K_NU \) is precompact, choose a finite subset \( U \subset C \) such that \( \min_{x \in A} \|y - K_Nx\| < \varepsilon \) for all \( y \in K_N(U) \). Then for \( z = Kx_0 \in K(U) \) and \( x \in A \),

\[
\|z - Kx\| = \|(K - K_N)x_0 + K_N(x_0 - x) + (K_N - K)x\| \\
\quad \leq 2\varepsilon + \|K_Nx_0 - K_Nx\|.
\]

Therefore \( \min_{x \in A} \|z - Kx\| < 3\varepsilon \), which shows \( K(U) \) is \( 3\varepsilon \) bounded for all \( \varepsilon > 0 \), so \( K(U) \) is totally bounded and hence precompact.

**Second Proof.** Suppose \( \{x_n\}_{n=1}^{\infty} \) is a bounded sequence in \( H \). By compactness, there is a subsequence \( \{x_n^1\}_{n=1}^{\infty} \) of \( \{x_n\}_{n=1}^{\infty} \) such that \( \{K_nx_n\}_{n=1}^{\infty} \) is convergent in \( B \). Working inductively, we may construct subsequences

\[
\{x_n\}_{n=1}^{\infty} \supset \{x_n^1\}_{n=1}^{\infty} \supset \{x_n^2\}_{n=1}^{\infty} \cdots \supset \{x_n^m\}_{n=1}^{\infty} \cdots
\]

such that \( \{K_nx_n^m\}_{n=1}^{\infty} \) is convergent in \( B \) for each \( m \). By the usual Cantor’s diagonalization procedure, let \( y_n := x_n \), then \( \{y_n\}_{n=1}^{\infty} \) is a subsequence of \( \{x_n\}_{n=1}^{\infty} \) such that \( \{K_ny_n\}_{n=1}^{\infty} \) is convergent for all \( m \). Since

**Page: 332  job: newanal  macro: svmonob.cls  date/time: 6-Jan-2012/17:01**
\[ \| K y_n - K y_m \| \leq \| (K - K_m) y_m \| + \| K_m (y_n - y_m) \| + \| (K_m - K) y_n \| \leq 2 \| K - K_m \| + \| K_m (y_n - y_m) \|, \]

\[ \limsup_{n, l \to \infty} \| K y_n - K y_l \| \leq 2 \| K - K_m \| \to 0 \text{ as } m \to \infty, \]

which shows \( \{ K y_n \}_{n=1}^{\infty} \) is Cauchy and hence convergent.

**Proposition 29.15.** A bounded operator \( K : H \to B \) is compact iff there exists finite rank operators, \( K_n : H \to B, \) such that \( \| K - K_n \| \to 0 \) as \( n \to \infty. \)

**Proof.** Since \( \overline{K(U)} \) is compact it contains a countable dense subset and from this it follows that \( \overline{K(H)} \) is a separable subspace of \( B. \) Let \( \{ \varphi_n \} \) be an orthonormal basis for \( \overline{K(H)} \subset B \) and

\[ P_N y = \sum_{n=1}^{N} \langle y, \varphi_n \rangle \varphi_n \]

be the orthogonal projection of \( y \) onto \( \text{span}\{ \varphi_n \}_{n=1}^{N}. \) Then \( \lim_{N \to \infty} \| P_N y - y \| = 0 \) for all \( y \in \overline{K(H)}. \) Define \( K_n := P_n K - K_n \) a finite rank operator on \( H. \) For sake of contradiction suppose that

\[ \limsup_{n \to \infty} \| K - K_n \| = \varepsilon > 0, \]

in which case there exists \( x_{n_k} \in U \) such that \( \| (K - K_{n_k}) x_{n_k} \| \geq \varepsilon \) for all \( n_k. \) Since \( K \) is compact, by passing to a subsequence if necessary, we may assume \( \{ K x_{n_k} \}_{k=1}^{\infty} \) is convergent in \( B. \) Letting \( y := \lim_{k \to \infty} K x_{n_k}, \)

\[ \| (K - K_{n_k}) x_{n_k} \| = \| (1 - P_{n_k}) K x_{n_k} \| \leq \| (1 - P_{n_k}) (K x_{n_k} - y) \| + \| (1 - P_{n_k}) y \| \leq \| K x_{n_k} - y \| + \| (1 - P_{n_k}) y \| \to 0 \text{ as } k \to \infty. \]

But this contradicts the assumption that \( \varepsilon \) is positive and hence we must have \( \lim_{n \to \infty} \| K - K_n \| = 0, \) i.e. \( K \) is an operator norm limit of finite rank operators. The converse direction follows from Corollary 29.13 and Lemma 29.14.

**Corollary 29.16.** If \( K \) is compact then so is \( K^*. \)

**Proof. First Proof.** Let \( K_n = P_n K \) be as in the proof of Proposition 29.15, then \( K_n^* = K^* P_n \) is still finite rank. Furthermore, using Proposition 16.16

\[ \| K^* - K_n^* \| = \| K - K_n \| \to 0 \text{ as } n \to \infty \]

showing \( K^* \) is a limit of finite rank operators and hence compact.

**Second Proof.** Let \( \{ x_n \}_{n=1}^{\infty} \) be a bounded sequence in \( B, \) then

\[ \| K^* x_n - K^* x_m \| = \langle x_n - x_m, K K^* (x_n - x_m) \rangle \leq C \| K K^* \| \| x_n - x_m \| \]

where \( C \) is a bound on the norms of the \( x_n. \) Since \( \{ K^* x_n \}_{n=1}^{\infty} \) is also a bounded sequence, by the compactness of \( K \) there is a subsequence \( \{ x'_n \} \) of \( \{ x_n \} \) such that \( K K^* x'_n \) is convergent and hence by Eq. (29.9), so is the sequence \( \{ K^* x'_n \}. \)

### 29.1.2 The Spectral Theorem for Self Adjoint Compact Operators

For the rest of this section, \( K \in \mathcal{K}(H) := \mathcal{K}(H_0, H) \) will be a self-adjoint compact operator or S.A.C.O. for short. Because of Proposition 29.15, we might expect compact operators to behave very much like finite dimensional matrices. This is typically the case as we will see below.

**Example 29.17 (Model S.A.C.O.).** Let \( H = \ell_2 \) and \( K \) be the diagonal matrix

\[ K = \begin{pmatrix} \lambda_1 & 0 & 0 & \cdots \\ 0 & \lambda_2 & 0 & \cdots \\ 0 & 0 & \lambda_3 & \cdots \\ \vdots & \vdots & \vdots & \ddots \end{pmatrix}, \]

where \( \lim_{n \to \infty} \| \lambda_n \| = 0 \) and \( \lambda_n \in \mathbb{R}. \) Then \( K \) is a self-adjoint compact operator. This assertion was proved in Example 29.10.

The main theorem (Theorem 29.19) of this subsection states that up to unitary equivalence, Example 29.17 is essentially the most general example of an S.A.C.O.

**Proposition 29.18.** Let \( K \) be a S.A.C.O., then either \( \lambda = \| K \| \) or \( \lambda = -\| K \| \) is an eigenvalue of \( K. \)

**Proof.** Without loss of generality we may assume that \( K \) is non-zero since otherwise the result is trivial. By Theorem 29.8 there exists \( u_n \in H \) such that \( \| u_n \| = 1 \)

\[ \frac{|\langle u_n, K u_n \rangle|}{\| u_n \|^2} = |\langle u_n, K u_n \rangle| \to \| K \| \text{ as } n \to \infty. \]  

(29.10)

By passing to a subsequence if necessary, we may assume that \( \lambda := \lim_{n \to \infty} \langle u_n, K u_n \rangle \) exists and \( \lambda \in \{ \pm \| K \| \}. \) By passing to a further subsequence if necessary, we may assume, using the compactness of \( K, \) that \( K u_n \) is convergent as well. We now compute:
If $K$ such that $\|K\|$ exists. By the continuity of the inner product, the limit in Eq. (29.11) we find that $\lim_{n \to \infty} u_n = 1 \neq 0$. By passing to the limit in Eq. (29.11) we find that $Ku = \lambda u$.

**Theorem 29.19 (Compact Operator Spectral Theorem).** Suppose that $K : H \to H$ is a non-zero S.A.C.O., then

1. there exists at least one eigenvalue $\lambda \in \{\pm \|K\|\}$.
2. There are at most countably many non-zero eigenvalues, $\{\lambda_n\}_{n=1}^N$, where $N = \infty$ is allowed. (Unless $K$ is finite rank (i.e. $\dim \text{Ran}(K) < \infty$), $N$ will be infinite.)
3. The $\lambda_n$’s (including multiplicities) may be arranged so that $|\lambda_n| \geq |\lambda_{n+1}|$ for all $n$. If $N = \infty$ then $\lim_{n \to \infty} |\lambda_n| = 0$. (In particular any eigenspace for $K$ with non-zero eigenvalue is finite dimensional.)
4. The eigenvectors $\{\varphi_n\}_{n=1}^N$ can be chosen to be an O.N. set such that $H = \text{span}\{\varphi_n\} \oplus \text{Null}(K)$.
5. Using the $\{\varphi_n\}_{n=1}^N$ above,

$$Kf = \sum_{n=1}^N \lambda_n (f|\varphi_n)\varphi_n \quad \text{for all } f \in H.$$  \hfill (29.12)

6. The spectrum of $K$ is $\sigma(K) = \{0\} \cup \{\lambda_n : n < N + 1\}$ if $\dim H = \infty$, otherwise $\sigma(K) = \{\lambda_n : n \leq N\}$ with $N \leq \dim H$.

**Proof.** We will find $\lambda_n$’s and $\varphi_n$’s recursively. Let $\lambda_1 \in \{\pm \|K\|\}$ and $\varphi_1 \in H$ such that $K\varphi_1 = \lambda_1 \varphi_1$ as in Proposition 29.18.

Take $M_1 = \text{span}(\varphi_1)$ so $K(M_1) \subset M_1$. By Lemma 16.17 $K|_{M_1} \subset M_1$. Define $K_1 : M_1 \to M_1$ via $K|_{K_1} = K|_{M_1}$. Then $K_1$ is again a compact operator. If $K_1 = 0$, we are done. If $K_1 \neq 0$, by Proposition 29.18 there exists $\lambda_2 \in \{\pm \|K_1\|\}$ and $\varphi_2 \in M_1$ such that $\|\varphi_2\| = 1$ and $K_1\varphi_2 = \lambda_2 \varphi_2$. Let $M_2 := \text{span}(\varphi_1, \varphi_2)$.

Again $K(M_2) \subset M_2$ and hence $K_2 := K|_{M_2} : M_2 \to M_2$ is compact and if $K_2 = 0$ we are done. When $K_2 \neq 0$, apply Proposition 29.18 again to find $\lambda_3 \in \{\pm \|K_2\|\}$ and $\varphi_3 \in M_2$ such that $\|\varphi_3\| = 1$ and $K_2\varphi_3 = \lambda_3 \varphi_3$.

Continuing this way indefinitely or until we reach a point where $K_n = 0$, we construct a sequence $\{\lambda_n\}_{n=1}^\infty$ of eigenvalues and orthonormal eigenvectors $\{\varphi_n\}_{n=1}^\infty$ such that $|\lambda_n| \geq |\lambda_{n+1}|$ with the further property that

$$|\lambda_n| = \sup_{\varphi \in \{\varphi_1, \varphi_2, \ldots, \varphi_{n-1}\}} \frac{\|K\varphi\|}{\|\varphi\|}.$$  \hfill (29.13)

When $N < \infty$, the remaining results in the theorem are easily verified. So from now on let us assume that $N = \infty$.

If $\varepsilon := \lim_{n \to \infty} |\lambda_n| > 0$, then $\{\lambda_n^{-1}\varphi_n\}_{n=1}^\infty$ is a bounded sequence in $H$. Hence, by the compactness of $K$, there exists a subsequence $\{n_k : k \in \mathbb{N}\}$ of $\mathbb{N}$ such that $\varphi_{n_k} = \lambda_{n_k}^{-1}K\varphi_{n_k}$ is a convergent sequence. However, since $\{\varphi_{n_k}\}_{k=1}^\infty$ is an orthonormal set, this is impossible and hence we must conclude that $\varepsilon := \lim_{n \to \infty} |\lambda_n| = 0$.

Let $M := \text{span}\{\varphi_n\}_{n=1}^\infty$. Then $K(M) \subset M$ and hence, by Lemma 16.17, $K(M^\perp) \subset M^\perp$. Using Eq. (29.13),

$$\|K|_{M^\perp}\| \leq \|K|_{M^\perp}\| = |\lambda_n| \to 0 \text{ as } n \to \infty$$

showing $K|_{M^\perp} = 0$. Define $P_0$ to be orthogonal projection onto $M^\perp$. Then for $f \in H$, $f = P_0 f + (1 - P_0) f = P_0 f + \sum_{n=1}^\infty (f|\varphi_n)\varphi_n$

and

$$Kf = KP_0 f + K\sum_{n=1}^\infty (f|\varphi_n)\varphi_n = \sum_{n=1}^\infty \lambda_n (f|\varphi_n)\varphi_n$$

which proves Eq. (29.12).

Since $\{\lambda_n\}_{n=1}^\infty \subset \sigma(K)$ and $\sigma(K)$ is closed, it follows that $0 \in \sigma(K)$ and hence $\{\lambda_n\}_{n=1}^\infty \cup \{0\} \subset \sigma(K)$. Suppose that $z \notin \{\lambda_n\}_{n=1}^\infty \cup \{0\}$ and let $d$ be the distance between $z$ and $\{\lambda_n\}_{n=1}^\infty \cup \{0\}$. Notice that $d > 0$ because $\lim_{n \to \infty} \lambda_n = 0$.

A few simple computations show that:

$$(K - z I) f = \sum_{n=1}^\infty (f|\varphi_n)(\lambda_n - z)\varphi_n - z P_0 f, \quad (K - z I) f = \sum_{n=1}^\infty (f|\varphi_n)(\lambda_n - z)^{-1} \varphi_n - z^{-1} P_0 f,$$

and

$$(K - z I)^{-1} f = \sum_{n=1}^\infty (f|\varphi_n)(\lambda_n - z)^{-1} \varphi_n - z^{-1} P_0 f,$$
\[ \| (K - zI)^{-1}f \|^2 = \sum_{n=1}^{\infty} |(f|\varphi_n|^2 \frac{1}{|\lambda_n - z|^2} + \frac{1}{|z|^2} \|P_0f\|^2 \]
\[ \leq \frac{1}{d} \left( \sum_{n=1}^{\infty} |(f|\varphi_n|^2 + \|P_0f\|^2 \right) = \frac{1}{d^2} \|f\|^2. \]

We have thus shown that \((K - zI)^{-1}\) exists, \(\| (K - zI)^{-1} \| \leq d^{-1} < \infty\) and hence \(z \notin \sigma(K)\).

**Theorem 29.20 (Structure of Compact Operators).** Let \(K : H \to B\) be a compact operator. Then there exists \(N \in \mathbb{N} \cup \{\infty\}\), orthonormal subsets \(\{\varphi_n\}_n \subset H\) and \(\{\psi_n\}_n \subset B\) and a sequence \(\{\alpha_n\}_n \subset \mathbb{R}_+\) such that \(\alpha_1 \geq \alpha_2 \geq \ldots\) (with \(\lim_{n \to \infty} \alpha_n = 0\) if \(N = \infty\)), \(\| \psi_n \| \leq 1\) for all \(n\) and

\[ Kf = \sum_{n=1}^{N} \alpha_n \langle f | \varphi_n \rangle \psi_n \text{ for all } f \in H, \quad (29.14) \]

**Proof.** Since \(K^*K\) is a self-adjoint compact operator, Theorem 29.19 implies there exists an orthonormal set \(\{\varphi_n\}_n \subset H\) and positive numbers \(\{\lambda_n\}_n \subset \mathbb{R}_+\) such that

\[ K^*K\psi = \sum_{n=1}^{N} \lambda_n \langle \psi | \varphi_n \rangle \varphi_n \text{ for all } \psi \in H. \]

Let \(A\) be the positive square root of \(K^*K\) defined by

\[ A\psi := \sum_{n=1}^{N} \sqrt{\lambda_n} \langle \psi | \varphi_n \rangle \varphi_n \text{ for all } \psi \in H. \]

A simple computation shows, \(A^2 = K^*K\), and therefore,

\[ \|A\psi\|^2 = \langle A\psi | A\psi \rangle = \langle \psi | A^2 \psi \rangle \]
\[ = \langle \psi | K^*K\psi \rangle = \langle K\psi | K\psi \rangle = \|K\psi\|^2 \]

for all \(\psi \in H\). Hence we may define a unitary operator, \(u : \text{Ran}(A) \to \text{Ran}(K)\) by the formula

\[ uA\psi = K\psi \text{ for all } \psi \in H. \]

We then have

\[ K\psi = uA\psi = \sum_{n=1}^{N} \sqrt{\lambda_n} \langle \psi | \varphi_n \rangle u\varphi_n \quad (29.15) \]

which proves the result with \(\psi_n := u\varphi_n\) and \(\alpha_n = \sqrt{\lambda_n}\).

It is instructive to find \(\psi_n\) explicitly and to verify Eq. (29.15) by brute force.

Since \(\varphi_n = \lambda_n^{-1/2} A\varphi_n\),

\[ \psi_n = \lambda_n^{-1/2} uA\varphi_n = \lambda_n^{-1/2} K\varphi_n \]

and

\[ \langle K\varphi_n | K\varphi_m \rangle = \langle \varphi_n | K^*K\varphi_m \rangle = \lambda_n \delta_{mn}. \]

This verifies that \(\{\psi_n\}_n \subset \mathbb{N}\) is an orthonormal set. Moreover,

\[ \sum_{n=1}^{N} \sqrt{\lambda_n} \langle \psi_n | \varphi_n \rangle \psi_n = \sum_{n=1}^{N} \sqrt{\lambda_n} \langle \psi_n | \varphi_n \rangle \lambda_n^{-1/2} K\varphi_n \]
\[ = K \sum_{n=1}^{N} \langle \psi_n | \varphi_n \rangle \varphi_n = K\psi \]

since \(\sum_{n=1}^{N} \langle \psi_n | \varphi_n \rangle \varphi_n = P\psi\) where \(P\) is orthogonal projection onto \(\text{Nul}(K)^\perp\).

**Second Proof.** Let \(K = u |K|\) be the polar decomposition of \(K\). Then \(|K|\) is self-adjoint and compact, by Corollary 38.12 below, and hence by Theorem 29.19 there exists an orthonormal basis \(\{\varphi_n\}_n \subset \text{Nul}(|K|)^\perp\) such that \(|K|\varphi_n = \lambda_n \varphi_n, \lambda_1 \geq \lambda_2 \geq \ldots\) and \(\lim_{n \to \infty} \lambda_n = 0\) if \(N = \infty\). For \(f \in H\),

\[ Kf = u |K| \sum_{n=1}^{N} \langle f | \varphi_n \rangle \varphi_n = \sum_{n=1}^{N} \langle f | \varphi_n \rangle u |K| \varphi_n = \sum_{n=1}^{N} \lambda_n \langle f | \varphi_n \rangle u\varphi_n \]

which is Eq. (29.14) with \(\psi_n := u\varphi_n\). ■
L² - Hilbert Spaces Techniques and Fourier Series

This section is concerned with Hilbert spaces presented as in the following example.

Example 30.1. Let \((X, \mathcal{M}, \mu)\) be a measure space. Then \(H := L^2(X, \mathcal{M}, \mu)\) with inner product

\[
\langle f | g \rangle = \int_X f \cdot \overline{g} \, d\mu
\]

is a Hilbert space.

It will be convenient to define

\[
\langle f, g \rangle := \int_X f(x) \, g(x) \, d\mu(x)
\]

(30.1)

for all measurable functions \(f, g\) on \(X\) such that \(fg \in L^1(\mu)\). So with this notation we have \(\langle f|g\rangle = \langle f, \bar{g} \rangle\) for all \(f, g \in H\).

Exercise 30.1. Let \(K : L^2(\nu) \to L^2(\mu)\) be the operator defined in Exercise 18.14. Show \(K^* : L^2(\mu) \to L^2(\nu)\) is the operator given by

\[
K^* g(y) = \int_X \overline{k}(x, y) g(x) \, d\mu(x).
\]

30.1 L²-Orthonormal Basis

Example 30.2. 1. Let \(H = L^2([-1,1], dm)\) and \(A := \{1, x, x^2, x^3 \ldots \}\) and \(\beta \subset H\) be the result of doing the Gram-Schmidt procedure on \(A\). By the Stone-Weierstrass theorem or by Exercise 19.13 directly, \(A\) is total in \(H\). Hence by Remark 16.26 \(\beta\) is an orthonormal basis for \(H\). The basis, \(\beta\), consists of polynomials which up to normalization are the so called “Legendre polynomials.”

2. Let \(H = L^2(\mathbb{R}, e^{-x^2} \, dx)\) and \(A := \{1, x, x^2, x^3 \ldots \}\). Again by Exercise 19.13 \(A\) is total in \(H\) and hence the Gram-Schmidt procedure applied to \(A\) produces an orthonormal basis, \(\beta\), of polynomial functions for \(H\). This basis consists, up to normalizations, of the so called “Hermite polynomials” on \(\mathbb{R}\).

Remark 30.3 (An Interesting Phenomena). Let \(H = L^2([-1,1], dm)\) and \(B := \{1, x, x^2, x^3, \ldots \}\). Then again \(A\) is total in \(H\) by the same argument as in item 2. Example 30.2. This is true even though \(B\) is a proper subset of \(A\). Notice that \(A\) is an algebraic basis for the polynomials on \([-1,1]\) while \(B\) is not! The following computations may help relieve some of the reader’s anxiety. Let \(f \in L^2([-1,1], dm)\), then, making the change of variables \(x = y^{1/3}\), shows that

\[
\int_{-1}^{1} |f(x)|^2 \, dx = \int_{-1}^{1} |f(y^{1/3})|^2 \frac{1}{3} y^{-2/3} \, dy = \int_{-1}^{1} |f(y^{1/3})|^2 \, d\mu(y) \tag{30.2}
\]

where \(d\mu(y) = \frac{1}{3} y^{-2/3} \, dy\). Since \(\mu([-1,1]) = m([-1,1]) = 2\), \(\mu\) is a finite measure on \([-1,1]\) and hence by Exercise 19.13 \(A := \{1, x, x^2, x^3 \ldots \}\) is total (see Definition 16.25) in \(L^2([-1,1], d\mu)\). In particular for any \(\varepsilon > 0\) there exists a polynomial \(p(y)\) such that

\[
\int_{-1}^{1} \left| f(y^{1/3}) - p(y) \right|^2 d\mu(y) < \varepsilon^2.
\]

However, by Eq. (30.2) we have

\[
\varepsilon^2 > \int_{-1}^{1} \left| f(y^{1/3}) - p(y) \right|^2 d\mu(y) = \int_{-1}^{1} |f(x) - p(x^3)|^2 \, dx.
\]

Alternatively, if \(f \in C([-1,1])\), then \(g(y) = f(y^{1/3})\) is back in \(C([-1,1])\). Therefore for any \(\varepsilon > 0\), there exists a polynomial \(p(y)\) such that

\[
\varepsilon > \|g - p\|_\infty = \sup \{|g(y) - p(y)| : y \in [-1,1] \} \\
= \sup \{|g(x^3) - p(x^3)| : x \in [-1,1] \} \\
= \sup \{|f(x) - p(x^3)| : x \in [-1,1] \}.
\]

This gives another proof the polynomials in \(x^3\) are dense in \(C([-1,1])\) and hence in \(L^2([-1,1])\).

Exercise 30.2. Suppose \((X, \mathcal{M}, \mu)\) and \((Y, \mathcal{N}, \nu)\) are \(\sigma\)-finite measure spaces such that \(L^2(\mu)\) and \(L^2(\nu)\) are separable. If \(\{f_m\}_{m=1}^\infty\) and \(\{g_m\}_{m=1}^\infty\) are orthonormal bases for \(L^2(\mu)\) and \(L^2(\nu)\) respectively, then
Exercise 30.3. \( f \otimes g (x, y) := f (x) g (y) \), see Notation \[47.13\]. Hint: model your proof on the proof of Proposition \[16.29\].

**Definition 30.4 (External direct sum of Hilbert spaces).** Suppose that \( \{ H_n \}_{n=1}^\infty \) is a sequence of Hilbert spaces. Let \( \oplus_{n=1}^\infty H_n \) denote the space of sequences, \( f \in \prod_{n=1}^\infty H_n \) such that

\[
\| f \| = \left( \sum_{n=1}^\infty \| f (n) \|_{H_n}^2 \right)^{1/2} < \infty.
\]

It is easily seen that \( \oplus_{n=1}^\infty H_n, \| \cdot \| \) is a Hilbert space with inner product defined, for all \( f, g \in \oplus_{n=1}^\infty H_n \), by

\[
\langle f | g \rangle_{\oplus_{n=1}^\infty H_n} = \sum_{n=1}^\infty \langle f (n) | g (n) \rangle_{H_n}.
\]

**Exercise 30.3.** Suppose \( H \) is a Hilbert space and \( \{ H_n : n \in \mathbb{N} \} \) are closed subspaces of \( H \) such that \( H_n \perp H_m \) for all \( m \neq n \) and if \( f \in H \) with \( f \perp H_n \) for all \( n \in \mathbb{N} \), then \( f = 0 \). For \( f \in \oplus_{n=1}^\infty H_n \), show the sum \( \sum_{n=1}^\infty f (n) \) is convergent in \( H \) and the map \( U : \oplus_{n=1}^\infty H_n \to H \) defined by \( U f := \sum_{n=1}^\infty f (n) \) is unitary.

**Exercise 30.4.** Suppose \( (X, \mathcal{M}, \mu) \) is a measure space and \( X = \bigcup_{n=1}^\infty X_n \) with \( X_n \in \mathcal{M} \) and \( \mu (X_n) > 0 \) for all \( n \). Then \( U : L^2 (X, \mu) \to \oplus_{n=1}^\infty L^2 (X_n, \mu) \) defined by \( (U f) (n) := f 1_{X_n} \) is unitary.

### 30.2 Hilbert Schmidt Operators

In this section \( H \) and \( B \) will be Hilbert spaces.

**Proposition 30.5.** Let \( H \) and \( B \) be a separable Hilbert spaces, \( K : H \to B \) be a bounded linear operator, \( \{ e_n \}_{n=1}^\infty \) and \( \{ u_m \}_{m=1}^\infty \) be orthonormal basis for \( H \) and \( B \) respectively. Then:

1. \( \sum_{n=1}^\infty \| Ke_n \|^2 = \sum_{m=1}^\infty \| K^* u_m \|^2 \) allowing for the possibility that the sums are infinite. In particular the **Hilbert Schmidt norm** of \( K \),

\[
\| K \|_{HS}^2 := \sum_{n=1}^\infty \| Ke_n \|^2,
\]

is well defined independent of the choice of orthonormal basis \( \{ e_n \}_{n=1}^\infty \). We say \( K : H \to B \) is a **Hilbert Schmidt operator** if \( \| K \|_{HS} < \infty \) and let \( HS (H, B) \) denote the space of Hilbert Schmidt operators from \( H \) to \( B \).

2. For all \( K \in L (H, B) \), \( \| K \|_{HS} = \| K^* \|_{HS} \) and

\[
\| K \|_{HS} \geq \| K \|_{op} := \sup \{ \| Kh \| : h \in H \text{ such that } \| h \| = 1 \}.
\]

3. The set \( HS (H, B) \) is a subspace of \( L (H, B) \) (the bounded operators from \( H \to B \)), \( \| \cdot \|_{HS} \) is a norm on \( HS (H, B) \) for which \( (HS (H, B), \| \cdot \|_{HS}) \) is a Hilbert space, and the corresponding inner product is given by

\[
\langle K_1 | K_2 \rangle_{HS} = \sum_{n=1}^\infty \langle Ke_n | K_2 e_n \rangle.
\]

4. If \( K : H \to B \) is a bounded finite rank operator, then \( K \) is Hilbert Schmidt.

5. Let \( P_N x := \sum_{n=1}^N \langle x | e_n \rangle e_n \) be an orthogonal projection onto \( \text{span} \{ e_n : n \leq N \} \subset H \) and for \( K \in HS (H, B) \), let \( K_N := KP_N \). Then

\[
\| K - K_N \|_{op}^2 \leq \| K - K_N \|_{HS}^2 \to 0 \text{ as } N \to \infty,
\]

which shows that finite rank operators are dense in \( (HS (H, B), \| \cdot \|_{HS}) \). In particular of \( HS (H, B) \subset K (H, B) \) – the space of compact operators from \( H \to B \).

6. If \( Y \) is another Hilbert space and \( A : Y \to H \) and \( C : B \to Y \) are bounded operators, then

\[
\| KA \|_{HS} \leq \| K \|_{HS} \| A \|_{op} \text{ and } \| CK \|_{HS} \leq \| K \|_{HS} \| C \|_{op},
\]

in particular \( HS (H, H) \) is an ideal in \( L (H) \).

**Proof.** Items 1. and 2. By Parseval’s equality and Fubini’s theorem for sums,

\[
\sum_{n=1}^\infty \| Ke_n \|^2 = \sum_{m=1}^\infty \sum_{n=1}^\infty | \langle Ke_n | u_m \rangle |^2 \\
= \sum_{m=1}^\infty \sum_{n=1}^\infty | \langle e_n | K^* u_m \rangle |^2 = \sum_{m=1}^\infty \| K^* u_m \|^2.
\]

This proves \( \| K \|_{HS} \) is well defined independent of basis and that \( \| K \|_{HS} = \| K^* \|_{HS} \). For \( x \in H \setminus \{ 0 \}, \| x \| \) may be taken to be the first element in an orthonormal basis for \( H \) and hence

\[
\| K \|_{HS} \| x \| \leq \| K x \| \leq \| K^* \|_{HS} \| x \|.
\]

Multiplying this inequality by \( \| x \| \) shows \( \| K x \| \leq \| K \|_{HS} \| x \| \) and hence

\[
\| K \|_{op} \leq \| K \|_{HS}.
\]
**Item 3.** For $K_1, K_2 \in L(H, B)$,

$$
||K_1 + K_2||_{HS} = \sqrt{\sum_{n=1}^{\infty} ||K_1 e_n + K_2 e_n||^2} \\
\leq \sqrt{\sum_{n=1}^{\infty} (||K_1 e_n|| + ||K_2 e_n||)^2} \\
= ||\{||K_1 e_n|| + ||K_2 e_n||\}_{n=1}^{\infty}||\ell_2 \\
\leq ||\{||K_1 e_n||\}_{n=1}^{\infty}||\ell_2 + ||\{||K_2 e_n||\}_{n=1}^{\infty}||\ell_2 \\
= ||K_1||_{HS} + ||K_2||_{HS}.
$$

From this triangle inequality and the homogeneity properties of $||\cdot||_{HS}$, we now easily see that $HS(H, B)$ is a subspace of $L(H, B)$ and $||\cdot||_{HS}$ is a norm on $HS(H, B)$. Since

$$
\sum_{n=1}^{\infty} |\langle K_1 e_n | K_2 e_n \rangle| \leq \sum_{n=1}^{\infty} ||K_1 e_n|| ||K_2 e_n|| \\
\leq \sqrt{\sum_{n=1}^{\infty} ||K_1 e_n||^2} \sqrt{\sum_{n=1}^{\infty} ||K_2 e_n||^2} = ||K_1||_{HS} ||K_2||_{HS},
$$

the sum in Eq. (30.3) is well defined and is easily checked to define an inner product on $HS(H, B)$ such that $||K||_{HS}^2 = \langle K | K \rangle_{HS}$.

The proof that $\{HS(H, B), ||\cdot||_{HS}^2\}$ is complete is very similar to the proof of Theorem 14.5. Indeed, suppose $\{K_m\}_{m=1}^{\infty}$ is a $||\cdot||_{HS}$-Cauchy sequence in $HS(H, B)$. Because $L(H, B)$ is complete, there exists $K \in L(H, B)$ such that $||K - K_m||_{op} \to 0$ as $m \to \infty$. Thus, making use of Fatou’s Lemma 4.12,

$$
\|K - K_m\|_{HS}^2 = \sum_{n=1}^{\infty} \| (K - K_m) e_n \|^2 \\
= \sum_{n=1}^{\infty} \liminf_{l \to \infty} \| (K_l - K_m) e_n \|^2 \\
\leq \liminf_{l \to \infty} \sum_{n=1}^{\infty} \| (K_l - K_m) e_n \|^2 \\
= \liminf_{l \to \infty} \| (K_l - K_m)_{HS}^2 \to 0 \text{ as } m \to \infty.
$$

Hence $K \in HS(H, B)$ and $\lim_{m \to \infty} ||K - K_m||_{HS}^2 = 0$.

**Item 4.** Since $\text{Null}(K^*)^\perp = \text{Ran}(K) = \text{Ran}(K)$,

$$
\|K\|_{HS}^2 = ||K^*||_{HS}^2 = \sum_{n=1}^{N} ||K^* v_n||_{H}^2 < \infty
$$

where $N := \dim \text{Ran}(K)$ and $\{v_n\}_{n=1}^{N}$ is an orthonormal basis for $\text{Ran}(K) = K(H)$.

**Item 5.** Simply observe,

$$
\|K - K_N\|_{op}^2 \leq ||K - K_N||_{HS}^2 = \sum_{n>N} ||K e_n||^2 \to 0 \text{ as } N \to \infty.
$$

**Item 6.** For $C \in L(B, Y)$ and $K \in L(H, B)$ then

$$
||CK||_{HS}^2 = \sum_{n=1}^{\infty} ||CK e_n||^2 \leq ||C||_{op}^2 \sum_{n=1}^{\infty} ||K e_n||^2 = ||C||_{op}^2 ||K||_{HS}^2
$$

and for $A \in L(Y, H)$,

$$
||KA||_{HS} = ||A^* K^*||_{HS} \leq ||A^*||_{op} ||K^*||_{HS} = ||A||_{op} ||K||_{HS}.
$$

**Remark 30.6.** The separability assumptions made in Proposition 30.5 are unnecessary. In general, we define

$$
\|K\|_{HS}^2 = \sum_{e \in \beta} ||K e||^2
$$

where $\beta \subset H$ is an orthonormal basis. The same proof of Item 1. of Proposition 30.5 shows $||K||_{HS}$ is well defined and $||K||_{HS} = ||K^*||_{HS}$. If $||K||_{HS} < \infty$, then there exists a countable subset $\beta_0 \subset \beta$ such that $Ke = 0$ if $e \in \beta \setminus \beta_0$. Let $H_0 := \text{span}(\beta_0)$ and $B_0 := K(H_0)$. Then $K(H) \subset B_0$, $K|_{H_0}^\perp = 0$ and hence by applying the results of Proposition 30.5 to $K|_{H_0}$, $H_0 \to B_0$ one easily sees that the separability of $H$ and $B$ are unnecessary in Proposition 30.5.

**Example 30.7.** Let $(X, \mu)$ be a measure space, $H = L^2(X, \mu)$ and

$$
k(x, y) := \sum_{i=1}^{n} f_i(x) g_i(y)
$$

where

$$
f_i, g_i \in L^2(X, \mu) \text{ for } i = 1, \ldots, n.
$$

Define

$$
(Kf)(x) = \int_{X} k(x, y) f(y) d\mu(y),
$$

then $K : L^2(X, \mu) \to L^2(X, \mu)$ is a finite rank operator and hence Hilbert Schmidt.
Exercise 30.5. Suppose that \((X, \mu)\) is a \(\sigma\)-finite measure space such that \(H = L^2(X, \mu)\) is separable and \(k : X \times X \rightarrow \mathbb{R}\) is a measurable function, such that
\[
\|k\|_{L^2(X \times X, \mu \otimes \mu)}^2 := \int_{X \times X} |k(x, y)|^2 d\mu(x) d\mu(y) < \infty.
\]
Define, for \(f \in H\),
\[
Kf(x) = \int_X k(x, y)f(y)d\mu(y),
\]
when the integral makes sense. Show:

1. \(Kf(x)\) is defined for \(\mu\)-a.e. \(x\) in \(X\).
2. The resulting function \(Kf\) is in \(H\) and \(K : H \rightarrow H\) is linear.
3. \(\|K\|_{HS} = \|k\|_{L^2(X \times X, \mu \otimes \mu)} < \infty\). (This implies \(K \in HS(H, H)\).)

Exercise 30.6 (Converse to Exercise 30.5). Suppose that \((X, \mu)\) is a \(\sigma\)-finite measure space such that \(H = L^2(X, \mu)\) is separable and \(K : H \rightarrow H\) is a Hilbert Schmidt operator. Show there exists \(k \in L^2(X \times X, \mu \otimes \mu)\) such that \(K\) is the integral operator associated to \(k\), i.e.,
\[
Kf(x) = \int_X k(x, y)f(y)d\mu(y).
\]  \(\text{(30.4)}\)

Example 30.8. Suppose that \(\Omega \subset \mathbb{R}^n\) is a bounded set, \(\alpha < n\), then the operator \(K : L^2(\Omega, m) \rightarrow L^2(\Omega, m)\) defined by
\[
Kf(x) := \int_{\Omega} \frac{1}{|x - y|} f(y)dy
\]
is compact.

**Proof.** For \(\varepsilon \geq 0\), let
\[
K_\varepsilon f(x) := \int_{\Omega} \frac{1}{|x - y| + \varepsilon} f(y)dy = [g_\varepsilon \ast (1_\Omega f)](x)
\]
where \(g_\varepsilon(x) = \frac{1}{|x|^{n+\varepsilon}} 1_C(x)\) with \(C \subset \mathbb{R}^n\) a sufficiently large ball such that \(\Omega - \Omega \subset C\). Since \(\alpha < n\), it follows that
\[
g_\varepsilon \leq g_0 = |\cdot|^{-\alpha} 1_C \in L^1(\mathbb{R}^n, m).
\]
Hence it follows by Proposition 19.23 that
\[
\| (K - K_\varepsilon) f \|_{L^2(\Omega)} \leq \|(g_0 - g_\varepsilon) \ast (1_\Omega f)\|_{L^2(\mathbb{R}^n)} \\
\leq \|(g_0 - g_\varepsilon)\|_{L^1(\mathbb{R}^n)} \|1_\Omega f\|_{L^2(\mathbb{R}^n)} \\
= \|(g_0 - g_\varepsilon)\|_{L^1(\mathbb{R}^n)} \|f\|_{L^2(\Omega)}
\]
which implies
\[
\|K - K_\varepsilon\|_{B(L^2(\Omega))} \leq \|g_0 - g_\varepsilon\|_{L^1(\mathbb{R}^n)} = \int_{\Omega} \left| \frac{1}{|x|^{n+\varepsilon} - \frac{1}{|x|^\varepsilon} } \right| dx \to 0 \text{ as } \varepsilon \downarrow 0 \quad (30.5)
\]
by the dominated convergence theorem. For any \(\varepsilon > 0\),
\[
\int_{\Omega \times \Omega} \left[ \frac{1}{|x - y|^{n+\varepsilon} + \varepsilon} \right]^2 dx dy < \infty,
\]
and hence \(K_\varepsilon\) is Hilbert Schmidt and hence compact. By Eq. (30.5), \(K_\varepsilon \to K\) as \(\varepsilon \downarrow 0\) and hence it follows that \(K\) is compact as well.

Exercise 30.7. Let \(H := L^2([0, 1], m)\), \(k(x, y) := \min(x, y)\) for \(x, y \in [0, 1]\) and define \(K : H \rightarrow H\) by
\[
Kf(x) = \int_0^1 k(x, y) f(y)dy.
\]
By Exercise 30.5, \(K\) is a Hilbert Schmidt operator and it is easily seen that \(K\) is self-adjoint. Show:

1. If \(g \in C^2([0, 1])\) with \(g(0) = 0 = g'(1)\), then \(Kg'' = -g\). Use this to conclude \((Kf)g'' = -f g\) for all \(g \in C^2_c((0, 1))\) and consequently that \(\text{Nul}(K) = \{0\}\).
2. Now suppose that \(f \in H\) is an eigenvector of \(K\) with eigenvalue \(\lambda \neq 0\). Show that there is a version \(f'\) of \(f\) which is in \(C([0, 1]) \cap C^2((0, 1))\) and this version, still denoted by \(f\), solves
\[
\lambda f'' = -f \text{ with } f(0) = f'(1) = 0.
\]  \(\text{(30.6)}\)

where \(f'(1) := \lim_{x \uparrow 1} f'(x)\).
3. Use Eq. (30.6) to find all the eigenvalues and eigenfunctions of \(K\).
4. Use the results above along with the spectral Theorem 29.19 to show
\[
\left\{ \sqrt{2} \sin \left( \left( n + \frac{1}{2} \right) \pi x \right) : n \in \mathbb{N}_0 \right\}
\]
is an orthonormal basis for \(L^2([0, 1], m)\).

Exercise 30.8. Let \((X, \mathcal{M}, \mu)\) be a \(\sigma\)-finite measure space, \(a \in L^\infty(\mu)\) and let \(A\) be the bounded operator on \(H := L^2(\mu)\) defined by \(Af(x) = a(x) f(x)\) for all \(f \in H\). (We will denote \(A\) by \(M_a\) in the future.) Show:

\(\text{1} A\) measurable function \(g\) is called a version of \(f\) iff \(g = f\) a.e.
1. \( \|A\|_{op} = \|a\|_{L^\infty(\mu)} \).
2. \( A^* = M_a \).
3. \( \sigma(A) = \text{essran}(a) \) where \( \sigma(A) \) is the spectrum of \( A \) and \( \text{essran}(a) \) is the essential range of \( a \), see Definitions 29.1 and 18.42 respectively.
4. Show \( \lambda \) is an eigenvalue for \( A = M_a \) iff \( \mu(\{a = \lambda\}) > 0 \), i.e. iff \( a \) has a “flat spot of height \( \lambda \).

### 30.3 Fourier Series Considerations

Throughout this section we will let \( d\theta, dx, d\alpha, \) etc. denote Lebesgue measure on \( \mathbb{R}^d \) normalized so that the cube, \( Q := (-\pi, \pi)^d \), has measure one, i.e. \( d\theta = (2\pi)^{-d} dm(\theta) \) where \( m \) is standard Lebesgue measure on \( \mathbb{R}^d \). As usual, for \( \alpha \in \mathbb{N}_0^d \), let

\[
D_\alpha^\alpha = \left( \frac{1}{i} \right)^{|\alpha|} \frac{\partial^{\alpha_1} \ldots \partial^{\alpha_d} \beta}{\partial \theta_1^{\alpha_1} \ldots \partial \theta_d^{\alpha_d}}.
\]

**Notation 30.9** Let \( C_{\text{per}}^k(\mathbb{R}^d) \) denote the \( 2\pi \)-periodic functions in \( C^k(\mathbb{R}^d) \), that is \( f \in C_{\text{per}}^k(\mathbb{R}^d) \) iff \( f \in C^k(\mathbb{R}^d) \) and \( f(\theta + 2\pi e_i) = f(\theta) \) for all \( \theta \in \mathbb{R}^d \) and \( i = 1, 2, \ldots, d \). Further let \( \langle \cdot | \cdot \rangle \) denote the inner product on the Hilbert space, \( H := L^2([-\pi, \pi]^d) \), given by

\[
\langle f | g \rangle := \int_Q f(\theta) \tilde{g}(\theta) d\theta = \left( \frac{1}{2\pi} \right)^d \int_Q f(\theta) \tilde{g}(\theta) dm(\theta)
\]

and define \( \varphi_k(\theta) := e^{ik\theta} \) for all \( k \in \mathbb{Z}^d \). For \( f \in L^1(Q) \), we will write \( \tilde{f}(k) \) for the **Fourier coefficient**

\[
\tilde{f}(k) := \langle f | \varphi_k \rangle = \int_Q f(\theta) e^{-ik\theta} d\theta.
\]  

(30.7)

Since any \( 2\pi \)-periodic functions on \( \mathbb{R}^d \) may be identified with function on the \( d \)-dimensional torus, \( \mathbb{T}^d := \mathbb{R}^d / (2\pi \mathbb{Z})^d \cong (S^1)^d \), I may also write \( C^k(\mathbb{T}^d) \) for \( C_{\text{per}}^k(\mathbb{R}^d) \) and \( L^p(\mathbb{T}^d) \) for \( L^p(Q) \) where elements in \( f \in L^p(Q) \) are to be thought of as there extensions to \( 2\pi \)-periodic functions on \( \mathbb{R}^d \).

**Theorem 30.10 (Fourier Series).** The functions \( \beta := \{ \varphi_k : k \in \mathbb{Z}^d \} \) form an orthonormal basis for \( H \), i.e. if \( f \in H \) then

\[
f = \sum_{k \in \mathbb{Z}^d} \langle f | \varphi_k \rangle \varphi_k = \sum_{k \in \mathbb{Z}^d} \tilde{f}(k) \varphi_k \tag{30.8}
\]

where the convergence takes place in \( L^2([-\pi, \pi]^d) \).

**Proof.** Simple computations show \( \beta := \{ \varphi_k : k \in \mathbb{Z}^d \} \) is an orthonormal set. We now claim that \( \beta \) is an orthonormal basis. To see this recall that \( C_n((\pi, \pi)^d) \) is dense in \( L^2((\pi, \pi)^d, dm) \). Any \( f \in C_n((\pi, \pi)) \) may be extended to be a continuous \( 2\pi \)-periodic function on \( \mathbb{R} \) and hence by Exercise 25.12 and Remark 25.44 \( f \) may uniformly (and hence in \( L^2 \)) be approximated by a trigonometric polynomial. Therefore \( \beta \) is a total orthonormal set, i.e. \( \beta \) is an orthonormal basis. This may also be proved by first proving the case \( d = 1 \) as above and then using Exercise 30.2 inductively to get the result for any \( d \). ■

**Exercise 30.9.** Let \( A \) be the operator defined in Lemma 29.7 and for \( g \in L^2(\mathbb{T}) \), let \( U g(k) := \tilde{g}(k) \) so that \( U : L^2(\mathbb{T}) \rightarrow L^2(\mathbb{Z}) \) is unitary. Show \( U^{-1} A U \in C_{\text{per}}^\infty(\mathbb{R}) \) is a function to be found. Use this representation and the results in Exercise 30.8 to give a simple proof of the results in Lemma 29.7.

### 30.3.1 Dirichlet, Fejér and Kernels

Although the sum in Eq. (30.8) is guaranteed to converge relative to the Hilbertian norm on \( H \) it certainly need not converge pointwise even if \( f \in C_{\text{per}}^k(\mathbb{R}^d) \) as will be proved in Section 31.3.1 below. Nevertheless, if \( f \) is sufficiently regular, then the sum in Eq. (30.8) will converge pointwise as well we will now show. In the process we will give a direct and constructive proof of the result in Exercise 25.12 see Theorem 30.12 below.

Let us restrict our attention to \( d = 1 \) here. Consider

\[
f_n(\theta) = \sum_{|k| \leq n} \tilde{f}(k) \varphi_k(\theta) = \sum_{|k| \leq n} \frac{1}{2\pi} \left[ \int_{[-\pi, \pi]} f(x) e^{-ik\pi x} dx \right] \varphi_k(\theta)
\]

\[
= \frac{1}{2\pi} \int_{[-\pi, \pi]} f(x) \sum_{|k| \leq n} e^{ik(\theta - x)} dx
\]

\[
= \frac{1}{2\pi} \int_{[-\pi, \pi]} f(x) D_n(\theta - x) dx
\]

(30.9)

where

\[
D_n(\theta) := \sum_{k=-n}^{n} e^{ik\theta}
\]

is called the **Dirichlet kernel**. Letting \( \alpha = e^{i\theta}/2 \), we have

\[
D_n(\theta) = \sum_{k=-n}^{n} \alpha^{2k} = \frac{\alpha^{2(n+1)} - \alpha^{-2n}}{\alpha^2 - 1} = \frac{\alpha^{2n+1} - \alpha^{-2n+1}}{\alpha - \alpha^{-1}}
\]

\[
= \frac{2i \sin(n + \frac{1}{2})\theta}{2i \sin \frac{1}{2}\theta} = \frac{\sin(n + \frac{1}{2})\theta}{\sin \frac{1}{2}\theta}.
\]
and therefore
\[ D_n(\theta) = \sum_{k=-n}^{n} e^{ik\theta} \frac{\sin(n + \frac{1}{2})\theta}{\sin \frac{1}{2}\theta}, \quad (30.10) \]
see Figure 30.3.1.

This is a plot $D_1$ and $D_{10}$.

with the understanding that the right side of this equation is $2n + 1$ whenever $\theta \in 2\pi\mathbb{Z}$.

**Theorem 30.11.** Suppose $f \in L^1([-\pi, \pi], dm)$ and $f$ is differentiable at some $\theta \in [-\pi, \pi]$, then $\lim_{n \to \infty} f_n(\theta) = f(\theta)$ where $f_n$ is as in Eq. (30.9).

**Proof.** Observe that
\[
\frac{1}{2\pi} \int_{[-\pi, \pi]} D_n(\theta - x) dx = \frac{1}{2\pi} \int_{[-\pi, \pi]} \sum_{|k| \leq n} e^{ik(\theta - x)} dx = 1
\]
and therefore,
\[
f_n(\theta) - f(\theta) = \frac{1}{2\pi} \int_{[-\pi, \pi]} [f(x) - f(\theta)] D_n(\theta - x) dx
= \frac{1}{2\pi} \int_{[-\pi, \pi]} [f(x) - f(\theta - x)] D_n(x) dx
= \frac{1}{2\pi} \int_{[-\pi, \pi]} \left[ f(\theta - x) - f(\theta) \right] \frac{\sin(n + \frac{1}{2})x}{\sin \frac{1}{2}x} dx. \quad (30.11)
\]
If $f$ is differentiable at $\theta$, the last expression in Eq. (30.11) tends to 0 as $n \to \infty$ by the Riemann Lebesgue Lemma (Corollary 19.17 or Lemma 19.39) and the fact that $1_{[-\pi, \pi]}(x) \frac{f(\theta - x) - f(\theta)}{\sin \frac{1}{2}x} \in L^1(dx)$.

Despite the Dirichlet kernel not being positive, it still satisfies the approximate $\delta$–sequence property, $\frac{1}{2\pi} D_n \to \delta_0$ as $n \to \infty$, when acting on $C^1$–periodic functions in $\theta$. In order to improve the convergence properties it is reasonable to try to replace $\{f_n : n \in \mathbb{N}_0\}$ by the sequence of averages (see Exercise 14.14),

\[
F_N(\theta) = \frac{1}{N+1} \sum_{n=0}^{N} f_n(\theta) = \frac{1}{N+1} \sum_{n=0}^{N} \frac{1}{2\pi} \int_{[-\pi, \pi]} f(x) \sum_{|k| \leq n} e^{ik(\theta - x)} dx
= \frac{1}{2\pi} \int_{[-\pi, \pi]} K_N(\theta - x) f(x) dx
\]
where
\[
K_N(\theta) := \frac{1}{N+1} \sum_{n=0}^{N} \sum_{|k| \leq n} e^{ik\theta} \quad (30.12)
\]
is the Fejér kernel.

**Theorem 30.12.** The Fejér kernel $K_N$ in Eq. (30.12) satisfies:

1. $\quad K_N(\theta) = \sum_{n=-N}^{N} \left[ 1 - \frac{|n|}{N+1} \right] \tilde{f}(n) e^{i\theta}$ \quad (30.13)

$$
\begin{align*}
K_N(\theta) &= \sum_{n=-N}^{N} \left[ 1 - \frac{|n|}{N+1} \right] \tilde{f}(n) e^{i\theta} \\
&= \frac{1}{N+1} \sin^2 \left( \frac{N+1}{2}\theta \right). \quad (30.14)
\end{align*}
$$

2. $\quad K_N(\theta) \geq 0$.

3. $\quad \frac{1}{2\pi} \int_{-\pi}^{\pi} K_N(\theta) d\theta = 1$

4. $\quad \sup_{\theta \leq \theta \leq \pi} K_N(\theta) \to 0$ as $N \to \infty$ for all $\varepsilon > 0$, see Figure 30.1

5. For any continuous $2\pi$–periodic function $f$ on $\mathbb{R}$, $K_N \ast f(\theta) \to f(\theta)$ uniformly in $\theta$ as $N \to \infty$, where

\[
K_N \ast f(\theta) = \frac{1}{2\pi} \int_{-\pi}^{\pi} K_N(\theta - \alpha) f(\alpha) d\alpha
= \sum_{n=-N}^{N} \left[ 1 - \frac{|n|}{N+1} \right] \tilde{f}(n) e^{i\theta}. \quad (30.15)
\]

**Proof.** 1. Equation (30.13) is a consequence of the identity,

\[
\sum_{n=0}^{N} \sum_{|k| \leq n} e^{ik\theta} = \sum_{|k| \leq n \leq N} e^{ik\theta} = \sum_{|k| \leq n \leq N} (N+1 - |k|) e^{ik\theta}.
\]
Moreover, letting $\alpha = e^{i\theta}/2$ and using Eq. \((3.3)\) shows

\[
K_N(\theta) = \frac{1}{N + 1} \sum_{n=0}^{N} a^{2n} = \frac{1}{N + 1} \sum_{n=0}^{N} \frac{\alpha^{2n+2} - \alpha^{-2n}}{\alpha^2 - 1}
\]

\[
= \frac{1}{(N + 1)(\alpha - \alpha^{-1})} \sum_{n=0}^{N} [\alpha^{2n+1} - \alpha^{-2n-1}]
\]

\[
= \frac{1}{(N + 1)(\alpha - \alpha^{-1})} \sum_{n=0}^{N} [\alpha \alpha^{2n} - \alpha^{-1} \alpha^{-2n}]
\]

\[
= \frac{1}{(N + 1)(\alpha - \alpha^{-1})} \sum_{n=0}^{N} [\alpha^{2n+1} - \alpha^{-2n-1}]
\]

\[
= \frac{1}{(N + 1)(\alpha - \alpha^{-1})} \sum_{n=0}^{N} \left[\alpha^{2n(N+1) - 1} + \alpha^{-2(n+1)} - 1\right]
\]

\[
= \frac{1}{(N + 1)(\alpha - \alpha^{-1})^2} \left[\alpha^{N(N+1)} - \alpha^{-2(N+1)} - 1\right]
\]

\[
= \frac{1}{N + 1} \frac{\sin^2((N + 1)\theta/2)}{\sin^2(\theta/2)}.
\]

Items 2. and 3. follow easily from Eqs. \((30.14)\) and \((30.13)\) respectively. Item 4. is a consequence of the elementary estimate;

\[
\sup_{\varepsilon \leq |\theta| \leq \pi} K_N(\theta) \leq \frac{1}{N + 1} \frac{1}{\sin^2(\pi/2)}
\]

and is clearly indicated in Figure \(30.1\). Item 5. now follows by the standard approximate $\delta$ – function arguments, namely,

\[
|K_N * f(\theta) - f(\theta)| = \frac{1}{2\pi} \left| \int_{-\pi}^{\pi} K_N(\theta - \alpha) [f(\alpha) - f(\theta)] d\alpha \right|
\]

\[
\leq \frac{1}{2\pi} \int_{-\pi}^{\pi} K_N(\alpha) |f(\theta - \alpha) - f(\theta)| d\alpha
\]

\[
\leq \frac{1}{\pi} \frac{1}{N + 1} \frac{1}{\sin^2(\pi/2)} \|f\|_\infty + \frac{1}{2\pi} \int_{|\alpha| \leq \varepsilon} K_N(\alpha) |f(\theta - \alpha) - f(\theta)| d\alpha
\]

\[
\leq \frac{1}{\pi} \frac{1}{N + 1} \frac{1}{\sin^2(\pi/2)} \|f\|_\infty + \sup_{|\alpha| \leq \varepsilon} |f(\theta - \alpha) - f(\theta)|.
\]

Therefore,

\[
\lim_{N \to \infty} \sup_{\theta} \|K_N * f - f\|_\infty \leq \sup_{\theta} \|f(\theta - \alpha) - f(\theta)\| \to 0 \text{ as } \varepsilon \downarrow 0.
\]

\[
\Box
\]

### 30.3.2 The Dirichlet Problems on $D$ and the Poisson Kernel

Let $D := \{z \in \mathbb{C} : |z| < 1\}$ be the open unit disk in $\mathbb{C} \cong \mathbb{R}^2$, write $z \in \mathbb{C}$ as $z = x + iy$ or $z = re^{i\theta}$, and let $\Delta = \frac{\partial^2}{\partial x^2} + \frac{\partial^2}{\partial y^2}$ be the Laplacian acting on $C^2(D)$.

**Theorem 30.13 (Dirichlet problem for $D$).** To every continuous function $g \in C(\text{bd}(D))$ there exists a unique function $u \in C(\overline{D}) \cap C^2(D)$ solving

\[
\Delta u(z) = 0 \text{ for } z \in D \text{ and } u|_{\partial D} = g.
\]

(30.16)

Moreover for $r < 1$, $u$ is given by,

\[
u(r e^{i\theta}) = \frac{1}{2\pi} \int_{-\pi}^{\pi} P_r(\theta - \alpha) u(e^{i\alpha}) d\alpha =: P_r * u(e^{i\theta})
\]

(30.17)

\[
\frac{1}{2\pi} \text{Re} \int_{-\pi}^{\pi} \frac{1 + re^{i(\theta - \alpha)}}{1 - re^{i(\theta - \alpha)}} u(e^{i\alpha}) d\alpha
\]

(30.18)

where $P_r$ is the Poisson kernel defined by

\[
P_r(\delta) := \frac{1 - r^2}{1 - 2r \cos \delta + r^2}.
\]

(The problem posed in Eq. \((30.16)\) is called the Dirichlet problem for $D$.)

**Proof.** In this proof, we are going to be identifying $S^1 = \text{bd}(D) := \{z \in \bar{D} : |z| = 1\}$ with $[-\pi, \pi]/(\pi \sim -\pi)$ by the map $\theta \in [-\pi, \pi] \to e^{i\theta} \in S^1$. Also recall that the Laplacian $\Delta$ may be expressed in polar coordinates as,
be the Fourier coefficients of \( g \) and \( \theta \to u \left( r e^{i\theta} \right) \) respectively. Then for \( r \in (0, 1) \),

\[
r^{-1} \partial_r \left( r \partial_r \tilde{u}(r, k) \right) = \frac{1}{2\pi} \int_{-\pi}^{\pi} r^{-1} \partial_r \left( r^{-1} \partial_r, u \right) \left( r e^{i\theta} \right) e^{-ik\theta} d\theta
\]

be the Fourier coefficients of \( g(\theta) \) and \( \theta \to u \left( r e^{i\theta} \right) \) respectively. Then for \( r \in (0, 1) \),

\[
A_k = \frac{1}{2\pi} \int_{-\pi}^{\pi} u(\epsilon e^{i\theta}) e^{-ik\theta} d\theta = \tilde{g}(k).
\]

Hence if \( u \) is a solution to Eq. \((30.16)\) then \( u \) must be given by

\[
u(r e^{i\theta}) = \sum_{k \in \mathbb{Z}} \tilde{g}(k) r^{|k|} e^{ik\theta} \quad \text{for } r < 1.
\]

or equivalently,

\[
u(z) = \sum_{k \in \mathbb{Z}} \tilde{g}(k) z^k + \sum_{k \in \mathbb{N}} \tilde{g}(-k) z^k.
\]

Notice that the theory of the Fourier series implies Eq. \((30.23)\) is valid in the \( L^2 (d\theta) \) sense. However more is true, since for \( r < 1 \), the series in Eq. \((30.23)\) is absolutely convergent and in fact defines a \( C^\infty \) function (see Exercise 4.12 or Corollary 45.31) which must agree with the continuous function, \( \theta \to u \left( r e^{i\theta} \right) \), for almost every \( \theta \) and hence for all \( \theta \). This completes the proof of uniqueness.

**Existence.** Given \( g \in C (\text{bd}(D)) \), let \( u \) be defined as in Eq. \((30.23)\). Then, again by Exercise 4.12 or Corollary 45.31, \( u \in C^\infty (D) \). So to finish the proof it suffices to show that \( \lim_{x \to y} u \left( x \right) = g \left( y \right) \) for all \( y \in \text{bd}(D) \). Inserting the formula for \( \tilde{g}(k) \) into Eq. \((30.23)\) gives

\[
u(r e^{i\theta}) = \frac{1}{2\pi} \int_{-\pi}^{\pi} P_r \left( \theta - \alpha \right) u(\epsilon e^{i\alpha}) d\alpha \quad \text{for } r < 1
\]

where

\[
P_r \left( \delta \right) = \sum_{k \in \mathbb{Z}} r^{|k|} e^{ik\delta} = \sum_{k=0}^{\infty} r^k e^{ik\delta} - \sum_{k=0}^{\infty} r^k e^{-ik\delta} - 1 = \Re \left[ \frac{1 + re^{i\delta}}{1 - re^{i\delta}} \right] = \Re \left[ \frac{1 - r^2 + 2ir \sin \delta}{1 - 2 r \cos \delta + r^2} \right]
\]

or

\[
P_r \left( \delta \right) = \frac{1 - r^2}{1 - 2r \cos \delta + r^2}.
\]

The Poisson kernel again solves the usual approximate \( \delta \) – function properties (see Figure 3), namely:

1. \( P_r \left( \delta \right) > 0 \) and

\[
\frac{1}{2\pi} \int_{-\pi}^{\pi} P_r \left( \theta - \alpha \right) d\alpha = \frac{1}{2\pi} \int_{-\pi}^{\pi} r^{|k|} e^{ik(\theta - \alpha)} d\alpha
\]

\[
eq \frac{1}{2\pi} \sum_{k \in \mathbb{Z}} r^{|k|} \int_{-\pi}^{\pi} e^{ik(\theta - \alpha)} d\alpha = 1.
\]
Remark 30.14 (Harmonic Conjugate). Moreover it follows from Eq. (30.24) that which shows $F = \text{Re} \cdot u$ where

$$F(z) := \frac{1}{2\pi} \int_{-\pi}^{\pi} \frac{1 + z e^{-i\alpha}}{1 - z e^{-i\alpha}} u(e^{i\alpha}) d\alpha.$$ 

Moreover it follows from Eq. (30.24) that

$$\text{Im} \cdot F(re^{i\theta}) = \frac{1}{\pi} \text{Im} \int_{-\pi}^{\pi} \frac{r \sin(\theta - \alpha)}{1 - 2r \cos(\theta - \alpha) + r^2} g(e^{i\alpha}) d\alpha$$

$$= (Q_r * u) (e^{i\theta})$$

where

$$Q_r(\delta) := \frac{r \sin(\delta)}{1 - 2r \cos(\delta) + r^2}.$$ 

From these remarks it follows that $v := (Q_r * u) (e^{i\theta})$ is the harmonic conjugate of $u$ and $\bar{P}_r = Q_r$. For more on this point see Section 20.7 below.

30.4 Weak $L^2$-Derivatives

Theorem 30.15 (Weak and Strong Differentiability). Suppose that $f \in L^2(\mathbb{R}^n)$ and $v \in \mathbb{R}^n \setminus \{0\}$. Then the following are equivalent:

1. There exists $\{t_n\}_{n=1}^\infty \subset \mathbb{R} \setminus \{0\}$ such that $\lim_{n \to \infty} t_n = 0$ and

$$\sup_n \left\| \frac{f(\cdot + t_n v) - f(\cdot)}{t_n} \right\|_2 < \infty.$$ 

2. There exists $g \in L^2(\mathbb{R}^n)$ such that $\langle f, \partial_v \varphi \rangle = -\langle g, \varphi \rangle$ for all $\varphi \in C_c^\infty(\mathbb{R}^n)$. 3. There exists $g \in L^2(\mathbb{R}^n)$ and $f_n \in C_c^\infty(\mathbb{R}^n)$ such that $f_n \xrightarrow{L^2} f$ and $\partial_v f_n \xrightarrow{L^2} g$ as $n \to \infty$. 4. There exists $g \in L^2$ such that

$$\frac{f(\cdot + tv) - f(\cdot)}{t} \xrightarrow{L^2} g as \ t \to 0.$$ 

(See Theorem 32.18 for the $L^p$ generalization of this theorem.)

Proof. 1. $\implies$ 2. We may assume, using Theorem 24.29 and passing to a subsequence if necessary, that $\frac{f(\cdot + t_n v) - f(\cdot)}{t_n} \xrightarrow{\text{weak}} g$ for some $g \in L^2(\mathbb{R}^n)$. Now for $\varphi \in C_c^\infty(\mathbb{R}^n)$,

$$\langle g | \varphi \rangle = \lim_{n \to \infty} \left\langle f(\cdot + t_n v) - f(\cdot), \varphi \right\rangle = \lim_{n \to \infty} \left\langle f, \frac{\varphi(\cdot - t_n v) - \varphi(\cdot)}{t_n} \right\rangle = \left\langle f, \lim_{n \to \infty} \frac{\varphi(\cdot - t_n v) - \varphi(\cdot)}{t_n} \right\rangle = -\langle f, \partial_v \varphi \rangle,$$

wherein we have used the translation invariance of Lebesgue measure and the dominated convergence theorem. 2. $\implies$ 3. Let $\varphi \in C_c^\infty(\mathbb{R}^n, \mathbb{R})$ such that $\int_{\mathbb{R}^n} \varphi(x) dx = 1$ and let $\varphi_m(x) = m^n \varphi(mx)$, then by Proposition 19.36 $h_m := \varphi_m * f \in C_c^\infty(\mathbb{R}^n)$ for all $m$ and

$$\partial_v h_m(x) = \varphi_m * f(x) = \int_{\mathbb{R}^n} \varphi_m(x-y) f(y) dy = \langle f, -\partial_v [\varphi_m(x - \cdot)] \rangle = \langle g, \varphi_m(x - \cdot) \rangle = \varphi_m * g(x).$$

By Theorem 19.32 $h_m \to f \in L^2(\mathbb{R}^n)$ and $\partial_v h_m = \varphi_m * g \to g$ in $L^2(\mathbb{R}^n)$ as $m \to \infty$. This shows 3. holds except for the fact that $h_m$ need not have compact support. To fix this let $\psi \in C_c^\infty(\mathbb{R}^n, [0, 1])$ such that $\psi = 1$ in a neighborhood of 0 and let $\psi(x) = \psi(\varepsilon x)$ and $(\partial_v \psi)(x) := (\partial_v \psi)(\varepsilon x)$. Then

$$\partial_v (\psi \varepsilon h_m) = \partial_v \psi \varepsilon h_m + \psi \varepsilon \partial_v h_m = \varepsilon (\partial_v \psi) \varepsilon h_m + \varepsilon \partial_v \varepsilon h_m.$$
so that \( \psi \varepsilon h_m \rightarrow h_m \) in \( L^2 \) and \( \partial_v (\psi \varepsilon h_m) \rightarrow \partial_v h_m \) in \( L^2 \) as \( \varepsilon \downarrow 0 \). Let \( f_m = \psi \varepsilon h_m \) where \( \varepsilon_m \) is chosen to be greater than zero but small enough so that
\[
\| \psi \varepsilon h_m - h_m \|_2 + \| \partial_v (\psi \varepsilon h_m) - \partial_v h_m \|_2 < 1/m.
\]

Then \( f_m \in C_c^\infty (\mathbb{R}^n) \), \( f_m \rightarrow f \) and \( \partial_v f_m \rightarrow g \) in \( L^2 \) as \( m \rightarrow \infty \). \( \implies 3. \implies 4. \) By the fundamental theorem of calculus
\[
\frac{\tau -tv f_m(x) - f_m(x)}{t} = \frac{f_m(x + tv) - f_m(x)}{t} = \frac{1}{t} \int_0^1 \frac{d}{ds} f_m(x + stv) ds = \int_0^1 (\partial_v f_m)(x + stv) ds.
\]

Let
\[
G_t(x) := \int_0^1 \tau -stv g(x) ds = \int_0^1 g(x + stv) ds
\]

which is defined for almost every \( x \) and is in \( L^2(\mathbb{R}^n) \) by Minkowski’s inequality for integrals, Theorem 18.27. Therefore
\[
\frac{\tau -tv f_m(x) - f_m(x)}{t} - G_t(x) = \int_0^1 [(\partial_v f_m)(x + stv) - g(x + stv)] ds
\]

and hence again by Minkowski’s inequality for integrals,
\[
\left\| \frac{\tau -tv f_m - f_m}{t} - G_t \right\|_2 \leq \int_0^1 \left\| (\partial_v f_m)(x + stv) - g(x + stv) \right\|_2 ds
\]

\[
= \int_0^1 \left\| \partial_v f_m - g \right\|_2 ds.
\]

Letting \( m \rightarrow \infty \) in this equation implies \( \frac{(\tau -tv f - f)/t}{t} = G_t \) a.e. Finally one more application of Minkowski’s inequality for integrals implies,
\[
\left\| \frac{\tau -tv f - f}{t} - g \right\|_2 = \| G_t - g \|_2 = \left\| \int_0^1 (\tau -stv g - g) ds \right\|_2
\]

\[
\leq \int_0^1 \left\| \tau -stv g - g \right\|_2 ds.
\]

By the dominated convergence theorem and Proposition 19.23 the latter term tends to 0 as \( t \rightarrow 0 \) and this proves 4. The proof is now complete since 4. \( \implies 1. \) is trivial.

### 30.5 Conditional Expectation

In this section let \((\Omega, \mathcal{F}, P)\) be a probability space, i.e. \((\Omega, \mathcal{F}, P)\) is a measure space and \( P(\Omega) = 1 \). Let \( \mathcal{G} \subset \mathcal{F} \) be a sub-\( \sigma \)-algebra of \( \mathcal{F} \) and write \( f \in \mathcal{G}_b \) if \( f : \Omega \rightarrow \mathbb{C} \) is bounded and \( f \) is \((\mathcal{G}, \mathcal{B}_\mathbb{C})\) measurable. In this section we will write
\[
Ef := \int_0 f dP.
\]

**Definition 30.16 (Conditional Expectation).** Let \( E_\mathcal{G} : L^2(\Omega, \mathcal{F}, P) \rightarrow L^2(\Omega, \mathcal{G}, P) \) denote orthogonal projection of \( L^2(\Omega, \mathcal{F}, P) \) onto the closed subspace \( L^2(\Omega, \mathcal{G}, P) \). For \( f \in L^2(\Omega, \mathcal{G}, P) \), we say that \( E_\mathcal{G}f \) is \( L^2(\Omega, \mathcal{F}, P) \) is the \textit{conditional expectation} of \( f \).

**Theorem 30.17.** Let \((\Omega, \mathcal{F}, P)\) and \( \mathcal{G} \subset \mathcal{F} \) be as above and \( f, g \in L^2(\Omega, \mathcal{F}, P) \).

1. If \( f \geq 0 \), \( P - a.e. \) then \( E_\mathcal{G}f \geq 0 \), \( P - a.e. \).
2. If \( f \geq g \), \( P - a.e. \) there \( E_\mathcal{G}f \geq E_\mathcal{G}g \), \( P - a.e. \).
3. \( |E_\mathcal{G}f| \leq E_\mathcal{G}|f| \), \( P - a.e. \).
4. \( \| E_\mathcal{G}f \|_{L^1} \leq \| f \|_{L^1} \) for all \( f \in L^2 \). So by the B.L.T. Theorem 50.4, \( E_\mathcal{G} \) extends uniquely to a bounded linear map from \( L^1(\Omega, \mathcal{F}, P) \) to \( L^1(\Omega, \mathcal{G}, P) \), which we will still denote by \( E_\mathcal{G} \).
5. If \( f \in L^1(\Omega, \mathcal{F}, P) \) then \( F = E_\mathcal{G}f \in L^1(\Omega, \mathcal{G}, P) \) iff
\[
E(Fh) = E(fh) \quad \text{for all } h \in \mathcal{G}_b.
\]
6. If \( g \in \mathcal{G}_b \) and \( f \in L^1(\Omega, \mathcal{F}, P) \), then \( E_\mathcal{G}(gf) = g \cdot E_\mathcal{G}f \), \( P - a.e. \).

**Proof.** By the definition of orthogonal projection for \( h \in \mathcal{G}_b \),
\[
E(fh) = E(f \cdot E_\mathcal{G}h) = E(E_\mathcal{G}f \cdot h).
\]

So if \( f, h \geq 0 \) then \( 0 \leq E(fh) \leq E(E_\mathcal{G}f \cdot h) \) and since this holds for all \( h \geq 0 \) in \( \mathcal{G}_b \), \( E_\mathcal{G}f \geq 0 \), \( P - a.e. \) this proves (1). Item (2) follows by applying item (1), to \( f \rightarrow g \). If \( f \) is real, \( \pm f \leq |f| \) and so by Item (2), \( \pm E_\mathcal{G}f \leq E_\mathcal{G}|f| \), i.e. \( |E_\mathcal{G}f| \leq E_\mathcal{G}|f| \), \( P - a.e. \). For complex \( f \), let \( h \geq 0 \) be a bounded and \( \mathcal{G} \) measurable function. Then
\[
E |E_\mathcal{G}|h| = E \cdot E_\mathcal{G} f \cdot E_\mathcal{G}|h| = E\left[ f \cdot E_\mathcal{G}|h| \right]
\]

\[
\leq E |f| \cdot h = E_\mathcal{G}|f| \cdot h.
\]

Since \( h \) is arbitrary, it follows that \( |E_\mathcal{G}f| \leq E_\mathcal{G}|f| \), \( P - a.e. \). Integrating this inequality implies
\[
\| E_\mathcal{G}f \|_{L^1} \leq E |E_\mathcal{G}|f| \leq E \| E_\mathcal{G}|f| \cdot 1 \| = E |f| = \| f \|_{L^1}.
\]
Suppose that \((\rho, \mathcal{G}, \mu)\) is a probability space, \(\varphi : \mathbb{R} \to \mathbb{R}\) is a convex function such that \((\text{for simplicity})\ \varphi(f) \in L^1(\Omega, \mathcal{F}, P)\), then \(\varphi(E_{\mathcal{G}} f) \leq E_{\mathcal{G}} [\varphi(f)]\), \(P\)-a.e.

**Proof.** Let us first assume that \(\varphi\) is \(C^1\) and \(f\) is bounded. In this case \(\varphi(x) - \varphi(x_0) \geq \varphi'(x_0)(x - x_0)\) for all \(x_0, x \in \mathbb{R}\). Taking \(x_0 = E_{\mathcal{G}} f\) and \(x = f\) in this inequality implies \(\varphi(f) - \varphi(E_{\mathcal{G}} f) \geq \varphi'(E_{\mathcal{G}} f)(f - E_{\mathcal{G}} f)\) and then applying \(E_{\mathcal{G}}\) to this inequality gives

\[
E_{\mathcal{G}} [\varphi(f)] - \varphi(E_{\mathcal{G}} f) = E_{\mathcal{G}} [\varphi(f) - \varphi(E_{\mathcal{G}} f)] \\
\geq \varphi'(E_{\mathcal{G}} f)(E_{\mathcal{G}} f - E_{\mathcal{G}} E_{\mathcal{G}} f) = 0
\]

is a \(\mu\) - null set. Since

\[
E [F \circ \pi_X] = \int \int d\mu(x) \int d\nu(y)|F(x)|\rho(x, y) = \int \int d\mu(x)|F(x)|\bar{\rho}(x) \\
= \int \int d\mu(x)\int \int d\nu(y)f(x, y)\rho(x, y) \\
\leq \int \int d\mu(x)\int \int d\nu(y)|f(x, y)|\rho(x, y) < \infty,
\]

\(F \circ \pi_X \in L^1(\Omega, \mathcal{G}, P)\). Let \(h = H \circ \pi_X\) be a bounded \(\mathcal{G}\) – measurable function, then

\[
E[F \circ \pi_X \cdot h] = \int \int d\mu(x)\int \int d\nu(y)F(x)H(x)\rho(x, y) \\
= \int \int d\mu(x)F(x)H(x)\bar{\rho}(x) \\
= \int \int d\mu(x)H(x)\int \int d\nu(y)f(x, y)\rho(x, y) \\
= E[hf]
\]

and hence \(E_{\mathcal{G}} f = F \circ \pi_X\) as claimed.

This example shows that conditional expectation is a generalization of the notion of performing integration over a partial subset of the variables in the integrand. Whereas to compute the expectation, one should integrate over all of the variables. See also Exercise 30.26 to gain more intuition about conditional expectations.

**Theorem 30.20 (Jensen’s inequality).** Let \((\Omega, \mathcal{F}, P)\) be a probability space and \(\varphi : \mathbb{R} \to \mathbb{R}\) be a convex function. Assume \(f \in L^1(\Omega, \mathcal{F}, P; \mathbb{R})\) is a function such that \(f \in L^1(\Omega, \mathcal{F}, P; \mathbb{R})\), then \(\varphi(E_{\mathcal{G}} f) \leq E_{\mathcal{G}} [\varphi(f)]\), \(P\)-a.e.
30.6 Exercises

Exercise 30.10. Let \((X, \mathcal{M}, \mu)\) be a measure space and \(H := L^2(X, \mathcal{M}, \mu)\).
Given \(f \in L^\infty(\mu)\) let \(M_f : H \to H\) be the multiplication operator defined by \(M_f g = fg\). Show \(M_f^2 = M_f\) iff there exists \(A \in \mathcal{M}\) such that \(f = 1_A\) a.e.

Exercise 30.11 (Haar Basis). In this problem, let \(L^2\) denote \(L^2([0,1],m)\)
with the standard inner product,
\[
\psi(x) = 1_{[0,1/2)}(x) - 1_{[1/2,1)}(x)
\]
and for \(k, j \in \mathbb{N}_0 := \mathbb{N} \cup \{0\}\) with \(0 \leq j < 2^k\) let
\[
\psi_{kj}(x) = 2^{k/2} \psi(2^k x - j) = 2^{k/2} \left(1_{-2^{-k}[j,2^{-k}j+1]}(x) - 1_{-2^{-k}2^{k}[j+1,2^{k}j+1]}(x)\right).
\]
The following pictures shows the graphs of \(\psi_{0,0}, \psi_{1,0}, \psi_{1,1}, \psi_{2,1}, \psi_{2,2}\) and \(\psi_{2,3}\)
respectively.

1. Let \(M_0 = \text{span}\{1\}\) and for \(n \in \mathbb{N}\) let
\[
M_n := \text{span}\left(\{1\} \cup \{\psi_{kj} : 0 \leq k < n \text{ and } 0 \leq j < 2^k\}\right),
\]
where 1 denotes the constant function 1. Show
\[
M_n = \text{span}\left(\{1, \psi_{kj} : 0 \leq k < n \text{ and } 0 \leq j < 2^k\}\right).
\]

2. Show \(\beta := \{1\} \cup \{\psi_{kj} : 0 \leq k \text{ and } 0 \leq j < 2^k\}\) is an orthonormal set. **Hint:** show \(\psi_{k+1,j} \in M_k\) for all \(0 \leq j < 2^{k+1}\) and show \(\{\psi_{kj} : 0 \leq j < 2^k\}\) is an orthonormal set for fixed \(k\).

3. Show \(\cup_{n=1}^\infty M_n\) is a dense subspace of \(L^2\) and therefore \(\beta\) is an orthonormal basis for \(L^2\). **Hint:** see Theorem 19.15

4. For \(f \in L^2\), let
\[
H_nf := \langle f|1\rangle + \sum_{k=0}^{n-1} \sum_{j=0}^{2^{k}-1} \langle f|\psi_{kj}\rangle \psi_{kj}.
\]
Exercise 30.13. Euclidean group representation and its infinitesimal genera-
tors including momentum and angular momentum operators.

Show (compare with Exercise 30.20)

\[ H_n f = \sum_{j=0}^{2^n-1} \left( 2^n \int_{j2^{-n}}^{(j+1)2^{-n}} f(x) \, dx \right) \mathbf{1}_{[j2^{-n},(j+1)2^{-n})} \]

and use this to show \( \|f - H_n f\|_\infty \to 0 \) as \( n \to \infty \) for all \( f \in C([0,1]) \).

**Hint:** Compute orthogonal projection onto \( M_n \) using a judiciously chosen basis for \( M_n \).

**Exercise 30.14.** Let \( O(n) \) be the orthogonal groups consisting of \( n \times n \) real orthogonal matrices \( O \), i.e. \( O^t O = I \). For \( O \in O(n) \) and \( f \in L^2(\mathbb{R}^n) \) let \( U_O f(x) = f(O^{-1}x) \). Show

1. \( U_O f \) is well defined, namely if \( f = g \) a.e. then \( U_O f = U_O g \) a.e.
2. \( U_O : L^2(\mathbb{R}^n) \to L^2(\mathbb{R}^n) \) is unitary and satisfies \( U_{O_1}U_{O_2} = U_{O_1O_2} \) for all \( O_1, O_2 \in O(n) \). That is to say the map \( O \in O(n) \to \mathcal{U}(L^2(\mathbb{R}^n)) \) - the unitary operators on \( L^2(\mathbb{R}^n) \) is a group homomorphism, i.e. a “unitary representation” of \( O(n) \).
3. For each \( f \in L^2(\mathbb{R}^n) \), the map \( O \in O(n) \to U_O f \in L^2(\mathbb{R}^n) \) is continuous. Take the topology on \( O(n) \) to be that inherited from the Euclidean topology on the vector space of all \( n \times n \) matrices. **Hint:** see the proof of Proposition 19.24

**Exercise 30.15.** Spherical Harmonics.

**Exercise 30.16.** The gradient and the Laplacian in spherical coordinates.

**Exercise 30.17.** Legendre polynomials.

### 30.7 Fourier Series Exercises

**Exercise 30.18.** Show \( \sum_{k=1}^{\infty} k^{-2} = \pi^2/6 \), by taking \( f(x) = x \) on \([-\pi,\pi]\) and computing \( \|f\|_2^2 \) directly and then in terms of the Fourier Coefficients \( \hat{f} \) of \( f \).

**Exercise 30.19.** Suppose \( f \in L^1([-\pi,\pi]^d) \) is a function such that \( \hat{f} \in l^1(\mathbb{Z}^d) \) and set

\[ g(x) := \sum_{k \in \mathbb{Z}^d} \hat{f}(k)e^{ik \cdot x} \text{ (pointwise).} \]

1. Show \( g \in C_{\text{per}}(\mathbb{R}^d) \).
2. Show \( g(x) = f(x) \) for \( m - \text{a.e. } x \in [-\pi,\pi]^d \). **Hint:** Show \( \check{g}(k) = \hat{f}(k) \) and then use approximation arguments to show

\[ \int_{[-\pi,\pi]^d} f(x)h(x) \, dx = \int_{[-\pi,\pi]^d} g(x)h(x) \, dx \forall h \in C([-\pi,\pi]^d) \]

and then refer to Lemma 19.11
3. Conclude that \( f \in L^1([-\pi,\pi]^d) \cap L^\infty([-\pi,\pi]^d) \) and in particular \( f \in L^p([-\pi,\pi]^d) \) for all \( p \in [1,\infty] \).

**Exercise 30.20.** Suppose \( m \in \mathbb{N}_0 \), \( \alpha \) is a multi-index such that \( |\alpha| \leq 2m \) and \( f \in C_{\text{per}}^m(\mathbb{R}^d) \).

1. Using integration by parts, show (using Notation 19.21) that

\[ (ik)^m \hat{f}(k) = \langle \partial^\alpha f|_{\mathbb{R}^d} \rangle \text{ for all } k \in \mathbb{Z}^d. \]

**Note:** This equality implies

\[ \hat{f}(k) \leq \frac{1}{k^\alpha} \|\partial^\alpha f\|_H \leq \frac{1}{k^\alpha} \|\partial^\alpha f\|_\infty. \]

2. Now let \( \Delta f = \sum_{i=1}^d \partial_i^2 f/\partial x_i^2 \), Working as in part 1) show

\[ \langle (1 - \Delta)^m f|_{\mathbb{R}^d} \rangle = (1 + |k|^2)^m \hat{f}(k). \]

**Remark 30.21.** Suppose that \( m \) is an even integer, \( \alpha \) is a multi-index and \( f \in C_{\text{per}}^{m+|\alpha|}(\mathbb{R}^d) \), then

\[ \left( \sum_{k \in \mathbb{Z}^d} |k^\alpha| \left| \hat{f}(k) \right|^2 \right)^{\frac{1}{2}} = \left( \sum_{k \in \mathbb{Z}^d} |\langle \partial^\alpha f|_{\mathbb{R}^d} \rangle| (1 + |k|^2)^{m/2} (1 + |k|^2)^{-m/2} \right)^{\frac{1}{2}} \]

\[ \leq \sum_{k \in \mathbb{Z}^d} \left| \langle (1 - \Delta)^{m/2} \partial^\alpha f|_{\mathbb{R}^d} \rangle \right| (1 + |k|^2)^{-m/2} \]

\[ \leq \sum_{k \in \mathbb{Z}^d} \left| \langle (1 - \Delta)^{m/2} \partial^\alpha f|_{\mathbb{R}^d} \rangle \right|^2 \cdot \sum_{k \in \mathbb{Z}^d} (1 + |k|^2)^{-m} \]

\[ = C_m \left\| (1 - \Delta)^{m/2} \partial^\alpha f \right\|_H^2. \]

\[ ^2 \text{ We view } C_{\text{per}}(\mathbb{R}) \text{ as a subspace of } H = L^2([-\pi,\pi]) \text{ by identifying } f \in C_{\text{per}}(\mathbb{R}) \text{ with } f|_{[-\pi,\pi]} \in H. \]
where $C_m := \sum_{k \in \mathbb{Z}^d} (1 + |k|^2)^{-m} < \infty$ iff $m > d/2$. So the smoother $f$ is the faster $\tilde{f}$ decays at infinity. The next problem is the converse of this assertion and hence smoothness of $f$ corresponds to decay of $\tilde{f}$ at infinity and visa-versa.

**Exercise 30.21 (A Sobolev Imbedding Theorem).** Suppose $s \in \mathbb{R}$ and \{${c_k \in \mathbb{C} : k \in \mathbb{Z}^d}$\} are coefficients such that

$$\sum_{k \in \mathbb{Z}^d} |c_k|^2 (1 + |k|^2)^s < \infty.$$ Show if $s > \frac{d}{2} + m$, the function $f$ defined by

$$f(x) = \sum_{k \in \mathbb{Z}^d} c_k e^{ik\cdot x}$$

is in $C^m_{\text{per}}(\mathbb{R}^d)$. **Hint:** Work as in the above remark to show

$$\sum_{k \in \mathbb{Z}^d} |c_k| |k^\alpha| < \infty \text{ for all } |\alpha| \leq m.$$ 

**Exercise 30.22 (Poisson Summation Formula).** Let $F \in L^1(\mathbb{R}^d)$,

$$E := \left\{ x \in \mathbb{R}^d : \sum_{k \in \mathbb{Z}^d} |F(x + 2\pi k)| = \infty \right\}$$

and set

$$\hat{F}(k) := (2\pi)^{-d/2} \int_{\mathbb{R}^d} F(x) e^{-ik\cdot x} dx.$$ Further assume $\hat{F} \in l^1(\mathbb{Z}^d)$. 

1. Show $m(E) = 0$ and $E + 2\pi k = E$ for all $k \in \mathbb{Z}^d$. **Hint:** Compute $ \int_{[-\pi,\pi]^d} \sum_{k \in \mathbb{Z}^d} |F(x + 2\pi k)| \, dx$. 

2. Let

$$f(x) := \left\{ \begin{array}{ll} \sum_{k \in \mathbb{Z}^d} F(x + 2\pi k) \text{ for } x \notin E & \\
0 & \text{if } x \in E. \end{array} \right.$$ Show $f \in L^1([-\pi,\pi]^d)$ and $\hat{f}(k) = (2\pi)^{-d/2} \hat{F}(k)$. 

3. Using item 2) and the assumptions on $F$, show

$$f(x) = \sum_{k \in \mathbb{Z}^d} \hat{f}(k) e^{ik\cdot x} = \sum_{k \in \mathbb{Z}^d} (2\pi)^{-d/2} \hat{F}(k) e^{ik\cdot x} \text{ for } m - \text{a.e. } x,$$ i.e.

$$\sum_{k \in \mathbb{Z}^d} F(x + 2\pi k) = (2\pi)^{-d/2} \sum_{k \in \mathbb{Z}^d} \hat{F}(k) e^{ik\cdot x} \text{ for } m - \text{a.e. } x \quad (30.31)$$

and form this conclude that $f \in L^1([-\pi,\pi]^d) \cap L^\infty([-\pi,\pi]^d)$.

**Hint:** see the hint for item 2. of Exercise 30.19

4. Suppose we now assume that $F \in C(\mathbb{R}^d)$ and $F$ satisfies $|F(x)| \leq C(1 + |x|)^{-s}$ for some $s > d$ and $C < \infty$. Under these added assumptions on $F$, show Eq. (30.31) holds for all $x \in \mathbb{R}^d$ and in particular

$$\sum_{k \in \mathbb{Z}^d} F(2\pi k) = (2\pi)^{-d/2} \sum_{k \in \mathbb{Z}^d} \hat{F}(k).$$

For notational simplicity, in the remaining problems we will assume that $d = 1$.

**Exercise 30.23 (Heat Equation 1.).** Let $(t, x) \in [0, \infty) \times \mathbb{R} \to u(t, x)$ be a continuous function such that $u(t, \cdot) \in C_{\text{per}}(\mathbb{R})$ for all $t \geq 0$, $\dot{u} := u_x$, $u_{xx}$, and $u_{xxx}$ exists and are continuous when $t > 0$. Further assume that $u$ satisfies the heat equation $\dot{u} = \frac{1}{2} u_{xx}$. Let $\tilde{u}(t, k) := \langle u(t, \cdot) | e_k \rangle$ for $k \in \mathbb{Z}$. Show for $t > 0$ and $k \in \mathbb{Z}$ that $\tilde{u}(t, k)$ is differential in $t$ and $\frac{d}{dt} \tilde{u}(t, k) = -k^2 \tilde{u}(t, k)/2$. Use this result to show

$$u(t, x) = \sum_{k \in \mathbb{Z}} e^{-\frac{1}{4} t k^2} \hat{f}(k) e^{ikx} \quad (30.32)$$

where $f(x) := u(0, x)$, and as above

$$\dot{\hat{f}}(k) = \langle f | e_k \rangle = \int_{-\pi}^{\pi} f(y) e^{-iky} dy = \frac{1}{2\pi} \int_{-\pi}^{\pi} f(y) e^{-iky} dm(y).$$ Notice from Eq. (30.32) that $(t, x) \to u(t, x)$ is $C^\infty$ for $t > 0$.

**Exercise 30.24 (Heat Equation 2.).** Let $q_t(x) := \frac{1}{\sqrt{4\pi t}} \sum_{k \in \mathbb{Z}} e^{-\frac{1}{4} t k^2} e^{ikx}$. Show that Eq. (30.32) may be rewritten as

$$u(t, x) = \int_{-\pi}^{\pi} q_t(x - y) f(y) dy$$

and

$$q_t(x) = \sum_{k \in \mathbb{Z}} p_t(x + k2\pi)$$

where $p_t(x) := \frac{1}{\sqrt{4\pi t}} e^{-\frac{1}{4} \pi x^2}$. Also show $u(t, x)$ may be written as

$$u(t, x) = p_t * f(x) := \int_{\mathbb{R}^d} p_t(x - y) f(y) dy.$$
Hint: To show $q_t(x) = \sum_{k \in \mathbb{Z}} p_t(x + k2\pi)$, use the Poisson summation formula and the Gaussian integration identity,

$$
\hat{p}_t(\omega) = \frac{1}{\sqrt{2\pi}} \int_{\mathbb{R}} p_t(x) e^{i\omega x} dx = \frac{1}{\sqrt{2\pi}} e^{-\frac{\omega^2}{2}}.
$$  \hspace{1cm} (30.33)

Equation (30.33) will be discussed in Example 34.4 below.

Exercise 30.25 (Wave Equation). Let $u \in C^2(\mathbb{R} \times \mathbb{R})$ be such that $u(t, \cdot) \in C_{\text{per}}(\mathbb{R})$ for all $t \in \mathbb{R}$. Further assume that $u$ solves the wave equation, $u_{tt} = u_{xx}$. Let $f(x) := u(0, x)$ and $g(x) = u_t(0, x)$. Show $\hat{u}(t, k) := \langle u(t, \cdot), e_k \rangle$ for $k \in \mathbb{Z}$ is twice continuously differentiable in $t$ and $\frac{d^2}{dt^2} \hat{u}(t, k) = -k^2 \hat{u}(t, k)$. Use this result to show

$$
u(t, x) = \sum_{k \in \mathbb{Z}} \left( \hat{f}(k) \cos(kt) + \hat{g}(k) \frac{\sin(kt)}{k} \right) e^{ikx} \hspace{1cm} (30.34)
$$

with the sum converging absolutely. Also show that $u$ may be written as

$$
u(t, x) = \frac{1}{2} [f(x + t) + f(x - t)] + \frac{1}{2} \int_{-t}^{t} g(x + \tau) d\tau. \hspace{1cm} (30.35)
$$

Hint: To show Eq. (30.34) implies (30.35) use

$$
\cos kt = \frac{e^{ikt} + e^{-ikt}}{2},
\sin kt = \frac{e^{ikt} - e^{-ikt}}{2i}, \text{ and}
\frac{e^{ik(x+t)} - e^{ik(x-t)}}{ikt} = \int_{-t}^{t} e^{ik(x+\tau)} d\tau.
$$

30.8 Conditional Expectation Exercises

Exercise 30.26. Suppose $(\Omega, \mathcal{F}, P)$ is a probability space and $\mathcal{A} := \{A_i\}_{i=1}^{\infty} \subset \mathcal{F}$ is a partition of $\Omega$. (Recall this means $\Omega = \bigsqcup_{i=1}^{\infty} A_i$.) Let $\mathcal{G}$ be the $\sigma$-algebra generated by $\mathcal{A}$. Show:

1. $B \in \mathcal{G}$ if $B = \bigcup_{i \in A} A_i$ for some $A \subset \mathbb{N}$.
2. $g : \Omega \rightarrow \mathbb{R}$ is $\mathcal{G}$ measurable if $g = \sum_{i=1}^{\infty} \lambda_i 1_{A_i}$ for some $\lambda_i \in \mathbb{R}$.
3. For $f \in L^1(\Omega, \mathcal{F}, P)$, let $E[f|A_i] := E[1_{A_i} f]/P(A_i)$ if $P(A_i) \neq 0$ and $E[f|A_i] = 0$ otherwise. Show

$$
E_{Q} f = \sum_{i=1}^{\infty} E(f|A_i) 1_{A_i}.
$$
Three Fundamental Principles of Banach Spaces

31.1 The Hahn-Banach Theorem

Our goal here is to show that continuous dual, $X^*$, of a Banach space, $X$, is always large. This will be the content of the Hahn-Banach Theorem 31.4 below.

Proposition 31.1. Let $X$ be a complex vector space over $\mathbb{C}$ and let $X_\mathbb{R}$ denote $X$ thought of as a real vector space. If $f \in X^*$ and $u = Re f \in X_\mathbb{R}$ then

$$f(x) = u(x) - iu(ix). \tag{31.1}$$

Conversely if $u \in X_\mathbb{R}$ and $f$ is defined by Eq. (31.1), then $f \in X^*$ and $\|u\|_{X^*} = \|f\|_{X^*}$. More generally if $p$ is a semi-norm (see Definition 4.24) on $X$, then

$$|f| \leq p \iff u \leq p.$$

Proof. Let $v(x) = \text{Im} f(x)$, then

$$v(ix) = \text{Im} f(ix) = \text{Im}(if(x)) = Re f(x) = u(x).$$

Therefore

$$f(x) = u(x) + iv(x) = u(x) + iu(-ix) = u(x) - iu(ix).$$

Conversely for $u \in X_\mathbb{R}$ let $f(x) = u(x) - iu(ix)$. Then

$$f((a + ib)x) = u(ax + ibx) - iu(iax - bx) = au(x) + bu(ix) - i(au(ix) - bu(x))$$

while

$$(a + ib)f(x) = au(x) + bu(ix) + i(bu(x) - au(ix)).$$

So $f$ is complex linear. Because $\|u(x)\| = |Re f(x)| \leq |f(x)|$, it follows that $\|u\| \leq \|f\|$. For $x \in X$ choose $\lambda \in S^1 \subset \mathbb{C}$ such that $|f(x)| = \lambda f(x)$ so

$$|f(x)| = f(\lambda x) = u(\lambda x) \leq \|u\| \|\lambda x\| = \|u\| \|x\|.$$

Since $x \in X$ is arbitrary, this shows that $\|f\| \leq \|u\|$ so $\|f\| = \|u\|^1$. For the last assertion, it is clear that $|f| \leq p$ implies that $u \leq |u| \leq |f| \leq p$. Conversely if $u \leq p$ and $x \in X$, choose $\lambda \in S^1 \subset \mathbb{C}$ such that $|f(x)| = \lambda f(x)$. Then

$$|f(x)| = \lambda f(x) = f(\lambda x) = u(\lambda x) \leq \lambda p = p.$$

This holds for all $x \in X.$

Definition 31.2 (Minkowski functional). A function $p : X \to [0, \infty)$ is a Minkowski functional if

1. $p(x + y) \leq p(x) + p(y)$ for all $x, y \in X$ and
2. $p(cx) = cp(x)$ for all $c \geq 0$ and $x \in X$.

Example 31.3. Suppose that $X = \mathbb{R}$ and

$$p(x) = \inf \{\lambda \geq 0 : x \in \lambda[-1, 2] = [-\lambda, 2\lambda]\}.$$

Notice that if $x \geq 0$, then $p(x) = x/2$ and if $x \leq 0$ then $p(x) = -x$, i.e.

$$p(x) = \begin{cases} x/2 & \text{if } x \geq 0 \\ |x| & \text{if } x \leq 0. \end{cases}$$

From this formula it is clear that $p(cx) = cp(x)$ for all $c \geq 0$ but not for $c < 0$. Moreover, $p$ satisfies the triangle inequality, indeed if $p(x) = \lambda$ and $p(y) = \mu$, then $x \in \lambda[-1, 2]$ and $y \in \mu[-1, 2]$ so that

$$x + y \in \lambda[-1, 2] + \mu[-1, 2] \subset (\lambda + \mu)[-1, 2]$$

$$\|f\|^2 = \sup_{\|x\|=1} |f(x)|^2 = \sup_{\|x\|=1} (|u(x)|^2 + |u(\lambda x)|)^2.$$

Suppose that $M = \sup_{\|x\|=1} |u(x)|$ and this supremum is attained at $x_0 \in X$ with $\|x_0\| = 1$. Replacing $x_0$ by $-x_0$ if necessary, we may assume that $u(x_0) = M$. Since $u$ has a maximum at $x_0$,

$$0 = \left. \frac{d}{dt} \right|_0 u \left( \frac{x_0 + itx_0}{\|x_0 + itx_0\|} \right)$$

$$= \left. \frac{d}{dt} \right|_0 \left\{ \frac{1}{\|1 + it\|^2} (u(x_0) + tu(ix_0)) \right\} = u(ix_0)$$

since $\frac{d}{dt}|_{t=0}[1 + it] = \frac{d}{dt}|_{t=0} \sqrt{1 + t^2} = 0$. This explains why $\|f\| = \|u\|^1$. $\blacksquare$
which shows that \( p(x + y) \leq \lambda + \mu = p(x) + p(y) \). To check the last set inclusion let \( a, b \in [-1, 2] \), then
\[
\lambda a + \mu b = (\lambda + \mu) \left( \frac{\lambda}{\lambda + \mu} a + \frac{\mu}{\lambda + \mu} b \right) \in (\lambda + \mu) [-1, 2]
\]
since \([-1, 2]\) is a convex set and \( \frac{\lambda}{\lambda + \mu} + \frac{\mu}{\lambda + \mu} = 1 \).

**Theorem 31.4 (Hahn-Banach).** Let \( X \) be a real vector space, \( p : X \to [0, \infty) \) be a Minkowski functional, \( M \subset X \) be a subspace \( f : M \to \mathbb{R} \) be a linear functional such that \( f \leq p \) on \( M \). Then there exists a linear functional \( F : X \to \mathbb{R} \) such that \( F|_M = f \) and \( F \leq p \) on \( X \).

**Proof. Step 1.** We show for all \( x \in X \setminus M \) there exists and extension \( F \) to \( M \oplus \mathbb{R}x \) with the desired properties. If \( F \) exists and \( \alpha = F(x) \), then for all \( y \in M \) and \( \lambda \in \mathbb{R} \) we must have
\[
f(y) + \lambda \alpha = F(y + \lambda x) \leq p(y + \lambda x).
\]
Dividing this equation by \( |\lambda| \) allows us to conclude that Eq. (31.2) is valid for all \( y \in M \) and \( \lambda \in \mathbb{R} \) iff
\[
f(y) + \varepsilon \alpha \leq p(y + \varepsilon x) \quad \text{for all } y \in M \text{ and } \varepsilon \in \{\pm 1\}.
\]
Equivalently put we must have, for all \( y, z \in M \), that
\[
\alpha \leq p(y + x) - f(y) \quad \text{and} \quad f(z) - p(z - x) \leq \alpha.
\]
Hence it is possible to find an \( \alpha \in \mathbb{R} \) such that Eq. (31.2) holds iff
\[
f(z) - p(z - x) \leq p(y + x) - f(y) \quad \text{for all } y, z \in M.
\]
(If Eq. (31.3) holds, then \( \sup_{x \in M} |f(z) - p(z - x)| = \inf_{y \in M} p(y + x) - f(y) \) and so we may choose \( \alpha = \sup_{x \in M} |f(z) - p(z - x)| \) for example.) Now Equation (31.3) is equivalent to having
\[
f(z) + f(y) = f(z + y) \leq p(y + x) + p(z - x) \quad \text{for all } y, z \in M.
\]
and this last equation is valid because
\[
f(z) + f(y) = p(y + x + z - x) \leq p(y + x) + p(z - x),
\]
wherein we use \( f \leq p \) on \( M \) and the triangle inequality for \( p \). In conclusion, if \( \alpha := \sup_{x \in M} |f(z)| - p(z - x) \) and \( F(y + \lambda x) := f(y) + \lambda \alpha \), then by following the above logic backwards, we have \( F|_M = f \) and \( F \leq p \) on \( M \oplus \mathbb{R}x \) showing \( F \) is the desired extension.

**Step 2.** Let us now write \( F : X \to \mathbb{R} \) to mean \( F \) is defined on a linear subspace \( D(F) \subset X \) and \( F : D(F) \to \mathbb{R} \) is linear. For \( F, G : X \to \mathbb{R} \) we will say \( F \prec G \) if \( D(F) \subset D(G) \) and \( F = G|_{D(F)} \), that is \( G \) is an extension of \( F \). Let
\[
\mathcal{F} = \{ F : X \to \mathbb{R} : f \prec F \text{ and } F \leq p \text{ on } D(F) \}.
\]
Then \( (\mathcal{F}, \prec) \) is a partially ordered set. If \( \Phi \subset \mathcal{F} \) is a chain (i.e. a linearly ordered subset of \( \mathcal{F} \)) then \( \Phi \) has an upper bound \( G \in \mathcal{F} \) defined by \( D(G) = \bigcup_{F \in \Phi} D(F) \) and \( G(x) = F(x) \) for \( x \in D(F) \). Then it is easily checked that \( D(G) \) is a linear subspace, \( G \in \mathcal{F} \), and \( F \prec G \) for all \( F \in \Phi \). We may now apply Zorn’s Lemma\(^2\) (see Theorem ??) to conclude there exists a maximal element \( F \in \mathcal{F} \). Necessarily, \( D(F) = X \) for otherwise we could extend \( F \) by step (1), violating the maximality of \( F \). Thus \( F \) is the desired extension of \( f \).

**Corollary 31.5.** Suppose that \( X \) is a complex vector space, \( p : X \to [0, \infty) \) is a semi-norm, \( M \subset X \) is a linear subspace, and \( f : M \to \mathbb{C} \) is linear functional such that \( |f(x)| \leq p(x) \) for all \( x \in M \). Then there exists \( F \in X' \) (\( X' \) is the algebraic dual of \( X \)) such that \( F|_M = f \) and \( |F| \leq p \).

**Proof.** Let \( u = \text{Ref} \) then \( u \leq p \) on \( M \) and hence by Theorem 31.4 there exists \( U \in X'_\mathbb{R} \) such that \( U|_M = u \) and \( U \leq p \) on \( M \). Define \( F(x) = U(x) - iU(ix) \) then as in Proposition 31.1 \( F = f \) on \( M \) and \( |F| \leq p \).

**Theorem 31.6.** Let \( X \) be a normed space \( M \subset X \) be a closed subspace and \( x \in X \setminus M \). Then there exists \( f \in X^* \) such that \( |f| = 1 \), \( f(x) = \delta = d(x, M) \) and \( f = 0 \) on \( M \).

**Proof.** Define \( h : M \oplus \mathbb{C}x \to \mathbb{C} \) by \( h(m + \lambda x) := \lambda \delta \) for all \( m \in M \) and \( \lambda \in \mathbb{C} \). Then
\[
|h| := \sup_{m \in M \text{ and } \lambda \neq 0} \frac{|\lambda| \delta}{\|m + \lambda x\|} = \sup_{m \in M \text{ and } \lambda \neq 0} \frac{\delta}{\|m + \lambda x\|} = \delta = 1
\]
and by the Hahn–Banach theorem there exists \( f \in X^* \) such that \( f|_{M \oplus \mathbb{C}x} = h \) and \( |f| \leq 1 \). Since \( 1 = |h| \leq |f| \leq 1 \), it follows that \( |f| = 1 \).
Corollary 31.7. To each \( x \in X \), let \( \hat{x} \in X^{**} \) be defined by \( \hat{x}(f) = f(x) \) for all \( f \in X^* \). Then the map \( x \in X \to \hat{x} \in X^{**} \) is a linear isometry of Banach spaces.

Proof. Since
\[
||\hat{x}(f)|| = |f(x)| \leq ||f||_X \cdot ||x||_X \text{ for all } f \in X^*,
\]

it follows that \( ||\hat{x}||_{X^{**}} \leq ||x||_X \). Now applying Theorem 31.6 with \( M = \{0\} \), there exists \( f \in X^* \) such that \( ||f|| = 1 \) and \( \hat{x}(f) = f(x) = ||x||_X \), which shows that \( ||\hat{x}||_{X^{**}} \geq ||x||_X \). This shows that \( x \in X \to \hat{x} \in X^{**} \) is an isometry. Since isometries are necessarily injective, we are done.

Definition 31.8. A Banach space \( X \) is reflexive if the map \( x \in X \to \hat{x} \in X^{**} \) is surjective.

Example 31.9. Every Hilbert space \( H \) is reflexive. This is a consequence of the Riesz Theorem 16.15.

Exercise 31.1. Show all finite dimensional Banach spaces are reflexive.

Definition 31.10. For subsets, \( M \subset X \) and \( N \subset X^* \), let
\[
M^0 := \{ f \in X^* : f|_M = 0 \} \quad \text{and} \quad N^\perp := \{ x \in X : f(x) = 0 \text{ for all } f \in N \}.
\]

We call \( M^0 \) the annihilator of \( M \) and \( N^\perp \) the backwards annihilator of \( N \).

Lemma 31.11. Let \( M \subset X \) and \( N \subset X^* \), then
1. \( M^0 \) and \( N^\perp \) are always closed subspace of \( X^* \) and \( X \) respectively.
2. If \( N \) is a subspace of \( X \), then \( (M^0)^\perp = M \).
3. If \( N \) is a subspace, then \( \hat{N} \subset (N^\perp)^0 \) with equality if \( X \) is reflexive. Also see Exercise 31.2, Example 31.12, and Proposition 31.17 below.

Proof. Since
\[
M^0 = \cap_{x \in M} \text{Nul}(\hat{x})\quad \text{and} \quad N^\perp = \cap_{f \in M} \text{Nul}(f),
\]

\( M^0 \) and \( N^\perp \) are both formed as an intersection of closed subspaces and hence are themselves closed subspaces.

If \( x \in M \), then \( f(x) = 0 \) for all \( f \in M^0 \) so that \( x \in (M^0)^\perp \) and hence \( \hat{M} \subset (M^0)^\perp \). If \( x \notin \hat{M} \), then there exists (by Theorem 31.6) \( f \in X^* \) such that \( f|_M = 0 \) while \( f(x) \neq 0 \), i.e. \( f \in M^0 \) yet \( f(x) \neq 0 \). This shows \( x \notin (M^0)^\perp \) and we have shown \( (M^0)^\perp \subset \hat{M} \). The proof of Item 3. is left to the reader in Exercise 31.2.

Exercise 31.2. Prove Item 3. of Lemma 31.11. Also show that it is possible that \( \hat{N} \neq (N^\perp)^0 \). Hint: let \( X = Y^* \) where \( Y \) is a non-reflexive Banach space (see Theorem 14.16 and Theorem 31.14 below) and take \( N = \hat{Y} \subset Y^{**} = X^* \).

Example 31.12 (Another example where \( \hat{N} \neq (N^\perp)^0 \)). As in Exercise 27.2, let \( (X, \tau) \) be a compact Hausdorff space which supports a positive measure \( \nu \) on \( B = (\tau) \) such that \( \nu(X) \neq \sum_{x \in X} \nu(\{x\}) \), i.e. \( \nu \) is not a counting type measure. Recall that \( C(X)^* \) is isomorphic to the space of complex Radon measures on \( (X, B) \) and let \( \lambda \in C(X)^{**} \) be defined by
\[
\lambda(\mu) = \sum_{x \in X} \mu(\{x\}).
\]

Then take
\[
\hat{N} := \left\{ \mu \in C(X)^* : \lambda(\mu) = \sum_{x \in X} \mu(\{x\}) = 0 \right\}
\]

which is a closed subspace \( C(X)^* \). If \( o \in X \) is a fixed point we will have \( \mu_o := \delta_o - \delta_x \in \hat{N} \) for all \( x \in X \) and therefore if \( f \in N^\perp \) we must have \( 0 = \mu_o(f) = f(x) - f(o) \) for all \( x \in X \) which shows that \( f = c \) is constant. We also know that \( \mu = \nu - \sum_{x \in X} \nu(\{x\}) \delta_x \in N \) and therefore
\[
0 = \mu(f) = \mu(c) = c \left[ \nu(X) - \sum_{x \in X} \nu(\{x\}) \right]
\]

from which it follows that \( c = 0 \). Therefore we have shown \( N^\perp = \{0\} \) and therefore \( (N^\perp)^0 = C(X)^* \) which properly contains \( N \).

Proposition 31.13. Suppose \( X \) is a Banach space, then \( X^{***} = (\hat{X}^*) \oplus (\hat{X})^0 \) where
\[
(\hat{X})^0 = \left\{ \lambda \in X^{**} : \lambda(\hat{x}) = 0 \text{ for all } x \in X \right\}.
\]

In particular \( X \) is reflexive iff \( X^* \) is reflexive.

Proof. Let \( \psi \in X^{***} \) and define \( f_\psi \in X^* \) by \( f_\psi(x) := \psi(\hat{x}) \) for all \( x \in X \) and set \( \psi' := \psi - f_\psi \). For \( x \in X \) (so \( \hat{x} \in X^* \)) we have
\[
\psi'(\hat{x}) = \psi(\hat{x}) - f_\psi(\hat{x}) = f_\psi(x) - \hat{x}(f_\psi) = f_\psi(x) - f_\psi(x) = 0.
\]

This shows \( \psi' \in (\hat{X})^0 \) and we have shown \( X^{***} = (\hat{X}^*) \oplus (\hat{X})^0 \). If \( \psi \in \hat{X}^* \cap (\hat{X})^0 \), then \( \psi = f \) for some \( f \in X^* \) and \( 0 = \hat{x}(f) = \hat{x}(f) = f(x) \) for all \( x \in X \), i.e. \( f = 0 \) so \( \psi = 0 \). Therefore \( X^{***} = (\hat{X}^*) \oplus (\hat{X})^0 \) as claimed.
If $X$ is reflexive, then $\hat{X} = X^{**}$ and so $\hat{X}^0 = \{0\}$ showing $(X^*)^{**} = X^{***} = (\hat{X}^*)^{**}$, i.e., $X^*$ is reflexive. Conversely if $X^*$ is reflexive we conclude that $(\hat{X})^0 = \{0\}$ and therefore

$$X^{**} = \{0\} = (\hat{X}^0)^\perp = \hat{X},$$

which shows $\hat{X}$ is reflexive. Here we have used

$$\left(\hat{X}^0\right)^\perp = \hat{X} = \hat{X}$$

since $\hat{X}$ is a closed subspace of $X^{**}$.

\[\square\]

**Theorem 31.14 (Continuation of Theorem 14.16).** Let $X$ be an infinite set, $\mu : X \to (0, \infty)$ be a function, $p \in [1, \infty]$, $q := p/(p - 1)$ be the conjugate exponent and for $f \in \ell^q(\mu)$ define $\varphi_f : \ell^p(\mu) \to \mathbb{F}$ by

$$\varphi_f (g) := \sum_{x \in X} f(x) g(x) \mu(x). \tag{31.4}$$

1. $\ell^p(\mu)$ is reflexive for $p \in (1, \infty)$.
2. The map $\varphi : \ell^1(\mu) \to \ell^\infty(X)^*$ is not surjective.
3. $\ell^1(\mu)$ and $\ell^\infty(X)$ are not reflexive.

See Lemma 31.15 below and Exercise 27.3 above for more examples of non-reflexive spaces.

**Proof.**

1. This basically follows from two applications of item 3 of Theorem 14.16. More precisely if $\lambda \in \ell^p(\mu)^*$, let $\hat{\lambda} (g) = \lambda(\varphi_g)$ for $g \in \ell^q(\mu)$. Then by item 3, there exists $f \in \ell^p(\mu)$ such that, for all $g \in \ell^q(\mu)$,

$$\lambda(\varphi_g) = \hat{\lambda}(g) = \varphi_f (g) = \varphi_g (f) = \hat{f}(\varphi_g).$$

Since $\ell^p(\mu)^* = \{\varphi_g : g \in \ell^q(\mu)\}$, this implies that $\lambda = \hat{f}$ and so $\ell^p(\mu)$ is reflexive.

2. Recall $c_0(X)$ as defined in Notation 14.15 and is a closed subspace of $\ell^\infty(X)$, see Exercise 14.4. Let $1 \in \ell^\infty(X)$ denote the constant function 1 on $X$. Notice that $\|1 - f\|_\infty \geq 1$ for all $f \in c_0(X)$ and therefore, by the Hahn-Banach Theorem, there exists $\lambda \in \ell^\infty(X)^*$ such that $\lambda(1) = 0$ while $\lambda|_{c_0(X)} \equiv 0$. Now if $\lambda = \varphi_f$ for some $f \in \ell^1(\mu)$, then $\mu(x) f(x) = \lambda(\delta_x) = 0$ for all $x$ and $f$ would have to be zero. This is absurd.

3. As we have seen $\ell^1(\mu)^* \cong \ell^\infty(X)$ while $\ell^\infty(X)^* \cong c_0(X)^* \neq \ell^1(\mu)$. Let $\lambda \in \ell^\infty(X)^*$ be the linear functional as described above. We view this as an element of $\ell^1(\mu)^*$ by using

$$\hat{\lambda}(\varphi_g) := \lambda(g) \text{ for all } g \in \ell^\infty(X).$$

Suppose that $\hat{\lambda} = \hat{f}$ for some $f \in \ell^1(\mu)$, then

$$\lambda(g) = \hat{\lambda}(\varphi_g) = \hat{f}(\varphi_g) = \varphi_g(f) = \varphi_f(g).$$

But $\lambda$ was constructed in such a way that $\lambda \neq \varphi_f$ for any $f \in \ell^1(\mu)$. It now follows from Proposition 31.13 that $\ell^1(\mu)^* \cong \ell^\infty(X)$ is also not reflexive.

\[\square\]

**Exercise 31.3.** Suppose $p \in (1, \infty)$ and $\mu$ is a $\sigma$-finite measure on a measurable space $(X, \mathcal{M})$, then $L^p(X, \mathcal{M}, \mu)$ is reflexive. **Hint:** model your proof on the proof of item 1. of Theorem 31.14 making use of Theorem 22.14.

**Lemma 31.15.** Suppose that $(X, o)$ is a pointed Hausdorff topological space (i.e. $o \in X$ is a fixed point) and $\nu$ is a finite measure on $B_X$ such that

1. $\text{supp}(\nu) = X$ while $\nu(\{o\}) = 0$ and
2. there exists $f_n \in C(X)$ such that $f_n \to 1_{\{o\}}$ boundedly as $n \to \infty$.

(For example suppose $X = [0, 1]$, $o = 0$, and $\mu = m$.)

Then the map $g \in L^1(\nu) \to \varphi_g \in L^\infty(\nu)^*$ is not surjective and the Banach space $L^1(\nu)$ is not reflexive. (In other words, Theorem 22.14 may fail when $p = \infty$ and $L^1$-spaces need not be reflexive.)

**Proof.** Since $\text{supp}(\nu) = X$, if $f \in C(X)$ we have

$$\|f\|_{L^\infty(\nu)} = \sup \{|f(x)| : x \in X\}$$

and we may view $C(X)$ as a closed subspace of $L^\infty(\nu)$. For $f \in C(X)$, let $\lambda(f) = f(o)$. Then $|\lambda|_{C(X)^*} = 1$, and therefore by Corollary 31.5 of the Hahn-Banach Theorem, there exists an extension $A \in (L^\infty(\nu)^*)^*$ such that $\lambda = A|_{C(X)}$ and $\|A\| = 1$.

If $A = \varphi_g$ for some $g \in L^1(\nu)$ then we would have

$$f(o) = \lambda(f) = A(f) = \varphi_g(f) = \int_X fg \, d\nu \text{ for all } f \in C(X).$$

Applying this equality to the $\{f_n\}_{n=1}^\infty$ in item 2. of the statement of the lemma and then passing to the limit using the dominated convergence theorem, we arrive at the following contradiction;
1 = \lim_{n \to \infty} f_n(o) = \lim_{n \to \infty} \int_X f_n g d\nu = \int_X 1_{\{o\}} g d\nu = 0.

Hence we must conclude that \( A \neq \varphi_k \) for any \( g \in L^1(\nu) \).

Since, by Theorem 22.14, the map \( f \in L^\infty(\nu) \to \varphi_f \in L^1(\nu)^* \) is an isometric isomorphism of Banach spaces we may define \( L \in L^1(\nu)^* \) by

\[
L(\varphi_f) := A(f) \quad \text{for all } f \in L^\infty(\nu).
\]

If \( L \) were to equal \( \hat{g} \) for some \( g \in L^1(\nu) \), then

\[
L(f) = L(\varphi_f) = \hat{g}(\varphi_f) = \varphi_f(g) = \int_X fg d\nu
\]

for all \( f \in C(X) \subset L^\infty(\nu) \). But we have just seen this is impossible and therefore \( L \neq \hat{g} \) for any \( g \in L^1(\nu) \) and thus \( L^1(\nu) \) is not reflexive. \hfill \Box

31.1.1 Hahn–Banach Theorem Problems

Exercise 31.4. Give another proof Corollary 50.15 based on Remark 50.13. \textbf{Hint:} the Hahn Banach Theorem 31.4 (or Corollary 31.5) implies

\[
\|f(b) - f(a)\| = \sup_{\lambda \in X^*, \lambda \neq 0} \frac{|\lambda(f(b)) - \lambda(f(a))|}{\|\lambda\|}.
\]

Exercise 31.5. Prove Theorem 50.39 using the following strategy.

1. Use the results from the proof in the text of Theorem 50.39 that

\[
s \to \int_a^d f(s,t) dt \quad \text{and} \quad t \to \int_a^b f(s,t) ds
\]

are continuous maps.

2. For the moment take \( X = \mathbb{R} \) and prove Eq. (50.26) holds by first proving it holds when \( f(s,t) = s^n t^m \) with \( m,n \in \mathbb{N}_0 \). Then use this result along with Theorem 50.35 to show Eq. (50.26) holds for all \( f \in C([a,b] \times [c,d], \mathbb{R}) \).

3. For the general case, use the special case proved in item 2, along with Hahn Banach Theorem 31.4 (or Corollary 31.5).

Exercise 31.6 (Liouville’s Theorem). (This exercise requires knowledge of complex variables.) Let \( X \) be a Banach space and \( f : \mathbb{C} \to X \) be a function which is complex differentiable at all points \( z \in \mathbb{C} \), i.e. \( f'(z) := \lim_{h \to 0} (f(z + h) - f(z))/h \) exists for all \( z \in \mathbb{C} \). If we further suppose that

\[
M := \sup_{z \in \mathbb{C}} \|f'(z)\| < \infty,
\]

then \( f \) is constant. \textbf{Hint:} use the Hahn Banach Theorem 31.4 (or Corollary 31.5) and the fact the result holds if \( X = \mathbb{C} \).

Exercise 31.7. Let \( M \) be a finite dimensional subspace of a normed space, \( X \). Show there exists a closed subspace, \( N \), such that \( X = M \oplus N \). \textbf{Hint:} let \( \beta = \{x_1, \ldots, x_n\} \subset M \) be a basis for \( M \) and construct \( N \) making use of \( \lambda_i \in X^* \) which you should construct to satisfy

\[
\lambda_i(x_j) = \delta_{ij} = \begin{cases} 1 & \text{if } i = j \\ 0 & \text{if } i \neq j \end{cases}
\]

Exercise 31.9. Let \( X \) be a Banach space such that \( X^* \) is separable. Show \( X \) is separable as well. (The converse is not true as can be seen by taking \( X = \ell^1(\mathbb{N}) \).) \textbf{Hint:} use the greedy algorithm, i.e. suppose \( D \subset X^* \setminus \{0\} \) is a countable dense subset of \( X^* \), for \( \ell \in D \) choose \( x_{\ell} \in X \) such that \( \|x_{\ell}\| = 1 \) and \( |\ell(x_{\ell})| \geq \frac{1}{2} \|\ell\| \).

31.1.2 *Quotient spaces, adjoints, and more reflexivity

Definition 31.16. Let \( X \) and \( Y \) be Banach spaces and \( A : X \to Y \) be a linear operator. The transposes of \( A \) is the linear operator \( A^\dagger : Y^* \to X^* \) defined by \( (A^\dagger f)(x) = f(Ax) \) for \( f \in Y^* \) and \( x \in X \). The null space of \( A \) is the subspace \( \text{Nul}(A) := \{x \in X : Ax = 0\} \subset X \). For \( M \subset X \) and \( N \subset X^* \) let

\[
M^0 := \{f \in X^* : f|_M = 0\} \quad \text{and} \quad N^\perp := \{x \in X : f(x) = 0 \text{ for all } f \in N\}.
\]

Proposition 31.17 (Basic properties of transposes and annihilators).

1. \( \|A\| = \|A^\dagger\| \) and \( A^\dagger \hat{\lambda} = \hat{\lambda}x \) for all \( x \in X \).

2. \( M^0 \) and \( N^\perp \) are always closed subspaces of \( X^* \) and \( X \) respectively.

3. \( (M^0)^\perp = M \).

4. \( \hat{N} \subset (N^\perp)^0 \) with equality when \( X \) is reflexive. (See Exercise 31.12. Example 31.12 above which shows that \( \hat{N} \neq (N^\perp)^0 \) in general.)

5. \( \text{Nul}(A) = \text{Ran}(A^\dagger)^\perp \) and \( \text{Nul}(A^\dagger) = \text{Ran}(A)^0 \). Moreover, \( \text{Ran}(A) = \text{Nul}(A^\dagger)^\perp \) and if \( X \) is reflexive, then \( \text{Ran}(A^\dagger) = \text{Nul}(A)^0 \).\\n
6. \( X \) is reflexive iff \( X^* \) is reflexive. More generally \( X^{\ast\ast} = \hat{X} \oplus \hat{X}^0 \) where

\[
X^0 = \{\lambda \in X^{\ast\ast} : \lambda(\hat{x}) = 0 \text{ for all } x \in X\}.
\]

Proof.
1. 
\[\|A\| = \sup_{\|x\| = 1} \|Ax\| = \sup_{\|x\| = 1} \sup_{\|f\| = 1} |f(Ax)| = \sup_{\|f\| = 1} \sup_{\|x\| = 1} |A^f(x)| = \sup_{\|f\| = 1} \|A^f\| = \|A\|.\]

2. This is an easy consequence of the assumed continuity off all linear functionals involved.

3. If \(x \in M\), then \(f(x) = 0\) for all \(f \in M^0\) so that \(x \in (M^0)^\perp\). Therefore \(M \subset (M^0)^\perp\). If \(x \notin M\), then there exists \(f \in X^\ast\) such that \(f|_M = 0\) while \(f(x) \neq 0\), i.e., \(f \in M^0\) yet \(f(x) \neq 0\). This shows \(x \notin (M^0)^\perp\) and we have shown \((M^0)^\perp \subset M\).

4. It is again simple to show \(N \subset (N^\perp)^0\) and therefore \(N \subset (N^\perp)^0\). Moreover, as above if \(f \notin \hat{N}\) there exists \(\psi \in X^{**}\) such that \(\psi|_N = 0\) while \(\psi(f) \neq 0\).

5. \(Nul(A) = \{x \in X : Ax = 0\} = \{x \in X : f(Ax) = 0 \forall f \in X^\ast\} = \{x \in X : f|_M = 0 \forall f \in X^\ast\} = \text{Ran}(A)^\perp\). Similarly,

\[\text{Nul}(A^\dagger) = \{f \in Y^\ast : A^\dagger f = 0\} = \{f \in Y^\ast : (A^\dagger f)(x) = 0 \forall x \in X\} = \{f \in Y^\ast : f|_{\text{Ran}(A)} = 0\} = \text{Ran}(A^\dagger)^0\).

6. Let \(\psi \in X^{***}\) and define \(f_\psi \in X^\ast\) by \(f_\psi(x) = \psi(\hat{x})\) for all \(x \in X\) and set \(\psi' := \psi - f_\psi\). For \(x \in X\) (so \(\hat{x} \in X^{**}\)) we have

\[\psi'(\hat{x}) = \psi(\hat{x}) - f_\psi(\hat{x}) = f_\psi(x) - f_\psi(\hat{x}) = f_\psi(x) - f_\psi(x) = 0.\]

This shows \(\psi' \in \hat{X}^0\) and we have shown \(X^{***} = \hat{X}^0 + \hat{X}^0\). If \(\psi \in \hat{X}^0 \cap \hat{X}^0\), then \(\psi = \hat{f}\) for some \(f \in X^\ast\) and \(0 = \hat{f}(\hat{x}) = f(x)\) for all \(x \in X\), i.e., \(f = 0\) so \(\psi = 0\). Therefore \(X^{***} = \hat{X}^0 \oplus \hat{X}^0\) as claimed. If \(X\) is reflexive, then \(\hat{X} = X^{**}\) and so \(\hat{X}^0 = \{0\}\) showing \(X^{***} = \hat{X}^0\), i.e., \(X^\ast\) is reflexive. Conversely if \(X^\ast\) is reflexive we conclude that \(X^0 = \{0\}\) and therefore \(X^{**} = \{0\}^\perp = \hat{X}\), so that \(X\) is reflexive.

**Alternative proof.** Notice that \(f_\psi = J^\dagger \psi\), where \(J : X \to X^{**}\) is given by \(Jx = \hat{x}\), and the composition

\[f \in X^* \to \hat{f} \in X^{***} \to J^\dagger \hat{f} \in X^*\]

is the identity map since \((J^\dagger \hat{f})(x) = \hat{f}(Jx) = \hat{f}(\hat{x}) = \hat{x}(f) = f(x)\) for all \(x \in X\). Thus it follows that \(X^* \to X^{***}\) is invertible iff \(J^\dagger\) is its inverse which can happen iff \(\text{Nul}(J^\dagger) = \{0\}\). But as above \(\text{Nul}(J^\dagger) = \text{Ran}(J)^0\) which will be zero iff \(\text{Ran}(J) = X^{**}\) and since \(J\) is an isometry this is equivalent to saying \(\text{Ran}(J) = X^{**}\). So we have again shown \(X^*\) is reflexive if \(X\) is reflexive.

\[\blacksquare\]

**Theorem 31.18.** Let \(X\) be a Banach space, \(M \subset X\) be a proper closed subspace, \(X/M\) the quotient space, \(\pi : X \to X/M\) the projection map \(\pi(x) = x + M\) for \(x \in X\) and define the quotient norm on \(X/M\) by

\[\|\pi(x)\|_{X/M} = \|x + M\|_{X/M} = \inf_{m \in M} \|x + m\|_X.\]

Then:

1. \(\|\|_{X/M}\) is a norm on \(X/M\).
2. The projection map \(\pi : X \to X/M\) has norm 1, \(\|\pi\| = 1\).
3. \((X/M, \|\|_{X/M})\) is a Banach space.
4. If \(Y\) is another normed space and \(T : X \to Y\) is a bounded linear transformation such that \(M \subset \text{Nul}(T)\), then there exists a unique linear transformation \(S : X/M \to Y\) such that \(S \circ \pi = T\) and moreover \(\|T\| = \|S\|\).

**Proof.** 1) Clearly \(\|x + M\| \geq 0\) and if \(\|x + M\| = 0\), then there exists \(m_n \in M\) such that \(\|x + m_n\| \to 0\) as \(n \to \infty\), i.e, \(x = \lim_{n \to \infty} m_n \in M\). Since \(x \in X, x + M = 0 \in X/M\). If \(c \in C\setminus \{0\}, x \in X\), then

\[\|cx + M\| = \inf_{m \in M} \|cx + m\| = |c| \inf_{m \in M} \|x + m/c\| = |c| \|x + M\|,\]

because \(m/c\) runs through \(M\) as \(m\) runs through \(M\). Let \(x_1, x_2 \in X\) and \(m_1, m_2 \in M\) then

\[\|x_1 + x_2 + M\| \leq \|x_1 + x_2 + m_1 + m_2\| \leq \|x_1 + m_1\| + \|x_2 + m_2\|.\]

Taking infimums over \(m_1, m_2 \in M\) then implies

\[\|x_1 + x_2 + M\| \leq \|x_1 + M\| + \|x_2 + M\|.\]
and we have completed the proof that the \((X/M, \| \cdot \|)\) is a normed space. 2) Since 

\[ ||\pi(x)|| = \inf_{m \in M} ||x + m|| \leq ||x|| \text{ for all } x \in X, \quad ||\pi|| \leq 1. \]

To see \(||\pi|| = 1\), let \(x \in X \setminus M\) so that \(\pi(x) \neq 0\). Given \(\alpha \in (0, 1)\), there exists \(m \in M\) such that 

\[ ||x + m|| \leq \alpha^{-1} ||\pi(x)||. \]

Therefore, 

\[ \frac{||\pi(x + m)||}{||x + m||} = \frac{||\pi(x)||}{||x + m||} \geq \frac{\alpha}{||x + m||} = \alpha \]

which shows \(||\pi|| \geq \alpha\). Since \(\alpha \in (0, 1)\) is arbitrary we conclude that \(||\pi(x)|| = 1\).

3) Let \(\pi(x_n) \in X/M\) be a sequence such that \(\sum ||\pi(x_n)|| < \infty\). As above there exists \(m_n \in M\) such that \(||\pi(x_n)|| \geq \frac{1}{2} ||x_n + m_n||\) and hence \(\sum ||x_n + m_n|| \leq 2 \sum ||\pi(x_n)|| < \infty\). Since \(X\) is complete, 

\[ x := \sum_{n=1}^{\infty} (x_n + m_n) \text{ exists in } X \]

and therefore by the continuity of \(\pi\), 

\[ \pi(x) = \sum_{n=1}^{\infty} \pi(x_n + m_n) = \sum_{n=1}^{\infty} \pi(x_n) \]

showing \(X/M\) is complete. 4) The existence of \(S\) is guaranteed by the “factor theorem” from linear algebra. Moreover \(||S|| = ||T||\) because 

\[ ||T|| = ||S \circ \pi|| \leq ||S|| ||\pi|| = ||S|| \]

and 

\[ ||S|| = \sup_{x \in X} \frac{||S(x)||}{||\pi(x)||} = \sup_{x \in X} \frac{||Tx||}{||\pi(x)||} \]

\[ \geq \sup_{x \notin M} \frac{||Tx||}{||x||} = \sup_{x \neq 0} \frac{||Tx||}{||x||} = ||T||. \]

\[ \blacksquare \]

Theorem 31.19. Let \(X\) be a Banach space. Then

1. Identifying \(X\) with \(\hat{X} \subset X^{**}\), the weak \(-\) star topology on \(X^{**}\) induces the weak topology on \(X\). More explicitly, the map \(x \in X \rightarrow \hat{x} \in \hat{X}\) is a homeomorphism when \(X\) is equipped with its weak topology and \(\hat{X}\) with the relative topology coming from the weak* topology on \(X^{**}\).

2. \(\hat{X} \subset X^{**}\) is dense in the weak* topology on \(X^{**}\).

3. Letting \(C\) and \(C^{**}\) be the closed unit balls in \(X\) and \(X^{**}\) respectively, then \(\hat{C} := \{\hat{x} \in C^{**} : x \in C\}\) is dense in \(C^{**}\) in the weak* topology on \(X^{**}\).

4. \(X\) is reflexive iff \(C\) is weakly compact.

(See Definition \[24.18\] for the topologies being used here.)

**Proof.**

1. The weak \(-\) * topology on \(X^{**}\) is generated by 

\[ \{ \hat{f} : f \in X^{*}\} = \{ \psi \in X^{**} \rightarrow \psi(f) : f \in X^{*}\}. \]

So the induced topology on \(X\) is generated by 

\[ \{ x \in X \rightarrow \hat{x} \in X^{**} \rightarrow \hat{x}(f) = f(x) : f \in X^{*}\} = X^{*} \]

and so the induced topology on \(X\) is precisely the weak topology.

2. A basic weak \(-\) star neighborhood of a point \(\lambda \in X^{**}\) is of the form 

\[ \mathcal{N} := \cap_{k=1}^{n} \{ x \in X^{**} : |\psi(f_k) - \lambda(f_k)| < \varepsilon \} \]

for some \(\{f_k\}_{k=1}^{n} \subset X^{*}\) and \(\varepsilon > 0\). be given. We must now find \(x \in X\) such that 

\[ \hat{x}(f_k) - \lambda(f_k) = |f_k(x) - \lambda(f_k)| < \varepsilon \quad \text{for } k = 1, 2, \ldots, n. \]

In fact we will show there exists \(x \in X\) such that \(\lambda(f_k) = f_k(x)\) for \(k = 1, 2, \ldots, n\). To prove this stronger assertion we may, by discarding some of the \(f_k's\) if necessary, assume that \(\{f_k\}_{k=1}^{n} \subset X^{*}\) and \(\varepsilon > 0\). be given. We must now find \(x \in X\) such that 

\[ (f_1(x), \ldots, f_n(x)) = Tx = (\lambda(f_1), \ldots, \lambda(f_n)) \]

as desired.

3. Let \(\lambda \in C^{**} \subset X^{**}\) and \(\mathcal{N}\) be the weak - star neighborhood of \(\lambda\) as in Eq. \[31.5\]. Working as before, given \(\varepsilon > 0\), we need to find \(x \in C\) such that Eq. \[31.6\] holds. It will be left to the reader to verify that it suffices again to assume \(\{f_k\}_{k=1}^{n}\) is a linearly independent set. (Hint: Suppose that \(\{f_1, \ldots, f_m\}\) were a maximal linearly independent subset of \(\{f_k\}_{k=1}^{n}\), then each \(f_k\) with \(m < n\) may be written as a linear combination \(\{f_1, \ldots, f_m\}\). As in the proof of item 2., there exists \(x \in X\) such that Eq. \[31.7\] holds. The problem is that \(x\) may not be in \(C\). To remedy this, let 

\[ N := \cap_{k=1}^{n} \text{Nul}(f_k) = \text{Nul}(T), \]

\(\pi : X \rightarrow X/N \cong C^n\) be the projection map and 

\[ f_k \in (X/N)^* \]

be chosen so that 

\(f_k = \hat{f_k} \circ \pi\) for \(k = 1, 2, \ldots, n\). Then we have produced \(x \in X\) such that 

\[ (\lambda(f_1), \ldots, \lambda(f_n)) = (f_1(x), \ldots, f_n(x)) = (\hat{f_1}(\pi(x)), \ldots, \hat{f_n}(\pi(x))). \]

Since \(\{\hat{f}_1, \ldots, \hat{f}_n\}\) is a basis for \((X/N)^*\) we find
360  31 Three Fundamental Principles of Banach Spaces

\[ \|\pi(x)\| = \sup_{\alpha \in \mathbb{C} \setminus \{0\}} \left| \sum_{i=1}^{n} \alpha_i f_i(\pi(x)) \right| = \sup_{\alpha \in \mathbb{C} \setminus \{0\}} \left| \sum_{i=1}^{n} \alpha_i \lambda_i f_i(y) \right| \]

\[ = \sup_{\alpha \in \mathbb{C} \setminus \{0\}} \left| \sum_{i=1}^{n} \alpha_i f_i(y) \right| \cdot \|\lambda\| \sup_{\alpha \in \mathbb{C} \setminus \{0\}} \left| \sum_{i=1}^{n} \alpha_i f_i(y) \right| \]

\[ \leq 1. \]

Hence we have shown \( \|\pi(x)\| \leq 1 \) and therefore for any \( \alpha > 1 \) there exists \( y = x + n \in X \) such that \( \|y\| < \alpha \) and \( (\lambda(f_1), \ldots, \lambda(f_n)) = (f_1(y), \ldots, f_n(y)) \).

\[ |\lambda(f_i) - f_i(y/\alpha)| \leq |f_i(y) - \alpha^{-1} f_i(y)| \leq (1 - \alpha^{-1}) |f_i(y)| \]

which can be arbitrarily small (i.e. less than \( \varepsilon \)) by choosing \( \alpha \) sufficiently close to 1.

4. Let \( \hat{C} := \{ \hat{x} : x \in C \} \subset C^{**} \subset X^{**} \). If \( X \) is reflexive, \( \hat{C} = C^{**} \) is weak\( - \ast \) compact and hence by item 1, \( C \) is weak\( - \ast \) compact in \( X \). Conversely if \( C \) is weak\( - \ast \) compact, then \( \hat{C} \subset C^{**} \) is weak\( - \ast \) compact being the continuous image of a compact map. Since the weak\( - \ast \) topology on \( X^{**} \) is Hausdorff, it follows that \( \hat{C} \) is weak\( - \ast \) closed and so by item 3, \( C^{**} = \hat{C} \) is weak\( - \ast \) compact. Hence \( \lambda \in X^{**} \), \( \lambda/\|\lambda\| \in C^{**} \), i.e. there exists \( x \in C \) such that \( \hat{x} = \lambda/\|\lambda\| \).

This shows \( \lambda = (\|\lambda\| x) \) and therefore \( \hat{X} = X^{**} \).

### 31.2 The Open Mapping Theorem

**Theorem 31.20 (Open Mapping Theorem).** Let \( X, Y \) be Banach spaces, \( T \in L(X,Y) \). If \( T \) is surjective then \( T \) is an open mapping, i.e. \( T(V) \) is open in \( Y \) for all open subsets \( V \subset X \).

**Proof.** For all \( \alpha > 0 \) let \( B_\alpha^X = \{ x \in X : \|x\|_X < \alpha \} \subset X \), \( B_\alpha^Y = \{ y \in Y : \|y\|_Y < \alpha \} \subset Y \) and \( E_\alpha = T(B_\alpha^X) \subset Y \). The proof will be carried out by proving the following three assertions.

1. There exists \( \delta > 0 \) such that \( B_{\alpha/\delta}^Y \subset E_\alpha \) for all \( \alpha > 0 \).
2. For the same \( \delta > 0 \), \( B_{\alpha/\delta}^Y \subset E_\alpha \), i.e. we may remove the closure in assertion 1.
3. The last assertion implies \( T \) is an open mapping.

1. Since \( Y = \bigcup_{n=1}^{\infty} E_n \), the Baire category theorem 26.2 implies there exists \( n \) such that \( E_n \neq \emptyset \), i.e. there exists \( y \in E_n \) and \( \varepsilon > 0 \) such that \( B^Y(y,\varepsilon) \subset E_n \).

Suppose \( \|y\| < \varepsilon \) then \( y \) and \( y + y' \) are in \( B^Y(y,\varepsilon) \subset E_n \) hence there exists \( \hat{x}, x \in B^X_n \) such that \( \|T\hat{x} - (y + y')\| \leq \varepsilon \) and \( \|Tx - y\| \) may be made small as we please, which we abbreviate as follows

\[ \|T\hat{x} - (y + y')\| \approx 0 \quad \text{and} \quad \|Tx - y\| \approx 0. \]

Hence by the triangle inequality,

\[ \|T(\hat{x} - x)\| = \|T\hat{x} - (y + y') - (Tx - y)\| \leq \|\hat{x} - y\| + \|x - y\| \approx 0 \]

with \( \hat{x} - x \in B^X_n \). This shows that \( y' \in E_n \) which implies \( B^Y(0,\varepsilon) \subset E_n \).

Since the map \( \varphi_\alpha : Y \to Y \) given by \( \varphi_\alpha(y) = \frac{\alpha}{\varepsilon} y \) is a homeomorphism, \( \varphi_\alpha(E_\alpha) = E_\alpha \) and \( \varphi_\alpha(B_\alpha^Y(0,\varepsilon)) = B^Y(0,\frac{\alpha}{\varepsilon}) \), it follows that \( B_{\alpha/\delta}^Y \subset E_\alpha \) where \( \delta := \frac{\alpha}{\varepsilon} > 0 \).

2. Let \( \delta \) be as in assertion 1., \( y \in B_{\alpha/\delta}^Y \) and \( \alpha_1 \in (\|y\|/\delta,1) \). Choose \( \{\alpha_n\}_{n=2}^{\infty} \subset (0,\infty) \) such that \( \sum_{n=1}^{\infty} \alpha_n < 1 \). Since \( y \in B_{\alpha_1}^Y \subset E_{\alpha_1} = T(B_{\alpha_1}^X) \) by assertion 1. there exists \( x_1 \in B_{\alpha_1}^X \) such that \( \|y - Tx_1\| < \alpha_2 \delta \). (Notice that \( \|y - Tx_1\| \) can be made as small as we please.) Similarly, since \( y - Tx_1 \in B_{\alpha_2/\delta}^Y \subset E_{\alpha_2} = T(B_{\alpha_2}^X) \) there exists \( x_2 \in B_{\alpha_2}^X \) such that \( \|y - Tx_1 - Tx_2\| < \alpha_3 \delta \). Continuing this way inductively, there exists \( x_n \in B_{\alpha_n}^X \) such that

\[ \|y - \sum_{k=1}^{n} Tx_k\| < \alpha_{n+1} \delta \quad \text{for all} \quad n \in \mathbb{N}. \]

Since \( \sum_{n=1}^{\infty} \alpha_n < 1, x := \sum_{n=1}^{\infty} x_n \) exists and \( \|x\| < 1 \), i.e. \( x \in B^X_1 \).

Passing to the limit in Eq. (31.8) shows, \( \|y - Tx\| = 0 \) and hence \( y \in T(B^X_1) = E_1 \). Therefore we have shown \( B_{\alpha}^Y \subset E_1 \). The same scaling argument as above then shows \( B_{\alpha/\delta}^Y \subset E_{\alpha/\delta} \) for all \( \alpha > 0 \).

3. If \( x \in V \subset_\alpha X \) and \( y = Tx \in TV \) we must show that \( TV \) contains a ball \( B^Y(y,\varepsilon) = Tx + B^Y_\varepsilon \) for some \( \varepsilon > 0 \). Now \( B^Y(y,\varepsilon) = Tx + B^Y_\varepsilon \subset TV \) iff \( B^Y_\varepsilon \subset TV - Tx = T(V - x) \). Since \( V - x \) is a neighborhood of 0 in \( X \), there exists \( \alpha > 0 \) such that \( B_{\alpha/\delta}^X \subset (V - x) \) and hence by assertion 2.,

\[ B_{\alpha/\delta}^Y \subset TB_{\alpha/\delta}^X \subset T(V - x) = T(V) - y \]

and therefore \( B^Y(y,\varepsilon) \subset TV \) with \( \varepsilon := \alpha \delta \).

**Corollary 31.21.** If \( X, Y \) are Banach spaces and \( T \in L(X,Y) \) is invertible (i.e. a bijective linear transformation) then the inverse map, \( T^{-1} \), is bounded, i.e. \( T^{-1} \in L(Y,X) \). (Note that \( T^{-1} \) is automatically linear.)
Definition 31.22. Let $X$ and $Y$ be normed spaces and $T : X \to Y$ be linear (not necessarily continuous) map.

1. Let $\Gamma : X \to X \times Y$ be the linear map defined by $\Gamma(x) := (x, T(x))$ for all $x \in X$ and let

$$\Gamma(T) = \{(x, T(x)) : x \in X\}$$

be the graph of $T$.

2. The operator $T$ is said to be closed if $\Gamma(T)$ is closed subset of $X \times Y$.

Exercise 31.11. Let $T : X \to Y$ be a linear map between normed vector spaces, show $T$ is closed iff for all convergent sequences \( \{x_n\}_{n=1}^{\infty} \subseteq X \) such that \( \{T(x_n)\}_{n=1}^{\infty} \subseteq Y \) is also convergent, we have $\lim_{n \to \infty} T(x_n) = T(\lim_{n \to \infty} x_n)$.

(Compare this with the statement that $T$ is continuous iff for every convergent sequences \( \{x_n\}_{n=1}^{\infty} \subseteq X \) we have \( \{T(x_n)\}_{n=1}^{\infty} \subseteq Y \) is necessarily convergent and $\lim_{n \to \infty} T(x_n) = T(\lim_{n \to \infty} x_n)$.)

Theorem 31.23 (Closed Graph Theorem). Let $X$ and $Y$ be Banach spaces and $T : X \to Y$ be linear map. Then $T$ is continuous iff $T$ is closed.

Proof. If $T$ is continuous and $(x_n, Tx_n) \to (x, y)$ in $X \times Y$ as $n \to \infty$ then $Tx_n \to Ty$ which implies $(x, y) \in \Gamma(T)$. Conversely suppose $T$ is closed, i.e. $\Gamma(T)$ is a closed subset of $X \times Y$ and therefore is a Banach space in its own right. The map $\pi_2 : X \times Y \to Y$ is continuous and $\pi_1|\Gamma(T) : \Gamma(T) \to X$ is continuous bijection which implies $\pi_1|\Gamma(T)^{-1}$ is bounded.

As an application we have the following proposition.

Proposition 31.24. Let $H$ be a Hilbert space. Suppose that $T : H \to H$ is a linear (not necessarily bounded) map such that there exists $T^* : H \to H$ such that

$$\langle Tx, y \rangle = \langle x, T^*y \rangle \forall x, y \in H.$$  

Then $T$ is bounded.

Proof. It suffices to show $T$ is closed. To prove this suppose that $x_n \in H$ such that $(x_n, Tx_n) \to (x, y) \in H \times H$. Then for any $z \in H$, $\langle Tx_n|z \rangle = \langle x_n|T^*z \rangle \to \langle x|T^*z \rangle = \langle Tx|z \rangle$ as $n \to \infty$.

On the other hand $\lim_{n \to \infty} \langle Tx_n|z \rangle = \langle y|z \rangle$ as well and therefore $\langle Tx|z \rangle = \langle y|z \rangle$ for all $z \in H$. This shows that $Tx = y$ and proves that $T$ is closed.

Here is another example.

Example 31.25. Suppose that $M \subseteq L^2([0,1], m)$ is a closed subspace such that each element of $M$ has a representative in $C([0,1])$. We will abuse notation and simply write $M \subseteq C([0,1])$. Then

1. There exists $A \in (0, \infty)$ such that $\|f\|_\infty \leq A\|f\|_{L^2}$ for all $f \in M$.
2. For all $x \in [0,1]$ there exists $g_x \in M$ such that $f(x) = \langle f|g_x \rangle := \int_0^1 f(y) g_x(y) \, dy$ for all $f \in M$.

Moreover we have $\|g_x\| \leq A$.

3. The subspace $M$ is finite dimensional and $\dim(M) \leq A^2$.

Proof. 1) I will give a two proofs of part 1. Each proof requires that we first show that $\|\cdot\|_\infty$ is a complete space. To prove this it suffices to show $M$ is a closed subspace of $C([0,1])$. So let $\{f_n\} \subseteq M$ and $f \in C([0,1])$ such that $\|f_n - f\|_\infty \to 0$ as $n \to \infty$. Then $\|f_n - f_m\|_{L^2} \leq \|f_n - f\|_\infty \to 0$ as $m, n \to \infty$, and since $M$ is closed in $L^2([0,1])$, $L^2 - \lim_{n \to \infty} f_n = g \in M$. By passing to a subsequence if necessary we know that $g(x) = \lim_{n \to \infty} f_n(x) = f(x)$ for $m - a.e. x$. So $f = g \in M$.

i) Let $i : (M, \|\cdot\|_\infty) \to (M, \|\cdot\|_2)$ be the identity map. Then $i$ is bounded and bijective. By the open mapping theorem, $j = i^{-1}$ is bounded as well. Hence there exists $A < \infty$ such that $\|f\|_\infty = \|j(f)\|_2 \leq A\|f\|_2$ for all $f \in M$.

ii) Let $j : (M, \|\cdot\|_2) \to (M, \|\cdot\|_\infty)$ be the identity map. We will show that $j$ is a closed operator and hence bounded by the closed graph Theorem 31.23. Suppose that $f_n \in M$ such that $f_n \to f$ in $L^2$ and $f_n = j(f_n) \to g$ in $C([0,1])$. Then as in the first paragraph, we conclude that $g = f = j(f)$ a.e. showing $j$ is closed. Now finish as in last line of proof i).

2) For $x \in [0,1]$, let \( e_x : M \to \mathbb{C} \) be the evaluation map $e_x(f) = f(x)$. Then

$$|e_x(f)| \leq |f(x)| \leq \|f\|_\infty \leq A\|f\|_{L^2}$$

which shows that $e_x \in M^*$. Hence there exists a unique element $g_x \in M$ such that

$$f(x) = e_x(f) = \langle f, g_x \rangle$$

Moreover $\|g_x\|_{L^2} = \|e_x\|_{M^*} \leq A$.

3) Let $\{f_j\}_{j=1}^\infty$ be an $L^2$ - orthonormal subset of $M$. Then
A^2 \geq \|e_x\|^2_{M^*} = \|g_x\|^2_{L^2} \geq \sum_{j=1}^n |\langle f_j, g_x \rangle|^2 = \sum_{j=1}^n |f_j(x)|^2

and integrating this equation over x \in [0,1] implies that

A^2 \geq \sum_{j=1}^n \int_0^1 |f_j(x)|^2 \, dx = \sum_{j=1}^n 1 = n

which shows that n \leq A^2. Hence \dim(M) \leq A^2.

\[ \text{Remark 31.26. Keeping the notation in Example 31.25, } G(x,y) = g_x(y) \text{ for all } x, y \in [0,1]. \]

Then

\[ f(x) = e_x(f) = \int_0^1 f(y)G(x,y)dy \text{ for all } f \in M. \]

The function G is called the reproducing kernel for M.

The above example generalizes as follows.

\[ \text{Proposition 31.27. Suppose that } (X, M, \mu) \text{ is a finite measure space, } p \in [1,\infty) \text{ and } W \text{ is a closed subspace of } L^p(\mu) \text{ such that } W \subseteq L^p(\mu) \cap L^\infty(\mu). \]

Then \dim(W) < \infty. (BRUCE: Check this carefully.)

\[ \text{Proof. With out loss of generality we may assume that } \mu(X) = 1. \text{ As in Example 31.25 we show that } W \text{ is a closed subspace of } L^\infty(\mu) \text{ and hence by the open mapping theorem, there exists a constant } A < \infty \text{ such that } \|f\|_\infty \leq A\|f\|_p \text{ for all } f \in W. \text{ Now if } 1 \leq p \leq 2, \text{ then } \]

\[ \|f\|_\infty \leq A\|f\|_p \leq A\|f\|_2 \]

and if \( p \in (2,\infty), \) then \( \|f\|_p \leq \|f\|_2 \|f\|^{p-2}_{\infty} \) or equivalently,

\[ \|f\|_p \leq \|f\|_2^{2/p} \|f\|^{1-2/p}_{\infty} \leq \|f\|_2^{2/p} \left( A\|f\|_p \right)^{1-2/p} \]

from which we learn that \( \|f\|_p \leq A^{1-2/p}\|f\|_2 \) and therefore that \( \|f\|_\infty \leq AA^{1-2/p}\|f\|_2 \) so that in any case there exists a constant B < \infty such that \( \|f\|_\infty \leq B\|f\|_2 \). Let \( \{f_n\}_{n=1}^N \) be an orthonormal subset of W and \( f = \sum_{n=1}^N c_n f_n \) with \( c_n \in \mathbb{C}, \) then

\[ \left\| \sum_{n=1}^N c_n f_n \right\|_\infty^2 \leq B^2 \sum_{n=1}^N |c_n|^2 \leq B^2 |c|^2 \]

where \( |c|^2 := \sum_{n=1}^N |c_n|^2 \). For each \( c \in \mathbb{C}^N, \) there is an exception set \( E_c \) such that for \( x \notin E_c, \)

\[ \left\| \sum_{n=1}^N c_n f_n(x) \right\|^2 \leq B^2 |c|^2. \]

Let \( D := (\mathbb{Q} + i\mathbb{Q})^N \) and \( E = \cap_{c \in D} E_c. \) Then \( \mu(E) = 0 \) and for \( x \notin E, \)

\[ \left\| \sum_{n=1}^N c_n f_n(x) \right\|^2 \leq B^2 |c|^2 \text{ for all } c \in \mathbb{C}^N. \]

Taking \( c_n = f_n(x) \) in this inequality implies that

\[ \left\| \sum_{n=1}^N f_n(x) \right\|^2 \leq B^2 \sum_{n=1}^N |f_n(x)|^2 \text{ for all } x \notin E \]

and therefore that

\[ \sum_{n=1}^N |f_n(x)|^2 \leq B^2 \text{ for all } x \notin E. \]

Integrating this equation over x then implies that \( N \leq B^2, \) i.e. \( \dim(W) \leq B^2. \)

\[ \square \]

31.3 Uniform Boundedness Principle

\[ \text{Theorem 31.28 (Uniform Boundedness Principle). Let } X \text{ and } Y \text{ be normed vector spaces, } A \subseteq L(X,Y) \text{ be a collection of bounded linear operators from } X \text{ to } Y, \]

\[ F = F_A = \{ x \in X : \sup_{A \in A} \|Ax\| < \infty \} \text{ and } R = R_A = F_c = \{ x \in X : \sup_{A \in A} \|Ax\| = \infty \}. \]

(31.9)

1. If \( \sup_{A \in A} \|A\| < \infty \) then \( F = X. \)
2. If \( F \) is not meager, then \( \sup_{A \in A} \|A\| < \infty. \)
3. If \( X \) is a Banach space, \( F \) is not meager iff \( \sup_{A \in A} \|A\| < \infty. \) In particular,

\[ \text{if } \sup_{A \in A} \|Ax\| < \infty \text{ for all } x \in X \text{ then } \sup_{A \in A} \|A\| < \infty. \]
If $X \subseteq L^p(M)$ where $M \subseteq \mathbb{R}$ is a subinterval, then $\dim(X) < \infty$. 

Fig. 31.1. Is this relevant at all.

4. If $X$ is a Banach space, then $\sup_{A \in A} \|Ax\| = \infty$ if and only if $R$ is residual. In particular, if $\sup_{A \in A} \|Ax\| = \infty$ then $\sup_{A \in A} \|Ax\| = M \|x\| < \infty$ for all $x \in X$ showing $F = X$.

Proof. 1. If $M := \sup_{A \in A} \|Ax\| < \infty$, then $\sup_{A \in A} \|Ax\| \leq M \|x\| < \infty$ for all $x \in X$ showing $F = X$.

2. For each $n \in N$, let $E_n \subseteq X$ be the closed sets given by

$$E_n = \{x : \sup_{A \in A} \|Ax\| \leq n\} = \bigcup_{A \in A} \{x : \|Ax\| \leq n\}.$$ 

Then $F = \bigcup_{n=1}^\infty E_n$ which is assumed to be non-meager and hence there exists an $n \in N$ such that $E_n$ has non-empty interior. Let $B_2(\delta)$ be a ball such that $B_2(\delta) \subseteq E_n$. Then for $y \in X$ with $\|y\| = \delta$ we know $x - y \in B_2(\delta) \subseteq E_n$, so $Ay = Ax - A(x - y)$ and hence for any $A \in A$,

$$\|Ay\| \leq \|Ax\| + \|A(x - y)\| \leq n + n = 2n.$$ 

Hence it follows that $\|A\| \leq 2n/\delta$ for all $A \in A$, i.e. $\sup_{A \in A} \|Ax\| < \infty$.

3. If $X$ is a Banach space, $F = X$ is not meager by the Baire Category Theorem [26.2]. So item 3. follows from items 1. and 2. and the fact that $F = X$ if and only if $\sup_{A \in A} \|Ax\| < \infty$ for all $x \in X$.

4. Item 3. is equivalent to $F$ being meager if and only if $\sup_{A \in A} \|Ax\| = \infty$. Since $R = F^c$, $R$ is residual if and only if $\sup_{A \in A} \|Ax\| = \infty$.

Remarks 31.29 Let $S \subseteq X$ be the unit sphere in $X$, $f_A(x) = Ax$ for $x \in S$ and $A \in A$.

1. The assertion $\sup_{A \in A} \|Ax\| < \infty$ for all $x \in X$ implies $\|A\| < \infty$ may be interpreted as follows. If $\sup_{A \in A} \|f_A(x)\| < \infty$ for all $x \in S$, then $\sup_{A \in A} \|f_A\| < \infty$, where $\|f_A\| := \sup_{x \in S} \|f_A(x)\| = \|A\|$.

2. If $\dim(X) < \infty$ we may give a simple proof of this assertion. Indeed, if $\{e_n\}_{n=1}^N \subseteq S$ is a basis for $X$ there is a constant $\varepsilon > 0$ such that

$$\|\sum_{n=1}^N \lambda_n e_n\| \geq \varepsilon \sum_{n=1}^N |\lambda_n|$$

and so the assumption $\sup_{A \in A} \|f_A(x)\| < \infty$ implies

$$\sup_{A \in A} \|A\| = \sup_{A \in A} \sup_{\lambda \neq 0} \\frac{\|\sum_{n=1}^N \lambda_n A e_n\|}{\sum_{n=1}^N |\lambda_n|} \leq \sup_{A \in A} \sup_{\lambda \neq 0} \frac{\sum_{n=1}^N |\lambda_n| \|A e_n\|}{\|e_n\|}$$

$$\leq \varepsilon^{-1} \sup_{A \in A} \|A e_n\| = \varepsilon^{-1} \sup_{n} \sup_{A \in A} \|A e_n\| < \infty.$$ 

Notice that we have used the linearity of each $A \in A$ in a crucial way.

3. If we drop the linearity assumption, so that $f_A \in C(S, Y)$ for all $A \in A$ — some index set, then it is no longer true that $\sup_{A \in A} \|f_A(x)\| < \infty$ for all $x \in S$, then $\sup_{A \in A} \|f_A\| < \infty$. The reader is invited to construct a counterexample when $X = \mathbb{R}^2$ and $Y = \mathbb{R}$ by finding a sequence $\{f_n\}_{n=1}^\infty$ of continuous functions on $S^1$ such that $\lim_{n \to \infty} f_n(x) = 0$ for all $x \in S^1$ while $\lim_{n \to \infty} \|f_n\|_{C(S^1)} = \infty$.

4. The assumption that $X$ is a Banach space in item 3 of Theorem [31.28] can not be dropped. For example, let $X \subseteq C([0, 1])$ be the polynomial functions on $[0, 1]$ equipped with the uniform norm $\|\cdot\|_\infty$ and for $t \in [0, 1]$, let $f_t(x) := (x(t) - x(0))/t$ for all $x \in X$. Then $\lim_{t \to 0} f_t(x) = \frac{d}{dt} x(t)$ and therefore
so by the uniform boundedness principle, Theorem 31.28 (item 3.) were true we would have \( M := \sup_{t \in (0, 1]} \| f_t \| < \infty \). This would then imply
\[
| x(t) - x(0) | \leq M \| x \|_\infty \quad \text{for all } x \in X \text{ and } t \in (0, 1].
\]
Letting \( t \downarrow 0 \) in this equation gives, \( | x(0) | \leq M \| x \|_\infty \) for all \( x \in X \). But taking \( x(t) = t^\alpha \) in this inequality shows \( M = \infty \).

Example 31.30. Suppose that \( \{ c_n \}_{n=1}^\infty \subset \mathbb{C} \) is a sequence of numbers such that
\[
\lim_{N \to \infty} \sum_{n=1}^N a_n c_n \text{ exists in } \mathbb{C} \text{ for all } a \in \ell^1.
\]
Then \( c \in \ell^\infty \).

**Proof.** Let \( f_N \in (\ell^1)^* \) be given by \( f_N(a) = \sum_{n=1}^N a_n c_n \) and set \( M_N := \max \{|c_n| : n = 1, \ldots, N\} \). Then
\[
| f_N(a) | \leq M_N \| a \|_{\ell^1}
\]
and by taking \( a = e_k \) with \( k \) such \( M_N = |c_k| \), we learn that \( \| f_N \| = M_N \). Now by assumption, \( \lim_{N \to \infty} f_N(a) \) exists for all \( a \in \ell^1 \) and in particular,
\[
\sup_N | f_N(a) | < \infty \quad \text{for all } a \in \ell^1.
\]
So by the uniform boundedness principle, Theorem 31.28
\[
\infty > \sup_N \| f_N \| = \sup_N M_N = \sup \{|c_n| : n = 1, 2, 3, \ldots \}.
\]

**31.3.1 Applications to Fourier Series**

Let \( T = S^1 \) be the unit circle in \( S^1 \), \( \varphi_n(z) := z^n \) for all \( n \in \mathbb{Z} \), and \( m \) denote the normalized arc length measure on \( T \), i.e. if \( f : T \to [0, \infty) \) is measurable, then
\[
\int_T f(w) dw := \int f dm := \frac{1}{2\pi} \int_{-\pi}^\pi f(e^{i\theta}) d\theta.
\]
From Section 30.3 we know \( \{ \varphi_n \}_{n \in \mathbb{Z}} \) is an orthonormal basis for \( L^2(T) \). For \( n \in \mathbb{N} \) and \( z \in \mathbb{C} \), let
\[
s_n(f, z) := \sum_{k=-n}^n \langle f, \varphi_n \rangle \varphi_k(z) = \int_T f(w) d_n(z \bar{w}) dw
\]
where
\[
d_n(e^{i\theta}) := \sum_{k=-n}^n e^{ik\theta} = \frac{\sin(n + \frac{1}{2})\theta}{\sin \frac{\theta}{2}},
\]
see Eqs. (30.9) and (30.10). By Theorem 30.10, for all \( f \in L^2(T) \) we know
\[
f = L^2(T) - \lim_{n \to \infty} s_n(f, \cdot).
\]
On the other hand the next proposition shows; if we fix \( z \in \mathbb{C} \), then \( \lim_{n \to \infty} s_n(f, z) \) does not even exist for the “typical” \( f \in C(T) \subset L^2(T) \).

**Proposition 31.31 (Lack of pointwise convergence).** For each \( z \in \mathbb{C} \), there exists a residual set \( R_z \subset C(T) \) such that \( \sup_n | s_n(f, z) | = \infty \) for all \( f \in R_z \). Recall that \( C(T) \) is a complete metric space, hence \( R_z \) is a dense subset of \( C(T) \).

**Proof.** By symmetry considerations, it suffices to assume \( z = 1 \in T \). Let \( A_n : C(T) \to \mathbb{C} \) be given by
\[
A_n f := s_n(f, 1) = \int_T f(w) d_n(\bar{w}) dw.
\]
An application of Corollary 49.70 below shows,
\[
\| A_n \| = \| d_n \|_1 = \int_T | d_n(\bar{w}) | dw = \frac{1}{2\pi} \int_{-\pi}^\pi | d_n(e^{-i\theta}) | d\theta = \frac{1}{2\pi} \int_{-\pi}^\pi \left| \frac{\sin(n + \frac{1}{2})\theta}{\sin \frac{\theta}{2}} \right| d\theta.
\]
Of course we may prove this directly as follows. Since
\[
| A_n f | = \int_T | f(w) d_n(\bar{w}) | dw \leq \int_T | f(w) d_n(\bar{w}) | dw \leq \| f \|_\infty \int_T | d_n(\bar{w}) | dw,
\]
we learn \( \| A_n \| \leq \int_T | d_n(\bar{w}) | dw \). For all \( \varepsilon > 0 \), let
\[
f_{\varepsilon}(z) := \frac{d_n(z)}{\sqrt{d_n^2(z) + \varepsilon}}.
\]
Then \( \| f_{\varepsilon} \|_{C(T)} \leq 1 \) and hence
\[
\| A_n \| \geq \lim_{\varepsilon \downarrow 0} | A_n f_{\varepsilon} | = \lim_{\varepsilon \downarrow 0} \int_T \frac{d_n^2(z)}{d_n^2(z) + \varepsilon} dw = \int_T | d_n(\bar{w}) | dw
\]
and the verification of Eq. (31.10) is complete.
Using
\[ |\sin x| = \left| \int_0^x \cos y \, dy \right| \leq \left| \int_0^x |\cos y| \, dy \right| \leq |x| \]
in Eq. (31.10) implies that
\[ \|A_n\| \geq \frac{1}{2\pi} \int_{-\pi}^\pi \left| \sin(n + \frac{1}{2}) \theta \right| \, d\theta = \frac{2}{\pi} \int_0^{2\pi} \left| \sin(n + \frac{1}{2}) \theta \right| \, d\theta \]
\[ = \frac{2}{\pi} \int_0^\pi \sin(n + \frac{1}{2}) \theta \, d\theta = \int_0^n \sin y \, dy \to \infty \quad \text{as} \quad n \to \infty \] (31.11)
and hence \( \sup_n \|A_n\| = \infty \). So by Theorem 31.28
\[ R_1 = \{ f \in C(T) : \sup_n |A_n f| = \infty \} \]
is a residual set.

See Rudin Chapter 5 for more details.

**Lemma 31.32.** For \( f \in L^1(T) \), let
\[ \tilde{f}(n) := \langle f, \varphi_n \rangle = \int_T f(w) \bar{\omega}^n \, dw. \]
Then \( \tilde{f} \in c_0 := C_0(\mathbb{Z}) \) (i.e. \( \lim_{n \to \infty} \tilde{f}(n) = 0 \)) and the map \( f \in L^1(T) \to \tilde{f} \in c_0 \) is a one to one bounded linear transformation into but not onto \( c_0 \).

**Proof.** By Bessel’s inequality, \( \sum_{n \in \mathbb{Z}} |\tilde{f}(n)|^2 < \infty \) for all \( f \in L^2(T) \) and in particular \( \lim_{|n| \to \infty} |\tilde{f}(n)| = 0 \). Given \( f \in L^1(T) \) and \( g \in L^2(T) \) we have
\[ |\tilde{f}(n) - \tilde{g}(n)| = \left| \int_T [f(w) - g(w)] \bar{\omega}^n \, dw \right| \leq \|f - g\|_1 \]
and hence
\[ \limsup_{n \to \infty} |\tilde{f}(n)| = \limsup_{n \to \infty} |\tilde{f}(n) - \tilde{g}(n)| \leq \|f - g\|_1 \]
for all \( g \in L^2(T) \). Since \( L^2(T) \) is dense in \( L^1(T) \), it follows that \( \limsup_{n \to \infty} |\tilde{f}(n)| = 0 \) for all \( f \in L^1 \). i.e. \( \tilde{f} \in c_0 \). Since \( |\tilde{f}(n)| \leq \|f\|_1 \), we have \( |\tilde{f}| \to_{\infty} \|f\|_1 \) showing that \( A\tilde{f} := \tilde{f} \) is a bounded linear transformation from \( L^1(T) \) to \( c_0 \). To see that \( A \) is injective, suppose \( \tilde{f} = A\tilde{f} \equiv 0 \), then \( \int_T f(w)p(w, \bar{w}) \, dw = 0 \) for all polynomials \( p \) in \( w \) and \( \bar{w} \). By the Stone - Wiererstrass and the dominated convergence theorem, this implies that
\[ \int_T f(w)g(w) \, dw = 0 \]
for all \( g \in C(T) \). Lemma [19.11] now implies \( f = 0 \) a.e. If \( A \) were surjective, the open mapping theorem would imply that \( A^{-1} : c_0 \to L^1(T) \) is bounded. In particular this implies there exists \( C < \infty \) such that
\[ \|f\|_{L^1} \leq C \|\tilde{f}\|_{c_0} \]
for all \( f \in L^1(T) \). (31.12)
Taking \( f = d_n \), we find (because \( \tilde{d}_n(k) = 1_{|k| \leq n} \)) that \( \|\tilde{d}_n\|_{c_0} = 1 \) while (by Eq. (31.11)) \( \lim_{n \to \infty} \|d_n\|_{L^1} = \infty \) contradicting Eq. (31.12). Therefore \( \text{Ran}(A) \neq c_0 \).

31.4 Exercises

31.4.1 More Examples of Banach Spaces

**Exercise 31.12.** Let \((X, M)\) be a measurable space and \( M(X) \) denote the space of complex measures on \((X, M)\) and for \( \mu \in M(X) \) let \( \|\mu\| := |\mu|(X) \). Show \((M(X), \|\cdot\|)\) is a Banach space. (Move to Section 23)

**Exercise 31.13.** Folland 5.9, p. 155. (Drop this problem, or move to Chapter 15)

**Exercise 31.14.** Folland 5.10, p. 155. (Drop this problem, or move later where it can be done.)

**Exercise 31.15.** Folland 5.11, p. 155. (Drop this problem, or move to Chapter 15)

31.4.2 Hahn-Banach Theorem Problems

**Exercise 31.16.** Let \( X \) be a normed vector space. Show a linear functional, \( f : X \to \mathbb{C} \), is bounded iff \( M := f^{-1}(\{0\}) \) is closed. **Hint:** If \( M \) is closed yet \( f \) is not continuous, consider \( y_n := x_0 - n / f(x_n) \) where \( x_0 \in X \) such that \( f(x_0) = 1 \) and \( x_n \in X \) such that \( \|x_n\| = 1 \) and \( \lim_{n \to \infty} |f(x_n)| = \infty \).

**Exercise 31.17.** Let \( M \) be a closed subspace of a normed space, \( X \), and \( x \in X \setminus M \). Show \( M \oplus \mathbb{C}x \) is closed. **Hint:** make use of a \( \lambda \in \mathbb{R}^X \) which you should construct so that \( \lambda(M) = 0 \) while \( \lambda(x) \neq 0 \).

**Exercise 31.18.** (Uses quotient spaces.) Let \( X \) be an infinite dimensional normed vector space. Show:
1. There exists a sequence \( \{x_n\}_{n=1}^{\infty} \subset X \) such that \( \|x_n\| = 1 \) for all \( n \) and \( \|x_m - x_n\| \geq \frac{1}{2} \) for all \( m \neq n \).
2. Show \( X \) is not locally compact.
31.4.3 Open Mapping and Closed Operator Problems

Exercise 31.19. Let \( X = \ell^1(\mathbb{N}) \),
\[
Y = \left\{ f \in X : \sum_{n=1}^{\infty} n |f(n)| < \infty \right\}
\]
with \( Y \) being equipped with the \( \ell^1(\mathbb{N}) \) - norm, and \( T : Y \to X \) be defined by \((Tf)(n) = nf(n)\). Show:

1. \( Y \) is a proper dense subspace of \( X \) and in particular \( Y \) is not complete.
2. \( T : Y \to X \) is a closed operator which is not bounded.
3. \( Y \) is algebraically invertible, \( S := T^{-1} : X \to Y \) is bounded and surjective but not open.

Exercise 31.20. Let \( X = C([0,1]) \) and \( Y = C^1([0,1]) \subset X \) with both \( X \) and \( Y \) being equipped with the uniform norm. Let \( T : Y \to X \) be the linear map, \( Tf = f' \). Here \( C^1([0,1]) \) denotes those functions, \( f \in C^1([0,1]) \cap C([0,1]) \) such that
\[
f'(1) := \lim_{x \uparrow 1} f'(x) \quad \text{and} \quad f'(0) := \lim_{x \downarrow 0} f'(x)
\]
exist.

1. \( Y \) is a proper dense subspace of \( X \) and in particular \( Y \) is not complete.
2. \( T : Y \to X \) is a closed operator which is not bounded.

Exercise 31.22. Let \( X \) be a vector space equipped with two norms, \( \|\cdot\|_1 \) and \( \|\cdot\|_2 \) such that \( \|\cdot\|_1 \leq \|\cdot\|_2 \) and \( X \) is complete relative to both norms. Show there is a constant \( C < \infty \) such that \( \|\cdot\|_2 \leq C \|\cdot\|_1 \).

Exercise 31.23 (No slowest decay rate). Show that it is impossible to find a sequence, \( \{a_n\}_{n \in \mathbb{N}} \subset (0, \infty) \), with the following property: if \( \{\lambda_n\}_{n \in \mathbb{N}} \) is a sequence in \( \mathbb{C} \), then \( \sum_{n=1}^{\infty} |\lambda_n| < \infty \) iff \( \sup_{n \rightarrow \infty} |\lambda_n| < \infty \). (Poetically speaking, there is no “slowest rate” of decay for the summands of absolutely convergent series.)

Outline: For sake of contradiction suppose such a “magic” sequence \( \{a_n\}_{n \in \mathbb{N}} \subset (0, \infty) \) were to exists.

1. For \( f \in \ell^\infty(\mathbb{N}) \), let \((Tf)(n) := a_n f(n)\) for \( n \in \mathbb{N} \). Verify that \( Tf \in \ell^1(\mathbb{N}) \) and \( T : \ell^\infty(\mathbb{N}) \to \ell^1(\mathbb{N}) \) is a bounded linear operator.
2. Show \( T : \ell^\infty(\mathbb{N}) \to \ell^1(\mathbb{N}) \) must be an invertible operator and that \( T^{-1} : \ell^1(\mathbb{N}) \to \ell^\infty(\mathbb{N}) \) is necessarily bounded, i.e. \( T : \ell^\infty(\mathbb{N}) \to \ell^1(\mathbb{N}) \) is a homeomorphism.
3. Arrive at a contradiction by showing either that \( T^{-1} \) is not bounded or by using the fact that, \( D \), the set of finitely supported sequences, is dense in \( \ell^1(\mathbb{N}) \) but not in \( \ell^\infty(\mathbb{N}) \).

Exercise 31.24. Folland 5.34, p. 164. (Not a very good problem, delete.)

Exercise 31.25. Folland 5.35, p. 164. (A quotient space exercise.)

Exercise 31.27. Suppose \( T : X \to Y \) is a linear map between two Banach spaces such that \( f \circ T \in X^* \) for all \( f \in Y^* \). Show \( T \) is bounded.

Exercise 31.28. Suppose \( T_n : X \to Y \) for \( n \in \mathbb{N} \) is a sequence of bounded linear operators between two Banach spaces such \( \lim_{n \to \infty} T_n x \) exists for all \( x \in X \). Show \( T x := \lim_{n \to \infty} T_n x \) defines a bounded linear operator from \( X \) to \( Y \).

Exercise 31.29. Let \( X, Y \) and \( Z \) be Banach spaces and \( B : X \times Y \to Z \) be a bilinear map such that \( B(x,\cdot) \in L(Y,Z) \) and \( B(\cdot,y) \in L(X,Z) \) for all \( x \in X \) and \( y \in Y \). Show there is a constant \( M < \infty \) such that
\[
\|B(x,y)\| \leq M \|x\| \|y\| \quad \text{for all} \quad (x,y) \in X \times Y
\]
and conclude from this that \( B : X \times Y \to Z \) is continuous.

Exercise 31.31. Folland 5.41, p. 165. (Drop this exercise, it is [26.2].)

31.4.4 Weak Topology and Convergence Problems

Definition 31.33. A sequence \( \{x_n\}_{n=1}^\infty \subset X \) is weakly Cauchy if for all \( V \in \tau_w \) such that \( 0 \in V \), \( x_n - x_m \in V \) for all \( m, n \) sufficiently large. Similarly a sequence \( \{f_n\}_{n=1}^\infty \subset X^* \) is weak-* Cauchy if for all \( V \in \tau_{w^*} \) such that \( 0 \in V \), \( f_n - f_m \in V \) for all \( m, n \) sufficiently large.

Remark 31.34. These conditions are equivalent to \( \{f(x_n)\}_{n=1}^\infty \) being Cauchy for all \( f \in X^* \) and \( \{f_n(x)\}_{n=1}^\infty \) being Cauchy for all \( x \in X \) respectively.

Exercise 31.32. Let \( X \) and \( Y \) be Banach spaces. Show:

1. Every weakly Cauchy sequence in \( X \) is bounded.
2. Every weak-* Cauchy sequence in \( X^* \) is bounded.
3. If \( \{T_n\}_{n=1}^\infty \subset L(X,Y) \) converges weakly (or strongly) then \( \sup_n \|T_n\|_{L(X,Y)} < \infty \).
Exercise 31.33. Let $X$ be a Banach space, $C := \{x \in X : \|x\| \leq 1\}$ and $C^* := \{\lambda \in X^* : \|\lambda\|_{X^*} \leq 1\}$ be the closed unit balls in $X$ and $X^*$ respectively.

1. Show $C$ is weakly closed and $C^*$ is weak-* closed in $X$ and $X^*$ respectively.
2. If $E \subset X$ is a norm-bounded set, then the weak closure, $E^w \subset X$, is also norm bounded.
3. If $F \subset X^*$ is a norm-bounded set, then the weak-* closure, $\overline{E}^w \subset X^*$, is also norm bounded.
4. Every weak-* Cauchy sequence $\{f_n\} \subset X^*$ is weak-* convergent to some $f \in X^*$.

Exercise 31.34. Folland 5.49, p. 171.

Exercise 31.35. If $X$ is a separable normed linear space, the weak-* topology on the closed unit ball in $X^*$ is second countable and hence metrizable. (See Theorem 24.24.)

Exercise 31.36. Let $X$ be a Banach space. Show every weakly compact subset of $X$ is norm bounded and every weak-* compact subset of $X^*$ is norm bounded.

Exercise 31.37. A vector subspace of a normed space $X$ is norm-closed if and only if it is weakly closed. (If $X$ is not reflexive, it is not necessarily true that a normed closed subspace of $X^*$ need be weak* closed, see Exercise 31.39) (Hint: this problem only uses the Hahn-Banach Theorem.)

Exercise 31.38. Let $X$ be a Banach space, $\{T_n\}_{n=1}^{\infty}$ and $\{S_n\}_{n=1}^{\infty}$ be two sequences of bounded operators on $X$ such that $T_n \rightarrow T$ and $S_n \rightarrow S$ strongly, and suppose $\{x_n\}_{n=1}^{\infty} \subset X$ such that $\lim_{n \rightarrow \infty} \|x_n - x\| = 0$. Show:

1. $\lim_{n \rightarrow \infty} \|T_n x_n - T x\| = 0$ and that
2. $T_n S_n \rightarrow TS$ strongly as $n \rightarrow \infty$.

Exercise 31.40 (Adjoint operation is strongly discontinuous). See exercises 11-12 on pages 512-513 of Dunford and Schwartz Volume I. Here you are asked to show that if $A_n, B_n \in B(H)$ then $A_n \rightarrow A$ and $B_n \rightarrow B$ strongly then $A_n B_n \rightarrow A B$ strongly. You are also asked to show that $A_n$ does not imply $A_n^* \rightarrow A^*$ strongly. Here is the key example. Let $H = \ell^2$ and $S_n (x_1, x_2, \ldots) = (x_1, x_2, \ldots)$ so that $S_n x \cdot y = \sum_{k=1}^{\infty} x_{n+k} y_k = (x_1, x_2, \ldots) \cdot \left(\overline{0, \ldots, 0, y_1, y_2, \ldots}\right)$

so that

$$S_n^* y = \left(0, \ldots, 0, y_1, y_2, \ldots\right).$$

We then observe that $S_n x \rightarrow 0$ for all $x \in \ell^2$ while $\|S_n^* x\| = \|x\|$ for all $x \in \ell^2$.

Moreover, $S_n S_n^* x = x$ while $S_n^* S_n x = \left(0, \ldots, 0, x_{n+1}, x_{n+2}, \ldots\right) \rightarrow 0$ as $n \rightarrow \infty$ so $S_n^* S_n \rightarrow 0$ strongly while $S_n S_n^* = I$ is not converging to zero in any Hausdorff topology. On the other hand $S_n \rightarrow 0$ weakly and $S_n^* \rightarrow 0$ weakly (as you should check). This shows that the map $(A, B) \rightarrow AB$ is not jointly continuous in the weak operator topology even though it is in the strong operator topology provided $A$ is restricted to a bounded set. When dealing with strongly convergent sequences (not nets though because $S_n x \rightarrow S x$ does not imply $\sup_n \|S_n x\| < \infty$ – the beginning of a net could contain an infinite number of elements!) we can ignore this last condition using the uniform boundedness principle. So if $A_n \rightarrow A$ and $B_n \rightarrow B$ strongly then both sequences are bounded in operator norm and we have $\delta A_n := A_n - A$ and $\delta B_n = B_n - B$ going strongly to zero. Therefore,

$$\|A_n B_n x - AB x\| = \|(A + \delta A_n) (B + \delta B_n) x - AB x\|$$

$$= \|\delta A_n B_n x + A \delta B_n x + \delta A_n \delta B_n x\|$$

$$\leq \|\delta A_n B_n x\| + \sup_k \|A_k\| \cdot \|\delta B_n x\| \rightarrow 0 \text{ as } n \rightarrow \infty.$$

Exercise 31.41 (Inverse operation is strongly discontinuous). Let $H = \ell^2$, $P_n : H \rightarrow H$ be orthogonal projection onto the first $n$ - components in $\ell^2$, and $Q_n = I - P_n$ be projection onto the remaining components. Then for any $\varepsilon_n \downarrow 0$ the operators $A_n = P_n + \varepsilon_n Q_n \rightarrow I$ inside the collection of invertible operators. As $\{A_n^{-1}\}_{n=1}^{\infty}$ is an unbounded in operator norm it follows that $A_n^{-1}$ can not converge strongly to $I$ otherwise we would violate the uniform boundedness principle. Moreover, making use of the no slowest rate of decay exercise 31.23 one may conclude there exists $h \in H$ such that $\|A_n^{-1} h\| \rightarrow \infty$ (alternatively this follows as a direct consequence of the uniform boundedness principle).
Weak and Strong Derivatives

For this section, let $\Omega$ be an open subset of $\mathbb{R}^d$, $p,q,r \in [1,\infty]$, $L^p(\Omega) = L^p(\Omega,\mathcal{B}_\Omega,\mu)$ and $L^p_{\text{loc}}(\Omega) = L^p_{\text{loc}}(\Omega,\mathcal{B}_\Omega,\mu)$, where $\mu$ is Lebesgue measure on $\mathbb{R}^d$ and $\mathcal{B}_\Omega$ is the Borel $\sigma$-algebra on $\Omega$. If $\Omega = \mathbb{R}^d$, we will simply write $L^p$ and $L^p_{\text{loc}}$ for $L^p(\mathbb{R}^d)$ and $L^p_{\text{loc}}(\mathbb{R}^d)$ respectively. Also let

$$\langle f,g \rangle := \int_{\Omega} fg \, dm$$

for any pair of measurable functions $f, g : \Omega \to \mathbb{C}$ such that $fg \in L^1(\Omega)$. For example, by Hölder’s inequality, if $\langle f,g \rangle$ is defined for $f \in L^p(\Omega)$ and $g \in L^q(\Omega)$ when $q = \frac{p}{p-1}$.

**Definition 32.1.** A sequence $\{u_n\}_{n=1}^\infty \subset L^p_{\text{loc}}(\Omega)$ is said to converge to $u \in L^p_{\text{loc}}(\Omega)$ if $\lim_{n \to \infty} \|u - u_n\|_{L^p(K)} = 0$ for all compact subsets $K \subset \Omega$.

The following simple but useful remark will be used (typically without further comment) in the sequel.

**Remark 32.2.** Suppose $r,p,q \in [1,\infty]$ are such that $r^{-1} = p^{-1} + q^{-1}$ and $f_t \to f$ in $L^p(\Omega)$ and $g_t \to g$ in $L^q(\Omega)$ as $t \to 0$, then $f_t g_t \to fg$ in $L^r(\Omega)$. Indeed,

$$\|f_t g_t - fg\|_r = \|(f_t - f) g_t + f (g_t-g)\|_r$$

$$\leq \|f_t - f\|_p \|g_t\|_q + \|f\|_p \|g_t - g\|_q \to 0 \text{ as } t \to 0$$

**32.1 Basic Definitions and Properties**

**Definition 32.3 (Weak Differentiability).** Let $v \in \mathbb{R}^d$ and $u \in L^p(\Omega) (u \in L^p_{\text{loc}}(\Omega))$ then $\partial_v u$ is said to **exist weakly** in $L^p(\Omega) (L^p_{\text{loc}}(\Omega))$ if there exists a function $g \in L^p(\Omega) (g \in L^p_{\text{loc}}(\Omega))$ such that

$$\langle u, \partial_v \varphi \rangle = -\langle g, \varphi \rangle \text{ for all } \varphi \in C^\infty_c(\Omega).$$

(32.1)

The function $g$ if it exists will be denoted by $\partial_v^{(w)} u$. Similarly if $\alpha \in \mathbb{N}_0^d$ and $\partial^\alpha$ is as in Notation [19.2], we say $\partial^\alpha u$ **exists weakly** in $L^p(\Omega) (L^p_{\text{loc}}(\Omega))$ if there exists $g \in L^p(\Omega) (L^p_{\text{loc}}(\Omega))$ such that

$$\langle u, \partial^\alpha \varphi \rangle = (-1)^{|\alpha|} \langle g, \varphi \rangle \text{ for all } \varphi \in C^\infty_c(\Omega).$$

More generally if $p(\xi) = \sum_{|\alpha| \leq N} a_\alpha \xi^\alpha$ is a polynomial in $\xi \in \mathbb{R}^n$, then $p(\partial)u$ **exists weakly** in $L^p(\Omega) (L^p_{\text{loc}}(\Omega))$ iff there exists $g \in L^p(\Omega) (L^p_{\text{loc}}(\Omega))$ such that

$$\langle u, p(\partial) \varphi \rangle = \langle g, \varphi \rangle \text{ for all } \varphi \in C^\infty_c(\Omega)$$

(32.2)

and we denote $g$ by $w - p(\partial)u$.

By Corollary [19.40] there is at most one $g \in L^1_{\text{loc}}(\Omega)$ such that Eq. (32.2) holds, so $w - p(\partial)u$ is well defined.

**Lemma 32.4.** Let $p(\xi)$ be a polynomial on $\mathbb{R}^d$, $k = \deg(p) \in \mathbb{N}$, and $u \in L^1_{\text{loc}}(\Omega)$ such that $p(\partial)u$ exists weakly in $L^1_{\text{loc}}(\Omega)$. Then

1. $\text{supp}_m(w - p(\partial)u) \subset \text{supp}_m(u)$, where $\text{supp}_m(u)$ is the essential support of $u$ relative to Lebesgue measure, see Definition [19.27]

2. If $\deg p = k$ and $u|_U \in C^k(U,\mathbb{C})$ for some open set $U \subset \Omega$, then $w - p(\partial)u = p(\partial)u$ a.e. on $U$.

**Proof.**

1. Since

$$\langle w - p(\partial)u, \varphi \rangle = -\langle u, p(-\partial) \varphi \rangle = 0 \text{ for all } \varphi \in C^\infty_c(\Omega \setminus \text{supp}_m(u)),$$

an application of Corollary [19.40] shows $w - p(\partial)u = 0$ a.e. on $\Omega \setminus \text{supp}_m(u)$. So by Lemma [19.26] $\Omega \setminus \text{supp}_m(u) \subset \Omega \setminus \supp_m(w - p(\partial)u)$, i.e. $\text{supp}_m(w - p(\partial)u) \subset \text{supp}_m(u)$.

2. Suppose that $u|_U \in C^k$ and let $\psi \in C^\infty_c(U)$. (We view $\psi$ as a function in $C^\infty_c(\mathbb{R}^d)$ by setting $\psi = 0$ on $\mathbb{R}^d \setminus U$.) By Corollary [19.37] there exists $\gamma \in C^\infty_c(\Omega)$ such that $0 \leq \gamma \leq 1$ and $\gamma = 1$ in a neighborhood of $\text{supp}(\psi)$. Then by setting $\gamma u = 0$ on $\mathbb{R}^d \setminus \text{supp}(\gamma)$ we may view $\gamma u \in C^k(\mathbb{R}^d)$ and so by standard integration by parts (see Lemma [19.38]) and the ordinary product rule,

$$\langle w - p(\partial)u, \psi \rangle = \langle u, p(-\partial) \psi \rangle = -\langle \gamma u, p(-\partial) \psi \rangle$$

$$= \langle p(\partial) \gamma u, \psi \rangle = \langle p(\partial) u, \psi \rangle$$

(32.3)
wherein the last equality we have $\gamma$ is constant on $\text{supp}(\psi)$. Since Eq. (32.3) is true for all $\psi \in C^\infty_c(U)$, an application of Corollary 19.40 with $h = w - p(\partial) u - p(\partial) u$ and $\mu = m$ shows $w - p(\partial) u = p(\partial) u$ a.e. on $U$.

**Notation 32.5** In light of Lemma 32.4 there is no danger in simply writing $p(\partial) u$ for $w - p(\partial) u$. So in the sequel we will always interpret $p(\partial) u$ in the weak or “distributional” sense.

**Example 32.6.** Suppose $u(x) = |x|$ for $x \in \mathbb{R}$, then $\partial u(x) = \text{sgn}(x)$ in $L^1_\text{loc}(\mathbb{R})$ while $\partial^2 u(x) = 2\delta(x)$ so $\partial^2 u(x)$ does not exist weakly in $L^1_\text{loc}(\mathbb{R})$.

**Example 32.7.** Suppose $d = 2$ and $u(x, y) = 1_{y > x}$. Then $u \in L^1_\text{loc}(\mathbb{R}^2)$, while $\partial_x 1_{y > x} = -\delta(y - x)$ and $\partial_y 1_{y > x} = \delta(y - x)$ and so that neither $\partial_x u$ or $\partial_y u$ exists weakly. On the other hand $(\partial_x + \partial_y) u = 0$ weakly. To prove these assertions, notice $u \in C^\infty(\mathbb{R}^2 \setminus \Delta)$ where $\Delta = \{(x, x) : x \in \mathbb{R}\}$. So by Lemma 32.4 for any polynomial $p(\xi)$ without constant term, if $p(\partial) u$ exists weakly then $p(\partial) u = 0$. However,

$$\langle u, -\partial_x \varphi \rangle = -\int_{y > x} \varphi(x, y) dy dx = -\int_{\mathbb{R}} \varphi(y, y) dy,$$

$$\langle u, -\partial_y \varphi \rangle = -\int_{y > x} \varphi(y, x) dy dx = \int_{\mathbb{R}} \varphi(x, x) dx$$

$$\langle u, -(\partial_x + \partial_y) \varphi \rangle = 0$$

from which it follows that $\partial_x u$ and $\partial_y u$ can not be zero while $(\partial_x + \partial_y) u = 0$.

On the other hand if $p(\xi)$ and $q(\xi)$ are two polynomials and $u \in L^1_\text{loc}(\Omega)$ is a function such that $p(\partial) u$ exists weakly in $L^1_\text{loc}(\Omega)$ and $q(\partial) [p(\partial) u]$ exists weakly in $L^1_\text{loc}(\Omega)$ then $(qp)(\partial) u$ exists weakly in $L^1_\text{loc}(\Omega)$. This is because

$$\langle u, (qp)(\partial) \varphi \rangle = \langle u, p(\partial) q(-\partial) \varphi \rangle = \langle p(\partial) u, q(-\partial) \varphi \rangle = \langle q(\partial) p(\partial) u, \varphi \rangle$$

for all $\varphi \in C^\infty_c(\Omega)$.

**Example 32.8.** Let $u(x, y) = 1_{x > 0} + 1_{y > 0}$ in $L^1_\text{loc}(\mathbb{R}^2)$. Then $\partial_x u(x, y) = \delta(x)$ and $\partial_y u(x, y) = \delta(y)$ so $\partial_x u(x, y)$ and $\partial_y u(x, y)$ do not exist weakly in $L^1_\text{loc}(\mathbb{R}^2)$. However $\partial_x \partial_y u$ does exist weakly and is the zero function. This shows $\partial_x \partial_y u$ may exist weakly despite the fact both $\partial_x u$ and $\partial_y u$ do not exist weakly in $L^1_\text{loc}(\mathbb{R}^2)$.

**Lemma 32.9.** Suppose $u \in L^1_\text{loc}(\Omega)$ and $p(\xi)$ is a polynomial of degree $k$ such that $p(\partial) u$ exists weakly in $L^1_\text{loc}(\Omega)$ then

$$\langle p(\partial) u, \varphi \rangle = \langle u, p(\partial) \varphi \rangle$$

**Note:** The point here is that Eq. (32.4) holds for all $\varphi \in C^k_c(\Omega)$ not just $\varphi \in C^\infty_c(\Omega)$.

**Proof.** Let $\varphi \in C^k(\Omega)$ and choose $\eta \in C^\infty_c(B(0, 1))$ such that $\int_{\mathbb{R}^d} \eta(x) dx = 1$ and let $\eta_x := e^{-d} \eta(x/\varepsilon)$. Then $\eta_x * \varphi \in C^\infty_c(\Omega)$ for $\varepsilon$ sufficiently small and $p(\partial) [\eta_x * \varphi] = \eta_x * p(\partial) \varphi \to p(\partial) \varphi$ and $\eta_x * \varphi \to \varphi$ uniformly on compact sets as $\varepsilon \to 0$. Therefore by the dominated convergence theorem,

$$\langle p(\partial) u, \varphi \rangle = \lim_{\varepsilon \to 0} \langle p(\partial) u, \eta_x * \varphi \rangle = \lim_{\varepsilon \to 0} \langle u, p(\partial) (\eta_x * \varphi) \rangle = \langle u, p(\partial) \varphi \rangle.$$

**Lemma 32.10 (Product Rule).** Let $u \in L^1_\text{loc}(\Omega)$, $v \in \mathbb{R}^d$ and $\varphi \in C^1(\Omega)$. If $\partial^v u$ exists in $L^1_\text{loc}(\Omega)$, then $\partial^v (\varphi u)$ exists in $L^1_\text{loc}(\Omega)$ and

$$\partial^v (\varphi u) = \partial_v \varphi \cdot u + \varphi \partial^v u$$

Moreover if $\varphi \in C^1(\Omega)$ and $F := \varphi u \in L^1$ (here we define $F$ on $\mathbb{R}^d$ by setting $F = 0$ on $\mathbb{R}^d \setminus \Omega$), then $\partial^v F = \partial_v \varphi \cdot u + \varphi \partial^v u$ exists weakly in $L^1(\mathbb{R}^d)$.

**Proof.** Let $\varphi \in C^\infty_c(\Omega)$, then using Lemma 32.9

$$\langle \varphi u, \partial_v \psi \rangle = -\langle \varphi, \partial_v \psi \rangle = -\langle u, \partial_v (\varphi \psi) - \partial_v \varphi \cdot \psi \rangle = \langle \partial_v^v (\varphi u), \psi \rangle + \langle \partial_v \varphi \cdot u, \psi \rangle$$

This proves the first assertion. To prove the second assertion let $\gamma \in C^\infty_c(\Omega)$ such that $0 \leq \gamma \leq 1$ and $\gamma = 1$ on a neighborhood of $\text{supp}(\varphi)$. So for $\psi \in C^\infty_c(\mathbb{R}^d)$, using $\partial_v \gamma = 0$ on $\text{supp}(\varphi)$ and $\gamma \varphi \in C^\infty_c(\Omega)$, we find

$$\langle F, \partial_v \psi \rangle = \langle \gamma F, \partial_v \psi \rangle = \langle F, \gamma \partial_v \psi \rangle = \langle (\varphi u), \partial_v (\gamma \psi) - \partial_v \gamma \cdot \psi \rangle$$

$$= \langle \varphi u, \partial_v (\gamma \psi) \rangle = -\langle \partial_v^v (\varphi u), (\gamma \psi) \rangle$$

$$= -\langle \partial_v \varphi \cdot u + \varphi \partial^v u, \gamma \psi \rangle = -\langle \partial_v \varphi \cdot u + \varphi \partial^v u, \psi \rangle.$$

This show $\partial^v F = \partial_v \varphi \cdot u + \varphi \partial^v u$ as desired.

**Lemma 32.11.** Suppose $q \in [1, \infty)$, $p(\xi)$ is a polynomial in $\xi \in \mathbb{R}^d$ and $u \in L^q_\text{loc}(\Omega)$. If there exists $\{u_m\}_{m=1}^\infty \subset L^q_\text{loc}(\Omega)$ such that $p(\partial) u_m$ exists in $L^q_\text{loc}(\Omega)$ for all $m$ and there exists $g \in L^q_\text{loc}(\Omega)$ such that for all $\varphi \in C^\infty_c(\Omega)$,

$$\lim_{m \to \infty} \langle u_m, \varphi \rangle = \langle u, \varphi \rangle \text{ and } \lim_{m \to \infty} \langle p(\partial) u_m, \varphi \rangle = \langle g, \varphi \rangle$$

then $p(\partial) u$ exists in $L^q_\text{loc}(\Omega)$ and $p(\partial) u = g$.

**Proof.** Since

$$\langle u, p(\partial) \varphi \rangle = \lim_{m \to \infty} \langle u_m, p(\partial) \varphi \rangle = -\lim_{m \to \infty} \langle p(\partial) u_m, \varphi \rangle = \langle g, \varphi \rangle$$

for all $\varphi \in C^\infty_c(\Omega)$, $p(\partial) u$ exists and is equal to $g \in L^q_\text{loc}(\Omega)$.
Proposition 32.12 (Mollification). Suppose \( q \in [1, \infty) \), \( p_1(\xi), \ldots, p_N(\xi) \) is a collection of polynomials in \( \xi \in \mathbb{R}^d \) and \( u \in L^q_{\text{loc}}(\Omega) \) such that \( p_i(\partial) u \) exists weakly in \( L^q_{\text{loc}}(\Omega) \) for \( l = 1, 2, \ldots, N \). Then there exists \( u_n \in C_0(\Omega) \) such that \( u_n \to u \) in \( L^q_{\text{loc}}(\Omega) \) and \( p_i(\partial) u_n \to p_i(\partial) u \) in \( L^q_{\text{loc}}(\Omega) \) for \( l = 1, 2, \ldots, N \).

Proof. Let \( \eta \in C_0^\infty(B(0,1)) \) such that \( \int_{\mathbb{R}^d} \eta \, dm = 1 \) and \( \eta_\varepsilon(x) := \varepsilon^{-d} \eta(x/\varepsilon) \) be as in the proof of Lemma 32.9. For any function \( f \in L^1_{\text{loc}}(\Omega) \), \( \varepsilon > 0 \) and \( x \in \Omega_\varepsilon := \{ y \in \Omega : \text{dist}(y, \Omega^c) > \varepsilon \} \), let

\[
f_\varepsilon(x) := f * \eta_\varepsilon(x) := 1_{\Omega} f * \eta_\varepsilon(x) = \int_{\Omega} f(y) \eta_\varepsilon(x-y) \, dy.
\]

Notice that \( f_\varepsilon \in C_0^\infty(\Omega_\varepsilon) \) and \( \Omega_\varepsilon \uparrow \Omega \) as \( \varepsilon \downarrow 0 \). Given a compact set \( K \subseteq \Omega \), let \( K_\varepsilon := \{ x \in \Omega : \text{dist}(x, K) \leq \varepsilon \} \). Then \( K_\varepsilon \downarrow K \) as \( \varepsilon \downarrow 0 \), there exists \( \varepsilon_0 > 0 \) such that \( K_0 := K_{\varepsilon_0} \) is a compact subset of \( \Omega_0 := \Omega_{\varepsilon_0} \subseteq \Omega \) (see Figure 32.1) and for \( x \in K \),

\[
f * \eta_\varepsilon(x) := \int_{\Omega} f(y) \eta_\varepsilon(x-y) \, dy = \int_{K_\varepsilon} f(y) \eta_\varepsilon(x-y) \, dy.
\]

Therefore, using Theorem 19.32

\[
\lim_{\varepsilon \downarrow 0} \| f * \eta_\varepsilon - f \|_{L^p(K)} = 0.
\]

Now let \( p(\xi) \) be a polynomial on \( \mathbb{R}^d \), \( u \in L^q_{\text{loc}}(\Omega) \) such that \( p(\partial) u \in L^q_{\text{loc}}(\Omega) \) and \( v_\varepsilon := \eta_\varepsilon * u \in C_0(\Omega) \) as above. Then for \( x \in K \) and \( \varepsilon < \varepsilon_0 \),

\[
p(\partial) v_\varepsilon(x) = \int_{\Omega} u(y) p(\partial_x) \eta_\varepsilon(x-y) \, dy = \int_{\Omega} u(y) p(\partial_y) \eta_\varepsilon(x-y) \, dy
\]

\[
= \int_{\Omega} u(y) p(\partial_y) \eta_\varepsilon(x-y) \, dy = \langle u, p(\partial) \eta_\varepsilon(x-\cdot) \rangle = (p(\partial) u, \eta_\varepsilon(x-\cdot)) = (p(\partial) u, \varepsilon(x)).
\]

From Eq. (32.6) we may now apply Eq. (32.5) with \( f = u \) and \( f = p_i(\partial) u \) for \( 1 \leq l \leq N \) to find

\[
\| v_\varepsilon - u \|_{L^p(K)} + \sum_{l=1}^{N} \| p_l(\partial) v_\varepsilon - p_l(\partial) u \|_{L^p(K)} \to 0 \text{ as } \varepsilon \downarrow 0.
\]

For \( n \in \mathbb{N} \), let

\[
K_n := \{ x \in \Omega : |x| \leq n \text{ and } d(x, \Omega^c) \geq 1/n \}
\]

so \( K_n \subseteq K_{n+1} \subseteq K_{n+1} \) for all \( n \) and \( K_n \uparrow \Omega \) as \( n \to \infty \) or see Lemma 24.8 and choose \( \psi_n \in C_0^\infty(K_n \setminus \{0,1\}) \), using Corollary 19.37 so that \( \psi_n = 1 \) on a neighborhood of \( K_n \). Choose \( \varepsilon_n \downarrow 0 \) such that \( K_{n+1} \subseteq \Omega_{\varepsilon_n} \) and

\[
\| v_{\varepsilon_n} - u \|_{L^p(K_n)} + \sum_{l=1}^{N} \| p_l(\partial) v_{\varepsilon_n} - p_l(\partial) u \|_{L^p(K_n)} \leq 1/n.
\]

Then \( u_n := \psi_n * v_{\varepsilon_n} \in C_0^\infty(\Omega) \) and since \( u_n = v_{\varepsilon_n} \) on \( K_n \) we still have

\[
\| u_n - u \|_{L^p(K_n)} + \sum_{l=1}^{N} \| p_l(\partial) u_n - p_l(\partial) u \|_{L^p(K_n)} \leq 1/n.
\]

Since any compact set \( K \subseteq \Omega \) is contained in \( K_n \) for all \( n \) sufficiently large, Eq. (32.7) implies

\[
\lim_{n \to \infty} \left[ \| u_n - u \|_{L^p(K_n)} + \sum_{l=1}^{N} \| p_l(\partial) u_n - p_l(\partial) u \|_{L^p(K)} \right] = 0.
\]

The following proposition is another variant of Proposition 32.12 which the reader is asked to prove in Exercise 32.2 below.
Proposition 32.13. Suppose \( q \in [1, \infty) \), \( p_1(\xi), \ldots, p_N(\xi) \) is a collection of polynomials in \( \xi \in \mathbb{R}^d \) and \( u \in L^q = L^q(\mathbb{R}^d) \) such that \( p_i(\partial) u \in L^q \) for \( l = 1, 2, \ldots, N \). Then there exists \( u_n \in C_0^\infty(\mathbb{R}^d) \) such that
\[
\lim_{n \to \infty} \left[ \|u_n - u\|_{L^q} + \sum_{l=1}^N \|p_l(\partial) u_n - p_l(\partial) u\|_{L^q} \right] = 0.
\]

Notation 32.14 (Difference quotients). For \( v \in \mathbb{R}^d \) and \( h \in \mathbb{R} \setminus \{0\} \) and a function \( u : \Omega \to \mathbb{C} \), let
\[
\partial^h_b u(x) := \frac{u(x + hv) - u(x)}{h}
\]
for those \( x \in \Omega \) such that \( x + hv \in \Omega \). When \( v \) is one of the standard basis elements, \( e_i \) for \( 1 \leq i \leq d \), we will write \( \partial^h_{e_i} u(x) \) rather than \( \partial^h_b u(x) \). Also let
\[
\nabla^h u(x) := (\partial^h_{e_1} u(x), \ldots, \partial^h_{e_d} u(x))
\]
be the difference quotient approximation to the gradient.

Definition 32.15 (Strong Differentiability). Let \( v \in \mathbb{R}^d \) and \( u \in L^p \), then \( \partial^v u \) is said to exist strongly in \( L^p \) if the limit \( h \to 0 \) \( \partial^h v u \) exists in \( L^p \). We will denote the limit by \( \partial^v u \).

It is easily verified that if \( u \in L^p \), \( v \in \mathbb{R}^d \) and \( \partial^v u \in L^p \) exists then \( \partial^v u \) and \( \partial^v u \) exist and \( \partial^v u = \partial^v u \). The key to checking this assertion is the identity,
\[
\langle \partial^h u, \varphi \rangle = \int_{\mathbb{R}^d} \frac{u(x + hv) - u(x)}{h} \varphi(x) dx = \int_{\mathbb{R}^d} \frac{u(x) \varphi(x - hv) - \varphi(x)}{h} dx = \langle u, \partial^h \varphi \rangle.
\]
Hence if \( \partial^v u = \lim_{h \to 0} \partial^h v u \) exists in \( L^p \) and \( \varphi \in C_0^\infty(\mathbb{R}^d) \), then
\[
\langle \partial^v u, \varphi \rangle = \lim_{h \to 0} \langle \partial^h u, \varphi \rangle = \lim_{h \to 0} \langle u, \partial^h \varphi \rangle = \int_{\mathbb{R}^d} \frac{d}{dh} \frac{u(x, \varphi(-hv))}{h} = \langle u, \partial_v \varphi \rangle
\]
wherein Corollary 45.31 has been used in the last equality to bring the derivative past the integral. This shows \( \partial^v u \) exists and is equal to \( \partial^v u \). What is somewhat more surprising is that the converse assertion that if \( \partial^v u \) then so does \( \partial^v u \). Theorem 32.18 is a generalization of Theorem 30.15 from \( L^2 \) to \( L^p \). For the reader’s convenience, let us give a self-contained proof of the version of the Banach - Alaoglu’s Theorem which will be used in the proof of Theorem 32.18 (This is the same as Theorem 24.24 above.)

Proposition 32.16 (Weak*-Compactness: Banach - Alaoglu’s Theorem). Let \( X \) be a separable Banach space and \( \{f_n\} \subset X^* \) be a bounded sequence, then there exist a subsequence \( \{f_{n_k}\} \subset \{f_n\} \) and \( f \in X^* \) such that \( \lim_{n \to \infty} f_n(x) = f(x) \) for all \( x \in X \).

Proof. Let \( D \subset X \) be a countable linearly independent subset of \( X \) such that \( \text{span}(D) = X \). Using Cantor’s diagonal trick, choose \( \{f_n\} \subset \{f_n\} \) such that \( \lambda_x := \lim_{n \to \infty} f_n(x) \) exist for all \( x \in D \). Define \( f : \text{span}(D) \to \mathbb{R} \) by the formula
\[
f(\sum_{x \in D} a_x x) = \sum_{x \in D} a_x \lambda_x
\]
where by assumption \( \#(\{x \in D : a_x \neq 0\}) < \infty \). Then \( f : \text{span}(D) \to \mathbb{R} \) is linear and moreover \( f_n(y) \to f(y) \) for all \( y \in \text{span}(D) \).

Hence by the B.L.T. Theorem 50.4, \( f \) extends uniquely to a bounded linear functional on \( X \). We still denote the extension of \( f \) by \( f \in X^* \). Finally, if \( x \in X \) and \( y \in \text{span}(D) \)
\[
|f(x) - f_n(x)| \leq |f(x) - f(y)| + |f(y) - f_n(y)| + |f_n(y) - f_n(x)| \leq \|f\| \|x - y\| + \|f_n\| \|x - y\| + |f(y) - f_n(y)| \leq 2C\|x - y\| + |f(y) - f_n(y)| \to 2C\|x - y\| \text{ as } n \to \infty.
\]
Therefore
\[
\lim_{n \to \infty} \left( f(x) - f_n(x) \right) \leq 2C\|x - y\| \to 0 \text{ as } y \to x.
\]

Corollary 32.17. Let \( p \in (1, \infty) \) and \( q = \frac{p}{p-1} \). Then to every bounded sequence \( \{u_n\}_{n=1}^\infty \subset L^p(\Omega) \) there is a subsequence \( \{u_{n_k}\}_{k=1}^\infty \) and an element \( u \in L^p(\Omega) \) such that
\[
\lim_{n \to \infty} \langle u_n, g \rangle = \langle u, g \rangle \text{ for all } g \in L^q(\Omega).
\]

Proof. By Theorem 22.14 the map
\[
v \in L^p(\Omega) \to \langle v, \cdot \rangle \in (L^q(\Omega))^*
\]
is an isometric isomorphism of Banach spaces. By Theorem 19.15, \( L^p(\Omega) \) is separable for all \( q \in [1, \infty) \) and hence the result now follows from Proposition 32.10.
Theorem 32.18 (Weak and Strong Differentiability). Suppose $p \in [1, \infty)$, $u \in L^p(\mathbb{R}^d)$ and $v \in \mathbb{R}^d \setminus \{0\}$. Then the following are equivalent:

1. There exists $g \in L^p(\mathbb{R}^d)$ and $\{h_n\}_{n=1}^{\infty} \subset \mathbb{R} \setminus \{0\}$ such that $\lim_{n \to \infty} h_n = 0$ and 
   \[ \lim_{n \to \infty} \langle \partial_v h_n u, \varphi \rangle = \langle g, \varphi \rangle \]
   for all $\varphi \in C^\infty_c(\mathbb{R}^d)$.

2. $\partial_v u$ exists and is equal to $g \in L^p(\mathbb{R}^d)$, i.e. $\langle u, \partial_v \varphi \rangle = -\langle g, \varphi \rangle$ for all $\varphi \in C^\infty_c(\mathbb{R}^d)$.

3. There exists $g \in L^p(\mathbb{R}^d)$ and $u_n \in C^\infty_c(\mathbb{R}^d)$ such that $u_n \xrightarrow{L^p} u$ and $\partial_v u_n \xrightarrow{L^p} g$ as $n \to \infty$.

4. $\partial_v u$ exists and is equal to $g \in L^p(\mathbb{R}^d)$, i.e. $\partial_v h u \to g$ in $L^p$ as $h \to 0$.

Moreover if $p \in (1, \infty)$ any one of the equivalent conditions 1. – 4. above are implied by the following condition.

1'. There exists $\{h_n\}_{n=1}^{\infty} \subset \mathbb{R} \setminus \{0\}$ such that $\lim_{n \to \infty} h_n = 0$ and $\sup_n \|\partial_v h_n u\|_p < \infty$.

Proof. 4. $\implies$ 1. is simply the assertion that strong convergence implies weak convergence. 1. $\implies$ 2. For $\varphi \in C^\infty_c(\mathbb{R}^d)$, Eq. (32.8) and the dominated convergence theorem implies 
   \[ \langle g, \varphi \rangle = \lim_{n \to \infty} \langle \partial_v h_n u, \varphi \rangle = \lim_{n \to \infty} \langle u, \partial_v h_n \varphi \rangle = -\langle u, \partial_v \varphi \rangle. \]

2. $\implies$ 3. Let $\eta \in C^\infty_c(\mathbb{R}^d, \mathbb{R})$ such that $\int_{\mathbb{R}^d} \eta(x) dx = 1$ and let $\eta_m(x) = m^d \eta(mx)$, then by Proposition 19.36 $h_m := \eta_m * u \in C^\infty_c(\mathbb{R}^d)$ for all $m$ and
   \[ \partial_v h_m(x) = \partial_v \eta_m * u(x) = \int_{\mathbb{R}^d} \partial_v \eta_m (x-y) u(y) dy \]
   \[ = \langle u, \partial_v \eta_m (x - \cdot - \cdot) \rangle = \langle g, \eta_m (x - \cdot) \rangle = \eta_m * g(x). \]

By Theorem 19.32 $h_m \to u$ in $L^p(\mathbb{R}^d)$ and $\partial_v h_m = \eta_m * g \to g$ in $L^p(\mathbb{R}^d)$ as $m \to \infty$. This shows 3. holds except for the fact that $h_m$ need not have compact support. To fix this let $\psi \in C^\infty_c([0, 1])$ such that $\psi = 1$ in a neighborhood of 0 and let $\tilde{\psi}_\varepsilon(x) = \psi(\varepsilon x)$ and $(\partial_v \tilde{\psi}_\varepsilon)(x) := (\partial_v \psi)(\varepsilon x)$. Then
   \[ \partial_v (\tilde{\psi}_\varepsilon h_m) = \partial_v \tilde{\psi}_\varepsilon h_m + \tilde{\psi}_\varepsilon \partial_v h_m = \varepsilon (\partial_v \tilde{\psi}_\varepsilon) h_m + \tilde{\psi}_\varepsilon \partial_v h_m \]
   so that $\psi_\varepsilon h_m \to h_m$ in $L^p$ and $\partial_v (\psi_\varepsilon h_m) \to \partial_v h_m$ in $L^p$ as $\varepsilon \downarrow 0$. Let $u_m = \psi_\varepsilon h_m$ where $\varepsilon$ is chosen to be greater than zero but small enough so that
   \[ \|\psi_\varepsilon h_m - h_m\|_p + \|\partial_v (\psi_\varepsilon h_m) - \partial_v h_m\|_p < 1/m. \]

Then $u_m \in C^\infty_c(\mathbb{R}^d)$, $u_m \to u$ and $\partial_v u_m \to g$ in $L^p$ as $m \to \infty$. 3. $\implies$ 4. By the fundamental theorem of calculus
   \[ \partial_v^h u_m(x) = \frac{u_m(x + hv) - u_m(x)}{h} = \frac{1}{h} \int_0^1 d u_m(x + shv) ds = \int_0^1 (\partial_v u_m)(x + shv) ds. \]

and therefore,
   \[ \partial_v^h u_m(x) - \partial_v u_m(x) = \int_0^1 ((\partial_v u_m)(x + shv) - \partial_v u_m(x)) ds. \]

So by Minkowski's inequality for integrals, Theorem 18.27
   \[ \|\partial_v^h u_m(x) - \partial_v u_m\|_p \leq \int_0^1 \| (\partial_v u_m)(\cdot + shv) - \partial_v u_m \|_p ds \]
   and letting $m \to \infty$ in this equation then implies
   \[ \|\partial_v^h u - g\|_p \leq \int_0^1 \|g(\cdot + shv) - g\|_p ds. \]

By the dominated convergence theorem and Proposition 19.24 the right member of this equation tends to zero as $h \to 0$ and this shows item 4. holds. (1' $\implies$ 1. when $p > 1$) This is a consequence of Corollary 32.17 (or see Theorem 24.24 above) which asserts, by passing to a subsequence if necessary, that $\partial_v^h u \to g$ for some $g \in L^p(\mathbb{R}^d)$.

Example 32.19. The fact that (1') does not imply the equivalent conditions 1 – 4 in Theorem 32.18 when $p = 1$ is demonstrated by the following example. Let $u := 1_{[0,1]}$, then
   \[ \int_{\mathbb{R}} \left| \frac{u(x + h) - u(x)}{h} \right| dx = \frac{1}{|h|} \int_{\mathbb{R}} \left| 1_{[-h,1-h]}(x) - 1_{[0,1]}(x) \right| dx = 2 \]
   for $|h| < 1$. On the other hand the distributional derivative of $u$ is $\partial u(x) = \delta(x) - \delta(x - 1)$ which is not in $L^1$.

Alternatively, if there exists $g \in L^1(\mathbb{R}, dm)$ such that
   \[ \lim_{n \to \infty} \frac{u(x + h_n) - u(x)}{h_n} = g(x) \]
   in $L^1$ for some sequence $\{h_n\}_{n=1}^{\infty}$ as above. Then for $\varphi \in C^\infty_c(\mathbb{R})$ we would have on one hand,
Corollary 32.20. If \( 1 \leq p < \infty \), \( u \in L^p \) such that \( \partial_v u \in L^p \), then \( \| \partial_v^b u \|_{L^p} \leq \| \partial_v u \|_{L^p} \) for all \( b \neq 0 \) and \( v \in \mathbb{R}^d \).

**Proof.** By Minkowski’s inequality for integrals, Theorem 18.27, we may let \( m \to \infty \) in Eq. (32.9), to find

\[
\partial_v^b u(x) = \int_0^1 (\partial_v u)(x + shv) \, ds \quad \text{for a.e. } x \in \mathbb{R}^d
\]

and

\[
\| \partial_v^b u \|_{L^p} \leq \int_0^1 \| (\partial_v u)(\cdot + shv) \|_{L^p} \, ds = \| \partial_v u \|_{L^p}.
\]

Proposition 32.21 (A weak form of Weyl’s Lemma). If \( u \in L^2(\mathbb{R}^d) \) such that \( f := \Delta u \in L^2(\mathbb{R}^d) \) then \( \partial^\alpha u \in L^2(\mathbb{R}^d) \) for \( |\alpha| \leq 2 \). Furthermore if \( k \in \mathbb{N}_0 \) and \( \partial^\beta f \in L^2(\mathbb{R}^d) \) for all \( |\beta| \leq k \), then \( \partial^\alpha u \in L^2(\mathbb{R}^d) \) for \( |\alpha| \leq k + 2 \).

**Proof.** By Proposition 32.13, there exists \( u_n \in C_c^\infty(\mathbb{R}^d) \) such that \( u_n \to u \) and \( \Delta u_n \to \Delta u = f \) in \( L^2(\mathbb{R}^d) \). By integration by parts we find

\[
\int_{\mathbb{R}^d} |\nabla (u_n - u_m)|^2 \, dm = (-\Delta (u_n - u_m), (u_n - u_m))_{L^2}
\]

\[
\to -(f - f, u - u) = 0 \text{ as } n, m \to \infty
\]

and hence by item 3. of Theorem \( 32.18 \) \( \partial u \in L^2 \) for each \( i \). Since

\[
\| \nabla u \|_{L^2}^2 = \lim_{n \to \infty} \int_{\mathbb{R}^d} |\nabla u_n|^2 \, dm = (-\Delta u_n, u_n)_{L^2} \to -(f, u) \text{ as } n \to \infty
\]

we also learn that

\[
\| \nabla u \|_{L^2}^2 = -(f, u) \leq \| f \|_{L^2} \cdot \| u \|_{L^2}.
\]  

(32.11)

Let us now consider

\[
\sum_{i,j=1}^d \int_{\mathbb{R}^d} |\partial_i \partial_j (u_n - u_m)|^2 \, dm = - \sum_{i,j=1}^d \int_{\mathbb{R}^d} \partial_i u_n \partial_i \partial_j u_n \, dm
\]

\[
= - \sum_{j=1}^d \int_{\mathbb{R}^d} \partial_j u_n \partial_j \Delta u_n \, dm = \sum_{j=1}^d \int_{\mathbb{R}^d} \partial_j^2 u_n \Delta u_n \, dm
\]

\[
= \int_{\mathbb{R}^d} |\Delta u_n|^2 \, dm = \| \Delta u_n \|_{L^2}^2.
\]

Replacing \( u_n \) by \( u_n - u_m \) in this calculation shows

\[
\sum_{i,j=1}^d \int_{\mathbb{R}^d} |\partial_i \partial_j (u_n - u_m)|^2 \, dm = \| \Delta (u_n - u_m) \|_{L^2}^2 \to 0 \text{ as } m, n \to \infty
\]

and therefore by Lemma 32.4 (also see Exercise 32.4), \( \partial_i \partial_j u \in L^2(\mathbb{R}^d) \) for all \( i, j \) and

\[
\sum_{i,j=1}^d \int_{\mathbb{R}^d} |\partial_i \partial_j u|^2 \, dm = \| \Delta u \|_{L^2}^2 = \| f \|_{L^2}^2.
\]  

(32.12)

Combining Eqs. (32.11) and (32.12) gives the estimate

\[
\sum_{|\alpha| \leq 2} \| \partial^\alpha u \|_{L^2}^2 \leq \| u \|_{L^2}^2 + \| f \|_{L^2} \cdot \| u \|_{L^2} + \| f \|_{L^2}^2
\]

\[
= \| u \|_{L^2}^2 + \| \Delta u \|_{L^2} \cdot \| u \|_{L^2} + \| \Delta u \|_{L^2}^2.
\]  

(32.13)

Let us now further assume \( \partial_i f = \partial_i \Delta u \in L^2(\mathbb{R}^d) \). Then for \( h \in \mathbb{R} \setminus \{0\} \), \( \partial^h u \in L^2(\mathbb{R}^d) \) and \( \partial^h \Delta u = \partial^h u \in L^2(\mathbb{R}^d) \) and hence by Eq. (32.13) and what we have just proved, \( \partial^\alpha \partial^h u = \partial^h \partial^\alpha u \in L^2 \) and

\[
\sum_{|\alpha| \leq 2} \| \partial^\alpha \partial^h u \|_{L^2(\mathbb{R}^d)}^2 \leq \| \partial^h u \|_{L^2}^2 + \| \partial^h f \|_{L^2} \cdot \| \partial^h u \|_{L^2} + \| \partial^h f \|_{L^2}^2
\]

\[
\leq \| \partial_i u \|_{L^2}^2 + \| \partial_i f \|_{L^2} \cdot \| \partial_i u \|_{L^2} + \| \partial_i f \|_{L^2}^2.
\]
where the last inequality follows from Corollary 32.20. Therefore applying Theorem 32.18 again we learn that \( \partial_t \partial^\alpha u \in L^2(\mathbb{R}^d) \) for all \( |\alpha| \leq 2 \) and
\[
\sum_{|\alpha| \leq 2} \| \partial_t \partial^\alpha u \|_{L^2(\mathbb{R}^d)}^2 \leq \| \partial_t u \|_{L^2}^2 + \| \partial_t f \|_{L^2}^2 \cdot \| \partial_t u \|_{L^2}^2 + \| \partial_t f \|_{L^2}^2 \leq \| \nabla u \|_{L^2}^2 + \| \partial_t f \|_{L^2}^2 \cdot \| \nabla u \|_{L^2}^2 + \| \partial_t f \|_{L^2}^2
\]
\[
+ \| \partial_t f \|_{L^2}^2 \cdot \sqrt{\| \nabla f \|_{L^2}^2 \cdot \| \nabla u \|_{L^2}^2 + \| \partial_t f \|_{L^2}^2}.
\]
The remainder of the proof, which is now an induction argument using the above ideas, is left as an exercise to the reader.

**Theorem 32.22.** Suppose that \( \Omega \) is an open subset of \( \mathbb{R}^d \) and \( V \) is an open precompact subset of \( \Omega \).

1. If \( 1 \leq p < \infty, \ u \in L^p(\Omega) \) and \( \partial_t u \in L^p(\Omega) \), then \( \| \partial_t^h u \|_{L^p(V)} \leq \| \partial_t u \|_{L^p(\Omega)} \) for all \( 0 < |h| < \frac{1}{2} \text{dist}(V, \Omega^c) \).

2. Suppose that \( 1 < p \leq \infty, u \in L^p(\Omega) \) and assume there exists a constants \( C_V < \infty \) and \( \varepsilon_V \in (0, \frac{1}{2} \text{dist}(V, \Omega^c)) \) such that
\[
\| \partial_t^h u \|_{L^p(V)} \leq C_V \text{ for all } 0 < |h| < \varepsilon_V.
\]
Then \( \partial_t u \in L^p(V) \) and \( \| \partial_t u \|_{L^p(V)} \leq C_V. \) Moreover if \( C := \sup_{V \subset \subset \Omega} C_V < \infty \) then in fact \( \partial_t u \in L^p(\Omega) \) and \( \| \partial_t u \|_{L^p(\Omega)} \leq C. \)

**Proof.** 1. Let \( U \subset \Omega \) such that \( \tilde{V} \subset U \) and \( \tilde{U} \) is a compact subset of \( \Omega \). For \( u \in C^1(\Omega) \cap L^p(\Omega) \), \( x \in B \) and \( 0 < |h| < \frac{1}{2} \text{dist}(V, U^c) \),
\[
\partial_t^h u(x) = \frac{u(x + h e_1) - u(x)}{h} = \int_0^1 \partial_t u(x + t h e_1) \, dt
\]
and in particular,
\[
|\partial_t^h u(x)| \leq \int_0^1 |\partial_t u(x + t h e_1)| dt.
\]
Therefore by Minikowski’s inequality for integrals,
\[
\| \partial_t^h u \|_{L^p(V)} \leq \int_0^1 \| \partial_t u(\cdot + t h e_1) \|_{L^p(V)} dt \leq \| \partial_t u \|_{L^p(V)}.
\]
(32.14)

For general \( u \in L^p(\Omega) \) with \( \partial_t u \in L^p(\Omega) \), by Proposition 32.12 there exists \( u_n \in C^\infty_0(\Omega) \) such that \( u_n \to u \) and \( \partial_t u_n \to \partial_t u \) in \( L^p(\Omega) \). Therefore we may replace \( u \) by \( u_n \) in Eq. (32.14) and then pass to the limit to find
\[
\| \partial_t^h u \|_{L^p(V)} \leq \| \partial_t u \|_{L^p(\Omega)} \leq \| \partial_t u \|_{L^p(V)}.
\]

2. If \( \| \partial_t^h u \|_{L^p(V)} \leq C_V \) for all \( h \) sufficiently small then by Corollary 32.17 there exists \( h_n \to 0 \) such that \( \partial_t^h u \xrightarrow{n} v \in L^p(V) \). Hence if \( \varphi \in C^\infty_c(V) \),
\[
\int_V v \varphi dm = \lim_{n \to \infty} \int_V \partial_t^h u \varphi dm = \lim_{n \to \infty} \int_\Omega \partial_t^h u \varphi dm
\]
\[
= - \int_\Omega u \partial_t \varphi dm = - \int_\Omega \partial_t \varphi \ dm.
\]
Therefore \( \partial_t u = v \in L^p(V) \) and \( \| \partial_t u \|_{L^p(V)} \leq \| v \|_{L^p(V)} \leq C_V \). Finally if \( C := \sup_{V \subset \subset \Omega} C_V < \infty \), then by the dominated convergence theorem,
\[
\| \partial_t u \|_{L^p(\Omega)} = \lim_{V \supset \Omega} \| \partial_t u \|_{L^p(V)} \leq C.
\]

We will now give a couple of applications of Theorem 32.18.

**Lemma 32.23.** Let \( v \in \mathbb{R}^d \).

1. If \( h \in L^1 \) and \( \partial_t h \in \mathbb{L}^1 \), then \( \int_{\mathbb{R}^d} \partial_t h(x) dx = 0. \)

2. If \( p, q, r \in [1, \infty) \) satisfy \( r^{-1} = p^{-1} + q^{-1} \), \( f \in L^p \) and \( g \in L^q \) are functions such that \( \partial_t f \) and \( \partial_t g \) exists in \( L^p \) and \( L^q \) respectively then \( \partial_t (fg) = \partial_t f \cdot g + f \cdot \partial_t g \). Moreover if \( r = 1 \) we have the integration by parts formula,
\[
(\partial_t f, g) = -(f, \partial_t g).
\]

3. If \( p = 1 \), \( \partial_t f \) exists in \( L^1 \) and \( g \in BC^1(\mathbb{R}^d) \) (i.e. \( g \in C^1(\mathbb{R}^d) \) with \( g \) and its first derivatives being bounded) then \( \partial_t (fg) \) exists in \( L^1 \) and \( \partial_t (fg) = \partial_t f \cdot g + f \cdot \partial_t g \) and again Eq. (32.15) holds.

**Proof.** 1) By item 3. of Theorem 32.18 there exists \( h_n \in C^\infty_c(\mathbb{R}^d) \) such that \( h_n \to h \) and \( \partial_t h_n \to \partial_t h \) in \( L^1 \). Then
\[
\int_{\mathbb{R}^d} \partial_t h_n(x) dx = \frac{d}{dt} \int_{\mathbb{R}^d} h_n(x + h \nu) dx = \frac{d}{dt} \int_{\mathbb{R}^d} h_n(x) dx = 0
\]

Here we have used the result that if \( f \in L^p \) and \( f_n \in L^p \) such that \( (f_n, \phi) \to (f, \phi) \) for all \( \phi \in C^\infty_c(\mathbb{R}^d) \), then \( \| f \|_{L^p(V)} \leq \liminf_{n \to \infty} \| f_n \|_{L^p(V)} \). To prove this, we have with \( g = \frac{h}{p-1} \) that
\[
|f| = \lim_{n \to \infty} |f_n| \leq \liminf_{n \to \infty} \| f_n \|_{L^p(V)} \cdot \| \phi \|_{L^q(V)}
\]
and therefore,
\[
\| f \|_{L^p(V)} = \sup_{\phi \in \Phi} \frac{|f|}{\| \phi \|_{L^q(V)}} \leq \liminf_{n \to \infty} \| f_n \|_{L^p(V)}.
\]
and letting $n \to \infty$ proves the first assertion. 2) Similarly there exists $f_n, g_n \in C^\infty_0(\mathbb{R}^d)$ such that $f_n \to f$ and $\partial_v f_n \to \partial_v f$ in $L^p$ and $g_n \to g$ and $\partial_v g_n \to \partial_v g$ in $L^q$ as $n \to \infty$. So by the standard product rule and Remark 32.2 $f_n g_n \to f g \in L^r$ as $n \to \infty$ and

$$\partial_v (f_n g_n) = \partial_v f_n \cdot g_n + f_n \cdot \partial_v g_n \to \partial_v f \cdot g + f \cdot \partial_v g \mbox{ in } L^r \mbox{ as } n \to \infty.$$  

It now follows from another application of Theorem 32.18 that $\partial_v (f g)$ exists in $L^r$ and $\partial_v (f g) = \partial_v f \cdot g + f \cdot \partial_v g$. Eq. 32.15 follows from this product rule and item 1. when $r = 1$. 3) Let $f_n \in C^\infty_0(\mathbb{R}^d)$ such that $f_n \to f$ and $\partial_v f_n \to \partial_v f$ in $L^1$ as $n \to \infty$. Then as above, $g_n f_n \to g f$ in $L^1$ and $\partial_v (g_n f_n) \to \partial_v (g f) + g \partial_v f_n$ in $L^1$ as $n \to \infty$. In particular if $\varphi \in C^\infty_0(\mathbb{R}^d)$, then

$$\langle g f, \partial_v \varphi \rangle = \lim_{n \to \infty} \langle g_n f_n, \partial_v \varphi \rangle = - \lim_{n \to \infty} \langle \partial_v (g_n f_n), \varphi \rangle$$

$$= - \lim_{n \to \infty} \langle \partial_v g_n \cdot f_n + g \partial_v f_n, \varphi \rangle = - \langle \partial_v g \cdot f + g \partial_v f, \varphi \rangle.$$  

This shows $\partial_v (f g)$ exists (weakly) and $\partial_v (f g) = \partial_v f \cdot g + f \cdot \partial_v g$. Again Eq. 32.15 holds in this case by item 1. already proved.

**Lemma 32.24.** Let $p, q, r \in [1, \infty]$ satisfy $p^{-1} + q^{-1} = 1 + r^{-1}$, $f \in L^p$, $g \in L^q$ and $v \in \mathbb{R}^d$.

1. If $\partial_v f$ exists strongly in $L^r$, then $\partial_v (f * g)$ exists strongly in $L^p$ and

$$\partial_v (f * g) = (\partial_v f) * g.$$  

2. If $\partial_v g$ exists strongly in $L^q$, then $\partial_v (f * g)$ exists strongly in $L^r$ and

$$\partial_v (f * g) = f * \partial_v g.$$  

3. If $\partial_v f$ exists weakly in $L^p$ and $g \in C^\infty_0(\mathbb{R}^d)$, then $f * g \in C^\infty(\mathbb{R}^d)$, $\partial_v (f * g)$ exists strongly in $L^r$ and

$$\partial_v (f * g) = f * \partial_v g = (\partial_v f) * g.$$  

**Proof.** Items 1 and 2. By Young’s inequality (Theorem 19.30) and simple computations:

$$\left\| \frac{\tau_{-h v} (f * g) - f * g}{h} \right\|_r \leq \left\| \frac{\tau_{-h v} f * g - f * g}{h} \right\|_r (\partial_v f) * g$$

$$= \left\| \frac{\tau_{-h v} f * g - f * g}{h} \right\|_r (\partial_v f) * g$$

$$= \left\| \frac{\tau_{-h v} f - f}{h} \right\|_p \| g \|_q$$

which tends to zero as $h \to 0$. The second item is proved analogously, or just make use of the fact that $f * g = g * f$ and apply Item 1. Using the fact that $g(x - \cdot) \in C_c^\infty(\mathbb{R}^d)$ and the definition of the weak derivative,

$$f * \partial_v g (x) = \int_{\mathbb{R}^d} f(y) \left( \partial_v g (x - y) \right) dy = - \int_{\mathbb{R}^d} f(y) \left( \partial_v g (x - \cdot) (y) \right) dy$$

$$= \int_{\mathbb{R}^d} \partial_v f(y) g(x - y) dy = \partial_v f \ast g(x).$$  

Item 3. is a consequence of this equality and items 1. and 2.  

**Proposition 32.25.** Let $\Omega = (\alpha, \beta) \subset \mathbb{R}$ be an open interval and $f \in L^1_{loc}(\Omega)$ such that $\partial_v^w f = 0$ in $L^1_{loc}(\Omega)$. Then there exists $c \in \mathbb{C}$ such that $f = c$ a.e. More generally, suppose $F : C_c^\infty(\Omega) \to \mathbb{C}$ is a linear functional such that $F(\varphi') = 0$ for all $\varphi \in C_c^\infty(\Omega)$, where $\varphi'(x) = \frac{d}{dx} \varphi(x)$, then there exists $c \in \mathbb{C}$ such that

$$F(\varphi) = \langle c, \varphi \rangle = \int_{\Omega} c \varphi(x) dx$$

for all $\varphi \in C_c^\infty(\Omega).$  

**Proof.** Before giving a proof of the second assertion, let us show it includes the first. Indeed, if $F(\varphi) := \int_{\Omega} \varphi f dm$ and $\partial_v^w f = 0$, then $F(\varphi') = 0$ for all $\varphi \in C_c^\infty(\Omega)$ and therefore there exists $c \in \mathbb{C}$ such that

$$\int_{\Omega} \varphi f dm = F(\varphi) = \langle c, \varphi \rangle = c \int_{\Omega} \varphi f dm.$$  

But this implies $f = c$ a.e. So it only remains to prove the second assertion. Let $\eta \in C_c^\infty(\Omega)$ such that $\int_{\Omega} \eta dm = 1$. Given $\varphi \in C_c^\infty(\Omega) \subset C_c^\infty(\mathbb{R})$, let $\psi(x) = \int_{-\infty}^{x} (\varphi(y) - \eta(y) \langle \varphi, 1 \rangle) dy$. Then $\psi'(x) = \varphi(x) - \eta(x) \langle \varphi, 1 \rangle$ and $\psi \in C_c^\infty(\Omega)$ as the reader should check. Therefore,

$$0 = F(\psi) = F(\varphi - \langle \varphi, \eta \rangle \eta) = F(\varphi) - \langle \varphi, 1 \rangle F(\eta)$$

which shows Eq. (32.16) holds with $c = F(\eta)$. This concludes the proof, however it will be instructive to give another proof of the first assertion.

**Alternative proof of first assertion.** Suppose $f \in L^1_{loc}(\Omega)$ and $\partial_v^w f = 0$ and $f_m := f * \eta_m$ as is in the proof of Lemma 32.9. Then $f_m' = \partial_v^w f * \eta_m = 0$, so $f_m = c_m$ for some constant $c_m \in \mathbb{C}$. By Theorem 19.32 $f_m \to f$ in $L_{loc}^1(\Omega)$ and therefore if $J = [a, b]$ is a compact subinterval of $\Omega$, $c_m - c_k = \frac{1}{b-a} \int_{J} |f_m - f_k| dm \to 0$ as $m, k \to \infty$.  

So $\{c_m\}_{m=1}^\infty$ is a Cauchy sequence and therefore $c := \lim_{m \to \infty} c_m$ exists and $f = \lim_{m \to \infty} f_m = c$ a.e.  

We will say more about the connection of weak derivatives to pointwise derivatives in Section 32.3 below.
32.2 Exercises

Exercise 32.1. Give another proof of Lemma 32.10 based on Proposition 32.12.

Exercise 32.2. Prove Proposition 32.13. Hints: 1. Use \( u_\varepsilon \) as defined in the proof of Proposition 32.12 to show it suffices to consider the case where \( u \in C^\infty \left( \mathbb{R}^d \right) \cap L^1 \left( \mathbb{R}^d \right) \) with \( \partial^\alpha u \in L^1 \left( \mathbb{R}^d \right) \) for all \( \alpha \in \mathbb{N}_0^n \). Then let \( \psi \in C^\infty_c (\mathbb{R}^d) \) such that \( \psi = 1 \) on a neighborhood of 0 and let \( u_\varepsilon (x) := u(x) \psi (x/\varepsilon) \).

Exercise 32.3. Suppose \( p(x) \) is a polynomial in \( x \in \mathbb{R}^d \), \( p \in (1, \infty) \), \( q := \frac{p}{p-1} \), \( u \in L^p \) such that \( p(\partial) u \in L^p \) and \( v \in L^q \) such that \( p(-\partial) v \in L^q \). Show \( p(\partial) u, v) = \langle u, p(-\partial) v \rangle \).

Exercise 32.4. Let \( p \in [1, \infty) \), \( \alpha \) be a multi index (if \( \alpha = 0 \) let \( \partial^\alpha \) be the identity operator on \( L^p \)),

\[
D(\partial^\alpha) := \{ f \in L^p (\mathbb{R}^n) : \partial^\alpha f \text{ exists weakly in } L^p (\mathbb{R}^n) \}
\]

and for \( f \in D(\partial^\alpha) \) (the domain of \( \partial^\alpha \)) let \( \partial^\alpha f \) denote the \( \alpha \)-weak derivative of \( f \). (See Definition 32.2.1.)

1. Show \( D(\partial^\alpha) \) is a densely defined operator on \( L^p \), i.e. \( D(\partial^\alpha) \) is a dense linear subspace of \( L^p \) and \( D(\partial^\alpha) \rangle \to L^p \) is a linear transformation.

2. Show \( \partial^\alpha : D(\partial^\alpha) \to L^p \) is a closed operator, i.e. the graph,

\[
\Gamma(\partial^\alpha) := \{ (f, \partial^\alpha f) \in L^p \times L^p : f \in D(\partial^\alpha) \},
\]

is a closed subspace of \( L^p \times L^p \).

3. Show \( \partial^\alpha : D(\partial^\alpha) \subset L^p \to L^p \) is not bounded unless \( \alpha = 0 \). (The norm on \( D(\partial^\alpha) \) is taken to be the \( L^p \) norm.)

Exercise 32.5. Let \( p \in [1, \infty) \), \( f \in L^p \) and \( \alpha \) be a multi index. Show \( \partial^\alpha f \) exists weakly (see Definition 32.3.1) in \( L^p \) iff there exists \( f_n \in C^\infty_c (\mathbb{R}^n) \) and \( g \in L^p \) such that \( f_n \to f \) and \( \partial^\alpha f_n \to g \) in \( L^p \) as \( n \to \infty \). Hints: See exercises 32.2 and 32.4.

Exercise 32.6. 8.8 on p. 246.

Exercise 32.7. Assume \( n = 1 \) and let \( \partial = \partial_1 \) where \( e_1 = (1) \in \mathbb{R}^1 = \mathbb{R} \).

1. Let \( f(x) = |x| \), show \( \partial f \) exists weakly in \( L^1_{\text{loc}} (\mathbb{R}) \) and \( \partial f(x) = \text{sgn}(x) \) for \( m \)-a.e. \( x \).

2. Show \( \partial (\partial f) \) does not exist weakly in \( L^1_{\text{loc}} (\mathbb{R}) \).

3. Generalize item 1. as follows. Suppose \( f \in C (\mathbb{R}, \mathbb{R}) \) and there exists a finite set \( A := \{ t_1 < t_2 < \cdots < t_N \} \subset \mathbb{R} \) such that \( f \in C^1 (\mathbb{R} \setminus A, \mathbb{R}) \). Assuming \( \partial f \in L^1_{\text{loc}} (\mathbb{R}) \), show \( \partial f \) exists weakly and \( \partial (\partial f) (x) = \partial f(x) \) for \( m \)-a.e. \( x \).

Exercise 32.8. Suppose that \( f \in L^1_{\text{loc}} (\Omega) \) and \( v \in \mathbb{R}^d \) and \( \{ e_j \}_{j=1}^n \) is the standard basis for \( \mathbb{R}^d \). If \( \partial_j f := \partial_1 f \) exists weakly in \( L^1_{\text{loc}} (\Omega) \) for all \( j = 1, 2, \ldots, n \) then \( \partial_v f \) exists weakly in \( L^1_{\text{loc}} (\Omega) \) and \( \partial_v f = \sum_{j=1}^n v_j \partial_j f \).

Exercise 32.9. Suppose, \( f \in L^1_{\text{loc}} (\mathbb{R}^d) \) and \( \partial_v f \) exists weakly and \( \partial_v f = 0 \) in \( L^1_{\text{loc}} (\mathbb{R}^d) \) for all \( v \in \mathbb{R}^d \). Then there exists \( \lambda \in \mathbb{C} \) such that \( f(x) = \lambda \) for \( m \)-a.e. \( x \in \mathbb{R}^d \). Hint: See steps 1 and 2. in the outline given in Exercise 32.10 below.

Exercise 32.10 (A generalization of Exercise 32.9). Suppose \( \Omega \) is a connected open subset of \( \mathbb{R}^d \) and \( f \in L^1_{\text{loc}} (\Omega) \). If \( \partial^\alpha f = 0 \) weakly for \( \alpha \in \mathbb{Z}_+^n \) with \( |\alpha| = N + 1 \), then \( f(x) = p(x) \) for \( m \)-a.e. \( x \) where \( p(x) \) is a polynomial of degree at most \( N \). Here is an outline.

1. Suppose \( x_0 \in \Omega \) and \( \varepsilon > 0 \) such that \( C := C_{x_0}(\varepsilon) \subset \Omega \) and let \( \eta_n \) be a sequence of approximate \( \delta \)-functions such \( \text{supp}(\eta_n) \subset B(1/n) \) for all \( n \). Then for \( n \) large enough, \( \partial^\alpha (f * \eta_n) = (\partial^\alpha f) * \eta_n \) on \( C \) for \( |\alpha| = N + 1 \). Now use Taylor’s theorem to conclude there exists a polynomial \( p_n \) of degree at most \( N \) such that \( f_n = p_n \) on \( C \).

2. Show \( p := \lim_{n \to \infty} p_n \) exists on \( C \) and then let \( n \to \infty \) in step 1. to show there exists a polynomial of degree at most \( N \) such that \( f = p \) a.e. on \( C \).

3. Use Taylor’s theorem to show if \( p \) and \( q \) are two polynomials on \( \mathbb{R}^d \) which agree on an open set then \( p = q \).

4. Finish the proof with a connectedness argument using the results of steps 2 and 3. above.

Exercise 32.11. Suppose \( \Omega \subset \mathbb{R}^d \) and \( v, w \in \mathbb{R}^d \). Assume \( f \in L^1_{\text{loc}} (\Omega) \) and that \( \partial_1 \partial_w f \) exists weakly in \( L^1_{\text{loc}} (\Omega) \), show \( \partial_w \partial_1 f \) also exists weakly and \( \partial_1 \partial_w f = \partial_w \partial_1 f \).

Exercise 32.12. Let \( d = 2 \) and \( f(x,y) = 1_{x \geq 0} \). Show \( \partial^{(1,1)} f = 0 \) weakly in \( L^1_{\text{loc}} \).
Bochner Integral

Throughout this chapter we will assume that \((\Omega, \mathcal{F}, \mu)\) be a fixed measure space, \(X\) is a separable real Banach space, \(B = B(X) = B_X^\sigma\) is the Borel \(\sigma\)-algebra, and \(X^*\) is the continuous dual of \(X\). In this chapter we will define the Bochner integral, \(\int f d\mu \in X\), of a measurable function \(f : \Omega \to X\). Define integrals of functions taking values in a Banach space. (Shortly we will further assume that \(\mu\) is a \(\sigma\)– finite on \(\mathcal{F}\).) We will also introduce a vector valued conditional expectation and prove some related vector valued martingale results.

Before getting down to business we need to address a couple measure theoretic properties of the Borel \(\sigma\)– algebra \((B_X)^\sigma\) on \(X\).

### 33.1 Basic Properties of \((X, B_X)^\sigma\)

**Proposition 33.1.** The Borel \(\sigma\)– algebra of \(X\) and the \(\sigma\)– algebra generated by \(\phi \in X^*\) are the same, i.e. \(\sigma(X^*) = B\).

**Proof.** If \(\phi \in X^*\), then \(\phi : X \to \mathbb{R}\) is continuous and hence Borel measurable. Therefore \(\sigma(X^*) \subset B\). For the converse. Choose \(x_n \in X\) such that \(|x_n| = 1\) for all \(n\) and

\[
\{x_n\} = S = \{x \in X : |x| = 1\}.
\]

By the Hahn Banach Theorem 31.4 (or Corollary 31.5), there exists \(\varphi_n \in X^*\) such that i) \(\varphi_n(x_n) = 1\) and ii) \(|\varphi_n|_{X^*} = 1\) for all \(n\). For \(x \in X\), \(|\varphi_n(x)| \leq |x|\) for all \(n\) and hence \(\sup_n |\varphi_n(x)| \leq |x|\).

Conversely, we may choose an increasing sequence \(\{n_k\}_{k=1}^\infty \subset \mathbb{N}\) such that \(x = \lim_{k \to \infty} |x|x_{n_k}\) in which case

\[
|\varphi_{n_k}(x) - \varphi_{n_k}(|x|x_{n_k})| \leq |x - |x||x_{n_k}| \to 0 \text{ as } k \to \infty.
\]

Hence \(\lim_{k \to \infty} |\varphi_{n_k}(x)| = |x|\) and we have shown

\[
|\varphi_n(x)| = \sup_n |\varphi_n(x)| \text{ for all } x \in X. \tag{33.1}
\]

Therefore

\[
|\cdot - x_0| = \sup_n |\varphi_n(\cdot - x_0)| = \sup_n |\varphi_n(\cdot) - \varphi_n(x_0)|
\]

is \(\sigma(X^*)\)–measurable for each \(x_0 \in X\) and hence

\[
\{x : |x - x_0| < \delta\} \in \sigma(X^*).
\]

Hence \(\sigma(X^*)\) contains all open balls in \(X\) and by separability all open sets of \(X\) which implies \(B(X) \subset \sigma(X^*)\).

**Corollary 33.2.** Suppose that \((\Omega, \mathcal{F}, \mu)\) is a measure space and \(F, G : \Omega \to X\) are \(F/B(X)\)– measurable functions. Then \(F(\omega) = G(\omega)\) for \(\mu\)– a.e. \(\omega \in \Omega\) iff \(\varphi \circ F(\omega) = \varphi \circ G(\omega)\) for \(\mu\)– a.e. \(\omega \in \Omega\) and every \(\varphi \in X^*\).

**Proof.** The direction, \(\Rightarrow\), is clear. For the converse direction let \(\{\varphi_n\} \subset X^*\) be as in Proposition 33.1 and for \(n \in \mathbb{N}\), let

\[
E_n := \{\omega \in \Omega : \varphi_n \circ F(\omega) \neq \varphi_n \circ G(\omega)\}.
\]

By assumption \(\mu(E_n) = 0\) and therefore \(E := \bigcup_{n=1}^\infty E_n\) is a \(\mu\)– null set as well. This completes the proof since \(\varphi_n(F - G) = 0\) on \(E^c\) and therefore, by Eq. 33.1

\[
\|F - G\| = \sup_n |\varphi_n(F - G)| = 0 \text{ on } E^c.
\]

**Definition 33.3.** \(FC_c^\infty(X) = \{f : X \to \mathbb{R} : f = F(\varphi_1, \varphi_2, \ldots, \varphi_n), F \in C_c^\infty(\mathbb{R}^n) \text{ and } \varphi_i \in X^*\}\).

**Lemma 33.4.** Given a rectangle \(R\) in \(\mathbb{R}^n\), say \(R = [a_1, b_1] \times \cdots \times [a_n, b_n]\), then there exists \(f_k \in C_c^\infty(\mathbb{R}^n)\) such that \(f_k \to 1_R\) boundedly.

**Proof.** It suffices to consider the one dimensional case. Let \(\varphi \in C_c^\infty(\mathbb{R})\) such that \(\varphi \geq 0\), \(\varphi\) is supported in \((-1, 0)\) and \(\int_{-\infty}^\infty \varphi(x)dx = 1\). Set \(\varphi_c(x) = \frac{1}{\epsilon} \varphi\left(\frac{x}{\epsilon}\right)\).

Then

\[
\varphi_c * 1_{[a,b)}(x) = \int_{-\infty}^\infty \varphi_c(y) 1_{[a,b)}(x - y) dy = \int_{-\infty}^\infty \varphi(y) 1_{[a,b)}(x - \epsilon y) dy
\]

\[
= \int_{-\infty}^0 \varphi(y) 1_{[a,b)}(x - \epsilon y) dy = 1_{[a,b)}(x) \text{ as } \epsilon \downarrow 0
\]

for all \(x \in \mathbb{R}\).
Lemma 33.5. The $\sigma$–algebra generated by $F_{\infty}^{c}(X)$ and the functions of the form $\{e^{i\varphi} : \varphi \in X^{*}\}$ are same as the Borel $\sigma$–algebra, i.e. $\sigma(F_{\infty}^{c}(X)) = B(X)$ and $\sigma(\{e^{i\varphi} : \varphi \in X^{*}\}) = B(X)$.

Proof. By Lemma 33.4 $1_{\varphi^{-1}(a,b)} = 1_{[a,b]} \circ \varphi$ is a bounded $\sigma(F_{\infty}^{c}(X))$ — measurable function for all $-\infty < a < b < \infty$ and $\varphi \in X^{*}$. Therefore it follows $\varphi^{-1}(a,b) \in \sigma(F_{\infty}^{c}(X))$ for all $-\infty < a < b < \infty$ and hence $\varphi$ is a bounded function of $\sigma(F_{\infty}^{c}(X))$ — measurable for all $\varphi \in X^{*}$. Hence we may conclude that

$$B(X) = \sigma(X^{*}) \subset \sigma(F_{\infty}^{c}(X)).$$

Since every $f \in F_{\infty}^{c}(X)$ is continuous, $\sigma(F_{\infty}^{c}(X)) \subset B(X)$ and the proof that $\sigma(F_{\infty}^{c}(X)) = B(X)$ is complete.

Clearly for all $\varphi \in X^{*}$, $e^{i\varphi}$ is $\sigma(X^{*})$ measurable so that $\{e^{i\varphi} : \varphi \in X^{*}\} \subset B(X)$. To prove the converse inclusion, suppose that $f \in C_{\infty}^{c}(R, C)$ and for $M >> 1$, let

$$f_{M}(x) = \sum_{k \in \mathbb{Z}} f(x + k2\pi M).$$

Then $f_{M}$ is a $2\pi M$ — periodic function on $R$ and therefore by the Stone–Weierstrass Theorem 25.31 there exists polynomials $p_{m}(\xi, \bar{\xi})$ for $\xi \in \mathbb{C}$ such that $p_{m}(e^{i\varphi}, e^{-i\varphi})$ converges to $f_{M}(x)$ uniformly in $x$ as $m \to \infty$. In particular this implies for any $\varphi \in X^{*}$ that $f_{M}(\varphi)$ is the uniform limit of $p_{m}(e^{i\varphi/M}, e^{-i\varphi/M})$ and there therefore $f_{M}(\varphi)$ is a bounded $\sigma(\{e^{i\varphi} : \varphi \in X^{*}\})$ — measurable function. Because $f_{M}(\varphi) \to f(\varphi)$ as $M \to \infty$, it now follows that $f(\varphi)$ is also a bounded $\sigma(\{e^{i\varphi} : \varphi \in X^{*}\})$ — measurable function. Letting $f$ approximate $1_{(a,b)}$ with $-\infty < a < b < \infty$ then shows that $1_{\varphi^{-1}(a,b)} = 1_{[a,b]} \circ \varphi$ is a bounded $\sigma(\{e^{i\varphi} : \varphi \in X^{*}\})$ — measurable function and therefore

$$B(X) = \sigma(X^{*}) \subset \sigma(\{e^{i\varphi} : \varphi \in X^{*}\}).$$

Alternative argument: apply the density Theorem 33.7 below with $\mu$ replaced by $\mu + \nu$. In more detail if $f : X \to \mathbb{C}$ is a bounded $B(X)$ — measurable function, we may find $f_{n} \in \text{span}\{e^{i\varphi} : \varphi \in X^{*}\}$ such that $f_{n} \to f$ in $L^{1}(\mu + \nu)$. Since this convergence takes place in $L^{1}(\mu)$ and $L^{1}(\nu)$ as well and $\mu(f_{n}) = \nu(f_{n})$ for all $n$, we may conclude,

$$\mu(f) = \lim_{n \to \infty} \mu(f_{n}) = \lim_{n \to \infty} \nu(f_{n}) = \nu(f).$$

\[ \text{Theorem 33.7 (Density Theorem I).} \] Let $\mu$ be a probability measure on $B(X)$ and $1 \leq p < \infty$. Then

1. $F_{\infty}^{c}(X)$ is dense in $L^{p}(X, B, \mu)$ and
2. span$\{e^{i\varphi} : \varphi \in X^{*}\}$ is dense in $L^{p}(X, B, \mu)$.

Proof. 1. Let $Q = F_{\infty}^{c}(X)$, $H$ denote the bounded measurable functions in $Q^{L^{p}}$ — the $L^{p}$—closure of $Q$. Then $Q \subset H$, 1 $\in H$ (as the reader should prove) and $H$ is a linear space which, by the dominated convergence theorem, is closed under bounded convergence. From the Dini's multiplicative system theorem (see Theorems 11.26 and 11.27), it follows that $H$ contains all bounded $\sigma(Q)$ — measurable functions. This result along with Lemma 33.5 implies $F_{\infty}^{c}(X)$ contains all bounded $B(X)$ — measurable functions and this latter class of functions is dense in $L^{p}$.

2. Let $H$ denote linear subspace consisting of all bounded functions in span$\{e^{i\varphi} : \varphi \in X^{*}\}^{L^{p}(\mu)}$. As before 1 $\in H$, $H$ is closed under bounded convergence and complex conjugation and contains the multiplicative system $Q := \{e^{i\varphi} : \varphi \in X^{*}\}$. Therefore $H$ contains all bounded $\sigma(Q)$ — measurable functions. This result along with Lemma 33.5 implies span$\{e^{i\varphi} : \varphi \in X^{*}\}^{L^{p}(\mu)}$ contains all bounded $B(X)$ — measurable functions and this latter class of functions is dense in $L^{p}$.

\[ \text{Proposition 33.8 (Density Theorem II).} \] Suppose $\mu$ is a probability measure such that for all $\varphi \in X^{*}$ there exists $\varepsilon = \varepsilon(\varphi) > 0$ such that $\mu(e^{i\varphi}) < \infty$. Then

$$F = \{P(\varphi_{1}, \ldots, \varphi_{n}) : P : \mathbb{R}^{n} \to \mathbb{R} \text{ a polynomial}\}$$

is dense in $L^{p}(X, B, \mu)$ for all $1 \leq p < \infty$.

Proof. If $T^{L^{p}}$ is a proper subspace of $L^{p}$ then by the Hahn Banach Theorem 31.4 (or Corollary 31.5) there exists $\lambda \in (L^{p})^{\ast}$ such that $\lambda \neq 0$ while $\lambda(F) = \{0\}$. Since $(L^{p})^{\ast} \cong L^{q}$ where $\frac{1}{p} + \frac{1}{q} = 1$, there exists $g \in L^{q}$ such that

$$\lambda(f) = \int_{X} f g d\mu \text{ for all } f \in L^{p}.$$
By assumption
\[ \int_X fg \, d\mu = \lambda(f) = 0 \text{ for all } f \in \mathcal{F} \tag{33.2} \]
and \( g \neq 0 \) because \( \lambda \neq 0 \). We will arrive at contradiction by showing \( g = 0 \). Let \( \varphi \in X^* \) and choose \( \varepsilon > 0 \) such that \( \int_X e^{i|\varphi|} \, d\mu < \infty \). Then for any \( n \in \mathbb{N}_0 \) and \( \delta \in (0, \varepsilon/p) \),
\[ \int_X |\varphi|^n e^{|\delta| |g|} \, d\mu \leq \|g\|_{L^p} \left( \int_X |\varphi|^n e^{\delta |\varphi|} \, d\mu \right)^{1/p} < \infty \]
for all \( 0 < \delta < \varepsilon/p \), since there exists \( C < \infty \) such that
\[ |\varphi|^n e^{|\delta| |g|} \leq C e^{\varepsilon |\varphi|}. \]
Define \( F(z) = \int_X e^{iz \varphi} \, d\mu \) for \( |Re \, z| < \delta \). Then \( F \) is analytic on \( |Re \, z| < \delta \) and
\[ F^{(n)}(z) = \int_X \varphi^n e^{iz \varphi} \, d\mu \text{ for all } n \in \mathbb{N}_0. \]
In particular \( F^{(n)}(0) = \int_X \varphi^n \, d\mu \) and hence \( F^{(n)}(0) = 0 \) for all \( n \in \mathbb{N}_0 \) by Eq. \( 33.2 \). By analytic continuation it then follows that \( F \equiv 0 \) on \( |Re \, z| < \delta \) and in particular
\[ \int_X e^{iz \varphi} \, d\mu = F(i) = 0. \]
Since \( \varphi \in X^* \) was arbitrary we have shown \( \int_X e^{iz \varphi} \, d\mu = 0 \) for all \( \varphi \in X^* \). Because \( \text{span}\{e^{iz} : \varphi \in X^*\} \) is dense in \( L^p(\mu) \) this implies \( g = 0 \in L^p \) and we have arrived at the desired contradiction. \( \blacksquare \)

### 33.2 Banach Valued \( L^p \) Spaces

**Remark 33.9.** Recall that we have already seen in this case that the Borel \( \sigma \) – field \( \mathcal{B} \) on \( X \) is the same as the \( \sigma \) – field \( \{\sigma(X^*)\} \) which is generated by \( X^* \) – the continuous linear functionals on \( X \). (This is done in Proposition \( 33.1 \) below.)

As a consequence \( F : \Omega \to X \) is \( F/B \) measurable if \( \varphi \circ F : \Omega \to \mathbb{R} \) is \( F/B(\mathbb{R}) \) – measurable for all \( \varphi \in X^* \). In particular it follows that if \( F, G : \Omega \to X \) are measurable functions then so is \( F + G \) and \( \lambda F \) for all \( \lambda \in \mathbb{F} \) and it follows that \( \{F \neq G\} = \{F - G \neq 0\} \) is measurable as well. Also note that \( ||| : X \to [0, \infty) \) is continuous and hence measurable and hence \( \omega \to \|F(\omega)\|_X \) is the composition of two measurable functions and therefore measurable.

**Definition 33.10.** For \( 1 \leq p < \infty \) let \( L^p(\mu; X) \) denote the space of measurable functions \( F : \Omega \to X \) such that \( \int_X \|F\|^p \, d\mu < \infty \). For \( F \in L^p(\mu; X) \), define
\[ \|F\|_{L^p} = \left( \int_X \|F\|^p \, d\mu \right)^{1/p}. \]
As usual in \( L^p \) – spaces we will identify two measurable functions, \( F, G : \Omega \to X \), if \( F = G \) a.e.

**Lemma 33.11.** Suppose \( a_n \in X \) and \( \|a_{n+1} - a_n\| \leq \varepsilon_n \) and \( \sum \varepsilon_n < \infty \). Then
\[ \lim_{n \to \infty} a_n = a \in X \text{ exists and } \|a - a_n\| \leq \delta_n = \sum_{k=n}^{\infty} \varepsilon_k. \]

**Proof.** (This is a special case of Exercise \( 13.9 \)) Let \( m > n \) then
\[ \|a_m - a_n\| = \left\| \sum_{k=n+1}^{m-1} (a_{k+1} - a_k) \right\| \leq \sum_{k=n}^{m-1} \|a_{k+1} - a_k\| \leq \sum_{k=n}^{\infty} \varepsilon_k = \delta_n. \]
So \( \|a_m - a_n\| \leq \delta_{\text{min}(m,n)} \to 0 \) as \( m, n \to \infty \), i.e. \( \{a_n\} \) is Cauchy. Let \( m \to \infty \) in \( 33.3 \) to find \( \|a - a_n\| \leq \delta_n \). \( \blacksquare \)

**Lemma 33.12.** Suppose that \( \{F_n\} \) is Cauchy in measure, i.e.
\[ \lim_{n \to \infty} \mu(\|F_n - F_m\| \geq \varepsilon) = 0 \text{ for all } \varepsilon > 0. \]
Then there exists a subsequence \( G_j = F_{n_j} \) such that \( F := \lim_{j \to \infty} G_j \) exists \( \mu - \text{a.e.} \) and moreover \( F \downarrow F \) as \( n \to \infty \), i.e. \( \lim_{n \to \infty} \mu(\|F_n - F\| \geq \varepsilon) = 0 \) for all \( \varepsilon > 0 \).

**Proof.** Let \( \varepsilon_n > 0 \) such that \( \sum_{n=1}^{\infty} \varepsilon_n < \infty \) (\( \varepsilon_n = 2^{-n} \) would do) and set \( \delta_n = \sum_{k=n}^{\infty} \varepsilon_k \). Choose \( G_j = F_{n_j} \) where \( \{n_j\} \) is a subsequence of \( \mathbb{N} \) such that
\[ \mu(\|G_{j+1} - G_j\| > \varepsilon_j) \leq \varepsilon_j. \]
Let
\[ A_N := \cup_{j \geq N} \{\|G_{j+1} - G_j\| > \varepsilon_j\} \quad \text{and} \quad E := \cap_{n=1}^{\infty} A_N = \{\|G_{j+1} - G_j\| > \varepsilon_j \text{ i.o.}\}. \]
Since \( \mu(A_N) \leq \delta_N < \infty \) and \( A_N \downarrow E \) it follows[5] that \( 0 = \mu(E) = \lim_{N \to \infty} \mu(A_N) \). For \( \omega \notin E \), \( \|G_{j+1}(\omega) - G_j(\omega)\| \leq \varepsilon_j \) for a.a. \( j \) and hence
\[ \sum_{j=1}^{\infty} \mu(\{\|G_{j+1} - G_j\| > \varepsilon_j\}) \leq \sum_{j=1}^{\infty} \varepsilon_j < \infty. \]
Theorem 33.13. For each \( j \geq 1 \), \( G_j(x) \) exists for \( x \notin F \). Let us define \( F(x) = 0 \) for all \( x \in E \).

Next we will show \( G_N \xrightarrow{\mu} F \) as \( N \to \infty \) where \( F \) and \( G_N \) are as above. If

\[
\omega \in A_N^+ = \cap_{j \geq N} \{ \| G_{j+1} - G \| \leq \varepsilon_j \},
\]

then

\[
\| G_{j+1}(\omega) - G(\omega) \| \leq \varepsilon_j \text{ for all } j \geq N.
\]

Another application of Lemma 33.11 shows \( \| F(\omega) - G(\omega) \| \leq \delta_j \) for all \( j \geq N \), i.e.,

\[
A_N^+ \subset \cap_{j \geq N} \{ \| F - G \| \leq \delta_j \} \subset \{ \| F - G \| \leq \delta_N \}.
\]

Therefore, by taking complements of this equation, \( \{ \| F - G \| > \delta_N \} \subset A_N \) and hence

\[
\mu(\| F - G \| > \delta_N) \leq \mu(A_N) \leq \delta_N \to 0 \text{ as } N \to \infty
\]

and in particular, \( G_N \xrightarrow{\mu} F \) as \( N \to \infty \).

With this in hand, it is straightforward to show \( F_n \xrightarrow{\mu} F \). Indeed, by the usual trick, for all \( j \in \mathbb{N} \),

\[
\mu(\{ \| F_n - F \| > \varepsilon \}) \leq \mu(\{ \| F - G \| > \varepsilon/2 \}) + \mu(\| G_j - F_n \| > \varepsilon/2).
\]

Therefore, letting \( j \to \infty \) in this inequality gives,

\[
\mu(\{ \| F_n - F \| > \varepsilon \}) \leq \limsup_{j \to \infty} \mu(\| G_j - F_n \| > \varepsilon/2) \to 0 \text{ as } n \to \infty,
\]

wherein we have used \( \{ F_n \}_{n=1}^\infty \) is Cauchy in measure and \( G_j \xrightarrow{\mu} F \).

\[\Box\]

Theorem 33.13. For each \( p \in [0, \infty) \), the space \( (L^p(\mu; X), \cdot \) \cdot \) \( L^p \) \( \) is a Banach space.

Proof. It is straightforward to check that \( \cdot \) \( L^p \) \( \) is a norm. For example,

\[
\| F + G \|_{L^p} = \left( \int \| F + G \|_X^p \ d\mu \right)^{\frac{1}{p}} \leq \left( \int (\| F \|_X + \| G \|_X)^p d\mu \right)^{\frac{1}{p}} \leq \| F \|_{L^p} + \| G \|_{L^p}.
\]

So the main point is to prove completeness of the norm.

Let \( \{ F_n \}_{n=1}^\infty \subset L^p(\mu) \) be a Cauchy sequence. By Chebyshev’s inequality, \( \{ F_n \} \) is Cauchy in measure and by Theorem 38.16 there exists a subsequence \( \{ G_j \} \) of \( \{ F_n \} \) such that \( G_j \to F \) a.e. By Fatou’s Lemma,

\[
\| G_j - F \|_p = \lim_{k \to \infty} \inf_{k \to \infty} \| G_j - G_k \|_p \mu \leq \lim_{k \to \infty} \inf_{k \to \infty} \| G_j - G_k \|_p d\mu
\]

\[
= \lim_{k \to \infty} \inf_{k \to \infty} \| G_j - G_k \|_p \to 0 \text{ as } j \to \infty.
\]

In particular, \( \| F \|_p \leq \| G_j - F \|_p + \| G_j \|_p < \infty \) so the \( F \in L^p \) and \( G_j \xrightarrow{\mu} F \).

The proof is finished because,

\[
\| F_n - F \|_p \leq \| F_n - G_j \|_p + \| G_j - F \|_p \to 0 \text{ as } j, n \to \infty.
\]

We say a function \( F : \Omega \to X \) is a simple function if \( F \) is measurable and has finite range. If \( F \) also satisfies, \( \mu(F \neq 0) < \infty \) we say that \( F \) is a \( \mu \) – simple function and let \( S(\mu; X) \) denote the vector space of \( \mu \) – simple functions.

Proposition 33.14. For each \( 1 \leq p < \infty \) the \( \mu \) – simple functions, \( S(\mu; X) \), are dense inside of \( L^p(\mu; X) \).

Proof. Let \( D := \{ x_n \}_{n=1}^\infty \) be a countable dense subset of \( X \setminus \{ 0 \} \). For each \( \varepsilon > 0 \) and \( n \in \mathbb{N} \) let

\[
B_n(\varepsilon) := \{ x \in X : \| x - x_n \| \leq \min \left( \varepsilon, \frac{1}{2} \| x_n \| \right) \}
\]

and then define \( A_n^\varepsilon := B_n^\varepsilon \setminus \left( \cup_{k=1}^\infty B_k^\varepsilon \right) \). Thus \( \{ A_n^\varepsilon \}_{n=1}^\infty \) is a partition of \( X \setminus \{ 0 \} \) with the added property that \( \| y - x_n \| \leq \varepsilon \) and \( \frac{1}{2} \| x_n \| \leq \| y \| \leq \frac{3}{2} \| x_n \| \) for all \( y \in A_n^\varepsilon \).

Given \( F \in L^p(\mu; X) \) let

\[
F_\varepsilon := \sum_{n=1}^\infty x_n \cdot 1_{F \in A_n^\varepsilon} = \sum_{n=1}^\infty x_n \cdot 1_{F^{-1}(A_n^\varepsilon)}.
\]

For \( \omega \in F^{-1}(A_n^\varepsilon) \), i.e. \( F(\omega) \in A_n^\varepsilon \), we have

\[
\| F_\varepsilon(\omega) \| = \| x_n \| \leq \| F(\omega) \| \text{ and } \| F_\varepsilon(\omega) - F(\omega) \| = \| x_n - F(\omega) \| \leq \varepsilon.
\]

Putting these two estimates together shows,

\[
\| F_\varepsilon - F \| \leq \varepsilon \text{ and } \| F_\varepsilon - F \| \leq \| F_\varepsilon \| + \| F \| \leq 3 \| F \|.
\]

Hence we may now apply the dominated convergence theorem in order to show

\[
\lim_{\varepsilon \downarrow 0} \| F_\varepsilon - F \|_{L^p(\mu; X)} = 0.
\]
As the \( F_x \) – have countable range we have not yet completed the proof. To remedy this defect, to each \( N \in \mathbb{N} \) let
\[
F^N_x := \sum_{n=1}^N x_n \cdot 1_{F^{-1}(A_n)}.
\]
Then it is clear that \( \lim_{N \to \infty} F^N_x = F_x \) and that \( \|F^N_x\| \leq \|F_x\| \leq 2 \|F\| \) for all \( N \). Therefore another application of the dominated convergence theorem implies, \( \lim_{N \to \infty} \|F^N_x - F_x\|_{L^p(\mu; X)} = 0 \). Thus any \( F \in L^p(\mu; X) \) may be arbitrarily well approximated by one of the \( F^N_x \in \mathcal{S}(\mu; X) \) with \( \varepsilon \) sufficiently small and \( N \) sufficiently large.

For later purposes it will be useful to record a result based on the partitions \( \{A_n\}_{n=1}^\infty \) of \( X \setminus \{0\} \) introduced in the above proof.

**Lemma 33.15.** Suppose that \( F : \Omega \to X \) is a measurable function such that \( \mu(F \neq 0) > 0 \). Then there exists \( B \in \mathcal{F} \) and \( \varphi X^* \) such that \( \mu(B) > 0 \) and \( \inf_{\omega \in B} \varphi \circ F(\omega) > 0 \).

**Proof.** Let \( \varepsilon > 0 \) be chosen arbitrarily, for example you might take \( \varepsilon = 1 \) and let \( \{A_n = A^n_{\varepsilon}\}_{n=1}^\infty \) be the partition of \( X \setminus \{0\} \) introduced in the proof of Proposition 33.14 above. Since \( \{F \neq 0\} = \bigcup_{n=1}^\infty \{F \in A_n\} \) and \( \mu(F \neq 0) > 0 \), it follows that that \( \mu(F \in A_n) > 0 \) for some \( n \in \mathbb{N} \). We now let \( B := \{F \in A_n\} = F^{-1}(A_n) \) and choose \( \varphi \in X^* \) such that \( \varphi(x_n) = \|x_n\| \) and \( \|\varphi\|_{X^*} = 1 \). For \( \omega \in B \) we have \( F(\omega) \in A_n \) and therefore \( \|F(\omega) - x_n\| \leq \frac{1}{2} \|x_n\| \) and hence,
\[
\|\varphi(F(\omega)) - \|x_n\|\| = \|\varphi(F(\omega)) - \varphi(x_n)\| \leq \|\varphi\|_X \cdot \|F(\omega) - x_n\| \leq \frac{1}{2} \|x_n\|.
\]
From this inequality we see that \( \varphi(F(\omega)) \geq \frac{1}{2} \|x_n\| > 0 \) for all \( \omega \in B \).

**Definition 33.16.** To each \( F \in \mathcal{S}(\mu; X) \), let
\[
I(F) = \sum_{x \in X} x \mu(F^{-1}(\{x\})) = \sum_{x \in X} x \mu(\{F = x\}) = \sum_{x \in F(\Omega)} x \mu(\{F = x\}) \in X.
\]

The following proposition is straightforward to prove.

**Proposition 33.17.** The map \( I : \mathcal{S}(\mu; X) \to X \) is linear and satisfies for all \( F \in \mathcal{S}(\mu; X) \),
\[
\|I(F)\|_X \leq \int_\Omega \|F\|_\mu \text{ and } \quad \|F\|_X \leq \int_\Omega \|F\|_\mu \text{ and } \quad \|\varphi(F)\| = \int_X \varphi \circ F \, d\mu \forall \varphi X^*.
\]

**Proof.** If \( 0 \neq c \in \mathbb{R} \) and \( F \in \mathcal{S}(\mu; X) \), then
\[
I(cF) = \sum_{x \in X} x \mu(cF = x) = \sum_{x \in X} x \mu(F = \frac{x}{c}) = \sum_{y \in X} cy \mu(F = y) = cI(F)
\]
and if \( c = 0 \), \( I(0F) = 0 = 0I(F) \). If \( F, G \in \mathcal{S}(\mu; X) \),
\[
I(F + G) = \sum_{x} x \mu(F + G = x) = \sum_{x} x \mu(F = y, G = z)
\]
and Eq. 33.5 follows from:
\[
\varphi(I(F)) = \varphi\left(\sum_{x \in X} x \mu(\{F = x\})\right) = \sum_{y} \varphi(x) \mu(\{F = x\}) = \int_X \varphi \circ F \, d\mu.
\]

**Theorem 33.18 (Bochner Integral).** There is a unique continuous linear map \( \bar{I} : L^1(\Omega, F, \mu; X) \to X \) such that \( \bar{I}|_{\mathcal{S}(\mu; X)} = I \) where \( I \) is defined in Definition 33.16. Moreover, for all \( F \in L^1(\Omega, F, \mu; X) \),
\[
\|\bar{I}(F)\|_X \leq \int_\Omega \|F\|_\mu \quad \text{and} \quad \bar{I}(F) \text{ is the unique element in } X \text{ such that }
\]
\[
\varphi(\bar{I}(F)) = \int_X \varphi \circ F \, d\mu \forall \varphi X^*.
\]
The map \( \tilde{I}(F) \) will be denoted suggestively by \( \int_X F d\mu \) or \( \mu(F) \) so that Eq. (33.7) may be written as
\[
\varphi \left( \int_X F d\mu \right) = \int_X \varphi \circ F d\mu \quad \forall \varphi \in X^* \quad \text{or} \quad \varphi \left( \mu(F) \right) = \mu \left( \varphi \circ F \right) \quad \forall \varphi \in X^*
\]

**Proof.** The existence of a continuous linear map \( \tilde{I} : L^1(\Omega, \mathcal{F}, \mu; X) \to X \) such that \( \tilde{I}|_S = I \) and Eq. (33.6) holds follows from Propositions 33.14 and 33.17 and the bounded linear transformation theorem 6.6. If \( \varphi \in X^* \) and \( F \in L^1(\Omega, \mathcal{F}, \mu; X) \), choose \( F_n \in S(\mu; X) \) such that \( F_n \to F \) in \( L^1(\Omega, \mathcal{F}, \mu; X) \) as \( n \to \infty \). Then \( \tilde{I}(F) = \lim_{n \to \infty} \tilde{I}(F_n) \) and hence by Eq. (33.5),
\[
\varphi(\tilde{I}(F)) = \varphi(\lim_{n \to \infty} \tilde{I}(F_n)) = \lim_{n \to \infty} \varphi(I(F_n)) = \lim_{n \to \infty} \int_X \varphi \circ F_n d\mu.
\]
This proves Eq. (33.7) since
\[
\left| \int_\Omega (\varphi \circ F - \varphi \circ F_n)d\mu \right| \leq \int_\Omega |\varphi \circ F - \varphi \circ F_n| d\mu
\]
\[
= \int_\Omega \|\varphi\| X \cdot \|\varphi \circ F - \varphi \circ F_n\| d\mu
\]
\[
= \|\varphi\| X \cdot \|F - F_n\|_{L^1} \to 0 \quad \text{as} \quad n \to \infty.
\]

The fact that \( \tilde{I}(F) \) is determined by Eq. (33.7) is a consequence of the Hahn – Banach theorem. \( \blacksquare \)

**Example 33.19.** Suppose that \( x \in X \) and \( f \in L^1(\mu; \mathbb{R}) \), then \( F(\omega) := f(\omega)x \) defines an element of \( L^1(\mu; X) \) and
\[
\int_\Omega F d\mu = \left( \int_\Omega f d\mu \right) x.
\]
To prove this just observe that \( \|F\| = |f| \|x\| \in L^1(\mu) \) and for \( \varphi \in X^* \) we have
\[
\varphi \left( \left( \int_\Omega f d\mu \right) x \right) = \left( \int_\Omega f d\mu \right) \cdot \varphi(x)
\]
\[
= \left( \int_\Omega f \varphi(x) d\mu \right) = \int_\Omega \varphi \circ F d\mu.
\]
Since \( \varphi \left( \int_\Omega F d\mu \right) = \int_\Omega \varphi \circ F d\mu \) for all \( \varphi \in X^* \) it follows that Eq. (33.8) is correct.

**Remark 33.20.** The separability assumption on \( X \) may be relaxed by assuming that \( F : \Omega \to X \) has separable essential range. In this case we may still define \( \int_X F d\mu \) by applying the above formalism with \( X \) replaced by the separable Banach space, \( X_0 := \text{span}(\text{essran}_\mu(F)) \). For example if \( \Omega \) is a compact topological space and \( F : \Omega \to X \) is a continuous map, then \( \int_\Omega F d\mu \) is always defined.

### 33.3 Conditional Expectation

Now that we have defined the Bochner integral it is time to move on to conditional expectations. For now let us now suppose that \( \mu \) is a probability measure on \( (\Omega, \mathcal{F}) \) and denote the Bochner integral, \( \mu(F) = \int_\Omega F d\mu \) by \( EF \). Given a sub-\( \sigma \) – algebra \( G \) of \( F \) we would like to define \( \mathbb{E}[F|G] \) as an element of \( L^1(\Omega, G, \mu; X) \) for each \( F \in L^1(\Omega, \mathcal{F}, \mu) \). As with the Bochner integral we will start with simple functions. For any \( F \in S(\mu; X) \) we have the identity,
\[
F = \sum_{x \in \text{Ran}(F) \setminus \{0\}} x 1_{\{F=x\}}
\]
and hence it is reasonable to require,
\[
\mathbb{E}_G F = \mathbb{E}[F|G] = \mathbb{E}\left[ \sum_{x \in \text{Ran}(F) \setminus \{0\}} x 1_{\{F=x\}}|G \right] = \sum_{x \in \text{Ran}(F) \setminus \{0\}} \mathbb{E}[x 1_{\{F=x\}}|G].
\]

Furthermore, since \( x \in X \) is constant in the previous formula we should further require,
\[
\mathbb{E}_G F = \sum_{x \in \text{Ran}(F) \setminus \{0\}} x \cdot \mathbb{E}[1_{\{F=x\}}|G].
\]

**Proposition 33.21.** If \( \mathbb{E}_G : S(\mu; X) \to L^1(\Omega, G, \mu; X) \) is the map defined by Eq. (33.9), then;

1. \( \mathbb{E}_G \) is linear
2. \( \|\mathbb{E}_G F\|_{L^1(G)} \leq \|F\|_{L^1(\mu)} \) for all \( F \in S(\mu; X) \), i.e. \( \mathbb{E}_G \) is a contraction,
3. \( \mathbb{E}_G F \) satisfies,
\[
\mathbb{E}[\mathbb{E}_G F : A] = \mathbb{E}[F : A] \quad \text{for all} \quad A \in G
\]
and
\[
\varphi \circ \mathbb{E}_G F = \mathbb{E}_G [\varphi \circ F] \quad \text{a.s. for all} \quad \varphi \in X^*.
\]

**Proof.** 1) If \( 0 \neq c \in \mathbb{R} \) and \( F \in S(\mu; X) \), then
\[\mathbb{E}_G(cF) = \sum_{x \in X} x \mathbb{E} \left[ 1_{\{cF=x\}} \right] \mathbb{G} = \sum_{x \in X} x \mathbb{E} \left[ 1_{\{F=x/c\}} \right] \mathbb{G} \]

implies,

\[||\mathbb{E}_G F|| = \sum_{x \in \text{Ran}(F) \setminus \{0\}} ||x|| \cdot \mathbb{E} \left[ 1_{\{F=x\}} \right] \mathbb{G}\]

2) Integrating the pointwise inequality,

\[||\mathbb{E}_G F|| \leq \sum_{x \in \text{Ran}(F) \setminus \{0\}} ||x|| \cdot \mathbb{E} \left[ 1_{\{F=x\}} \right] \mathbb{G} \]

\[= \sum_{x \in \text{Ran}(F) \setminus \{0\}} ||x|| \cdot \mathbb{E} \left( 1_{\{F=x\}} \right) \]

\[= \mathbb{E} \left( \sum_{x \in \text{Ran}(F) \setminus \{0\}} ||x|| \cdot 1_{\{F=x\}} \right) \]

\[= \mathbb{E} \|F\| = \|F\|_{L^1(\mu)} \cdot \]

3. If \( A \in \mathcal{G} \) we have,

\[\mathbb{E} \left[ \mathbb{E}_G F : A \right] = \mathbb{E} \left[ \sum_{x \neq 0} x \cdot \mathbb{E} \left[ 1_{\{F=x\}} \right] \mathbb{G} \cdot 1_A \right] \]

\[= \sum_{x \neq 0} \mathbb{E} \left[ x \cdot \mathbb{E} \left[ 1_{\{F=x\}} \right] \mathbb{G} \right] \]

\[= \sum_{x \neq 0} \mathbb{E} \left[ x \cdot 1_{\{F=x\}} \mathbb{G} \right] \]

\[= \mathbb{E} \left[ \sum_{x \neq 0} x \cdot 1_{\{F=x\}} \right] \]

\[= \mathbb{E} \left[ F : A \right] . \]

where we have used Example 33.19 two times in the above computation and all of the above sums are really over \( x \in \text{Ran} (F) \setminus \{0\} \). Finally if \( \varphi \in X^* \) we have,

\[\varphi \circ \mathbb{E}_G F = \sum_{x \neq 0} \varphi(x) \cdot \mathbb{E} \left[ 1_{\{F=x\}} \mathbb{G} \right] \]

\[= \mathbb{E} \left[ \sum_{x \neq 0} \varphi(x) \cdot 1_{\{F=x\}} \right] \mathbb{G} = \mathbb{E} \left[ \varphi \circ F \mathbb{G} \right] . \]

We may now apply the bounded linear transformation Theorem 30.4 in order to extend \( \mathbb{E}_G \) to all of \( L^1(\Omega, F, \mu; X) \).

**Theorem 33.22 (Conditional expectation).** Let \( F \in L^1(\Omega, F, \mu; X) \). There is a linear map, \( \mathbb{E}_G : L^1(\Omega, F, \mu; X) \to L^1(\Omega, \mathcal{G}, \mu; X) \), such that \( \mathbb{E}_G F \) is uniquely determined by either:

1. \( \mathbb{E}_G F \) is the unique element in \( L^1(\Omega, \mathcal{G}, \mu; X) \) such that

\[\mathbb{E} \left[ \mathbb{E}_G F : A \right] = \mathbb{E} \left[ F : A \right] \text{ for all } A \in \mathcal{G} \]

or
2. \( \mathbb{E}_G F \) is the unique element in \( L^1(\Omega, \mathcal{G}, \mu; X) \) such that \( \varphi \circ \mathbb{E}_G F = \mathbb{E}_G [\varphi \circ F] \) a.s. for all \( \varphi \in X^* \).

Moreover, \( \mathbb{E}_G : L^1(\Omega, \mathcal{F}, \mu; X) \to L^1(\Omega, \mathcal{G}, \mu; X) \) is a contraction.

**Proof.** The existence of contraction \( \mathbb{E}_G : L^1(\Omega, \mathcal{F}, \mu; X) \to L^1(\Omega, \mathcal{G}, \mu; X) \) with the desired properties easily follows from Propositions \ref{proposition:continuous_linear functional} and \ref{proposition:continuous_linear functional 2} along with the bounded linear transformation Theorem \ref{theorem:bounded_linear_transformation}. So it only remains to verify that \( \mathbb{E}_G F \) is uniquely determined by either of the two conditions above.

1. If \( G \in L^1(\Omega, \mathcal{G}, \mu; X) \) satisfies \( \mathbb{E}[G : A] = \mathbb{E}[F : A] = \mathbb{E}[\mathbb{E}_G F : A] \) for all \( A \in \mathcal{G} \) then \( \mathbb{E}[G - \mathbb{E}_G F : A] = 0 \) for all \( A \in \mathcal{G} \). If \( G \neq \mathbb{E}_G F \) a.s., we may use Lemma \ref{lemma:continuous_linear functional} in order to find \( A \in \mathcal{G} \) with \( \mu(A) > 0 \) and \( \varphi \in X^* \) such that \( \varphi \circ (G - \mathbb{E}_G F) > 0 \) on \( A \). We then may conclude,

\[
0 = \varphi(0) = \varphi(\mathbb{E}[G - \mathbb{E}_G F : A]) = \mathbb{E}[\varphi(G - \mathbb{E}_G F) : A] > 0
\]

which is absurd and hence we must have \( G = \mathbb{E}_G F \) a.s.

2. If \( G \in L^1(\Omega, \mathcal{G}, \mu; X) \) satisfies \( \varphi \circ G = \mathbb{E}_G [\varphi \circ F] = \varphi \circ \mathbb{E}_G F \) a.s. for all \( \varphi \in X^* \) then \( \varphi(G - \mathbb{E}_G F) = 0 \) a.s. for all \( \varphi \in X^* \) and the result follows from Corollary \ref{corollary:continuous_linear functional}. Let us recall the proof here. As in the proof of Proposition \ref{proposition:continuous_linear functional} there is a countable subset, \( \mathbb{D} \subset X^* \), such that \( \|\varphi\| = \sup_{\varphi \in \mathbb{D}} \varphi(x) \) for all \( x \in X \). Therefore we may conclude,

\[
\|G - \mathbb{E}_G F\| = \sup_{\varphi \in \mathbb{D}} \varphi(G - \mathbb{E}_G F) = 0 \text{ a.s.,}
\]

i.e. \( G = \mathbb{E}_G F \) a.s.

**Alternate proof.** If \( G \in L^1(\Omega, \mathcal{G}, \mu; X) \) satisfies \( \varphi \circ G = \mathbb{E}_G [\varphi \circ F] \) for \( \varphi \in X^* \) then for any \( A \in \mathcal{G} \) we have

\[
\varphi(\mathbb{E}[G : A]) = \mathbb{E}[\varphi \circ G : A] = \mathbb{E}[\varphi \circ \mathbb{E}_G F : A] = \varphi(\mathbb{E}[\mathbb{E}_G F : A])
\]

Therefore by the Hahn - Banach theorem \( X^* \) separates points and we may conclude that \( \mathbb{E}[G : A] = \mathbb{E}[\mathbb{E}_G F : A] \) and so by item 1, \( G = \mathbb{E}_G F \) a.s.

**Proposition 33.23.** Let \( \mathcal{G} \subset \mathcal{F} \) and \( F \in L^1(\Omega, \mathcal{F}, \mu; X) \). The conditional expectation operator \( \mathbb{E}_G \) satisfies the following additional properties;

1. If \( \mathbb{E}_G F \) is the unique element in \( L^1(\Omega, \mathcal{G}, \mu; X) \) such that \( \varphi \circ \mathbb{E}_G F = \mathbb{E}_G [\varphi \circ F] \) a.s. for all \( \varphi \in X^* \), then

\[
\|\mathbb{E}_G F\| \leq \|\varphi \circ F\| \text{ a.s.}
\]

2. \( \|\mathbb{E}_G F\|_{L^p(\mu)} \leq \|F\|_{L^p(\mu)} \) for all \( F \in L^p(\Omega, \mathcal{F}, \mu; X) \) where \( 1 \leq p < \infty \).

3. If \( \mu \) is the Lebesgue measure, then \( \mathbb{E}_G [hF] = h \cdot \mathbb{E}_G [F] \) a.s.

4. If \( \mathcal{G}_0 \subset \mathcal{G} \subset \mathcal{F} \) and \( \mathbb{E}_{\mathcal{G}_0} \mathbb{E}_G = \mathbb{E}_{\mathcal{G}_0} \mathbb{E}_{\mathcal{G}_0} \), then

\[
\mathbb{E}_{\mathcal{G}_0} \mathbb{E}_G = \mathbb{E}_{\mathcal{G}_0} \mathbb{E}_{\mathcal{G}_0} = \mathbb{E}_G \mathbb{E}_{\mathcal{G}_0}.
\]

**Proof.** We prove each item in turn.
33.4 Basic Martingale Results

In this section we will write \(\mu\) for \(P\). Suppose \((\Omega, \mathcal{F}, \{\mathcal{F}_n\}_{n=0}^\infty, P)\) is a filtered probability space, \(1 \leq p < \infty\), and let \(\mathcal{L}^p := \{\mathcal{F}_n\} := \sigma(\cup_{n=1}^\infty \mathcal{F}_n)\). We will say that \(M_\cdot : \Omega \to X\) is a **martingale** if \(\{M_n\}_{n=1}^\infty\) is an adapted integrable process such that \(\mathbb{E}M_{n+1} = M_n\) a.s. Notice that if \(\{M_n\}\) is a martingale then \(X_\cdot := \|M_\cdot\|\) is a positive submartingale.

**Lemma 33.24.** The space \(\cup_{n=1}^\infty L^p (\Omega, \mathcal{F}_n, P)\) is dense in \(L^p (\Omega, \mathcal{F}_\infty, P)\).

**Proof.** The spaces \(L^p (\Omega, \mathcal{F}_n, P)\) form an increasing sequence of closed subspaces of \(L^p (\Omega, \mathcal{F}_\infty, P)\). Further let \(\mathbb{A}\) be the algebra of functions consisting of those \(f \in \cup_{n=1}^\infty L^p (\Omega, \mathcal{F}_n, P)\) such that \(f\) is bounded. As a consequence of the density Theorem ?? (from the probability notes), we know that \(\mathbb{A}\) and hence \(\cup_{n=1}^\infty L^p (\Omega, \mathcal{F}_n, P)\) is dense in \(L^p (\Omega, \mathcal{F}_\infty, P)\). This completes the proof. However for the readers convenience let us quickly review the proof of Theorem ?? (from the probability notes) in this context.

Let \(\mathbb{H}\) denote those bounded \(\mathcal{F}_\infty\) measurable functions, \(f : \Omega \to \mathbb{R}\), for which there exists \(\{\varphi_n\}_{n=1}^\infty \subset \mathbb{A}\) such that \(\lim_{n \to \infty} \|f - \varphi_n\|_{L^p(P)} = 0\). A routine check shows \(\mathbb{H}\) is a subspace of the bounded \(\mathcal{F}_\infty\) measurable \(\mathbb{R}\) valued functions on \(\Omega\). \(1 \in \mathbb{H}, \mathbb{A} \subset \mathbb{H}\) and \(\mathbb{H}\) is closed under bounded convergence. To verify the latter assertion, suppose \(f_n \in \mathbb{H}\) and \(f_n \to f\) boundedly. Then, by the dominated (or bounded) convergence theorem, \(\lim_{n \to \infty} \|f - f_n\|_{L^p(P)} = 0\).

We may now choose \(\varphi_n \in \mathbb{A}\) such that \(\|\varphi_n - f_n\|_{L^p(P)} \leq \frac{1}{n}\) then

\[
\lim_{n \to \infty} \sup_{\|f\|_{L^p(P)} \leq \frac{1}{n}} \|f - \varphi_n\|_{L^p(P)} \leq \lim_{n \to \infty} \|f - f_n\|_{L^p(P)} + \lim_{n \to \infty} \|f_n - \varphi_n\|_{L^p(P)} = 0,
\]

which implies \(f \in \mathbb{H}\).

An application of Dynkin’s Multiplicative System Theorem, now shows \(\mathbb{H}\) contains all bounded \(\sigma(\mathbb{A}) = \mathcal{F}_\infty\) measurable functions on \(\Omega\). Since for any \(f \in L^p (\Omega, \mathcal{F}, P)\), \(1_{\{|f| \leq \varphi_n\}} \in \mathbb{H}\) there exists \(\varphi_n \in \mathbb{A}\) such that \(\|f_n - \varphi_n\| \leq n^{-1}\). Using the DCT we know that \(f_n \to f\) in \(L^p\) and therefore by Minkowski’s inequality it follows that \(\varphi_n \to f\) in \(L^p\).

**Corollary 33.25.** The space \(\cup_{n=1}^\infty L^p (\Omega, \mathcal{F}_n, P; X)\) is dense in \(L^p (\Omega, \mathcal{F}_\infty, P; X)\).

**Proof.** Since \(S (\Omega, \mathcal{F}, P; X)\) is dense in \(L^p (\Omega, \mathcal{F}_\infty, P; X)\) it suffices to show that every element of \(S (\Omega, \mathcal{F}, P; X)\) is well approximated by some \(G \in \cup_{n=1}^\infty L^p (\Omega, \mathcal{F}_n, P; X)\) and for this it suffices to show \(1_A \cdot x\) is well approximated by some \(G \in \cup_{n=1}^\infty L^p (\Omega, \mathcal{F}_n, P; X)\) for all \(x \in X\) and \(A \in \mathcal{F}\). But as a consequence Lemma 33.24 we may find \(h \in \cup_{n=1}^\infty L^p (\Omega, \mathcal{F}_n, P)\) such that \(\|h - 1_A\|_{L^p(P)}\) is as small as we please and therefore

\[
\|1_A \cdot x - h \cdot x\|_{L^p(P)} \leq \|x\| \cdot \|h - 1_A\|_{L^p(P)}
\]

can be made as small as we please as well.

**Theorem 33.26.** For every \(F \in L^p (\Omega, \mathcal{F}, P)\), \(M_\cdot := \mathbb{E}[F|\mathcal{F}_n]\) is a martingale. Since conditional expectation is a contraction on \(L^p\) it follows that \(\|M_n\|^p \leq \|F\|^p < \infty\) for all \(n \in \mathbb{N}\) \(\cup \{\infty\}\). So to finish the proof we need to show \(M_n \to M_\infty\) in \(L^p (\Omega, \mathcal{F}, P)\) as \(n \to \infty\).

If \(F \in \cup_{n=1}^\infty L^p (\Omega, \mathcal{F}_n, P; X)\), then \(M_n = F\) for all sufficiently large \(n\) and for \(n = \infty\) and the result holds. Now suppose that \(F \in L^p (\Omega, \mathcal{F}_\infty, P)\) and \(G \in \cup_{n=1}^\infty L^p (\Omega, \mathcal{F}_n, P; X)\). Then

\[
\|E_{\mathcal{F}_\infty} F - E_{\mathcal{F}_n} F\|_p \leq \|E_{\mathcal{F}_\infty} F - E_{\mathcal{F}_\infty} G\|_p + \|E_{\mathcal{F}_n} G - E_{\mathcal{F}_\infty} G\|_p + \|E_{\mathcal{F}_n} G - E_{\mathcal{F}_n} F\|_p
\]

\[
\leq 2 \|F - G\|_p + \|E_{\mathcal{F}_\infty} G - E_{\mathcal{F}_n} G\|_p
\]

and hence

\[
\lim_{n \to \infty} \sup_{\|F\|_p \leq 2 \|F - G\|_p} \|E_{\mathcal{F}_\infty} F - E_{\mathcal{F}_n} F\|_p \leq 2 \|F - G\|_p.
\]

Using the density Corollary 33.25 we may choose \(G \in \cup_{n=1}^\infty L^p (\Omega, \mathcal{F}_n, P; X)\) as close to \(F \in L^p (\Omega, \mathcal{F}_\infty, P; X)\) as we please and therefore it follows that \(\limsup_{n \to \infty} \|E_{\mathcal{F}_\infty} F - E_{\mathcal{F}_n} F\|_p = 0\).

For general \(F \in L^p (\Omega, \mathcal{F}, P)\) it suffices to observe that \(M_\infty := \mathbb{E}[F|\mathcal{F}_\infty]\) in \(L^p (\Omega, \mathcal{F}_\infty, P)\) and by the tower property of conditional expectations,

\[
\mathbb{E}[M_\infty |\mathcal{F}_n] = \mathbb{E}[\mathbb{E}[F|\mathcal{F}_\infty] |\mathcal{F}_n] = \mathbb{E}[F |\mathcal{F}_n] = M_n,
\]

So again \(M_n \to M_\infty\) in \(L^p\) as desired.

The converse of Theorem 33.26 holds as well but is not really needed for our purposes. It use compactness results from the probability notes which need to be transferred here.

**Theorem 33.27 (Probably should skip).** Suppose \(1 \leq p < \infty\) and \(\{M_n\}_{n=1}^\infty \subset L^p (\Omega, \mathcal{F}, P; X)\) is a martingale. Further assume that \(\sup_{n} \|M_n\|^p < \infty\) and that \(\{M_n\}_{n=1}^\infty\) is uniformly integrable if \(p = 1\). Then there exists \(M_\infty \in L^p (\Omega, \mathcal{F}, P; X)\) such that \(M_n := \mathbb{E}[M_\infty |\mathcal{F}_n]\), Moreover by Theorem 33.26 we know that \(M_n \to M_\infty\) in \(L^p (\Omega, \mathcal{F}_\infty, P)\) as \(n \to \infty\) and hence \(M_\infty\) is uniquely determined by \(\{M_n\}_{n=1}^\infty\).
Proof. By Theorems ?? and ?? exists $M_\infty \in L^p (\Omega, F_\infty, P)$ and a subsequence, $Y_k = M_n$ such that 

$$\lim_{k \to \infty} E[Y_k h] = E[M_\infty h] \text{ for all } h \in L^q (\Omega, F_\infty, P)$$

where $q := p (p - 1)^{-1}$. Using the martingale property, if $h \in (F_n)_h$ for some $n$, it follows that $E[Y_k h] = E[M_n h]$ for all large $k$ and therefore that 

$$E[M_\infty h] = E[M_n h] \text{ for all } h \in (F_n)_h.$$ 

This implies that $M_n = E[M_\infty | F_n]$ as desired. 

Theorem 33.28 (Almost sure convergence). Suppose $(\Omega, F, \{F_n\}_n=0, P)$ is a filtered probability space, $1 \leq p < \infty$, and let $F_\infty := \cup_{n=1}^\infty F_n := \sigma(\cup_{n=1}^\infty F_n)$. Then for every $F \in L^1 (\Omega, F, P; X)$, the martingale, $M_n = E[F | F_n]$, converges almost surely to $M_\infty := E[F | F_\infty]$. 

Proof. We follow the proof in Stroock [28 Corollary 5.2.7]. Let $H$ denote those $F \in L^1 (\Omega, F_\infty, P; X)$ such that $M_n := E[F | F_n] \to M_\infty = F$ a.s. As we saw above $H$ contains the dense subspace $\cup_{n=1}^\infty L^1 (\Omega, F_n, P; X)$. It is also easy to see that $H$ is a linear space. Thus it suffices to show that $H$ is closed in $L^1 (P; X)$. To prove this let $F^{(k)} \in H$ with $F^{(k)} \to F$ in $L^1 (P)$ and let $M_n^{(k)} := E[F^{(k)} | F_n]$. Then by the Doob’s maximal inequality applied to the submartingale \{$\{M_n - M_n^{(k)}\}\}_n=1^\infty$ we have 

$$P \left( \sup_{n} \|M_n - M_n^{(k)}\| \geq a \right) \leq \frac{1}{a} \sup_{n} \|M_n - M_n^{(k)}\| \leq \frac{1}{a} \|F - F^{(k)}\|$$ 

for all $a > 0$ and $k \in N$. Therefore, 

$$P \left( \sup_{n \geq N} \|F - M_n\| \geq 3a \right)$$ 

$$\leq P \left( \|F - F^{(k)}\| \geq a \right) + P \left( \sup_{n \geq N} \|F^{(k)} - M_n^{(k)}\| \geq a \right)$$ 

$$+ P \left( \sup_{n \geq N} \|M_n^{(k)} - M_n\| \geq a \right)$$ 

$$\leq \frac{2}{a} \|F - F^{(k)}\| + P \left( \sup_{n \geq N} \|F^{(k)} - M_n^{(k)}\| \geq a \right)$$ 

and hence 

$$\limsup_{N \to \infty} P \left( \sup_{n \geq N} \|F - M_n\| \geq 3a \right) \leq \frac{2}{a} \|F - F^{(k)}\| \to 0 \text{ as } k \to \infty.$$ 

Thus we have shown 

$$\limsup_{N \to \infty} P \left( \sup_{n \geq N} \|F - M_n\| \geq 3a \right) = 0 \text{ for all } a > 0.$$ 

Since 

$$\left\{ \limsup_{n \to \infty} \|F - M_n\| \geq 3a \right\} \subseteq \left\{ \sup_{n \geq N} \|F - M_n\| \geq 3a \right\} \text{ for all } N,$$ 

it follows that 

$$P \left( \limsup_{n \to \infty} \|F - M_n\| \geq 3a \right) = 0 \text{ for all } a > 0$$ 

and therefore \limsup_{n \to \infty} \|F - M_n\| = 0 \text{ (P a.s.) which shows that } F \in H. \quad \square$$ 

33.5 Hilbert Valued Integral

In this section, let $H$ be a Hilbert space, $B_H$ be the Borel $\sigma$-algebra on $H$ and $(X, M, \mu)$ be a measure space.

Definition 33.29. Given $p \in \{1, \infty\}$, a Banach space $B$ and a measure space $(X, M, \mu)$, let $L^p (\mu; B)$ denote the space of Borel measurable functions $f : X \to B$ such that $\|f\|_{L^p (\mu; B)} < \infty$ where 

$$\|f\|_{L^p (\mu; B)} := \left( \int_X \|f(x)\|^p_B \, d\mu(x) \right)^{1/p} \text{ if } p \neq \infty$$ 

$$\|f\|_{L^\infty (\mu; B)} := \left( \|f(\cdot)\|_{\sup} \right)^{1/p} \text{ if } p = \infty.$$ 

As for the case where $B = \mathbb{C}$, we will say two Borel measurable functions, $f, g : X \to B$ are equivalent if $f(x) = g(x)$ for $\mu$ - a.e. $x$ and we will let $L^p (\mu; B)$ denote $L^p (\mu; B)$ modulo this equivalence relation.

Proposition 33.30. The space $(L^p (\mu; B), \|\cdot\|_{L^p (\mu; B)})$ is a Banach space.

For the rest of this section we will assume $B = H$ is a Hilbert space.

Theorem 33.31. Let $(X, M, \mu)$ be a measure space and $H$ be a Hilbert space. There exists a unique bounded linear map $I_\mu : L^1 (\mu; H) \to H$ such that 

$$\langle h, I_\mu (f) \rangle = \int_X \langle f(x), h \rangle \, d\mu(x) \text{ for all } h \in H.$$ 

In the future we will write
\[ \int_X f \, d\mu = \int_X f(x) \, d\mu(x) \]

for \( I_\mu(f) \). We also have

\[ \left\| \int_X f \, d\mu \right\|_H \leq \int_X \| f(\cdot) \|_H \, d\mu. \]

**Definition 33.32.** A map \( C : (X, \mathcal{M}, \mu) \to L(H) \) is said to be weakly measurable if \( x \to \langle C(x)v, w \rangle \in \mathbb{C} \) is measurable for all \( v, w \in H \).

**Remark 33.33.** If \( H \) is separable and \( D \) be a dense subset of the unit sphere in \( H \), then

\[ \|C(x)\|_{B(H)} = \sup_{h, k \in D} |\langle C(x)h, k \rangle|. \]

Hence if \( C : (X, \mathcal{M}, \mu) \to L(H) \) is weakly measurable, then \( x \in X \to \|C(x)\|_{B(H)} \in \mathbb{R} \) is measurable.

**Proposition 33.34.** Suppose \( H \) is separable Hilbert space, \( C : (X, \mathcal{M}, \mu) \to L(H) \) is weakly measurable such that \( M := \int_X \|C(x)\| \, d\mu(x) < \infty \), then there exists a unique operator \( B \in B(H) \) (written in the future as \( \int_X C(x) \, d\mu(x) \)) such that

\[ (Bv, w) := \int_X \langle C(x)v, w \rangle \, d\mu(x) \quad \text{for all} \quad v, w \in H. \quad (33.10) \]

**Proof.** BRUCE: Perhaps should use the Riesz theorem here? To construct \( B \), let \( \{e_i\}_{i=1}^\infty \) be an orthonormal basis for \( H \), and set

\[ Bv = \sum_{i=1}^\infty (Bv, e_i)e_i = \sum_{i=1}^\infty \int_X \langle C(x)v, e_i \rangle \, d\mu(x)e_i. \quad (33.11) \]

This expression makes sense because,

\[ \sum_{i=1}^\infty \left| \int_X \langle C(x)v, e_i \rangle \, d\mu(x) \right|^2 = \sum_{i=1}^\infty \int_{X^2} \langle C(x)v, e_i \rangle \langle C(y)v, e_i \rangle \, d\mu(x) \, d\mu(y) \]
\[ = \int_{X^2} \langle C(x)v, C(y)v \rangle \, d\mu(x) \, d\mu(y) \]
\[ \leq \int_{X^2} \|C(x)v\| \|C(y)v\| \, d\mu(x) \, d\mu(y) \]
\[ \leq M^2 \|v\|^2. \]

The operator \( B \) in Eq. (33.11) satisfies Eq. (33.10) and its norm is bounded by \( M \). In summary, there exists a unique operator \( \int_X C(x) \, d\mu(x) \) such that

\[ \left( \int_X C(x) \, d\mu(x)v, w \right) = \int_X (C(x)v, w) \, d\mu(x) \quad \text{for all} \quad v, w \in H \]

and this operator satisfies

\[ \left\| \int_X C(x) \, d\mu(x) \right\| \leq \int_X \|C(x)\| \, d\mu(x). \]

**Theorem 33.35.** Let \( (X, \mathcal{M}, \mu) \) and \( (Y, \mathcal{N}, \nu) \) be two \( \sigma \)-finite measures spaces, \( C : (X, \mathcal{M}, \mu) \to L(H) \) and \( D : Y \to L(H) \) map be a weakly measurable functions such that

\[ \int_X \|C(x)\| \, d\mu(x) + \int_Y \|D(y)\| \, d\nu(y) < \infty, \]

then

\[ \int_X C(x) \, d\mu(x) \int_Y D(y) \, d\nu(y) = \int_{X \times Y} C(x)D(y)d(\mu \otimes \nu)(x, y). \]

**Proof.** Indeed,

\[ \left( v, \int_X C(x) \, d\mu(x) \int_Y D(y) \, d\nu(y)w \right) \]
\[ = \sum_{i=1}^\infty \left( v, \int_X C(x) \, d\mu(x)e_i \right) \left( e_i, \int_Y D(y) \, d\nu(y)w \right) \]
\[ = \sum_{i=1}^\infty \int_X \langle v, C(x)e_i \rangle \, d\mu(x) \cdot \int_Y \langle e_i, D(y)w \rangle \, d\nu(y) \]
\[ = \sum_{i=1}^\infty \int_X \int_Y \langle v, C(x)e_i \rangle \, d\mu(x) \, d\nu(y) \]
\[ = \sum_{i=1}^\infty \int_{X \times Y} \langle v, C(x)e_i \rangle \langle e_i, D(y)w \rangle \, d(\mu \otimes \nu)(x, y) \]
\[ \quad (33.12) \]
\[
\sum_{i=1}^{\infty} \int_{X \times Y} |(v, C(x) e_i) (e_i, D(y) w)| \, d(\mu \otimes \nu)(x, y)
\]

\[
= \int_{X \times Y} \sum_{i=1}^{\infty} |(v, C(x) e_i) (e_i, D(y) w)| \, d(\mu \otimes \nu)(x, y)
\]

\[
\leq \int_{X \times Y} \left( \sum_{i=1}^{\infty} |(v, C(x) e_i)|^2 \right)^{1/2} \left( \sum_{i=1}^{\infty} |(e_i, D(y) w)| \right)^{1/2} \, d(\mu \otimes \nu)(x, y)
\]

\[
= \int_{X \times Y} \| C^* (x) v \| \| D(y) w \| \, d(\mu \otimes \nu)(x, y)
\]

\[
\leq \int_{X \times Y} \| C(x) \| \| D(y) \| \, d(\mu \otimes \nu)(x, y) < \infty.
\]

Therefore we may interchange the sum and the integral in Eq. (33.12) to conclude,

\[
\left( v, \int_{X} C(x) \, d\mu(x) \int_{Y} D(y) \, d\nu(y) w \right)
\]

\[
= \int_{X \times Y} \sum_{i=1}^{\infty} (v, C(x) e_i) (e_i, D(y) w) \, d(\mu \otimes \nu)(x, y)
\]

\[
= \int_{X \times Y} (v, C(x) D(y) w) \, d(\mu \otimes \nu)(x, y) \tag{33.13}
\]

as claimed. \[\square\]
The Fourier Transform and Distributions
The underlying space in this section is $\mathbb{R}^n$ with Lebesgue measure. The Fourier inversion formula is going to state that
\[
\hat{f}(x) = \left(\frac{1}{2\pi}\right)^n \int_{\mathbb{R}^n} d\xi \hat{f}(\xi) e^{ix\cdot\xi}.
\] (34.1)
If we let $\xi = 2\pi\eta$, this may be written as
\[
f(x) = \int_{\mathbb{R}^n} d\eta e^{i2\pi\eta \cdot x} \hat{f}(\eta) e^{-i2\pi\eta \cdot y}
\]
and we have removed the multiplicative factor of $\left(\frac{1}{2\pi}\right)^n$ in Eq. (34.1) at the expense of placing factors of $2\pi$ in the arguments of the exponentials. Another way to avoid writing the $2\pi$’s altogether is to redefine $dx$ and $d\xi$ and this is what we will do here.

**Notation 34.1** Let $m$ be Lebesgue measure on $\mathbb{R}^n$ and define:
\[
dx = \left(\frac{1}{\sqrt{2\pi}}\right)^n dm(x) \quad \text{and} \quad d\xi = \left(\frac{1}{\sqrt{2\pi}}\right)^n dm(\xi).
\]
To be consistent with this new normalization of Lebesgue measure we will redefine $\|f\|_p$ and $(f, g)$ as
\[
\|f\|_p = \left(\int_{\mathbb{R}^n} |f(x)|^p \, dx\right)^{1/p} = \left(\frac{1}{2\pi}\right)^{n/2} \left(\int_{\mathbb{R}^n} |f(x)|^p \, dm(x)\right)^{1/p}
\]
and
\[
(f, g) := \int_{\mathbb{R}^n} f(x)g(x) \, dx \quad \text{when} \quad fg \in L^1.
\]
Similarly we will define the convolution relative to these normalizations by
\[
f \star g := \left(\frac{1}{2\pi}\right)^n f \ast g, \quad \text{i.e.}
\]
\[
f \star g(x) := \int_{\mathbb{R}^n} f(x-y)g(y) \, dy = \int_{\mathbb{R}^n} f(x-y)g(y) \left(\frac{1}{2\pi}\right)^{n/2} \, dm(y).
\]

The following notation will also be convenient; given a multi-index $\alpha \in \mathbb{Z}_+^n$, let $|\alpha| = \alpha_1 + \cdots + \alpha_n$, $x^\alpha := \prod_{j=1}^n x_j^{\alpha_j}$, $\partial_x^\alpha := \prod_{j=1}^n \left(\frac{\partial}{\partial x_j}\right)^{\alpha_j}$ and $D_x^\alpha := \left(\frac{1}{i}\right)^{|\alpha|} \left(\frac{\partial}{\partial x}\right)^\alpha = \left(\frac{1}{i}\right)^{|\alpha|} \left(\frac{\partial}{\partial x}\right)^\alpha$.

Also let
\[
\langle x \rangle := (1 + |x|^2)^{1/2}
\]
and for $s \in \mathbb{R}$ let
\[
\nu_s(x) = (1 + |x|)^s.
\]

### 34.1 Fourier Transform

**Definition 34.2 (Fourier Transform).** For $f \in L^1$, let
\[
\hat{f}(\xi) = \mathcal{F}(f)(\xi) := \int_{\mathbb{R}^n} e^{-ix\cdot\xi} f(x) \, dx
\]
(34.2)
and
\[
g^\vee(x) = \mathcal{F}^{-1}(g)(x) := \int_{\mathbb{R}^n} e^{ix\cdot\xi} g(\xi) \, d\xi = \mathcal{F}(g)(-x)
\]
(34.3)

The next theorem summarizes some more basic properties of the Fourier transform.

**Theorem 34.3.** Suppose that $f, g \in L^1$. Then
1. $\hat{f} \in C_0(\mathbb{R}^n)$ and $\|\hat{f}\|_{L^\infty} \leq \|f\|_1$.
2. For $y \in \mathbb{R}^n$, $(\tau_y f)^\vee(\xi) = e^{-iy\cdot\xi} \hat{f}(\xi)$ where, as usual, $\tau_y f(x) := f(x-y)$.
3. The Fourier transform takes convolution to products, i.e. $(f \star g) = \hat{f} \hat{g}$.
4. For $f, g \in L^1$, $(f, g) = \langle f, \hat{g} \rangle$.
5. If $T: \mathbb{R}^n \rightarrow \mathbb{R}^n$ is an invertible linear transformation, then
\[
(f \circ T)^\vee(\xi) = |\text{det } T|^{-1} \hat{f}((T^{-1})^\ast \xi) \quad \text{and} \quad (f \circ T)^\vee(\xi) = |\text{det } T|^{-1} f^\vee((T^{-1})^\ast \xi)
\]
6. If \((1 + |x|)^k f(x) \in L^1\), then \(\hat{f} \in C^k\) and \(\partial^\alpha \hat{f} \in C_0\) for all \(|\alpha| \leq k\). Moreover,
\[
\partial^\alpha \hat{f}(\xi) = \mathcal{F}[( -ix)^\alpha f(x)](\xi)
\] (34.4)
for all \(|\alpha| \leq k\).

7. If \(f \in C^k\) and \(\partial^\alpha f \in L^1\) for all \(|\alpha| \leq k\), then \((1 + |\xi|)^k \hat{f}(\xi) \in C_0\) and
\[
(\partial^\alpha f)(\xi) = (i\xi)^\alpha \hat{f}(\xi)
\] (34.5)
for all \(|\alpha| \leq k\).

8. Suppose \(g \in L^1(\mathbb{R}^k)\) and \(h \in L^1(\mathbb{R}^{n-k})\) and \(f = g \otimes h\), i.e.
\[
f(x) = g(x_1, \ldots, x_k)h(x_{k+1}, \ldots, x_n),
\]
then \(\hat{f} = \hat{g} \otimes \hat{h}\).

**Proof.** Item 1. is the Riemann Lebesgue Lemma [19.39]. Items 2. – 5. are proved by the following straightforward forward computations:

\[
(\tau_y f)^\wedge(\xi) = \int_{\mathbb{R}^n} e^{-ix\cdot\xi} f(x-y) \, dx = \int_{\mathbb{R}^n} e^{-i(x+y)\cdot\xi} f(x) \, dx = e^{-iy\cdot\xi} \hat{f}(\xi),
\]

\[
(\hat{f} \otimes g)^\wedge(\xi) = \int_{\mathbb{R}^n} \hat{f}(\xi) g(\xi) \, d\xi = \int_{\mathbb{R}^n} d\xi g(\xi) \int_{\mathbb{R}^n} dx e^{-ix\cdot\xi} f(x) = \int_{\mathbb{R}^n} d\xi \int_{\mathbb{R}^n} dx g(x) e^{-ix\cdot\xi} f(x) = (\hat{f} \otimes g)(\xi),
\]

\[
(f \otimes \hat{g})^\wedge(\xi) = \int_{\mathbb{R}^n} e^{-ix\cdot\xi} \hat{g}(\xi) f(x) \, dx \equiv \int_{\mathbb{R}^n} e^{-iy\cdot\xi} \int_{\mathbb{R}^n} f(x-y) g(y) \, dy \, dx
\]

\[
= \int_{\mathbb{R}^n} dy \int_{\mathbb{R}^n} dx e^{-ix\cdot\xi} \hat{f}(x-y) g(y)
\]

\[
= \int_{\mathbb{R}^n} dy \int_{\mathbb{R}^n} dx e^{-iy\cdot\xi} f(x-y) g(y)
\]

\[
= \int_{\mathbb{R}^n} dy e^{-iy\cdot\xi} g(y) \int_{\mathbb{R}^n} dx e^{-ix\cdot\xi} f(x) = \hat{f}(\xi) \hat{g}(\xi)
\]
and letting \(y = Tx\) so that \(dx = |\det T|^{-1} dy\)
\[
(f \circ T)^\wedge(\xi) = \int_{\mathbb{R}^n} e^{-ix\cdot\xi} f(Tx) \, dx = \int_{\mathbb{R}^n} e^{-i(T^{-1}x)\cdot\xi} f(y) \, |\det T|^{-1} dy
\]

\[
= |\det T|^{-1} \hat{f}(T^{-1} \circ \xi).
\]

Item 6. is simply a matter of differentiating under the integral sign which is easily justified because \((1 + |x|)^k f(x) \in L^1\). Item 7. follows by using Lemma 19.38 repeatedly (i.e. integration by parts) to find
\[
(\partial^\alpha f)^\wedge(\xi) = \int_{\mathbb{R}^n} \partial^\alpha_x f(x) e^{-ix\cdot\xi} dx = (-1)^{|\alpha|} \int_{\mathbb{R}^n} f(x) \partial^\alpha_x e^{-ix\cdot\xi} dx
\]

\[
= (-1)^{|\alpha|} \int_{\mathbb{R}^n} f(x) (-i\xi)^\alpha e^{-ix\cdot\xi} dx = (i\xi)^\alpha \hat{f}(\xi).
\]

Since \(\partial^\alpha f \in L^1\) for all \(|\alpha| \leq k\), it follows that \((i\xi)^\alpha \hat{f}(\xi) = (\partial^\alpha f)^\wedge(\xi) \in C_0\) for all \(|\alpha| \leq k\). Since
\[
(1 + |\xi|)^k \leq \sum_{|\alpha| \leq k} c_\alpha |\xi|^\alpha
\]
where \(0 < c_\alpha < \infty\),
\[
\left| (1 + |\xi|)^k \hat{f}(\xi) \right| \leq \sum_{|\alpha| \leq k} c_\alpha |\xi|^\alpha \hat{f}(\xi) \to 0 \text{ as } \xi \to \infty.
\]

Item 8. is a simple application of Fubini’s theorem. 

**Example 34.4.** If \(f(x) = e^{-|x|^2/2}\) then \(\hat{f}(\xi) = e^{-|\xi|^2/2}\), in short
\[
\mathcal{F}e^{-|x|^2/2} = e^{-|\xi|^2/2} \text{ and } \mathcal{F}^{-1}e^{-|\xi|^2/2} = e^{-|x|^2/2}.\] (34.6)

More generally, for \(t > 0\) let
\[
p_t(x) := t^{-n/2} e^{-1/2t|x|^2}\] (34.7)
then
\[
\hat{p}_t(\xi) = e^{-1/2t|\xi|^2} \text{ and } (\hat{p}_t)^\wedge(x) = p_t(x).\] (34.8)

By Item 8. of Theorem 34.3 to prove Eq. (34.6) it suffices to consider the 1 - dimensional case because \(e^{-|x|^2/2} = \prod_{i=1}^n e^{-x_i^2/2}\). Let \(g(\xi) := \left(\mathcal{F}e^{-x^2/2}\right)(\xi)\), then by Eq. (34.4) and Eq. (34.5),
\[
g'(\xi) = \mathcal{F} \left[ (-ix) e^{-x^2/2} \right](\xi) = i \mathcal{F} \left[ \frac{d}{dx} e^{-x^2/2} \right](\xi)
\]

\[
= i(i\xi) \mathcal{F} \left[ e^{-x^2/2} \right](\xi) = -\xi g(\xi).\] (34.9)

Lemma 47.35 implies
\[
g(0) = \int_{\mathbb{R}^n} e^{-x^2/2} dx = \frac{1}{\sqrt{2\pi}} \int_{\mathbb{R}^n} e^{-x^2/2} dm(x) = 1,
\]
and so solving Eq. (34.9) with \(g(0) = 1\) gives \(\mathcal{F} \left[ e^{-x^2/2} \right](\xi) = g(\xi) = e^{-\xi^2/2}\) as desired. The assertion that \(\mathcal{F}^{-1}e^{-|\xi|^2/2} = e^{-|x|^2/2}\) follows similarly or by using Eq. (34.3) to conclude,
\[ \mathcal{F}^{-1}\left[e^{-|\xi|^2/2}\right](x) = \mathcal{F}\left[e^{-|\xi|^2/2}\right](x) = \mathcal{F}\left[e^{-|\xi|^2/2}\right](x) = e^{-|x|^2/2}. \]

The results in Eq. (34.8) now follow from Eq. (34.6) and item 5 of Theorem 34.3. For example, since \( p_t(x) = t^{-n/2}p_1(x/\sqrt{t}) \),

\[ (\hat{p}_t)(\xi) = t^{-n/2}\left(\sqrt{t}\right)^n \hat{p}_1(\sqrt{t}\xi) = e^{-\frac{1}{2}|\xi|^2}. \]

This may also be written as \((\hat{p}_t)(\xi) = t^{-n/2}p_{\frac{1}{t}}(\xi)\). Using this and the fact that \( p_t \) is an even function,

\[ (\hat{p}_t)^n(x) = \mathcal{F}\hat{p}_t(-x) = t^{-n/2}\mathcal{F}p_{\frac{1}{t}}(-x) = t^{-n/2}t^{n/2}p_t(-x) = p_t(x). \]

### 34.2 Schwartz Test Functions

**Definition 34.5.** A function \( f \in C(\mathbb{R}^n, \mathbb{C}) \) is said to have rapid decay or rapid decrease if

\[ \sup_{x \in \mathbb{R}^n} (1 + |x|)^N |f(x)| < \infty \quad \text{for} \quad N = 1, 2, \ldots. \]

Equivalently, for each \( N \in \mathbb{N} \) there exists constants \( C_N < \infty \) such that \( |f(x)| \leq C_N (1 + |x|)^{-N} \) for all \( x \in \mathbb{R}^n \). A function \( f \in C(\mathbb{R}^n, \mathbb{C}) \) is said to have (at most) polynomial growth if there exists \( N < \infty \) such

\[ \sup_{x \in \mathbb{R}^n} (1 + |x|)^{-N} |f(x)| < \infty, \]

i.e., there exists \( N \in \mathbb{N} \) and \( C < \infty \) such that \( |f(x)| \leq C (1 + |x|)^N \) for all \( x \in \mathbb{R}^n \).

**Definition 34.6 (Schwartz Test Functions).** Let \( S \) denote the space of functions \( f \in C^\infty(\mathbb{R}^n) \) such that \( f \) and all of its partial derivatives have rapid decay and let

\[ \|f\|_{N, \alpha} = \sup_{x \in \mathbb{R}^n} |(1 + |x|)^N \partial^\alpha f(x)| \]

so that

\[ S = \left\{ f \in C^\infty(\mathbb{R}^n) : \|f\|_{N, \alpha} < \infty \text{ for all } N \text{ and } \alpha \right\}. \]

Also let \( \mathcal{P} \) denote those functions \( g \in C^\infty(\mathbb{R}^n) \) such that \( g \) and all of its derivatives have at most polynomial growth, i.e. \( g \in C^\infty(\mathbb{R}^n) \) is in \( \mathcal{P} \) iff for all multi-indices \( \alpha \), there exists \( N_\alpha < \infty \) such

\[ \sup_{x \in \mathbb{R}^n} (1 + |x|)^{-N_\alpha} |\partial^\alpha g(x)| < \infty. \]

(Notice that any polynomial function on \( \mathbb{R}^n \) is in \( \mathcal{P} \).)

**Remark 34.7.** Since \( C^\infty_c(\mathbb{R}^n) \subset S \subset L^2(\mathbb{R}^n) \), it follows that \( S \) is dense in \( L^2(\mathbb{R}^n) \).

**Exercise 34.1.** Let

\[ L = \sum_{|\alpha| \leq k} a_\alpha(x) \partial^\alpha \]

with \( a_\alpha \in \mathcal{P} \). Show \( L(S) \subset S \) and in particular \( \partial^\alpha f \) and \( x^\alpha f \) are back in \( S \) for all multi-indices \( \alpha \).

**Notation 34.8** Suppose that \( p(x, \xi) = \Sigma_{|\alpha| \leq N} a_\alpha(x) \xi^\alpha \) where each function \( a_\alpha(x) \) is a smooth function. We then set

\[ p(x, D_x) := \Sigma_{|\alpha| \leq N} a_\alpha(x) D^\alpha \]

and if each \( a_\alpha(x) \) is also a polynomial in \( x \) we will let

\[ p(-D_\xi, \xi) := \Sigma_{|\alpha| \leq N} a_\alpha(-D_\xi) M^\alpha_\xi \]

where \( M_\xi \) is the operation of multiplication by \( \xi^\alpha \).

**Proposition 34.9.** Let \( p(x, \xi) \) be as above and assume each \( a_\alpha(x) \) is a polynomial in \( x \). Then for \( f \in S \),

\[ (p(x, D_x)f)^\wedge(\xi) = p(-D_\xi, \xi) \hat{f}(\xi) \]

and

\[ p(x, D_x)f(\xi) = [p(x, -D_\xi)f(\xi)]^\wedge(\xi). \]

**Proof.** The identities \((-D_\xi)^\alpha e^{-ix\xi} = x^\alpha e^{-ix\xi} \) and \( D^\alpha_\xi e^{ix\xi} = \xi^\alpha e^{ix\xi} \) imply, for any polynomial function \( q \) on \( \mathbb{R}^n \),

\[ q(-D_\xi) e^{-ix\xi} = q(x)e^{-ix\xi} \quad \text{and} \quad q(D_\xi) e^{ix\xi} = q(\xi)e^{ix\xi}. \]

Therefore using Eq. (34.13) repeatedly,

\[ (p(x, D_x)f)^\wedge(\xi) = \int_{\mathbb{R}^n} \sum_{|\alpha| \leq N} a_\alpha(x) D^\alpha_\xi f(x) \cdot e^{-ix\xi} \, d\xi \]

\[ = \int_{\mathbb{R}^n} \sum_{|\alpha| \leq N} D^\alpha_\xi f(x) \cdot a_\alpha(-D_\xi) e^{-ix\xi} \, d\xi \]

\[ = \int_{\mathbb{R}^n} f(x) \sum_{|\alpha| \leq N} (-D_\xi)^\alpha [a_\alpha(-D_\xi) e^{-ix\xi}] \, d\xi \]

\[ = \int_{\mathbb{R}^n} f(x) \sum_{|\alpha| \leq N} a_\alpha(-D_\xi) [\xi^\alpha e^{-ix\xi}] \, d\xi = p(-D_\xi, \xi) \hat{f}(\xi) \]
wherein the third inequality we have used Lemma \[19.38\] to do repeated integration by parts, the fact that mixed partial derivatives commute in the fourth, and in the last we have repeatedly used Corollary \[45.31\] to differentiate under the integral. The proof of Eq. \[34.12\]\ is similar:

\[
p(\xi, D\xi)\hat{f}(\xi) = p(\xi, D\xi) \int_{\mathbb{R}^n} f(x)e^{-ix\cdot\xi}dx = \int_{\mathbb{R}^n} f(x)p(\xi, -x)e^{-ix\cdot\xi}dx
\]

\[
= \sum_{|\alpha| \leq N} \int_{\mathbb{R}^n} f(x)(-x)^{\alpha}a_\alpha(\xi)e^{-ix\cdot\xi}dx
\]

\[
= \sum_{|\alpha| \leq N} \int_{\mathbb{R}^n} f(x)(-x)^{\alpha}a_\alpha(-D\xi)e^{-ix\cdot\xi}dx
\]

\[
= \sum_{|\alpha| \leq N} \int_{\mathbb{R}^n} e^{-ix\cdot\xi}a_\alpha(D\xi)\left((-x)^{\alpha}f(x)\right)dx
\]

\[
= [p(D\xi, -x)f(x)](\xi).
\]

\[\blacksquare\]

**Corollary 34.10.** The Fourier transform preserves the space $S$, i.e. $\mathcal{F}(S) \subset S$.

**Proof.** Let $p(x, \xi) = \sum_{|\alpha| \leq N}a_\alpha(x)\xi^\alpha$ with each $a_\alpha(x)$ being a polynomial function in $x$. If $f \in S$ then $p(D\xi, -x)f \in S \subset L^1$ and so by Eq. \[34.12\], $p(\xi, D\xi)\hat{f}(\xi)$ is bounded in $\xi$, i.e.

\[
\sup_{\xi \in \mathbb{R}^n} |p(\xi, D\xi)\hat{f}(\xi)| \leq C(p, f) < \infty.
\]

Taking $p(x, \xi) = (1 + |x|^2)^{N}\xi^\alpha$ with $N \in \mathbb{Z}_+$ in this estimate shows $\hat{f}(\xi)$ and all of its derivatives have rapid decay, i.e. $\hat{f}$ is in $S$.

\[\blacksquare\]

### 34.3 Fourier Inversion Formula

**Theorem 34.11 (Fourier Inversion Theorem).** Suppose that $f \in L^1$ and $\hat{f} \in L^1$ (for example suppose $f \in S$), then

1. there exists $f_0 \in C_0(\mathbb{R}^n)$ such that $f = f_0$ a.e.,
2. $f_0 = \mathcal{F}^{-1}\mathcal{F}f$ and $\hat{f}_0 = \mathcal{F}\mathcal{F}^{-1}f$,
3. $f$ and $\hat{f}$ are in $L^1 \cap L^\infty$ and
4. $\|f\|_2 = \|\hat{f}\|_2$.

In particular, $\mathcal{F} : S \to S$ is a linear isomorphism of vector spaces.

**Proof.** First notice that $\hat{f} \in C_0(\mathbb{R}^n) \subset L^\infty$ and $\hat{f} \in L^1$ by assumption, so that $\hat{f} \in L^1 \cap L^\infty$. Let $p_t(x) := t^{n/2}e^{-\frac{1}{2}|x|^2}$ be as in Example \[34.4\] so that $\hat{p}_t(\xi) = e^{-\frac{1}{2}|\xi|^2}$ and $\hat{p}_t' = p_t$. Define $f_0 := \hat{f}^\vee \in C_0$ then

\[
f_0(x) = \langle \hat{f}, e^{-ix\cdot\xi} \rangle = \int_{\mathbb{R}^n} \hat{f}(\xi)e^{ix\cdot\xi}d\xi
\]

\[
= \lim_{t \downarrow 0} \int_{\mathbb{R}^n} f(y)e^{i\xi\cdot(y-x)}\hat{p}_t(\xi)d\xi dy
\]

\[
= \lim_{t \downarrow 0} \int_{\mathbb{R}^n} f(y)p_t(x-y)dy = f(x) \text{ a.e.}
\]

wherein we have used Theorem \[19.32\] in the last equality along with the observations that $p_t(y) = p_t(y/\sqrt{t})$ and $\int_{\mathbb{R}^n} p_t(y)dy = 1$ so that

\[
L^1\lim_{t \downarrow 0} \int_{\mathbb{R}^n} f(y)p_t(x-y)dy = f(x).
\]

In particular this shows that $f \in L^1 \cap L^\infty$. A similar argument shows that $\mathcal{F}^{-1}\mathcal{F}f = f_0$ as well. Let us now compute the $L^2$ – norm of $f$,

\[
\|\hat{f}\|_2^2 = \int_{\mathbb{R}^n} \hat{f}(\xi)\overline{\hat{f}(\xi)}d\xi = \int_{\mathbb{R}^n} d\xi \hat{f}(\xi) \int_{\mathbb{R}^n} dx f(x)e^{ix\cdot\xi}
\]

\[
= \int_{\mathbb{R}^n} dx f(x) \int_{\mathbb{R}^n} d\xi \hat{f}(\xi)e^{ix\cdot\xi} \text{ (by Fubini)}
\]

\[
= \int_{\mathbb{R}^n} dx \overline{f(x)}f(x) = \|f\|_2^2
\]

because $\int_{\mathbb{R}^n} d\xi \hat{f}(\xi)e^{ix\cdot\xi} = \mathcal{F}^{-1}\hat{f}(x) = f(x) \text{ a.e.}$

\[\blacksquare\]

**Corollary 34.12.** By the B.L.T. Theorem \[30.1\] the maps $\mathcal{F}|_S$ and $\mathcal{F}^{-1}|_S$ extend to bounded linear maps $\mathcal{F}$ and $\mathcal{F}^{-1}$ from $L^2 \to L^2$. These maps satisfy the following properties:

1. $\mathcal{F}$ and $\mathcal{F}^{-1}$ are unitary and are inverses to one another as the notation suggests.
2. If $f \in L^2$, then $\mathcal{F}f$ is uniquely characterized as the function, $G \in L^2$ such that

\[
\langle G, \psi \rangle = \langle f, \hat{\psi} \rangle \text{ for all } \psi \in C_c^\infty(\mathbb{R}^n).
\]
3. If $f \in L^1 \cap L^\infty$, then $\mathcal{F}f = \hat{f}$ a.e.
4. For $f \in L^2$ we may compute $\mathcal{F}$ and $\mathcal{F}^{-1}$ by

\[
\mathcal{F}f(\xi) = L^2\lim_{R \to \infty} \int_{|x| \leq R} f(x)e^{-ix\cdot\xi}dx \quad \text{ and } \quad \mathcal{F}^{-1}f(\xi) = L^2\lim_{R \to \infty} \int_{|\xi| \leq R} f(x)e^{ix\cdot\xi}dx.
\]
5. We may further extend \( \hat{\mathcal{F}} \) to a map from \( L^1 + L^2 \rightarrow C_0 + L^2 \) (still denote by \( \mathcal{F} \)) defined by \( \hat{\mathcal{F}} f = \hat{h} + \hat{\mathcal{F}} g \) where \( f = h + g \in L^1 + L^2 \). For \( f \in L^1 + L^2 \), \( \hat{\mathcal{F}} f \) may be characterized as the unique function \( F \in L^1_{loc}(\mathbb{R}^n) \) such that

\[
\langle F, \varphi \rangle = \langle f, \varphi \rangle \quad \text{for all } \varphi \in C^\infty_c(\mathbb{R}^n).
\] (34.16)

Moreover if Eq. (34.16) holds then \( F \in C_0 + L^2 \subset L^1_{loc}(\mathbb{R}^n) \) and Eq. (34.16) is valid for all \( \varphi \in \mathcal{S} \).

Proof. 1. and 2. If \( f \in L^2 \) and \( \varphi_n \in \mathcal{S} \) such that \( \varphi_n \rightarrow f \) in \( L^2 \), then \( \hat{\mathcal{F}} f := \lim_{n \to \infty} \hat{\varphi}_n \). Since \( \hat{\varphi}_n \in \mathcal{S} \subset L^1 \), we may concluded that \( \| \hat{\varphi}_n \|_2 = \| \varphi_n \|_2 \) for all \( n \). Thus

\[
\| \hat{\mathcal{F}} f \|_2 = \lim_{n \to \infty} \| \hat{\varphi}_n \|_2 = \lim_{n \to \infty} \| \varphi_n \|_2 = \| f \|_2
\]

which shows that \( \hat{\mathcal{F}} \) is an isometry from \( L^2 \) to \( L^2 \) and similarly \( \hat{\mathcal{F}}^{-1} \) is an isometry. Hence \( \hat{\mathcal{F}}^{-1} \), \( \hat{F} = \hat{\mathcal{F}}^{-1} \mathcal{F} = \text{id} \) on the dense set \( S \), it follows by continuity that \( \hat{\mathcal{F}}^{-1} \mathcal{F} = \text{id} \) on all of \( L^2 \). Hence \( \hat{\mathcal{F}}^{-1} \) is the inverse of \( \mathcal{F} \). This proves item 1. Moreover, if \( \psi \in C^\infty_c(\mathbb{R}^n) \), then

\[
\langle \hat{\mathcal{F}} f, \psi \rangle = \lim_{n \to \infty} \langle \hat{\varphi}_n, \psi \rangle = \lim_{n \to \infty} \langle \varphi_n, \hat{\psi} \rangle = \langle f, \psi \rangle
\] (34.17)

and this equation uniquely characterizes \( \hat{\mathcal{F}} f \) by Corollary 19.40 Notice that Eq. (34.17) also holds for all \( \psi \in \mathcal{S} \).

3. If \( f \in L^1 \cap L^2 \), we have already seen that \( \hat{f} \in C_0(\mathbb{R}^n) \subset L^1_{loc} \) and that \( \langle \hat{f}, \psi \rangle = \langle f, \psi \rangle \) for all \( \psi \in C^\infty_c(\mathbb{R}^n) \). Combining this with item 2. shows \( \langle \hat{f} - \mathcal{F} f, \psi \rangle = 0 \) or all \( \psi \in C^\infty_c(\mathbb{R}^n) \) and so again by Corollary 19.40 we conclude that \( \hat{f} - \mathcal{F} f = 0 \) a.e.

4. Let \( f \in L^2 \) and \( R < \infty \) and set \( f_R(x) := f(x)1_{|x| \leq R} \). Then \( f_R \in L^1 \cap L^2 \) and therefore \( \hat{\mathcal{F}} f_R = \hat{f}_R \). Since \( \hat{\mathcal{F}} \) is an isometry and (by the dominated convergence theorem) \( f_R \rightarrow f \) in \( L^2 \), it follows that

\[
\mathcal{F} f = L^2 - \lim_{R \to \infty} \hat{\mathcal{F}} f_R = L^2 - \lim_{R \to \infty} \hat{f}_R.
\]

5. If \( f = h + g \in L^1 + L^2 \) and \( \varphi \in \mathcal{S} \), then by Eq. (34.17) and item 4. of Theorem 34.3

\[
\langle \hat{h} + \hat{\mathcal{F}} g, \varphi \rangle = \langle h, \varphi \rangle + \langle g, \varphi \rangle = \langle h + g, \varphi \rangle.
\] (34.18)

In particular if \( h + g = 0 \) a.e., then \( \langle \hat{h} + \hat{\mathcal{F}} g, \varphi \rangle = 0 \) for all \( \varphi \in \mathcal{S} \) and since \( \hat{\mathcal{F}} g \in L^1_{loc} \) it follows from Corollary 19.40 that \( \hat{h} + \hat{\mathcal{F}} g = 0 \) a.e. This shows that \( \mathcal{F} f \) is well defined independent of how \( f \in L^1 + L^2 \) is decomposed into the sum of an \( L^1 \) and an \( L^2 \) function. Moreover Eq. (34.18) shows Eq. (34.16) holds with \( F = \hat{h} + \hat{\mathcal{F}} g \in C_0 + L^2 \) and \( \varphi \in \mathcal{S} \). Now suppose \( G \in L^1_{loc} \) and \( \langle G, \varphi \rangle = \langle f, \varphi \rangle \) for all \( \varphi \in C^\infty_c(\mathbb{R}^n) \). Then by what we just proved, \( \langle G, \varphi \rangle = \langle \hat{F}, \varphi \rangle \) for all \( \varphi \in C^\infty_c(\mathbb{R}^n) \) and so another application of Corollary 19.40 shows \( G = \mathcal{F} F \in C_0 + L^2 \).

\[ \begin{align*}
\text{Notation 34.13} & \quad \text{Given the results of Corollary 34.12 there is little danger in writing } f \text{ or } \mathcal{F} f \text{ for } \mathcal{F} f \text{ when } f \in L^1 + L^2.
\end{align*} \]

Corollary 34.14. If \( f \) and \( g \) are \( L^1 \) functions such that \( \hat{f}, \hat{g} \in L^1 \), then

\[
\mathcal{F}(fg) = \hat{f} \star \hat{g} \text{ and } \mathcal{F}^{-1}(fg) = f^\prime \star g^\prime.
\]

Since \( \mathcal{S} \) is closed under pointwise products and \( \mathcal{F} : \mathcal{S} \rightarrow \mathcal{S} \) is an isomorphism it follows that \( \mathcal{S} \) is closed under convolution as well.

Proof. By Theorem 34.11 \( f, g, \hat{f}, \hat{g} \in L^1 \cap L^\infty \) and hence \( f \cdot g \in L^1 \cap L^\infty \) and \( f \star g \in L^1 \cap L^\infty \). Since

\[
\mathcal{F}^{-1} \left( f \star g \right) = \mathcal{F}^{-1} \left( \hat{f} \right) \cdot \mathcal{F}^{-1} \left( \hat{g} \right) = f \cdot g \in L^1
\]

we may conclude from Theorem 34.11 that

\[
\hat{f} \star \hat{g} = \mathcal{F}^{-1} \left( \hat{f} \star \hat{g} \right) = \mathcal{F}(f \cdot g).
\]

Similarly one shows \( \mathcal{F}^{-1}(fg) = f^\prime \star g^\prime \).

\[ \begin{align*}
\text{Corollary 34.15.} & \quad \text{Let } p(x, \xi) \text{ and } p(x, D_x) \text{ be as in Notation 34.8 with each function } a_n(x) \text{ being a smooth function of } x \in \mathbb{R}^n. \text{ Then for } f \in \mathcal{S},
\end{align*} \]

\[
p(x, D_x)f(x) = \int_{\mathbb{R}^n} p(x, \xi) \hat{f}(\xi) e^{ix \cdot \xi} d\xi.
\] (34.19)

Proof. For \( f \in \mathcal{S} \), we have

\[
p(x, D_x)f(x) = p(x, D_x) \left( \mathcal{F}^{-1} \hat{f} \right)(x) = p(x, D_x) \int_{\mathbb{R}^n} \hat{f}(\xi) e^{ix \cdot \xi} d\xi = \int_{\mathbb{R}^n} \hat{f}(\xi) p(x, D_x) e^{ix \cdot \xi} d\xi = \int_{\mathbb{R}^n} \hat{f}(\xi) p(x, \xi) e^{ix \cdot \xi} d\xi.
\]

If \( p(x, \xi) \) is a more general function of \( (x, \xi) \) then that given in Notation 34.8 the right member of Eq. (34.19) may still make sense, in which case we may use it as a definition of \( p(x, D_x) \). A linear operator defined this way is called a pseudo differential operator and they turn out to be a useful class of operators to study when working with partial differential equations.
Corollary 34.16. Suppose \( p(\xi) = \sum_{|\alpha| \leq N} a_{\alpha} \xi^\alpha \) is a polynomial in \( \xi \in \mathbb{R}^n \) and \( f \in L^2 \). Then \( p(\partial) f \) exists in \( L^2 \) (see Definition 32.3) iff \( \xi \rightarrow p(i\xi) \hat{f}(\xi) \in L^2 \) in which case

\[
(p(\partial) f)(\xi) = p(i\xi) \hat{f}(\xi) \quad \text{for a.e. } \xi.
\]

In particular, if \( g \in L^2 \) then \( f \in L^2 \) solves the equation, \( p(\partial) f = g \) iff \( p(i\xi) \hat{f}(\xi) = \hat{g}(\xi) \) for a.e. \( \xi \).

**Proof.** By definition \( p(\partial) f = g \) in \( L^2 \) iff

\[
\langle g, \varphi \rangle = \langle f, p(-\partial) \varphi \rangle \quad \text{for all } \varphi \in C_c^\infty(\mathbb{R}^n). \tag{34.20}
\]

If follows from repeated use of Lemma 32.23 that the previous equation is equivalent to

\[
\langle g, \varphi \rangle = \langle f, p(-\partial) \varphi \rangle \quad \text{for all } \varphi \in \mathcal{S}(\mathbb{R}^n). \tag{34.21}
\]

This may also be easily proved directly as well as follows. Choose \( \psi \in C_c^\infty(\mathbb{R}^n) \) such that \( \psi(x) = 1 \) for \( x \in B_0(1) \) and for \( \varphi \in \mathcal{S}(\mathbb{R}^n) \) let \( \varphi_n(x) := \psi(x/n) \varphi(x) \). By the chain rule and the product rule (Eq. ?? of Appendix ??),

\[
\partial^\alpha \varphi_n(x) = \sum_{|\beta| \leq \alpha} \binom{\alpha}{\beta} n^{-|\beta|} (\partial^\beta \psi)(x/n) \cdot \partial^{\alpha - \beta} \varphi(x)
\]

along with the dominated convergence theorem shows \( \varphi_n \rightarrow \varphi \) and \( \partial^\alpha \varphi_n \rightarrow \partial^\alpha \varphi \) in \( L^2 \) as \( n \rightarrow \infty \). Therefore if Eq. (34.20) holds, we find Eq. (34.21) holds because

\[
\langle g, \varphi \rangle = \lim_{n \rightarrow \infty} \langle g, \varphi_n \rangle = \lim_{n \rightarrow \infty} \langle f, p(-\partial) \varphi_n \rangle = \langle f, p(-\partial) \varphi \rangle.
\]

To complete the proof simply observe that \( \langle g, \varphi \rangle = \langle \hat{g}, \varphi' \rangle \) and

\[
\langle f, p(-\partial) \varphi \rangle = \langle \hat{f}, p(-\partial) \varphi' \rangle = \langle \hat{f}(\xi), p(i\xi) \varphi'(\xi) \rangle = \langle p(i\xi) \hat{f}(\xi), \varphi'(\xi) \rangle = \langle p(i\xi) \hat{f}(\xi), \varphi'(\xi) \rangle
\]

for all \( \varphi \in \mathcal{S}(\mathbb{R}^n) \). From these two observations and the fact that \( \mathcal{F} \) is bijective on \( \mathcal{S} \), one sees that Eq. (34.21) holds iff \( \xi \rightarrow p(i\xi) \hat{f}(\xi) \in L^2 \) and \( \hat{g}(\xi) = p(i\xi) \hat{f}(\xi) \) for a.e. \( \xi \). \( \blacksquare \)

### 34.4 Summary of Basic Properties of \( \mathcal{F} \) and \( \mathcal{F}^{-1} \)

The following table summarizes some of the basic properties of the Fourier transform and its inverse.

<table>
<thead>
<tr>
<th>Property</th>
<th>( \mathcal{F} )</th>

### 34.5 Fourier Transforms of Measures and Bochner’s Theorem

To motivate the next definition suppose that \( \mu \) is a finite measure on \( \mathbb{R}^n \) which is absolutely continuous relative to Lebesgue measure, \( d\mu(x) = \rho(x)dx \). Then it is reasonable to require

\[
\hat{\mu}(\xi) := \hat{\rho}(\xi) = \int_{\mathbb{R}^n} e^{-i\xi \cdot x} \rho(x)dx = \int_{\mathbb{R}^n} e^{-i\xi \cdot x} d\mu(x)
\]

and

\[
(\mu \ast g)(x) := \mu \ast g(x) = \int_{\mathbb{R}^n} g(x-y)\rho(x)dx = \int_{\mathbb{R}^n} g(x-y)d\mu(y)
\]

when \( g : \mathbb{R}^n \rightarrow \mathbb{C} \) is a function such that the latter integral is defined, for example assume \( g \) is bounded. These considerations lead to the following definitions.

**Definition 34.17.** The Fourier transform, \( \hat{\mu} \), of a complex measure \( \mu \) on \( \mathbb{R}^n \) is defined by

\[
\hat{\mu}(\xi) = \int_{\mathbb{R}^n} e^{-i\xi \cdot x} d\mu(x) \tag{34.22}
\]

and the convolution with a function \( g \) is defined by

\[
(\mu \ast g)(x) = \int_{\mathbb{R}^n} g(x-y)d\mu(y)
\]

when the integral is defined.

**Example 34.18.** Let \( \sigma_t \) be the surface measure on the sphere \( S_t \) of radius \( t \) centered at zero in \( \mathbb{R}^3 \). Then

\[
\hat{\sigma}_t(\xi) = 4\pi t \frac{\sin \left( \frac{t|\xi|}{2} \right)}{|\xi|}.
\]

Indeed,

\[
\hat{\sigma}_t(\xi) = \int_{S^2} e^{-i\xi \cdot x} d\sigma(x) = t^2 \int_{S^2} e^{-i\xi \cdot x} d\sigma(x)
\]

\[
= t^2 \int_{S^2} e^{-i\xi \cdot |\xi|} d\sigma(x) = t^2 \int_{0}^{2\pi} d\theta \int_{0}^{\pi} d\phi \sin \phi e^{-it\cos \phi |\xi|}
\]

\[
= 2\pi t^2 \int_{-1}^{1} e^{-it|\xi|} du = 2\pi t^2 \frac{1}{-i|\xi|} e^{-it|\xi|} \bigg|_{u=-1}^{u=1} = 4\pi t^2 \frac{\sin t|\xi|}{t|\xi|}.
\]
Definition 34.19. A function \( \chi : \mathbb{R}^n \rightarrow \mathbb{C} \) is said to be positive (semi) definite if the matrices \( A := \{ \chi(\xi_k - \xi_j) \}_{k,j=1}^{m} \) are positive definite for all \( m \in \mathbb{N} \) and \( \{ \xi_j \}_{j=1}^{m} \subset \mathbb{R}^n \).

Lemma 34.20. If \( \chi \in C(\mathbb{R}^n, \mathbb{C}) \) is a positive definite function, then

1. \( \chi(0) \geq 0 \).
2. \( \chi(-\xi) = \overline{\chi(\xi)} \) for all \( \xi \in \mathbb{R}^n \).
3. \( |\chi(\xi)| \leq \chi(0) \) for all \( \xi \in \mathbb{R}^n \).
4. For all \( f \in S(\mathbb{R}^d) \),

   \[
   \int_{\mathbb{R}^n \times \mathbb{R}^n} \chi(\xi - \eta)f(\xi)\overline{f(\eta)}d\xi d\eta \geq 0.
   \]  

Proof. Taking \( m = 1 \) and \( \xi_1 = 0 \) we learn \( \chi(0)|\lambda|^2 \geq 0 \) for all \( \lambda \in \mathbb{C} \) which proves item 1. Taking \( m = 2 \), \( \xi_1 = \xi \) and \( \xi_2 = \eta \), the matrix

\[
A := \begin{bmatrix} \chi(0) & \chi(\xi - \eta) \\ \chi(\eta - \xi) & \chi(0) \end{bmatrix}
\]

is positive definite from which we conclude \( \chi(\xi - \eta) = \overline{\chi(\eta - \xi)} \) (since \( A = A^* \) by definition) and

\[
0 \leq \det \begin{bmatrix} \chi(0) & \chi(\xi - \eta) \\ \chi(\eta - \xi) & \chi(0) \end{bmatrix} = |\chi(0)|^2 - |\chi(\xi - \eta)|^2.
\]

and hence \( |\chi(\xi)| \leq \chi(0) \) for all \( \xi \). This proves items 2. and 3. Item 4. follows by approximating the integral in Eq. [34.23] by Riemann sums,

\[
\int_{\mathbb{R}^n \times \mathbb{R}^n} \chi(\xi - \eta)f(\xi)\overline{f(\eta)}d\xi d\eta = \lim_{\varepsilon \downarrow 0} \varepsilon^{-2n} \sum_{\xi,\eta \in (\varepsilon \mathbb{Z}^n)^* \cap [-\varepsilon^{-1}, \varepsilon^{-1}]^n} \chi(\xi - \eta)f(\xi)\overline{f(\eta)} \geq 0.
\]

We now show \( I(f) ) \) is positive in the sense if \( f \in S \) and \( f \geq 0 \) then \( I(f) \geq 0 \).

For general \( f \in S \) we have

\[
I(|f|^2) = \int_{\mathbb{R}^n} \chi(\xi) \left(|f(\xi)|^2 \right)^\vee \xi d\xi = \int_{\mathbb{R}^n} \chi(\xi) \left( f(\xi)^\vee \right)^\vee (\xi) d\xi
\]

\[
= \int_{\mathbb{R}^n} \chi(\xi)f^\vee(\xi - \eta)\overline{f^\vee(\eta)}d\eta d\xi = \int_{\mathbb{R}^n} \chi(\xi)f^\vee(\xi - \eta)f^\vee(-\eta)d\eta d\xi
\]

\[
= \int_{\mathbb{R}^n} \chi(\xi - \eta)f^\vee(\xi)f^\vee(-\eta)d\eta d\xi \geq 0.
\]

For \( t > 0 \) let \( p_t(x) := t^{-n/2}e^{-|x|^2/2t} \in S \) and define

\[
I_t(x) := I(p_t(x) := I(p_t(x - \cdot)) = I(\sqrt{p_t(x - \cdot)})^2
\]

which is non-negative by Eq. [34.24] and the fact that \( \sqrt{p_t(x - \cdot)} \in S \). Using
There exists a unique Radon–measure which coupled with the dominated convergence theorem shows

\[ \langle I * p_t, \psi \rangle \to \int_{\mathbb{R}^n} \chi(\xi) \psi(\xi) d\xi = I(\psi) \text{ as } t \downarrow 0. \]

Hence if \( \psi \geq 0 \), then \( I(\psi) = \lim_{t \downarrow 0} \langle I, \psi \rangle \geq 0 \).

Let \( K \subset \mathbb{R} \) be a compact set and \( \psi \in C_c(\mathbb{R}, [0, \infty)) \) be a function such that \( \psi = 1 \) on \( K \). If \( f \in C_c^\infty(\mathbb{R}, \mathbb{R}) \) is a smooth function with \( \text{supp}(f) \subset K \), then

\[ 0 \leq \| f \|_\infty \| \psi - f \|_\infty \leq \| f \|_\infty \langle I, \psi \rangle - \langle I, f \rangle \]

and therefore \( \langle I, f \rangle \leq \| f \|_\infty \langle I, \psi \rangle \). Replacing \( f \) by \( -f \) implies \( \langle I, f \rangle \leq \| f \|_\infty \langle I, \psi \rangle \) and hence we have proved

\[ \| I, f \| \leq C(\text{supp}(f)) \| f \|_\infty \]

(34.25)

for all \( f \in D_{\mathbb{R}^n} := C_c^\infty(\mathbb{R}^n, \mathbb{R}) \) where \( C(K) \) is a finite constant for each compact subset of \( \mathbb{R}^n \). Because of the estimate in Eq. (34.25), it follows that \( I|_{D_{\mathbb{R}^n}} \) has a unique extension \( I \) to \( C_c(\mathbb{R}, \mathbb{R}) \) still satisfying the estimates in Eq. (34.25) and moreover this extension is still positive. So by the Riesz–Markov Theorem 49.49 there exists a unique Radon–measure \( \mu \) on \( \mathbb{R}^n \) such that

\[ \langle I, f \rangle = \mu(f) \]

for all \( f \in C_c(\mathbb{R}, \mathbb{R}) \).

To finish the proof we must show \( \hat{\mu}(\eta) = \chi(\eta) \) for all \( \eta \in \mathbb{R}^n \) given

\[ \mu(f) = \int_{\mathbb{R}^n} \chi(\xi) f(\xi) d\xi \] for all \( f \in C_c^\infty(\mathbb{R}^n, \mathbb{R}) \).

(34.26)

Let \( f \in C_c(\mathbb{R}^n, \mathbb{R}) \) be a radial function such that \( f(0) = 1 \) and \( f(x) \) is decreasing as \( |x| \) increases. Let \( f_\varepsilon(x) := f(\varepsilon x) \), then by Theorem 34.3

\[ F^{-1} \left[ e^{-i\eta x} f_\varepsilon(x) \right](\xi) = \varepsilon^{-n} f(\frac{\xi - \eta}{\varepsilon}) \]

and therefore, from Eq. (34.26),

\[ \int_{\mathbb{R}^n} e^{-i\eta x} f_\varepsilon(x) d\mu(x) = \int_{\mathbb{R}^n} \chi(\xi) \varepsilon^{-n} f(\frac{\xi - \eta}{\varepsilon}) d\xi. \]

(34.27)

Because \( \int_{\mathbb{R}^n} f(\xi) d\mu(\xi) = F(f)(0) = f(0) = 1 \), we may apply the approximate \( \delta \)-function Theorem 19.32 to Eq. (34.27) to find

\[ \int_{\mathbb{R}^n} e^{-i\eta x} f_\varepsilon(x) d\mu(x) \rightarrow \chi(\eta) \text{ as } \varepsilon \downarrow 0. \]

(34.28)

On the other hand, when \( \eta = 0 \), the monotone convergence theorem implies \( \mu(f) \uparrow \mu(1) = \mu(\mathbb{R}^n) \) and therefore \( \mu(\mathbb{R}^n) = \mu(1) = \chi(0) < \infty \). Now knowing the \( \mu \) is a finite measure we may use the dominated convergence theorem to conclude

\[ \mu(e^{-i\eta x} f_\varepsilon(x)) \rightarrow \mu(e^{-i\eta x}) = \hat{\mu}(\eta) \]

as \( \varepsilon \downarrow 0 \) for all \( \eta \). Combining this equation with Eq. (34.28) shows \( \hat{\mu}(\eta) = \chi(\eta) \) for all \( \eta \in \mathbb{R}^n \).

34.6 Supplement: Heisenberg Uncertainty Principle

Suppose that \( H \) is a Hilbert space and \( A, B \) are two densely defined symmetric operators on \( H \). More explicitly, \( A \) is a densely defined symmetric linear operator on \( H \) means there is a dense subspace \( D_A \subset H \) and a linear map \( A : D_A \rightarrow H \) such that \( \langle A \varphi | \psi \rangle = \langle \varphi | A \psi \rangle \) for all \( \varphi, \psi \in D_A \). Let

\[ D_{AB} := \{ \varphi \in H : \varphi \in D_B \text{ and } B \varphi \in D_A \} \]

and for \( \varphi \in D_{AB} \) let \( (AB) \varphi = A(B \varphi) \) with a similar definition of \( D_{BA} \) and \( BA \). Moreover, let \( D_C := D_{AB} \cap D_{BA} \) and for \( \varphi \in D_C \), let

\[ C \varphi = \frac{1}{i} [A, B] \varphi = \frac{1}{i} (AB - BA) \varphi. \]

Notice that for \( \varphi, \psi \in D_C \) we have

\[ \langle C \varphi | \psi \rangle = \frac{1}{i} \{ \langle AB \varphi | \psi \rangle - \langle BA \varphi | \psi \rangle \} = \frac{1}{i} \{ \langle B \varphi | A \psi \rangle - \langle A \varphi | B \psi \rangle \} = \frac{1}{i} \left( \langle \varphi | BA \psi \rangle - \langle \varphi | AB \psi \rangle \right) = \langle \varphi | C \psi \rangle, \]

so that \( C \) is symmetric as well.
Theorem 34.23 (Heisenberg Uncertainty Principle). Continue the above notation and assumptions,
\[
\frac{1}{2} |\langle \psi | C | \psi \rangle| \leq \sqrt{\| A | \psi \|^2 - \langle \psi | A | \psi \rangle} \cdot \sqrt{\| B | \psi \|^2 - \langle \psi | B | \psi \rangle}
\tag{34.29}
\]
for all $\psi \in \mathcal{D}_C$. Moreover if $\| \psi \| = 1$ and equality holds in Eq. (34.29), then
\[
\begin{align*}
(A - \langle \psi | A | \psi \rangle) I &= i \alpha (B - \langle \psi | B | \psi \rangle) I & \text{or} \\
(B - \langle \psi | B | \psi \rangle) I &= i \alpha (A - \langle \psi | A | \psi \rangle) I
\end{align*}
\tag{34.30}
\]
for some $\alpha \in \mathbb{R}$.

Proof. By homogeneity (34.29) we may assume that $\| \psi \| = 1$. Let $a := \langle \psi | A | \psi \rangle$, $b := \langle \psi | B | \psi \rangle$, $A = A - a I$, and $B = B - b I$. Then we have still have
\[
[A, B] = [A - a I, B - b I] = i C.
\]
Now
\[
\begin{align*}
i \langle \psi | C | \psi \rangle &= -\langle \psi | i C | \psi \rangle = -\langle \psi | [\hat{A}, \hat{B}] | \psi \rangle = -\langle \psi | \hat{A} \hat{B} | \psi \rangle + \langle \psi | \hat{B} \hat{A} | \psi \rangle \\
&= -\left( \langle \hat{A} \hat{B} | \psi \rangle - \langle \hat{B} \hat{A} | \psi \rangle \right) = -2 i \text{Im} \langle \hat{A} \hat{B} | \psi \rangle
\end{align*}
\]
from which we learn
\[
|\langle \psi | C | \psi \rangle| = 2 |\text{Im} \langle \hat{A} \hat{B} | \psi \rangle| \leq 2 \left| \langle \hat{A} \hat{B} | \psi \rangle \right| \leq 2 \left| \hat{A} \hat{B} \right| \| \hat{B} \psi \| \tag{34.31}
\]
with equality iff Re $\langle \hat{A} \hat{B} | \psi \rangle = 0$ and $\hat{A} \psi$ and $\hat{B} \psi$ are linearly dependent, i.e. iff Eq. (34.30) holds. Equation (34.29) now follows from the inequality in Eq. (34.31) and the identities,
\[
\| \hat{A} \| \| \hat{B} \psi \| = \| A \psi - a | \psi \| = \| A \psi \| + a^2 \| \psi \|^2 - 2 a \text{Re} \langle A | \psi \rangle
\]
and similarly
\[
\| \hat{B} \psi \|^2 = \| B \psi - \langle B | \psi \rangle \psi \|^2 = \| B \psi \|^2 - \langle B | \psi \rangle \psi \|.
\]

Example 34.24. As an example, take $H = L^2(\mathbb{R})$, $A = \frac{i}{2} \partial_x$ and $B = M_x$ with $\mathcal{D}_A := \{ f \in H : f' \in H \}$ ($f'$ is the weak derivative) and $\mathcal{D}_B := \{ f \in H : \int_{\mathbb{R}} |x f(x)|^2 \, dx < \infty \}$. In this case,
\[
\mathcal{D}_C = \{ f \in H : f', x f \text{ and } x f' \text{ are in } H \}
\]
and $C = -I$ on $\mathcal{D}_C$. Therefore for a unit vector $\psi \in \mathcal{D}_C$,
\[
\frac{1}{2} \leq \left\| \frac{1}{i} \psi' - a \psi \right\|_2 \cdot \| x \psi - b \psi \|_2
\]
where $a = \int_{\mathbb{R}} \psi \bar{\psi}' \, dm$ and $b = \int_{\mathbb{R}} x |\psi(x)|^2 \, dm(x)$. Thus we have
\[
\frac{1}{4} = \frac{1}{4} \int_{\mathbb{R}} |\psi|^2 \, dm \leq \int_{\mathbb{R}} (k - a)^2 \left| \psi(k) \right|^2 \, dk \cdot \int_{\mathbb{R}} (x - b)^2 |\psi(x)|^2 \, dx. \tag{34.32}
\]
Equality occurs if there exists $\lambda \in \mathbb{R}$ such that
\[
i \lambda \lambda (x - b) \psi(x) = \left( \frac{1}{i} \partial_x - a \right) \psi(x) \text{ a.e.}
\]
Working formally, this gives rise to the ordinary differential equation (in weak form),
\[
\psi_x = -\lambda (x - b) + ia \psi \tag{34.33}
\]
which has solutions (see Exercise 34.5 below)
\[
\psi = C \exp \left( \int_{\mathbb{R}} [\lambda (x - b) + ia] \, dx \right) = C \exp \left( -\frac{\lambda}{2} (x - b)^2 + ia \right). \tag{34.34}
\]
Let $\lambda = \frac{1}{2 t}$ and choose $C$ so that $\| \psi \|_2 = 1$ to find
\[
\psi_{t,a,b}(x) = \left( \frac{1}{2 t} \right)^{1/4} \exp \left( - \frac{1}{4 t} (x - b)^2 + ia \right)
\]
are the functions (called coherent states) which saturate the Heisenberg uncertainty principle in Eq. (34.32).

34.6.1 Exercises

Exercise 34.2. Let $f \in L^2(\mathbb{R}^n)$ and $\alpha$ be a multi-index. If $\partial^\alpha f$ exists in $L^2(\mathbb{R}^n)$ then $\mathcal{F}(\partial^\alpha f) = (i \xi)^\alpha \hat{f}(\xi)$ in $L^2(\mathbb{R}^n)$ and conversely if $\left( \xi \to \xi^\alpha \hat{f}(\xi) \right) \in L^2(\mathbb{R}^n)$ then $\partial^\alpha f$ exists.

1 The constant $\alpha$ may also be described as
\[
a = i \int_{\mathbb{R}} \psi \bar{\psi}' \, dm = \sqrt{2 \pi a} \int_{\mathbb{R}} \psi(\xi) \bar{\psi}'(\xi) \, d\xi \xi \\
= \int_{\mathbb{R}} \sqrt{\xi} \psi(\xi) \, dm(\xi).
\]
Exercise 34.3. Suppose $p(\xi)$ is a polynomial in $\xi \in \mathbb{R}^d$ and $u \in L^2$ such that $p(\partial)u \in L^2$. Show
\[ \mathcal{F}(p(\partial)u)(\xi) = p(i\xi)\hat{u}(\xi) \in L^2. \]
Conversely if $u \in L^2$ such that $p(i\xi)\hat{u}(\xi) \in L^2$, show $p(\partial)u \in L^2$.

Exercise 34.4. Suppose $\mu$ is a complex measure on $\mathbb{R}^n$ and $\hat{\mu}(\xi)$ is its Fourier transform as defined in Definition 34.17. Show
\[ \langle \hat{\mu}, \varphi \rangle := \int_{\mathbb{R}^n} \hat{\mu}(\xi)\varphi(\xi)d\xi = \mu(\hat{\varphi}) := \int_{\mathbb{R}^n} \hat{\varphi}d\mu \quad \text{for all } \varphi \in \mathcal{S} \]
and use this to show if $\mu$ is a complex measure such that $\hat{\mu} \equiv 0$, then $\mu \equiv 0$.

Exercise 34.5. Show that $\psi$ described in Eq. (34.34) is the general solution to Eq. (34.33). Hint: Suppose that $\varphi$ is any solution to Eq. (34.33) and $\psi$ is given as in Eq. (34.34) with $C = 1$. Consider the weak – differential equation solved by $\varphi/\psi$.

34.6.2 More Proofs of the Fourier Inversion Theorem

Exercise 34.6. Suppose that $f \in L^1(\mathbb{R})$ and assume that $f$ continuously differentiable in a neighborhood of 0, show
\[ \lim_{M \to \infty} \int_{-\infty}^{\infty} \frac{\sin Mx}{x} f(x)dx = \pi f(0) \tag{34.35} \]
using the following steps.
1. Use Example 47.23 to deduce,
\[ \lim_{M \to \infty} \int_{-1}^{1} \frac{\sin Mx}{x} dx = \lim_{M \to \infty} \int_{-M}^{M} \frac{\sin x}{x} dx = \pi. \]
2. Explain why
\[ 0 = \lim_{M \to \infty} \int_{|x| \geq 1} \sin Mx \cdot \frac{f(x)}{x} dx \quad \text{and} \quad 0 = \lim_{M \to \infty} \int_{|x| \leq 1} \sin Mx \cdot \frac{f(x) - f(0)}{x} dx. \]
3. Add the previous two equations and use part (1) to prove Eq. (34.35).

Exercise 34.7 (Fourier Inversion Formula). Suppose that $f \in L^1(\mathbb{R})$ such that $\hat{f} \in L^1(\mathbb{R})$.

1. Further assume that $f$ is continuously differentiable in a neighborhood of 0. Show that
\[ A := \int_{\mathbb{R}} \hat{f}(\xi)d\xi = f(0). \]
Hint: by the dominated convergence theorem, $A := \lim_{M \to \infty} \int_{|\xi| \leq M} \hat{f}(\xi)d\xi$.
Now use the definition of $\hat{f}(\xi)$, Fubini’s theorem and Exercise 34.6
2. Apply part 1. of this exercise with $f$ replace by $\tau_y f$ for some $y \in \mathbb{R}$ to prove
\[ f(y) = \int_{\mathbb{R}} \hat{f}(\xi)e^{iy\xi}d\xi \tag{34.36} \]
provided $f$ is now continuously differentiable near $y$.

The goal of the next exercises is to give yet another proof of the Fourier inversion formula.

Notation 34.25 For $L > 0$, let $C^1_L(\mathbb{R})$ denote the space of $C^k - 2\pi L$ periodic functions:
\[ C^1_L(\mathbb{R}) := \left\{ f \in C^k(\mathbb{R}) : f(x + 2\pi L) = f(x) \text{ for all } x \in \mathbb{R} \right\}. \]
Also let $\langle \cdot, \cdot \rangle_L$ denote the inner product on the Hilbert space $H_L := L^2([-\pi L, \pi L])$ given by
\[ \langle f, g \rangle_L := \frac{1}{2\pi L} \int_{-\pi L, \pi L} f(x)\bar{g}(x)dx. \]

Exercise 34.8. Recall that $\{\chi^L_k(x) := e^{ikx/L} : k \in \mathbb{Z}\}$ is an orthonormal basis for $H_L$ and in particular for $f \in H_L$,
\[ f = \sum_{k \in \mathbb{Z}} \langle f, \chi^L_k \rangle_L \chi^L_k \tag{34.37} \]
where the convergence takes place in $L^2([-\pi L, \pi L])$. Suppose now that $f \in C^1_L(\mathbb{R})^2$ Show (by two integration by parts)
\[ |\langle f, \chi^L_k \rangle_L| \leq \frac{L^2}{k^2} \|f''\|_{\infty} \]
where $\|g\|_{\infty}$ denote the uniform norm of a function $g$. Use this to conclude that the sum in Eq. (34.37) is uniformly convergent and from this conclude that Eq. (34.37) holds pointwise. BRUCE: it is enough to assume $f \in C_L(\mathbb{R})$ by making use of the identity,
\[ \| \chi^L_k \|_{\infty} \leq \frac{1}{k^2 \pi} \]

\[ \|f''\|_{\infty} \leq \frac{1}{k^2 \pi} \]
where $\|g\|_{\infty}$ denote the uniform norm of a function $g$. Use this to conclude that the sum in Eq. (34.37) is uniformly convergent and from this conclude that Eq. (34.37) holds pointwise. BRUCE: it is enough to assume $f \in C_L(\mathbb{R})$ by making use of the identity,
\[ \| \chi^L_k \|_{\infty} \leq \frac{1}{k^2 \pi} \]

\[ \|f''\|_{\infty} \leq \frac{1}{k^2 \pi} \]
where $\|g\|_{\infty}$ denote the uniform norm of a function $g$. Use this to conclude that the sum in Eq. (34.37) is uniformly convergent and from this conclude that Eq. (34.37) holds pointwise. BRUCE: it is enough to assume $f \in C_L(\mathbb{R})$ by making use of the identity,
along with the Cauchy Schwarz inequality to see

\[
\left( \sum_{k \neq 0} |\langle f | \chi^L_k \rangle_L|^2 \right)^2 \leq \sum_{k \neq 0} |\langle f' | \chi^L_k \rangle_L|^2 \cdot \sum_{k \neq 0} \left( \frac{L}{|k|} \right)^2 .
\]

**Exercise 34.9 (Fourier Inversion Formula on \( S \)).** Let \( f \in S(\mathbb{R}) \), \( L > 0 \) and

\[
f_L(x) := \sum_{k \in \mathbb{Z}} f(x + 2\pi kL).
\]  

(34.38)

Show:

1. The sum defining \( f_L \) is convergent and moreover that \( f_L \in C^\infty_L(\mathbb{R}) \).
2. Show \( \langle f_L | \chi^L_k \rangle_L = \frac{1}{\sqrt{2\pi L}} \hat{f}(k/L) \).
3. Conclude from Exercise 34.8 that

\[
f_L(x) = \frac{1}{\sqrt{2\pi L}} \sum_{k \in \mathbb{Z}} \hat{f}(k/L) e^{ikx/L} \quad \text{for all } x \in \mathbb{R}.
\]

(34.39)

4. Show, by passing to the limit, \( L \to \infty \), in Eq. (34.39) that Eq. (34.36) holds for all \( x \in \mathbb{R} \). **Hint:** Recall that \( \hat{f} \in S \).

**Exercise 34.10.** Folland 8.13 on p. 254.

**Exercise 34.11.** Folland 8.14 on p. 254. (Wirtinger’s inequality.)

**Exercise 34.12.** Folland 8.15 on p. 255. (The sampling Theorem. Modify to agree with notation in notes, see Solution ?? below.) My version of Folland 8.15.

**Exercise 34.13.** Folland 8.16 on p. 255.

**Exercise 34.14.** Folland 8.17 on p. 255.

**Exercise 34.15.** Folland 8.19 on p. 256. (The Fourier transform of a function whose support has finite measure.)

**Exercise 34.16.** Folland 8.22 on p. 256. (Bessel functions.)

**Exercise 34.17.** Folland 8.23 on p. 256. (Hermite Polynomial problems and Harmonic oscillators.)

**Exercise 34.18.** Folland 8.31 on p. 263. (Poisson Summation formula problem.)
Constant Coefficient partial differential equations

Suppose that \( p(\xi) = \sum_{|\alpha| \leq k} a_\alpha \xi^\alpha \) with \( a_\alpha \in \mathbb{C} \) and

\[
L = p(D_x) := \sum_{|\alpha| \leq N} a_\alpha D_x^\alpha = \sum_{|\alpha| \leq N} a_\alpha \left( \frac{1}{i} \partial_x \right)^\alpha.
\]  

(35.1)

Then for \( f \in S \)

\[
\hat{L} \hat{f}(\xi) = p(\xi) \hat{f}(\xi),
\]

that is to say the Fourier transform takes a constant coefficient partial differential operator to multiplication by a polynomial. This fact can often be used to solve constant coefficient partial differential equation. For example suppose \( g : \mathbb{R}^n \to \mathbb{C} \) is a given function and we want to find a solution to the equation \( Lf = g \). Taking the Fourier transform of both sides of the equation \( Lf = g \) would imply \( p(\xi) \hat{f}(\xi) = \hat{g}(\xi) \) and therefore \( \hat{f}(\xi) = \frac{\hat{g}(\xi)}{p(\xi)} \) provided \( p(\xi) \) is never zero. (We will discuss what happens when \( p(\xi) \) has zeros a bit more later.) So we should expect

\[
f(x) = \mathcal{F}^{-1} \left( \frac{1}{p(\xi)} \hat{g}(\xi) \right)(x) = \mathcal{F}^{-1} \left( \frac{1}{p(\xi)} \right) \star g(x).
\]

Definition 35.1. Let \( L = p(D_x) \) as in Eq. (35.1). Then we let \( \sigma(L) := \text{Ran}(p) \subset \mathbb{C} \) and call \( \sigma(L) \) the spectrum of \( L \). Given a measurable function \( G : \sigma(L) \to \mathbb{C} \), we define (a possibly unbounded operator)

\[
G(L) : L^2(\mathbb{R}^n, m) \to L^2(\mathbb{R}^n, m)
\]

by

\[
G(L)f := \mathcal{F}^{-1} M_{Gop} \mathcal{F}
\]

where \( M_{Gop} \) denotes the operation on \( L^2(\mathbb{R}^n, m) \) of multiplication by \( G \circ p \), i.e.

\[
M_{Gop}f = (G \circ p)f
\]

with domain given by those \( f \in L^2 \) such that \( (G \circ p)f \in L^2 \).

At a formal level we expect

\[
G(L)f = \mathcal{F}^{-1} (G \circ p) \star g.
\]

35.1 Elliptic examples

As a specific example consider the equation

\[
(-\Delta + m^2) f = g
\]

(35.2)

where \( f, g : \mathbb{R}^n \to \mathbb{C} \) and \( \Delta = \sum_{i=1}^n \partial_i^2 / \partial x_i^2 \) is the usual Laplacian on \( \mathbb{R}^n \). By Corollary 34.16 (i.e. taking the Fourier transform of this equation), solving Eq. (35.2) with \( f, g \in L^2 \) is equivalent to solving

\[
\left( |\xi|^2 + m^2 \right) \hat{f}(\xi) = \hat{g}(\xi).
\]

(35.3)

The unique solution to this latter equation is

\[
\hat{f}(\xi) = \left( |\xi|^2 + m^2 \right)^{-1} \hat{g}(\xi)
\]

and therefore,

\[
f(x) = \mathcal{F}^{-1} \left( \left( |\xi|^2 + m^2 \right)^{-1} \hat{g}(\xi) \right)(x) =: (-\Delta + m^2)^{-1} g(x).
\]

We expect

\[
\mathcal{F}^{-1} \left( \left( |\xi|^2 + m^2 \right)^{-1} \hat{g}(\xi) \right)(x) = G_m \star g(x) = \int_{\mathbb{R}^n} G_m(x-y)g(y)dy,
\]

where

\[
G_m(x) := \mathcal{F}^{-1} \left( |\xi|^2 + m^2 \right)^{-1}(x) = \int_{\mathbb{R}^n} \frac{1}{m^2 + |\xi|^2} e^{ix \cdot \xi} d\xi.
\]

At the moment \( \mathcal{F}^{-1} \left( |\xi|^2 + m^2 \right)^{-1} \) only makes sense when \( n = 1, 2, \) or 3 because only then is \( \left( |\xi|^2 + m^2 \right)^{-1} \in L^2(\mathbb{R}^n) \).

For now we will restrict our attention to the one dimensional case, \( n = 1 \), in which case

\[
G_m(x) = \frac{1}{\sqrt{2\pi}} \int_{\mathbb{R}} \frac{1}{(\xi + mi)(\xi - mi)} e^{ix\xi} d\xi.
\]

(35.4)
The function $G_m$ may be computed using standard complex variable contour integration methods to find, for $x \geq 0$,

$$G_m(x) = \frac{1}{\sqrt{2\pi}} e^{\frac{ix^2}{2m}} = \frac{1}{2m} \sqrt{\frac{2\pi}{m}} e^{-mx}$$

and since $G_m$ is an even function,

$$G_m(x) = F^{-1} \left( \frac{|x|^2 + m^2}{\sqrt{2m}} \right)^{-1} (x) = \frac{\sqrt{2\pi}}{2m} e^{-m|x|}. \quad (35.5)$$

This result is easily verified to be correct, since

$$F \left[ \frac{\sqrt{2\pi}}{2m} e^{-m|x|} \right] (\xi) = \frac{\sqrt{2\pi}}{2m} \int_{\mathbb{R}} e^{-m|x|} e^{-ix\xi} \, dx$$

$$= \frac{1}{2m} \left( \int_{0}^{\infty} e^{-mx} e^{-ix\xi} \, dx + \int_{-\infty}^{0} e^{mx} e^{-ix\xi} \, dx \right)$$

$$= \frac{1}{2m} \left( \frac{1}{m + i\xi} + \frac{1}{m - i\xi} \right) = \frac{1}{m^2 + \xi^2}.$$ 

Hence in conclusion we find that $(-\Delta + m^2) f = g$ has solution given by

$$f(x) = G_m \star g(x) = \frac{\sqrt{2\pi}}{2m} \int_{\mathbb{R}} e^{-m|x-y|} g(y) dy = \frac{1}{2m} \int_{\mathbb{R}} e^{-m|x-y|} g(y) dy.$$

**Question.** Why do we get a unique answer here given that $f(x) = A\sinh(x) + B\cosh(x)$ solves

$$(-\Delta + m^2) f = 0?$$

The answer is that such an $f$ is not in $L^2$ unless $f = 0$! More generally it is worth noting that $A\sinh(x) + B\cosh(x)$ is not in $\mathcal{F}$ unless $A = B = 0$.

What about when $m = 0$ in which case $m^2 + \xi^2$ becomes $\xi^2$ which has a zero at $0$. Noting that constants are solutions to $\Delta f = 0$, we might look at

$$\lim_{m \to 0} G_m(x) = \lim_{m \to 0} \frac{\sqrt{2\pi}}{2m} (e^{-m|x|} - 1) = -\frac{\sqrt{2\pi}}{2} |x|.$$ 

as a solution, i.e. we might conjecture that

$$f(x) := -\frac{1}{2} \int_{\mathbb{R}} |x-y| g(y) dy$$

solves the equation $-f'' = g$. To verify this we have

$$f(x) := -\frac{1}{2} \int_{-\infty}^{x} (x-y) g(y) dy - \frac{1}{2} \int_{x}^{\infty} (y-x) g(y) dy$$

so that

$$f'(x) = -\frac{1}{2} \int_{-\infty}^{x} g(y) dy + \frac{1}{2} \int_{x}^{\infty} g(y) dy$$

and

$$f''(x) = -\frac{1}{2} g(x) - \frac{1}{2} g(x).$$

### 35.2 Poisson Semi-Group

Let us now consider the problems of finding a function $(x_0, x) \in [0, \infty) \times \mathbb{R}^n \to u(x_0, x) \in \mathbb{C}$ such that

$$\left( \frac{\partial^2}{\partial x_0^2} + \Delta \right) u = 0 \text{ with } u(0, \cdot) = f \in L^2(\mathbb{R}^n). \quad (35.6)$$

Let $\hat{u}(x_0, \xi) := \int_{\mathbb{R}^n} u(x_0, x) e^{-ix\xi} dx$ denote the Fourier transform of $u$ in the $x \in \mathbb{R}^n$ variable. Then Eq. (35.6) becomes

$$\left( \frac{\partial^2}{\partial x_0^2} - |\xi|^2 \right) \hat{u}(x_0, \xi) = 0 \text{ with } \hat{u}(0, \xi) = \hat{f}(\xi) \quad (35.7)$$

and the general solution to this differential equation ignoring the initial condition is of the form

$$\hat{u}(x_0, \xi) = A(\xi) e^{-x_0|\xi|} + B(\xi) e^{x_0|\xi|} \quad (35.8)$$

for some function $A(\xi)$ and $B(\xi)$. Let us now impose the extra condition that $u(x_0, \cdot) \in L^2(\mathbb{R}^n)$ or equivalently that $\hat{u}(x_0, \cdot) \in L^2(\mathbb{R}^n)$ for all $x_0 \geq 0$. The solution in Eq. (35.8) will not have this property unless $B(\xi)$ decays very rapidly at $\infty$. The simplest way to achieve this is to assume $B = 0$ in which case we now get a unique solution to Eq. (35.7), namely

$$\hat{u}(x_0, \xi) = \hat{f}(\xi) e^{-x_0|\xi|}.$$ 

Applying the inverse Fourier transform gives

$$u(x_0, x) = F^{-1} \left[ \hat{f}(\xi) e^{-x_0|\xi|} \right] (x) = \left( e^{-x_0\sqrt{-\Delta}} f \right) (x)$$

and moreover

$$\left( e^{-x_0\sqrt{-\Delta}} f \right) (x) = P_{x_0} \ast f(x).$$
where $P_{x_0}(x) = (2\pi)^{-n/2} (\mathcal{F}^{-1} e^{-|x|^2}) (x)$. From Exercise 35.1

$$P_{x_0}(x) = (2\pi)^{-n/2} \left( \mathcal{F}^{-1} e^{-|x|^2} \right) (x) = c_n \frac{x_0}{(x_0^2 + |x|^2)^{(n+1)/2}}$$

where

$$c_n = (2\pi)^{-n/2} \Gamma((n+1)/2) \sqrt{\pi}^{2n/2} = \frac{\Gamma((n+1)/2)}{2^n \pi^{(n+1)/2}}.$$ 

Hence we have proved the following proposition.

**Proposition 35.2.** For $f \in L^2(\mathbb{R}^n)$,

$$e^{-|x_0|^2/2} f = P_{x_0} * f \text{ for all } x_0 \geq 0$$

and the function $u(x_0, x) := e^{-|x_0|^2/2} f(x)$ is $C^\infty$ for $(x_0, x) \in (0, \infty) \times \mathbb{R}^n$ and solves Eq. (35.6).

### 35.3 Heat Equation on $\mathbb{R}^n$

The heat equation for a function $u : \mathbb{R}^+ \times \mathbb{R}^n \to \mathbb{C}$ is the partial differential equation

$$\left( \partial_t - \frac{1}{2} \Delta \right) u = 0 \text{ with } u(0, x) = f(x), \tag{35.9}$$

where $f$ is a given function on $\mathbb{R}^n$. By Fourier transforming Eq. (35.9) in the $x$-variables only, one finds that (35.9) implies that

$$\left( \partial_t + \frac{1}{2} |\xi|^2 \right) \hat{u}(t, \xi) = 0 \text{ with } \hat{u}(0, \xi) = \hat{f}(\xi). \tag{35.10}$$

and hence that $\hat{u}(t, \xi) = e^{-t|\xi|^2/2} \hat{f}(\xi)$. Inverting the Fourier transform then shows that

$$u(t, x) = \mathcal{F}^{-1} \left( e^{-t|\xi|^2/2} \hat{f}(\xi) \right)(x) = \mathcal{F}^{-1} \left( e^{-t|\xi|^2/2} \right) \ast f(x) = e^{t/2} f(x).$$

From Example 34.4

$$\mathcal{F}^{-1} \left( e^{-t|\xi|^2/2} \right)(x) = p_t(x) = t^{-n/2} e^{-\frac{1}{4t} |x|^2}$$

and therefore,

$$u(t, x) = \int_{\mathbb{R}^n} p_t(x - y) f(y) dy.$$ 

This suggests the following theorem.

**Theorem 35.3.** Let

$$\rho(t, x, y) := (2\pi t)^{-n/2} e^{-|x-y|^2/2t} \tag{35.11}$$

be the heat kernel on $\mathbb{R}^n$. Then

$$\left( \partial_t - \frac{1}{2} \Delta \right) \rho(t, x, y) = 0 \text{ and } \lim_{t \to 0} \rho(t, x, y) = \delta_x(y), \tag{35.12}$$

where $\delta_x$ is the $\delta$-function at $x$ in $\mathbb{R}^n$. More precisely, if $f$ is a continuous bounded (can be relaxed considerably) function on $\mathbb{R}^n$, then

$$u(t, x) = \int_{\mathbb{R}^n} \rho(t, x, y) f(y) dy$$

is a solution to Eq. (35.9) where $u(0, x) := \lim_{t \to 0} u(t, x)$.

**Proof.** Direct computations show that $(\partial_t - \frac{1}{2} \Delta) \rho(t, x, y) = 0$ and an application of Theorem 19.32 shows $\lim_{t \to 0} \rho(t, x, y) = \delta_x(y)$ or equivalently that $\lim_{t \to 0} \int_{\mathbb{R}^n} \rho(t, x, y) f(y) dy = f(x)$ uniformly on compact subsets of $\mathbb{R}^n$. This shows that $\lim_{t \to 0} u(t, x) = f(x)$ uniformly on compact subsets of $\mathbb{R}^n$.

This notation suggests that we should be able to compute the solution to $g$ to $(\Delta - m^2) g = f$ using

$$g(x) = \left( m^2 - \Delta \right)^{-1} f(x) = \int_0^\infty \left( e^{-(m^2 - \Delta) t} \right) f(x) dt \tag{35.13}$$

which is a fact which is easily verified using the Fourier transform. This gives us a method to compute $G_m(x)$ from the previous section, namely

$$G_m(x) = \int_0^\infty e^{-m^2 t} p_{2t}(x) dt = \int_0^\infty (2t)^{-n/2} e^{-m^2 t - \frac{1}{4t} |x|^2} dt.$$ 

We make the change of variables, $\lambda = |x|^2/4t$ ($t = |x|^2/4\lambda$, $dt = \frac{|x|^2}{2\lambda^2} d\lambda$) to find

$$G_m(x) = \int_0^\infty (2t)^{-n/2} e^{-m^2 t - \frac{1}{4t} |x|^2} dt = \int_0^\infty \left( \frac{|x|^2}{2\lambda} \right)^{-n/2} e^{-m^2 |x|^2/4\lambda - \frac{1}{2\lambda}} |x|^2 d\lambda$$

$$= \frac{2^{(n^2/2-1)}}{|x|^{n^2-2}} \int_0^\infty \lambda^{n/2-2} e^{-\lambda} e^{-m^2 |x|^2/4\lambda} d\lambda. \tag{35.13}$$

In case $n = 3$, Eq. (35.13) becomes
The function $f(x) = (2\pi)^{-3/2} \int_{\mathbb{R}^3} \sqrt{\frac{\pi}{|x-y|}} e^{-m|x-y|} f(y) dy$

where $m = 3$ and $n = 3$.

The point is we are still going to get exponential decay at infinity. When $m = 0$, Eq. (35.13) becomes

\[ G_0(x) = \frac{2(n/2-2)}{|x|^{n-2}} \int_0^\infty \lambda^{n/2-2} e^{-\lambda e^{-m^2|x|^2}/4\lambda} d\lambda = \frac{2(n/2-2)}{|x|^{n-2}} \Gamma(n/2 - 1) \]

where $\Gamma(x)$ is the gamma function defined in Eq. (47.44). Hence for reasonable functions $f$ (and $n \neq 2$) we expect that (see Proposition 35.4 below).
\((-\Delta)^{-1} f(x) = G_0 \star f(x) = 2^{(n/2 - 2)} \Gamma(n/2 - 1)(2\pi)^{-n/2} \int_{\mathbb{R}^n} \frac{1}{|x - y|^{n-2}} f(y)dy = \frac{1}{4\pi^{n/2}} \Gamma(n/2 - 1) \int_{\mathbb{R}^n} \frac{1}{|x - y|^{n-2}} f(y)dy.\)

The function

\[ G(x) := \frac{1}{4\pi^{n/2}} \Gamma(n/2 - 1) \frac{1}{|x|^{n-2}} \]  

(35.15)
is a “Green’s function” for \(-\Delta\). Recall from Exercise \[12.12\] that, for \(n = 2k\), \(\Gamma(\frac{n}{2} - 1) = \Gamma(k - 1) = (k - 2)!\), and for \(n = 2k + 1\),

\[ \Gamma(\frac{n}{2} - 1) = \Gamma(k - 1/2) = \Gamma(k - 1 + 1/2) = \sqrt{\pi} \frac{1 \cdot 3 \cdot 5 \cdots (2k - 3)}{2^{k-1}} \]

\[ = \sqrt{\pi} \frac{(2k - 3)!}{2^{k-1}} \text{ where } (-1)!! = 1. \]

Hence

\[ G(x) = \frac{1}{4\pi} \frac{1}{|x|^{n-2}} \begin{cases} \frac{1}{\pi} \frac{(k - 2)!}{2^{k-1}} & \text{if } n = 2k \\ \frac{1}{\pi} \frac{(2k - 3)!}{2^{k-1}} & \text{if } n = 2k + 1 \end{cases} \]

and in particular when \(n = 3\),

\[ G(x) = \frac{1}{4\pi} \frac{1}{|x|} \]

which is consistent with Eq. \[35.14\] with \(m = 0\).

**Proposition 35.4.** Let \(n \geq 3\) and for \(x \in \mathbb{R}^n\), let \(\rho_t(x) = \rho(t, x, 0) := \left(\frac{1}{2\pi t}\right)^{n/2} e^{-\frac{1}{t}|x|^2}\) (see Eq. \[35.11\]) and \(G(x)\) be as in Eq. \[35.15\] so that

\[ G(x) := \frac{C_n}{|x|^{n-2}} = \frac{1}{2} \int_0^\infty \rho_t(x)dt \text{ for } x \neq 0. \]

Then

\[ -\Delta (G \ast u) = -G \ast \Delta u = u \]

for all \(u \in C_c^2 (\mathbb{R}^n)\).

**Proof.** For \(f \in C_c (\mathbb{R}^n)\),

\[ G \ast f (x) = C_n \int_{\mathbb{R}^n} f(x-y) \frac{1}{|y|^{n-2}}dy \]
is well defined, since

\[ \int_{\mathbb{R}^n} |f(x-y)| \frac{1}{|y|^{n-2}}dy \leq M \int_{|y| \leq R + |x|} \frac{1}{|y|^{n-2}}dy < \infty \]

where \(M\) is a bound on \(f\) and \(\text{supp}(f) \subset B(0, R)\). Similarly, \(|x| \leq r\), we have

\[ \sup_{|x| \leq r} |f(x-y)| \frac{1}{|y|^{n-2}} \leq M \int_{|y| \leq r} \frac{1}{|y|^{n-2}}dy \in L^1(\mathbb{R}), \]

from which it follows that \(G \ast f\) is a continuous function. Similar arguments show if \(f \in C^2_c (\mathbb{R}^n)\), then \(G \ast f \in C^2 (\mathbb{R}^n)\) and \(\Delta (G \ast f) = G \ast \Delta f\). So to finish the proof it suffices to show \(G \ast \Delta u = u\).

For this we now write, making use of Fubini-Tonelli, integration by parts, the fact that \(\partial_k \rho_t(y) = \frac{1}{2} \Delta \rho_t(y)\) and the dominated convergence theorem,

\[ G \ast \Delta u(x) = \frac{1}{2} \int_{\mathbb{R}^n} \Delta u(x - y) \left( \int_0^\infty \rho_t(y) dt \right) dy = \frac{1}{2} \int_0^\infty dt \int_{\mathbb{R}^n} \Delta u(x - y) \rho_t(y) dy \]

\[ = \frac{1}{2} \int_0^\infty dt \int_{\mathbb{R}^n} \Delta u(x - y) \rho_t(y) dy \]

\[ = \lim_{\varepsilon \downarrow 0} \int_{\varepsilon}^\infty dt \int_{\mathbb{R}^n} u(x - y) \frac{d}{dt} \rho_t(y) dy \]

\[ = \lim_{\varepsilon \downarrow 0} \int_{\varepsilon}^\infty dt \int_{\mathbb{R}^n} u(x - y) \left( \int_0^\infty \frac{d}{dt} \rho_t(y) dt \right) dy \]

\[ = -\lim_{\varepsilon \downarrow 0} \int_{\varepsilon}^\infty dt \int_{\mathbb{R}^n} u(x - y) \rho_t(y) dy = u(x), \]

where in the last equality we have used the fact that \(\rho_t\) is an approximate \(\delta\)–sequence. \(

\)

**35.4 Wave Equation on \(\mathbb{R}^n\)**

Let us now consider the wave equation on \(\mathbb{R}^n\),

\[ 0 = (\partial_t^2 - \Delta) u(t, x) \text{ with } \]

\[ u(0, x) = f(x) \text{ and } u_t(0, x) = g(x). \]  

(35.16)

Taking the Fourier transform in the \(x\) variables gives the following equation

\[ 0 = \hat{u}_t(t, \xi) + |\xi|^2 \hat{u}(t, \xi) \text{ with } \]

\[ \hat{u}(0, \xi) = \hat{f}(\xi) \text{ and } \hat{u}_t(0, \xi) = \hat{g}(\xi). \]  

(35.17)
The solution to these equations is
\[ \dot{u}(t, \xi) = \hat{f}(\xi) \cos(t|\xi|) + \hat{g}(\xi) \frac{\sin t|\xi|}{|\xi|} \]
and hence we should have
\[
u(t, x) = \mathcal{F}^{-1} \left( \hat{f}(\xi) \cos(t|\xi|) + \hat{g}(\xi) \frac{\sin t|\xi|}{|\xi|} \right)(x) \]
\[ = \mathcal{F}^{-1} \cos(t|\xi|) \ast f(x) + \mathcal{F}^{-1} \frac{\sin t|\xi|}{|\xi|} \ast g(x) \]
\[ = \frac{d}{dt} \mathcal{F}^{-1} \left[ \frac{\sin t|\xi|}{|\xi|} \right] \ast f(x) + \mathcal{F}^{-1} \left[ \frac{\sin t|\xi|}{|\xi|} \right] \ast g(x). \tag{35.18} \]

The question now is how to interpret this equation. In particular what are the inverse Fourier transforms of \( \mathcal{F}^{-1} \cos(t|\xi|) \) and \( \mathcal{F}^{-1} \frac{\sin t|\xi|}{|\xi|} \)? Since \( \frac{\sin t|\xi|}{|\xi|} \in L^2(\mathbb{R}^n) \) iff \( n = 1 \) so that is the case we should start with.

Again by complex contour integration methods one can show
\[
(\mathcal{F}^{-1} \xi^{-1} \sin t\xi)(x) = \frac{\pi}{\sqrt{2\pi}} \left( 1_{x+\xi > 0} - 1_{x-\xi > 0} \right) \]
\[ = \frac{\pi}{\sqrt{2\pi}} \left( 1_{x > \xi} - 1_{x > -\xi} \right) = \frac{\pi}{\sqrt{2\pi}} 1_{\xi \in [-1,1]}(x) \]
where in writing the last line we have assumed that \( t \geq 0 \). Again this easily seen to be correct because
\[
\mathcal{F} \left[ \frac{\pi}{\sqrt{2\pi}} 1_{\xi \in [-1,1]}(x) \right] = \frac{1}{2} \int_{-1}^{1} e^{-i\xi x} dx = \frac{1}{2} \left( e^{i\xi t} - e^{-i\xi t} \right) = \xi^{-1} \sin t\xi. \]

Therefore,
\[(\mathcal{F}^{-1} \xi^{-1} \sin t\xi) \ast f(x) = \frac{1}{2} \int_{-1}^{1} f(x-y) dy \]
and the solution to the one dimensional wave equation is
\[
u(t, x) = \frac{d}{dt} \frac{1}{2} \int_{-1}^{1} f(x-y) dy + \frac{1}{2} \int_{-1}^{1} g(x-y) dy \]
\[ = \frac{1}{2} (f(x-t) + f(x+t)) + \frac{1}{2} \int_{-1}^{1} g(x-y) dy \]
\[ = \frac{1}{2} (f(x-t) + f(x+t)) + \frac{1}{2} \int_{x-t}^{x+t} g(y) dy. \]

We can arrive at this same solution by more elementary means as follows. We first note in the one dimensional case that wave operator factors, namely
\[ 0 = (\partial_{x}^2 - \partial_{t}^2) u(t, x) = (\partial_{t} - \partial_{x})(\partial_{t} + \partial_{x}) u(t, x). \]
Let \( U(t, x) := (\partial_{t} + \partial_{x}) u(t, x) \), then the wave equation states \( (\partial_{t} - \partial_{x}) U = 0 \) and hence by the chain rule \( \frac{d}{dt} U(t, x-t) = 0 \).

\[ U(t, x-t) = U(0, x) = g(x) + f'(x) \]

and replacing \( x \) by \( x+t \) in this equation shows
\[(\partial_{t} + \partial_{x}) u(t, x) = U(t, x) = g(x+t) + f'(x+t). \]

Working similarly, we learn that
\[
\frac{d}{dt}u(t, x+t) = g(x+2t) + f'(x+2t) \]
which upon integration implies
\[
u(t, x+t) = u(0, x) + \int_{0}^{t} \{ g(x+2\tau) + f'(x+2\tau) \} d\tau \]
\[ = f(x) + \int_{0}^{t} g(x+2\tau) d\tau + \frac{1}{2} f(x+2\tau) \bigg|_{0} \]
\[ = \frac{1}{2} (f(x) + f(x+2t)) + \int_{0}^{t} g(x+2\tau) d\tau. \]

Replacing \( x \to x-t \) in this equation gives
\[
u(t, x) = \frac{1}{2} (f(x-t) + f(x+t)) + \int_{0}^{t} g(x-t+2\tau) d\tau \]
and then letting \( y = x-t+2\tau \) in the last integral shows again that
\[
u(t, x) = \frac{1}{2} (f(x-t) + f(x+t)) + \frac{1}{2} \int_{x-t}^{x+t} g(y) dy. \]

When \( n > 3 \) it is necessary to treat \( \mathcal{F}^{-1} \left[ \frac{\sin t|\xi|}{|\xi|} \right] \) as a “distribution” or “generalized function,” see Section 36 below. So for now let us take \( n = 3 \), in which case from Example 34.18 it follows that
\[
\mathcal{F}^{-1} \left[ \frac{\sin t|\xi|}{|\xi|} \right] = \frac{t}{4\pi t^2} \delta_t = t \delta_t \tag{35.19} \]

where \( \bar{u} \) is the surface measure on \( S_1 \) normalized to have total measure one. Hence from Eq. (35.18) the solution to the three dimensional wave equation should be given by

\[
 u(t,x) = \frac{d}{dt} (t\bar{u} \star f(x)) + t\bar{u} \star g(x). \tag{35.20}
\]

Using this definition in Eq. (35.20) gives

\[
 u(t,x) = \frac{d}{dt} \left\{ t \int_{S_1} f(x-y)d\bar{u}(y) \right\} + t \int_{S_1} g(x-y)d\bar{u}(y)
 = \frac{d}{dt} \left\{ t \int_{S_1} f(x-t\omega)d\bar{u}(\omega) \right\} + t \int_{S_1} g(x-t\omega)d\bar{u}(\omega)
 = \frac{d}{dt} \left\{ t \int_{S_1} f(x+t\omega)d\bar{u}(\omega) \right\} + t \int_{S_1} g(x+t\omega)d\bar{u}(\omega). \tag{35.21}
\]

**Proposition 35.5.** Suppose \( f \in C^3(\mathbb{R}^3) \) and \( g \in C^2(\mathbb{R}^3) \), then \( u(t,x) \) defined by Eq. (35.21) is in \( C^2(\mathbb{R} \times \mathbb{R}^3) \) and is a classical solution of the wave equation in Eq. (35.16).

**Proof.** The fact that \( u \in C^2(\mathbb{R} \times \mathbb{R}^3) \) follows by the usual differentiation under the integral arguments. Suppose we can prove the proposition in the special case that \( f \equiv 0 \). Then for \( f \in C^3(\mathbb{R}^3) \), the function \( v(t,x) = t\int_{S_1} g(x-t\omega)d\bar{u}(\omega) \) solves the wave equation \( 0 = (\partial_{tt}^2 - \Delta) v(t,x) \) with \( v(0,x) = 0 \) and \( v_t(0,x) = g(x) \). Differentiating the wave equation in \( t \) shows \( u = v_t \) also solves the wave equation with \( u(0,x) = g(x) \) and \( u_t(0,x) = -\Delta x v(0,x) = 0 \). These remarks reduced the problems to showing \( u \) in Eq. (35.21) with \( f \equiv 0 \) solves the wave equation. So let

\[
 u(t,x) := t \int_{S_1} g(x+t\omega)d\bar{u}(\omega). \tag{35.22}
\]

We now give two proofs the \( u \) solves the wave equation.

**Proof 1.** Since solving the wave equation is a local statement and \( u(t,x) \) only depends on the values of \( g \) in \( B(t,x) \) it suffices to consider the case where \( g \in C^2(\mathbb{R}^3) \). Taking the Fourier transform of Eq. (35.22) in the \( x \) variable shows

\[
 \hat{u}(t,\xi) = t \int_{S_1} \hat{d}\bar{u}(\omega) \int_{\mathbb{R}^3} g(x+t\omega)e^{-ik \cdot x}dx
 = t \int_{S_1} \hat{d}\bar{u}(\omega) \int_{\mathbb{R}^3} g(x)e^{-ik \cdot x}e^{i\omega \cdot \xi}dx
 = \hat{g}(\xi) t \int_{S_1} e^{i\omega \cdot \xi}d\bar{u}(\omega)
 = \hat{g}(\xi) t \frac{\sin |tk|}{|k|} = \frac{\hat{g}(\xi)}{|\xi|} t \frac{|\xi|}{|\xi|}.
\]

wherein we have made use of Example 34.18. This completes the proof since \( \hat{u}(t,\xi) \) solves Eq. (35.17) as desired.

**Proof 2.** Differentiating

\[
 S(t,x) := \int_{S_1} g(x+t\omega)d\bar{u}(\omega)
\]

in \( t \) gives

\[
 S_t(t,x) = \frac{1}{4\pi} \int_{S_1} \nabla g(x+t\omega) \cdot \omega d\bar{u}(\omega)
 = \frac{1}{4\pi} \int_{B(0,1)} \nabla \omega \cdot \nabla g(x+t\omega)dm(\omega)
 = \frac{t}{4\pi} \int_{B(0,1)} \partial_t g(x+t\omega)dm(\omega)
 = \frac{1}{4\pi t^2} \int_{B(0,t)} \Delta g(x+y)dm(y)
 = \frac{1}{4\pi t^2} \int_0^t dr \int_{|y|=r} \Delta g(x+y)d\sigma(y)
\]

where we have used the divergence theorem, the change of variables \( y = t\omega \) and used the disintegration formula in Eq. (47.36),

\[
 \int_{\mathbb{R}^n} f(x)dm(x) = \int_{0}^{\infty} \int_{|y|=r} f(r\omega) \sigma(\omega) r_{n-1} dr = \int_0^\infty dr \int_{|y|=r} f(y)d\sigma(y).
\]

Since \( u(t,x) = t S(t,x) \) if follows that

\[
 u_{tt}(t,x) = \frac{\partial}{\partial t} [S(t,x) + tS_t(t,x)]
 = S_t(t,x) + \frac{\partial}{\partial t} \left[ \frac{1}{4\pi t} \int_0^t dr \int_{|y|=r} \Delta g(x+y)d\sigma(y) \right]
 = S_t(t,x) - \frac{1}{4\pi t^2} \int_0^t dr \int_{|y|=r} \Delta g(x+y)d\sigma(y)
 + \frac{1}{4\pi t} \int_{|y|=t} \Delta g(x+y)d\sigma(y)
 = S_t(t,x) - S(t,x) + \frac{t}{4\pi t^2} \int_{|y|=1} \Delta g(x+t\omega)d\sigma(\omega)
 = t \Delta u(t,x)
\]

as required.
It is easily seen that the solution \( u \) is a solution to the two dimensional wave equation. See figure 35.2 below.

The solution of the two dimensional wave equation may be found using “Hadamard’s method of decent” which we now describe. Suppose now that \( f \) and \( g \) are functions on \( \mathbb{R}^2 \) which we may view as functions on \( \mathbb{R}^3 \) which happen not to depend on the third coordinate. We now go ahead and solve the three dimensional wave equation using Eq. (35.21) and \( f \) and \( g \) as initial conditions. It is easily seen that the solution \( u(t, x, y, z) \) is again independent of \( z \) and hence is a solution to the two dimensional wave equation. See figure 35.2 below.

Notice that we still have finite speed of propagation but no longer sharp propagation. The explicit formula for \( u \) is given in the next proposition.

**Proposition 35.6.** Suppose \( f \in C^3(\mathbb{R}^2) \) and \( g \in C^2(\mathbb{R}^2) \), then

\[
u(t, x) := \frac{\partial}{\partial t} \left[ \frac{t}{2\pi} \iint_{D_t} \frac{f(x + tw)}{\sqrt{1 - |w|^2}} dm(w) \right] + \frac{t}{2\pi} \iint_{D_t} \frac{g(x + tw)}{\sqrt{1 - |w|^2}} dm(w)
\]

is in \( C^2(\mathbb{R} \times \mathbb{R}^2) \) and solves the wave equation in Eq. (35.16).

The solution in Eq. (35.21) exhibits a basic property of wave equations, namely finite propagation speed. To exhibit the finite propagation speed, suppose that \( f = 0 \) (for simplicity) and \( g \) has compact support near the origin, for example think of \( g = \delta_0(x) \). Then \( x + tw = 0 \) for some \( w \) iff \( |x| = t \). Hence the “wave front” propagates at unit speed and the wave front is sharp. See Figure 35.1 below.

The solution in Eq. (35.21) exhibits a basic property of wave equations, namely finite speed of propagation but no longer sharp propagation of the wave front, similar to water waves.

**Proof.** As usual it suffices to consider the case where \( f \equiv 0 \). By symmetry \( u \) may be written as

\[
u(t, x) = 2t \int_{S_t^+} g(x - y) d\tilde{\sigma}_t(y) = 2t \int_{S_t^+} g(x + y) d\tilde{\sigma}_t(y)
\]

where \( S_t^+ \) is the portion of \( S_t \) with \( z \geq 0 \). The surface \( S_t^+ \) may be parametrized by \( R(u, v) = (u, v, \sqrt{t^2 - u^2 - v^2}) \) with \( (u, v) \in D_t := \{ (u, v) : u^2 + v^2 \leq t^2 \} \). In these coordinates we have

\[
4\pi t^2 d\tilde{\sigma}_t = \left| \left( -\partial_u \sqrt{t^2 - u^2 - v^2}, -\partial_v \sqrt{t^2 - u^2 - v^2}, 1 \right) \right| dudv
= \left| \left( \frac{u}{\sqrt{t^2 - u^2 - v^2}}, \frac{v}{\sqrt{t^2 - u^2 - v^2}}, 1 \right) \right| dudv
= \frac{t}{\sqrt{t^2 - u^2 - v^2}} dudv
\]

Fig. 35.2. The geometry of the solution to the wave equation in two dimensions. A flash at \( 0 \in \mathbb{R}^2 \) looks like a line of flashes to the fictitious 3-d observer and hence she sees the effect of the flash for \( t \geq |x| \). The wave still propagates with speed 1. However there is no longer sharp propagation of the wave front, similar to water waves.
and therefore,
\[ u(t, x) = \frac{2t}{4\pi t^2} \int_{D_t} g(x + (u, v, \sqrt{t^2 - u^2 - v^2})) \frac{|t|}{\sqrt{t^2 - u^2 - v^2}} dudv \]
\[ = \frac{1}{2\pi} \text{sgn}(t) \int_{D_t} g(x + (u, v)) \frac{1}{\sqrt{t^2 - u^2 - v^2}} dudv. \]

This may be written as
\[ u(t, x) = \frac{1}{2\pi} \text{sgn}(t) \int_{D_t} g(x + w) \frac{t^2}{|t|} \int_{D_1} g(x + tw) \frac{1}{\sqrt{1 - |w|^2}} dm(w) \]
\[ = \frac{1}{2\pi} \int_{D_1} g(x + tw) \frac{1}{\sqrt{1 - |w|^2}} dm(w) \]

\[ , \]

\[ \text{Fig. 35.3. The region } M \text{ and the cutoff functions, } \theta \text{ and } \alpha. \]

35.5 Elliptic Regularity

The following theorem is a special case of the main theorem (Theorem 35.11) of this section.

**Theorem 35.7.** Suppose that \( M \subset \mathbb{R}^n, v \in C^\infty(M) \) and \( u \in L^1_{\text{loc}}(M) \) satisfies \( \Delta u = v \) weakly, then \( u \) has a (necessarily unique) version \( \tilde{u} \in C^\infty(M) \).

**Proof.** We may always assume \( n \geq 3 \), by embedding the \( n = 1 \) and \( n = 2 \) cases in the \( n = 3 \) cases. For notational simplicity, assume \( 0 \in M \) and we will show \( u \) is smooth near 0. To this end let \( \theta \in \mathcal{C}^\infty_c(M) \) such that \( \theta = 1 \) in a neighborhood of 0 and \( \alpha \in \mathcal{C}^\infty_c(M) \) such that \( \text{supp}(\alpha) \subset \{ \theta = 1 \} \) and \( \alpha = 1 \) in a neighborhood of 0 as well, see Figure 35.3. Then formally, we have with \( \beta := 1 - \alpha \),

\[ G \ast (\theta v) = G \ast (\theta \Delta u) = G \ast (\theta \Delta(\alpha u + \beta u)) \]
\[ = G \ast (\Delta(\alpha u + \theta \Delta(\beta u))) = \alpha u + G \ast (\theta \Delta(\beta u)) \]

so that
\[ u(x) = G \ast (\theta v)(x) - G \ast (\theta \Delta(\beta u))(x) \]
for \( x \in \text{supp}(\alpha) \). The last term is formally given by
\[ G \ast (\theta \Delta(\beta u))(x) = \int_{\mathbb{R}^n} G(x - y)\theta(y)\Delta(\beta(y)u(y))dy \]
\[ = \int_{\mathbb{R}^n} \beta(y)\Delta_y[G(x - y)\theta(y)] \cdot u(y)dy \]

which makes sense for \( x \) near 0. Therefore we find
\[ u(x) = G \ast (\theta v)(x) - \int_{\mathbb{R}^n} \beta(y)\Delta_y[G(x - y)\theta(y)] \cdot u(y)dy. \]

Clearly all of the above manipulations were correct if we know \( u \) were \( C^2 \) to begin with. So for the general case, let \( u_n = u \ast \delta_n \) with \( \{\delta_n\}_{n=1}^\infty \) – the usual sort of \( \delta \) – sequence approximation. Then \( \Delta u_n = v \ast \delta_n =: v_n \) away from \( \partial M \) and

\[ u_n(x) = G \ast (\theta v_n)(x) - \int_{\mathbb{R}^n} \beta(y)\Delta_y[G(x - y)\theta(y)] \cdot u_n(y)dy. \]

Since \( u_n \to u \) in \( L^1_{\text{loc}}(O) \) where \( O \) is a sufficiently small neighborhood of 0, we may pass to the limit in Eq. (35.23) to find \( u(x) = \tilde{u}(x) \) for a.e. \( x \in O \) where

\[ \tilde{u}(x) := G \ast (\theta v)(x) - \int_{\mathbb{R}^n} \beta(y)\Delta_y[G(x - y)\theta(y)] \cdot u(y)dy. \]

This concluded the proof since \( \tilde{u} \) is smooth for \( x \) near 0. \( \square \)

**Definition 35.8.** We say \( L = p(D_x) \) as defined in Eq. (35.1) is elliptic if \( p_k(\xi) := \sum_{|\alpha|=k} a_{\alpha} \xi^\alpha \) is zero iff \( \xi = 0 \). We will also say the polynomial \( p(\xi) := \sum_{|\alpha|\leq k} a_{\alpha} \xi^\alpha \) is elliptic if this condition holds.

**Remark 35.9.** If \( p(\xi) := \sum_{|\alpha|\leq k} a_{\alpha} \xi^\alpha \) is an elliptic polynomial, then there exists \( A < \infty \) such that \( \inf_{|\xi| > A} |p(\xi)| > 0 \). Since \( p_k(\xi) \) is everywhere non-zero for \( \xi \in S^{n-1} \) and \( S^{n-1} \subset \mathbb{R}^n \) is compact, \( \varepsilon := \inf_{|\xi|=1} |p_k(\xi)| > 0 \). By homogeneity this implies

\[ |p_k(\xi)| \geq \varepsilon |\xi|^k \text{ for all } \xi \in \mathbb{A}^n. \]
Since
\[
|p(\xi)| = |p_k(\xi) + \sum_{|\alpha|<k} a_\alpha \xi^\alpha| \geq |p_k(\xi)| - \sum_{|\alpha|<k} a_\alpha \xi^\alpha \\
\geq \varepsilon |\xi|^k - C \left(1 + |\xi|^{k-1}\right)
\]
for some constant \(C < \infty\) from which it is easily seen that for \(A\) sufficiently large,
\[
|p(\xi)| \geq \frac{\varepsilon}{2} |\xi|^k \quad \text{for all} \quad |\xi| \geq A.
\]

For the rest of this section, let \(L = p(D_x)\) be an elliptic operator and \(M \subset_0 \mathbb{R}^n\). As mentioned at the beginning of this section, the formal solution to \(Lu = v\) for \(v \in L^2(\mathbb{R}^n)\) is given by
\[
u = L^{-1}v = G \ast v
\]
where
\[
G(x) := \int_{\mathbb{R}^n} \frac{1}{p(\xi)} e^{ix \cdot \xi} d\xi.
\]

Of course this integral may not be convergent because of the possible zeros of \(p\) and the fact \(\frac{1}{p(\xi)}\) may not decay fast enough at infinity. We will introduce a smooth cut off function \(\chi(\xi)\) which is 1 on \(C_0(A) := \{x \in \mathbb{R}^n : |x| \leq A\}\) and \(\text{supp}(\chi) \subset C_0(2A)\) where \(A\) is as in Remark 35.9. Then for \(M > 0\) let
\[
G_M(x) = \int_{\mathbb{R}^n} \frac{(1 - \chi(\xi)) \chi(\xi / M)}{p(\xi)} e^{ix \cdot \xi} d\xi, \quad (35.24)
\]
\[
\delta(x) := \chi^\vee(x) = \int_{\mathbb{R}^n} \chi(\xi)e^{ix \cdot \xi} d\xi, \quad \text{and} \quad \delta_M(x) = M^n \delta(Mx). \quad (35.25)
\]

Notice \(\int_{\mathbb{R}^n} \delta(x) dx = \mathcal{F}\delta(0) = \chi(0) = 1, \delta \in \mathcal{S} \text{ since } \chi \in \mathcal{S}\)

\[
L G_M(x) = \int_{\mathbb{R}^n} (1 - \chi(\xi)) \chi(\xi / M) e^{ix \cdot \xi} d\xi = \int_{\mathbb{R}^n} \left[\chi(\xi / M) - \chi(\xi)\right] e^{ix \cdot \xi} d\xi \equiv \delta_M(x) - \delta(x)
\]
provided \(M > 2\).

**Proposition 35.10.** Let \(p\) be an elliptic polynomial of degree \(m\). The function \(G_M\) defined in Eq. (35.24) satisfies the following properties,

1. \(G_M \in \mathcal{S}\) for all \(M > 0\).
2. \(LG_M(x) = M^n \delta(Mx) - \delta(x)\).

3. There exists \(G \in C^\infty(\mathbb{R}^n \setminus \{0\})\) such that for all multi-indices \(\alpha\), \(\lim_{M \to \infty} \partial^\alpha G_M(x) = \partial^\alpha G(x)\) uniformly on compact subsets in \(\mathbb{R}^n \setminus \{0\}\).

**Proof.** We have already proved the first two items. For item 3., we notice that
\[
(-x)^\beta D^\alpha G(x) = \int_{\mathbb{R}^n} \frac{(1 - \chi(\xi)) \chi(\xi / M)}{p(\xi)} (-D)^\beta e^{ix \cdot \xi} d\xi
\]
\[
= \int_{\mathbb{R}^n} D_\xi^\beta \left[\frac{(1 - \chi(\xi)) \chi(\xi / M)}{p(\xi)}\right] e^{ix \cdot \xi} d\xi
\]
\[
= \int_{\mathbb{R}^n} D_\xi^\beta \left[\frac{(1 - \chi(\xi)) \chi(\xi / M)}{p(\xi)}\right] e^{ix \cdot \xi} d\xi + R_M(x)
\]
where
\[
R_M(x) = \sum_{\gamma < \beta} \binom{\beta}{\gamma} M^{\gamma - |\beta|} \int_{\mathbb{R}^n} D_\xi^\gamma \left[\frac{(1 - \chi(\xi)) \chi(\xi / M)}{p(\xi)}\right] e^{ix \cdot \xi} d\xi.
\]
Using
\[
\left|D_\xi^\beta \left[\frac{\chi(\xi)}{p(\xi)}\right] e^{ix \cdot \xi}\right| \leq C |\xi|^{|\gamma| - m - |\beta|}
\]
and the fact that
\[
\text{supp}((D^{\beta-\gamma}(\chi(\xi)/M))) \subset \{\xi \in \mathbb{R}^n : A \leq |\xi| / M \leq 2A\}
\]
\[
= \{\xi \in \mathbb{R}^n : AM \leq |\xi| \leq 2AM\}
\]
we easily estimate
\[
|R_M(x)| \leq C \sum_{\gamma < \beta} \binom{\beta}{\gamma} M^{\gamma - |\beta|} \int_{\{\xi \in \mathbb{R}^n : AM \leq |\xi| \leq 2AM\}} |\xi|^{|\gamma| - m - |\beta|} d\xi
\]
\[
\leq C \sum_{\gamma < \beta} \binom{\beta}{\gamma} M^{\gamma - |\beta|} M^{|\alpha| - m - |\beta| + n} = CM^{\gamma - |\beta| - m + n}.
\]

Therefore, \(R_M \to 0\) uniformly in \(x\) as \(M \to \infty\) provided \(|\beta > |\alpha| - m + n\). It follows easily now that \(G_M \to G\) in \(C^\infty_c(\mathbb{R}^n \setminus \{0\})\) and furthermore that
\[
(-x)^\beta D^\alpha G(x) = \int_{\mathbb{R}^n} D_\xi^\beta \left[\frac{(1 - \chi(\xi)) \chi(\xi / M)}{p(\xi)}\right] e^{ix \cdot \xi} d\xi
\]
provided \(\beta\) is sufficiently large. In particular we have shown,
\[
D^\alpha G(x) = \frac{1}{|x|^{2k}} \int_{\mathbb{R}^n} (-\Delta)^k \left[\frac{(1 - \chi(\xi)) \chi(\xi / M)}{p(\xi)}\right] e^{ix \cdot \xi} d\xi
\]
provided \(m - |\alpha| + 2k > n\), i.e. \(k > (n - m + |\alpha|)/2\). We are now ready to use this result to prove elliptic regularity for the constant coefficient case.
Theorem 35.11. Suppose \( L = p(D_x) \) is an elliptic differential operator on \( \mathbb{R}^n \), \( M \subset_\circ \mathbb{R}^n \), \( v \in C^\infty(M) \) and \( u \in L^1_{\text{loc}}(M) \) satisfies \( Lu = v \) weakly, then \( u \) has a (necessarily unique) version \( \check{u} \in C^\infty(M) \).

Proof. For notational simplicity, assume \( 0 \in M \) and we will show \( u \) is smooth near \( 0 \). To this end let \( \theta \in C^\infty(M) \) such that \( \theta = 1 \) in a neighborhood of \( 0 \) and \( \alpha \in C^\infty(M) \) such that \( \text{supp}(\alpha) \subset \{ \theta = 1 \} \), and \( \alpha = 1 \) in a neighborhood of \( 0 \) as well. Then formally, we have with \( \beta := 1 - \alpha \),

\[
G_M * (\theta v) = G_M * (\theta L u) = G_M * (\theta L(\alpha u + \beta u)) \\
= G_M * (\theta L(\alpha u) + \theta L(\beta u)) \\
= \delta_M * (\alpha u) - \delta * (\alpha u) + G_M * (\theta L(\beta u))
\]

so that

\[
\delta_M * (\alpha u)(x) = G_M * (\theta v)(x) - G_M * (\theta L(\beta u))(x) + \delta * (\alpha u) \quad (35.26)
\]

Since

\[
\mathcal{F}[G_M * (\theta v)](\xi) = G_M(\xi)(\theta v)(\xi) = \frac{(1 - \chi(\xi)) \chi(\xi/M)}{p(\xi)} (\theta v)(\xi) \\
\rightarrow \frac{(1 - \chi(\xi))}{p(\xi)} (\theta v)(\xi) \text{ as } M \rightarrow \infty
\]

with the convergence taking place in \( L^2 \) (actually in \( S \)), it follows that

\[
G_M * (\theta v) \rightarrow "G * (\theta v)" (x) := \int_{\mathbb{R}^n} \frac{(1 - \chi(\xi))}{p(\xi)} (\theta v)(\xi) e^{ix \cdot \xi} d\xi
\]

\[
= \mathcal{F}^{-1} \left[ \frac{(1 - \chi(\xi))}{p(\xi)} (\theta v)(\xi) \right](x) \in S.
\]

So passing the the limit, \( M \rightarrow \infty \), in Eq. (35.26) we learn for almost every \( x \in \mathbb{R}^n \),

\[
u(x) = G * (\theta v)(x) - \lim_{M \rightarrow \infty} G_M * (\theta L(\beta u))(x) + \delta * (\alpha u)(x)
\]

for a.e. \( x \in \text{supp}(\alpha) \). Using the support properties of \( \theta \) and \( \beta \) we see for \( x \) near \( 0 \) that \( (\theta L(\beta u))(y) = 0 \) unless \( y \in \text{supp}(\theta) \) and \( y \notin \{ \alpha = 1 \} \), i.e. unless \( y \) is in an annulus centered at \( 0 \). So taking \( x \) sufficiently close to \( 0 \), we find \( x - y \) stays away from \( 0 \) as \( y \) varies through the above mentioned annulus, and therefore

\[
G_M * (\theta L(\beta u))(x) = \int_{\mathbb{R}^n} G_M(x - y)(\theta L(\beta u))(y) dy
\]

\[
= \int_{\mathbb{R}^n} L_y^* \{ \theta(y)G_M(x - y) \} \cdot (\beta u)(y) dy
\]

\[
\rightarrow \int_{\mathbb{R}^n} L_y^* \{ \theta(y)G(x - y) \} \cdot (\beta u)(y) dy \text{ as } M \rightarrow \infty.
\]

Therefore we have shown,

\[
u(x) = G * (\theta v)(x) - \int_{\mathbb{R}^n} L_y^* \{ \theta(y)G(x - y) \} \cdot (\beta u)(y) dy + \delta * (\alpha u)(x)
\]

for almost every \( x \) in a neighborhood of \( 0 \). (Again it suffices to prove this equation and in particular Eq. (35.26) assuming \( u \in C^2(M) \) because of the same convolution argument we have use above.) Since the right side of this equation is the linear combination of smooth functions we have shown \( u \) has a smooth version in a neighborhood of \( 0 \). \( \blacksquare \)

Remarks 35.12 We could avoid introducing \( G_M(x) \) if \( \deg(p) > n \), in which case \( \frac{1 - \chi(\xi)}{p(\xi)} \in L^1 \) and so

\[
G(x) := \int_{\mathbb{R}^n} \frac{(1 - \chi(\xi))}{p(\xi)} e^{ix \cdot \xi} d\xi
\]

is already well defined function with \( G \in C^\infty(\mathbb{R}^n \setminus \{0\}) \cap BC(\mathbb{R}^n) \). If \( \deg(p) < n \), we may consider the operator \( L^k = [p(D_x)]^k = p^k(D_x) \) where \( k \) is chosen so that \( k \cdot \deg(p) > n \). Since \( Lu = v \) implies \( L^k u = L^{k-1} v \) weakly, we see to prove the hypoellipticity of \( L \) it suffices to prove the hypoellipticity of \( L^k \).

35.6 Exercises

Exercise 35.1. Using

\[
\frac{1}{|\xi|^2 + m^2} = \int_0^\infty e^{-\lambda(|\xi|^2 + m^2)} d\lambda,
\]

the identity in Eq. (35.5) and Example 34.4 show for \( m > 0 \) and \( x \geq 0 \) that

\[
e^{-mx} = \frac{m}{\sqrt{\pi}} \int_0^\infty d\lambda \frac{1}{\sqrt{\lambda}} e^{-\lambda x^2} e^{-\lambda m^2} \quad (let \lambda \rightarrow \lambda/m^2) \quad (35.27)
\]

\[
e^{-x^2} = \int_0^\infty d\lambda \frac{1}{\sqrt{\pi}} e^{-\lambda x^2} \cdot \frac{1}{\sqrt{\pi}} \lambda \quad (35.28)
\]

Use this formula and Example 34.4 to show, in dimension \( n \), that

\[
\mathcal{F}[e^{-m|x|}](\xi) = 2^{n/2} \Gamma((n+1)/2) \sqrt{\pi} \frac{m}{m^2 + |\xi|^2 n+1/2}
\]

where \( \Gamma(x) \) in the gamma function defined in Eq. (47.44). (I am not absolutely positive I have got all the constants exactly right, but they should be close.)
Elementary Generalized Functions / Distribution Theory

36.1 Distributions on \( U \subset \mathbb{R}^n \)

Let \( U \) be an open subset of \( \mathbb{R}^n \) and

\[
C_c^\infty(U) = \bigcup_{K \subset U} C_c^\infty(K)
\]
denote the set of smooth functions on \( U \) with compact support in \( U \).

**Definition 36.1.** A sequence \( \{ \varphi_k \}_{k=1}^\infty \subset \mathcal{D}(U) \) converges to \( \varphi \in \mathcal{D}(U) \), iff there is a compact set \( K \sqsubseteq U \) such that \( \text{supp}(\varphi_k) \subset K \) for all \( k \) and \( \varphi_k \to \varphi \) in \( C^\infty(K) \).

**Definition 36.2 (Distributions on \( U \subset \mathbb{R}^n \)).** A generalized function \( T \) on \( U \subset \mathbb{R}^n \) is a continuous linear functional on \( \mathcal{D}(U) \), i.e. \( T : \mathcal{D}(U) \to \mathbb{C} \) is linear and \( \lim_{n \to \infty} (T, \varphi_n) = 0 \) for all \( \{ \varphi_n \} \subset \mathcal{D}(U) \) such that \( \varphi_n \to 0 \) in \( \mathcal{D}(U) \). We denote the space of generalized functions by \( \mathcal{D}'(U) \).

**Proposition 36.3.** Let \( T : \mathcal{D}(U) \to \mathbb{C} \) be a linear functional. Then \( T \in \mathcal{D}'(U) \) iff for all \( K \sqsubseteq U \), there exist \( n \in \mathbb{N} \) and \( C < \infty \) such that

\[
|T(\varphi)| \leq C p_n(\varphi) \text{ for all } \varphi \in C^\infty(K).
\]

**Proof.** Suppose that \( \{ \varphi_k \} \subset \mathcal{D}(U) \) such that \( \varphi_k \to 0 \) in \( \mathcal{D}(U) \). Let \( K \) be a compact set such that \( \text{supp}(\varphi_k) \subset K \) for all \( k \). Since \( \lim_{k \to \infty} p_n(\varphi_k) = 0 \), it follows that if Eq. (36.2) holds then \( \lim_{n \to \infty} (T, \varphi_n) = 0 \). Conversely, suppose that there is a compact set \( K \sqsubseteq U \) such that for no choice of \( n \in \mathbb{N} \) and \( C < \infty \), Eq. (36.2) holds. Then we may choose non-zero \( \varphi_n \in C^\infty(K) \) such that

\[
|T(\varphi_n)| \geq C p_n(\varphi_n) \text{ for all } n.
\]

Let \( \psi_n = \frac{1}{n p_n(\varphi_n)} \varphi_n \in C^\infty(K) \), then \( p_n(\psi_n) = 1/n \to 0 \) as \( n \to \infty \) which shows that \( \psi_n \to 0 \) in \( \mathcal{D}(U) \). On the other hand, hence \( |T(\psi_n)| \geq 1 \) so that \( \lim_{n \to \infty} (T, \psi_n) \neq 0 \). *Alternate Proof:* The definition of \( T \) being continuous is equivalent to \( T|_{C^\infty(K)} \) being sequentially continuous for all \( K \sqsubseteq U \). Since \( C^\infty(K) \) is a metric space, sequential continuity and continuity are the same thing. Hence \( T \) is continuous iff \( T|_{C^\infty(K)} \) is continuous for all \( K \sqsubseteq U \). Now \( T|_{C^\infty(K)} \) is continuous iff a bound like Eq. (36.2) holds.

**Definition 36.4.** Let \( Y \) be a topological space and \( T_y \in \mathcal{D}'(U) \) for all \( y \in Y \). We say that \( T_y \to T \in \mathcal{D}'(U) \) as \( y \to y_0 \) iff

\[
\lim_{y \to y_0} (T_y, \varphi) = (T, \varphi) \text{ for all } \varphi \in \mathcal{D}(U).
\]

36.2 Examples of distributions and related computations

**Example 36.5.** Let \( \mu \) be a positive Radon measure on \( U \) and \( f \in L^1_{\text{loc}}(U) \). Define \( T \in \mathcal{D}'(U) \) by \( (T_f, \varphi) = \int_U \varphi f d\mu \) for all \( \varphi \in \mathcal{D}(U) \). Notice that if \( \varphi \in C^\infty(K) \) then

\[
|\langle T_f, \varphi \rangle| \leq \int_U |\varphi f| d\mu = \int_K |\varphi f| d\mu \leq C_K \|\varphi\|_\infty
\]

where \( C_K := \int_K |f| d\mu < \infty \). Hence \( T_f \in \mathcal{D}'(U) \). Furthermore, the map

\( f \in L^1_{\text{loc}}(U) \to T_f \in \mathcal{D}'(U) \)

is injective. Indeed, \( T_f = 0 \) is equivalent to

\[
\int_U \varphi f d\mu = 0 \text{ for all } \varphi \in \mathcal{D}(U).
\]

for all \( \varphi \in C^\infty(K) \). By the dominated convergence theorem and the usual convolution argument, this is equivalent to

\[
\int_U \varphi f d\mu = 0 \text{ for all } \varphi \in C_c(U).
\]

Now fix a compact set \( K \sqsubseteq U \) and \( \varphi_n \in C_c(U) \) such that \( \varphi_n \to \text{sgn}(f)1_K \) in \( L^1(\mu) \). By replacing \( \varphi_n \) by \( \chi(\varphi_n) \) if necessary, where

\[
\chi(z) = \begin{cases} z & \text{if } |z| \leq 1 \\ \frac{z}{|z|} & \text{if } |z| \geq 1 \end{cases}
\]

we may assume that \( |\varphi_n| \leq 1 \). By passing to a further subsequence, we may assume that \( \varphi_n \to \text{sgn}(f)1_K \) a.e. Thus we have
This shows that \(|f(x)| = 0\) for \(\mu\) -a.e. \(x \in K\). Since \(K\) is arbitrary and \(U\) is the countable union of such compact sets \(K\), it follows that \(f(x) = 0\) for \(\mu\) -a.e. \(x \in U\).

The injectivity may also be proved slightly more directly as follows. As before, it suffices to prove Eq. \([36.4]\) implies that \(f(x) = 0\) for \(\mu\) -a.e. \(x\). We may further assume that \(f\) is real by considering real and imaginary parts separately. Let \(K \subset \subset U\) and \(\varepsilon > 0\) be given. Set \(A = \{f > 0\} \cap K\), then \(\mu(A) < \infty\) and hence since all \(\sigma\) finite measure on \(U\) are Radon, there exists \(F \subset A \subset V\) with \(F\) compact and \(V \subset U\) such that \(\mu(V \setminus F) < \delta\). By Uryshon’s lemma, there exists \(\varphi \in C_c(V)\) such that \(0 \leq \varphi \leq 1\) and \(\varphi = 1\) on \(F\). Then by Eq. \([36.4]\)

\[
0 = \int_U \varphi f \, d\mu = \int_F \varphi f \, d\mu + \int_{V \setminus F} \varphi f \, d\mu = \int_F \varphi f \, d\mu + \int_{V \setminus F} \varphi f \, d\mu
\]

so that

\[
\int_F f \, d\mu = \int_{V \setminus F} \varphi f \, d\mu \leq \int_{V \setminus F} |f| \, d\mu < \varepsilon
\]

provided that \(\delta\) is chosen sufficiently small by the \(\varepsilon - \delta\) definition of absolute continuity. Similarly, it follows that

\[
0 \leq \int_A f \, d\mu \leq \int_F f \, d\mu + \varepsilon \leq 2\varepsilon.
\]

Since \(\varepsilon > 0\) is arbitrary, it follows that \(\int_A f \, d\mu = 0\). Since \(K\) was arbitrary, we learn that

\[
\int_{\{f > 0\}} f \, d\mu = 0
\]

which shows that \(f \leq 0\) \(\mu\) -a.e. Similarly, one shows that \(f \geq 0\) \(\mu\) -a.e. and hence \(f = 0\) \(\mu\) -a.e.

**Example 36.6.** Let us now assume that \(\mu = m\) and write \(\langle T_f, \varphi \rangle = \int_U \varphi f \, dm\). For the moment let us also assume that \(U = \mathbb{R}\). Then we have

1. \(\lim_{M \to \infty} T_{\sin M} = 0\)
2. \(\lim_{M \to \infty} T_{M^{-1} \sin M} = \pi \delta_0\) where \(\delta_0\) is the point measure at 0.
3. If \(f \in L^1(\mathbb{R}^n, dm)\) with \(\int_{\mathbb{R}^n} f \, dm = 1\) and \(f_\varepsilon(x) = \varepsilon^{-n} f(x/\varepsilon)\), then \(\lim_{\varepsilon \to 0} T_{f_\varepsilon} = \delta_0\). As a special case, consider \(\lim_{\varepsilon \to 0} \frac{\pi}{\varepsilon^2 + \varepsilon^2} = \delta_0\).

**Definition 36.7 (Multiplication by smooth functions).** Suppose that \(g \in C^\infty(U)\) and \(T \in D'(U)\) then we define \(gT \in D'(U)\) by

\[
\langle gT, \varphi \rangle = \langle T, g\varphi \rangle\quad \text{for all } \varphi \in D(U).
\]

It is easily checked that \(gT\) is continuous.

**Definition 36.8 (Differentiation).** For \(T \in D'(U)\) and \(i \in \{1, 2, \ldots, n\}\) let \(\partial_i T \in D'(U)\) be the distribution defined by

\[
\langle \partial_i T, \varphi \rangle = -\langle T, \partial_i \varphi \rangle\quad \text{for all } \varphi \in D(U).
\]

Again it is easy to check that \(\partial_i T\) is a distribution.

More generally if \(L = \sum_{|\alpha| \leq m} a_\alpha \partial^\alpha\) with \(a_\alpha \in C^\infty(U)\) for all \(\alpha\), then \(LT\) is the distribution defined by

\[
\langle LT, \varphi \rangle = \langle T, \sum_{|\alpha| \leq m} (-1)^{|\alpha|} \partial^\alpha (a_\alpha \varphi) \rangle\quad \text{for all } \varphi \in D(U).
\]

Hence we can talk about distributional solutions to differential equations of the form \(LT = S\).

**Example 36.9.** Suppose that \(f \in L^1_{\text{loc}}(U)\) and \(g \in C^\infty(U)\), then \(gT_f = T_{gf}\). If further \(f \in C^1(U)\), then \(\partial_i T_f = T_{\partial_i f}\). If \(f \in C^m(U)\), then \(LT_f = T_{Lf}\).

**Example 36.10.** Suppose that \(a \in U\), then

\[
\langle \partial_i \delta_a, \varphi \rangle = -\partial_i \varphi(a)
\]

and more generally we have

\[
\langle L\delta_a, \varphi \rangle = \sum_{|\alpha| \leq m} (-1)^{|\alpha|} \partial^\alpha (a_\alpha \varphi)(a).
\]

**Example 36.11.** Consider the distribution \(T := T_{|x|}\) for \(x \in \mathbb{R}\), i.e. take \(U = \mathbb{R}\). Then

\[
\frac{d}{dx} T = T_{\text{sgn}(x)} \quad \text{and} \quad \frac{d^2}{dx^2} T = 2\delta_0.
\]

More generally, suppose that \(f\) is piecewise \(C^1\), the

\[
\frac{d}{dx} T_f = T_f' + \sum (f(x^+) - f(x^-)) \delta_x.
\]
Example 36.12. Consider $T = T_{\ln|x|}$ on $\mathcal{D}(\mathbb{R})$. Then

$$
\langle T', \varphi \rangle = -\int_{\mathbb{R}} \ln |x| \varphi'(x) dx = -\lim_{\varepsilon \downarrow 0} \int_{|x| > \varepsilon} \ln |x| \varphi'(x) dx
$$

$$
= -\lim_{\varepsilon \downarrow 0} \int_{|x| > \varepsilon} \ln |x| \varphi'(x) dx
$$

$$
= \lim_{\varepsilon \downarrow 0} \int_{|x| > \varepsilon} \frac{1}{x} \varphi(x) dx - \lim_{\varepsilon \downarrow 0} \left[ \ln \varepsilon (\varphi(\varepsilon) - \varphi(-\varepsilon)) \right]
$$

$$
= \lim_{\varepsilon \downarrow 0} \int_{|x| > \varepsilon} \frac{1}{x} \varphi(x) dx.
$$

We will write $T' = PV \frac{1}{x}$ in the future. Here is another formula for $T'$,

$$
\langle T', \varphi \rangle = \lim_{\varepsilon \downarrow 0} \int_{1 \geq |x| > \varepsilon} \frac{1}{x} \varphi(x) dx + \int_{|x| > 1} \frac{1}{x} \varphi(x) dx
$$

$$
= \lim_{\varepsilon \downarrow 0} \int_{1 \geq |x| > \varepsilon} \frac{1}{x} \varphi(x) dx + \int_{|x| > 1} \frac{1}{x} \varphi(x) dx
$$

$$
= \int_{1 \geq |x|} \frac{1}{x} \varphi(x) dx + \int_{|x| > 1} \frac{1}{x} \varphi(x) dx.
$$

Please notice in the last example that $\frac{1}{x} \notin L_{loc}^{1}(\mathbb{R})$ so that $T_{1/x}$ is not well defined. This is an example of the so called division problem of distributions. Here is another possible interpretation of $\frac{1}{x}$ as a distribution.

Example 36.13. Here we try to define $1/x$ as $\lim_{y \downarrow 0} \frac{1}{x \pm iy}$, that is we want to define a distribution $T_{\pm}$ by

$$
\langle T_{\pm}, \varphi \rangle := \lim_{y \downarrow 0} \int \frac{1}{x \pm iy} \varphi(x) dx.
$$

Let us compute $T_{+}$ explicitly,

$$
\lim_{y \downarrow 0} \int_{\mathbb{R}} \frac{1}{x + iy} \varphi(x) dx
$$

$$
= \lim_{y \downarrow 0} \int_{|x| \leq 1} \frac{1}{x + iy} \varphi(x) dx + \lim_{y \downarrow 0} \int_{|x| > 1} \frac{1}{x + iy} \varphi(x) dx
$$

$$
= \lim_{y \downarrow 0} \int_{|x| \leq 1} \frac{1}{x + iy} \varphi(x) dx + \varphi(0) \lim_{y \downarrow 0} \int_{|x| \leq 1} \frac{1}{x + iy} dx
$$

$$
+ \int_{|x| > 1} \frac{1}{x} \varphi(x) dx
$$

$$
= PV \int_{\mathbb{R}} \frac{1}{x} \varphi(x) dx + \varphi(0) \lim_{y \downarrow 0} \int_{|x| \leq 1} \frac{1}{x + iy} dx.
$$

Now by deforming the contour we have

$$
\int_{|x| \leq 1} \frac{1}{x + iy} dx = \int_{|x| \leq 1} \frac{1}{x + iy} dx + \int_{C_{\varepsilon}} \frac{1}{z + iy} dz
$$

where $C_{\varepsilon} : z = \varepsilon e^{i\theta}$ with $\theta : \pi \to 0$. Therefore,

$$
\lim_{y \downarrow 0} \int_{|x| \leq 1} \frac{1}{x + iy} dx = \lim_{y \downarrow 0} \int_{|x| \leq 1} \frac{1}{x + iy} dx + \lim_{y \downarrow 0} \int_{C_{\varepsilon}} \frac{1}{z + iy} dz
$$

$$
= \int_{|x| \leq 1} \frac{1}{x} dx + \int_{C_{\varepsilon}} \frac{1}{z} dz = 0 - \pi.
$$

Hence we have shown that $T_{+} = PV \frac{1}{x} - i\pi \delta_{0}$. Similarly, one shows that $T_{-} = PV \frac{1}{x} + i\pi \delta_{0}$. Notice that it follows from these computations that $T_{-} - T_{+} = i2\pi \delta_{0}$. Notice that

$$
\frac{1}{x - iy} - \frac{1}{x + iy} = \frac{2iy}{x^{2} + y^{2}}
$$

and hence we conclude that $\lim_{y \downarrow 0} \frac{y}{x^{2} + y^{2}} = \pi \delta_{0}$ - a result that we saw in Example 36.6 item 3.

Example 36.14. Suppose that $\mu$ is a complex measure on $\mathbb{R}$ and $F(x) = \mu((\infty, x])$, then $T_{F} = \mu$. Moreover, if $f \in L_{loc}^{1}(\mathbb{R})$ and $T_{f} = \mu$, then $f = F + C$ a.e. for some constant $C$.

Proof. Let $\varphi \in \mathcal{D} : = \mathcal{D}(\mathbb{R})$, then

$$
\langle T_{F}', \varphi \rangle = -\langle T_{F}, \varphi' \rangle = -\int_{\mathbb{R}} F(x) \varphi'(x) dx = -\int_{\mathbb{R}} d\mu(y) \varphi'(x) 1_{y \leq x}
$$

$$
= -\int_{\mathbb{R}} d\mu(y) \int_{y \leq x} d\varphi'(x) = \int_{\mathbb{R}} d\mu(y) \varphi(y) = \langle \mu, \varphi \rangle
$$

by Fubini’s theorem and the fundamental theorem of calculus. If $T_{f} = \mu$, then $T_{f-F} = 0$ and the result follows from Corollary 36.16 below.

Lemma 36.15. Suppose that $T \in \mathcal{D}'(\mathbb{R}^{n})$ is a distribution such that $\partial_{i} T = 0$ for some $i$, then there exists a distribution $S \in \mathcal{D}'(\mathbb{R}^{n-1})$ such that $\langle T, \varphi \rangle = \langle S, \tilde{\varphi}_{i} \rangle$ for all $\varphi \in \mathcal{D}(\mathbb{R}^{n})$ where

$$
\tilde{\varphi}_{i} = \int_{\mathbb{R}} \tau_{\varepsilon_{i}} \varphi dt \in \mathcal{D}(\mathbb{R}^{n-1}).
$$

Proof. To simplify notation, assume that $i = n$ and write $x \in \mathbb{R}^{n}$ as $x = (y, z)$ with $y \in \mathbb{R}^{n-1}$ and $z \in \mathbb{R}$. Let $\theta \in C_{c}^{\infty}(\mathbb{R})$ such that $\int_{\mathbb{R}} \theta(z) dz = 1$ and for $\psi \in \mathcal{D}(\mathbb{R}^{n-1})$, let $\psi \otimes \theta(x) = \psi(y)\theta(z)$. The mapping
is easily seen to be sequentially continuous and therefore \( \langle S, \psi \rangle := \langle T, \psi \otimes \theta \rangle \) defined a distribution in \( \mathcal{D}'(\mathbb{R}^n) \). Now suppose that \( \varphi \in \mathcal{D}(\mathbb{R}^n) \). If \( \varphi = \partial_n f \) for some \( f \in \mathcal{D}(\mathbb{R}^n) \) we would have to have \( f \varphi(y, z)dz = 0 \). This is not generally true, however the function \( \varphi - \bar{\varphi} \otimes \theta \) does have this property. Define
\[
f(y, z) := \int_{-\infty}^{z} [\varphi(y, z') - \bar{\varphi}(y)\theta(z')] \, dz',
\]
then \( f \in \mathcal{D}(\mathbb{R}^n) \) and \( \partial_n f = \varphi - \bar{\varphi} \otimes \theta \). Therefore,
\[
0 = -\langle \partial_n T, f \rangle = \langle T, \partial_n f \rangle = \langle T, \varphi \rangle - \langle T, \bar{\varphi} \otimes \theta \rangle = \langle T, \varphi \rangle - \langle S, \bar{\varphi} \rangle.
\]

**Corollary 36.16.** Suppose that \( T \in \mathcal{D}'(\mathbb{R}^n) \) is a distribution such that there exists \( m \geq 0 \) such that
\[
\partial^\alpha T = 0 \quad \text{for all } |\alpha| = m,
\]
then \( T = T_p \) where \( p(x) \) is a polynomial on \( \mathbb{R}^n \) of degree less than or equal to \( m - 1 \), where by convention if \( \text{deg}(p) = -1 \) then \( p := 0 \).

**Proof.** The proof will be by induction on \( n \) and \( m \). The corollary is trivially true when \( m = 0 \) and \( n \) is arbitrary. Let \( n = 1 \) and assume the corollary holds for \( m = k - 1 \) with \( k \geq 1 \). Let \( T \in \mathcal{D}'(\mathbb{R}) \) such that \( 0 = \partial^k T = \partial^{k-1} \partial T \). By the induction hypothesis, there exists a polynomial, \( q \), of degree \( k - 2 \) such that \( T' = T_q \). Let \( p(x) = \int_{-\infty}^{x} q(z) \, dz \), then \( p \) is a polynomial of degree at most \( k - 1 \) such that \( p' = q \) and hence \( T_p = T_q = T \). So \( \langle T - T_p, f \rangle = 0 \) and hence by Lemma 36.15 \( T - T_p = T_C \) where \( C = \langle T - T_p, \theta \rangle \) and \( \theta \) is as in the proof of Lemma 36.15. This proves the he result for \( n = 1 \). For the general induction, suppose there exists \( (m, n) \in \mathbb{N}^2 \) with \( m \geq 0 \) and \( n \geq 1 \) such that assertion in the corollary holds for pairs \( (m', n') \) such that \( n' < n \) of \( n' = n \) and \( m' \leq m \). Suppose that \( T \in \mathcal{D}'(\mathbb{R}^n) \) is a distribution such that
\[
\partial^\alpha T = 0 \quad \text{for all } |\alpha| = m + 1.
\]
In particular this implies that \( \partial^\alpha \partial_n T = 0 \) for all \( |\alpha| = m - 1 \) and hence by induction \( \partial_n T = T_{q_n} \), where \( q_n \) is a polynomial of degree at most \( m - 1 \) on \( \mathbb{R}^n \). Let \( p_n(x) = \int_{0}^{x} q_n(y, z') \, dz' \) a polynomial of degree at most \( m \) on \( \mathbb{R}^n \). The polynomial \( p_n \) satisfies, 1) \( \partial^\alpha p_n = 0 \) if \( |\alpha| = m \) and \( \alpha_n = 0 \) and 2) \( \partial_n p_n = q_n \). Hence \( \partial_n(T - T_{p_n}) = 0 \) and so by Lemma 36.15
\[
\langle T - T_{p_n}, \varphi \rangle = \langle S, \bar{\varphi}_n \rangle
\]
for some distribution \( S \in \mathcal{D}'(\mathbb{R}^{n-1}) \). If \( \alpha \) is a multi-index such that \( \alpha_n = 0 \) and \( |\alpha| = m \), then
\[
0 = \langle \partial^\alpha T - \partial^\alpha T_{p_n}, \varphi \rangle = \langle T - T_{p_n}, \partial^\alpha \varphi \rangle = \langle S, \partial^\alpha \bar{\varphi}_n \rangle = \langle S, \partial^\alpha \bar{\varphi}_n \rangle = (-1)^{|\alpha|} \langle \partial^\alpha S, \bar{\varphi}_n \rangle.
\]
and in particular by taking \( \varphi = \psi \otimes \theta \), we learn that \( \langle \partial^\alpha S, \psi \rangle = 0 \) for all \( \psi \in \mathcal{D}'(\mathbb{R}^{n-1}) \). Thus by the induction hypothesis, \( S = T_p \) for some polynomial \( (r) \) of degree at most \( m \) on \( \mathbb{R}^{n-1} \). Letting \( p(y, z) = p_n(y, z) + r(y) \) - a polynomial of degree at most \( m \) on \( \mathbb{R}^n \), it is easily checked that \( T = T_p \).

**Example 36.17.** Consider the wave equation
\[
(\partial_t - \partial_x) (\partial_t + \partial_x) u(t, x) = (\partial_x^2 - \partial_t^2) u(t, x) = 0.
\]
From this equation one learns that \( u(t, x) = f(x + t) + g(x - t) \) solves the wave equation on \( f, g \in C^2 \). Suppose that \( f \) is a bounded Borel measurable function on \( \mathbb{R} \) and consider the function \( f(x + t) \) as a distribution on \( \mathbb{R} \). We compute
\[
\langle (\partial_t - \partial_x) f(x + t), \varphi(x, t) \rangle = \int_{\mathbb{R}^2} f(x + t) (\partial_t - \partial_x) \varphi(x, t) \, dx \, dt
\]
\[
= \int_{\mathbb{R}^2} f(x) (\partial_t - \partial_x) \varphi(x - t, t) \, dx \, dt
\]
\[
= -\int_{\mathbb{R}^2} f(x) \frac{d}{dt} [\varphi(x - t, t)] \, dx \, dt
\]
\[
= -\int_{\mathbb{R}} f(x) [\varphi(x - t, t)] |_{t=-\infty}^{t=\infty} \, dx = 0.
\]
This shows that \( (\partial_t - \partial_x) f(x + t) = 0 \) in the distributional sense. Similarly, \( (\partial_t + \partial_x) g(x - t) = 0 \) in the distributional sense. Hence \( u(t, x) = f(x + t) + g(x - t) \) solves the wave equation in the distributional sense whenever \( f \) and \( g \) are bounded Borel measurable functions on \( \mathbb{R} \).

**Example 36.18.** Consider \( f(x) = \ln|x| \) for \( x \in \mathbb{R}^2 \) and let \( T = T_f \). Then, pointwise we have
\[
\nabla \ln |x| = \frac{x}{|x|^2}, \quad \text{and } \Delta \ln |x| = \frac{2}{|x|^2} - 2 \cdot \frac{x}{|x|^4} = 0.
\]
Hence \( \Delta f(x) = 0 \) for all \( x \in \mathbb{R}^2 \) except at \( x = 0 \) where it is not defined. Does this imply that \( \Delta T = 0 \)? No, in fact \( \Delta T = 2\pi \delta \) as we shall now prove. By definition of \( \Delta T \) and the dominated convergence theorem,
\[
\langle \Delta T, \varphi \rangle = \langle T, \Delta \varphi \rangle = \int_{\mathbb{R}^2} \ln |x| \Delta \varphi(x) \, dx = \lim_{\varepsilon \downarrow 0} \int_{|x| > \varepsilon} \ln |x| \Delta \varphi(x) \, dx.
\]
Using the divergence theorem,
\[
\int_{|x|>\varepsilon} \ln |x| \Delta \varphi(x) dx
= -\int_{|x|>\varepsilon} \nabla \ln |x| \cdot \nabla \varphi(x) dx + \int_{|x|>\varepsilon} \ln |x| \nabla \varphi(x) \cdot n(x) dS(x)
= \int_{|x|>\varepsilon} \Delta \ln |x| \varphi(x) dx - \int_{|x|>\varepsilon} \nabla \ln |x| \cdot n(x) \varphi(x) dS(x)
+ \int_{\partial{|x|>\varepsilon}} \ln |x| (\nabla \varphi(x) \cdot n(x)) dS(x)
= \int_{\partial{|x|>\varepsilon}} \ln |x| (\nabla \varphi(x) \cdot n(x)) dS(x)
- \int_{\partial{|x|>\varepsilon}} \nabla \ln |x| \cdot n(x) \varphi(x) dS(x),
\]
where \(n(x)\) is the outward pointing normal, i.e. \(n(x) = -\hat{x} := x/|x|\). Now
\[
\left| \int_{\partial{|x|>\varepsilon}} \ln |x| (\nabla \varphi(x) \cdot n(x)) dS(x) \right| \leq C (\ln \varepsilon^{-1}) 2\pi \varepsilon \to 0 \text{ as } \varepsilon \downarrow 0
\]
where \(C\) is a bound on \((\nabla \varphi(x) \cdot n(x))\). While
\[
\int_{\partial{|x|>\varepsilon}} \nabla \ln |x| \cdot n(x) \varphi(x) dS(x) = \int_{\partial{|x|>\varepsilon}} \frac{\hat{x}}{|x|} \cdot (-\hat{x}) \varphi(x) dS(x)
= -\frac{1}{\varepsilon} \int_{\partial{|x|>\varepsilon}} \varphi(x) dS(x)
\to -2\pi \varphi(0) \text{ as } \varepsilon \downarrow 0.
\]
Combining these results shows
\[
(\Delta T, \varphi) = 2\pi \varphi(0).
\]

**Exercise 36.1.** Carry out a similar computation to that in Example 36.18 to show
\[
\Delta T_{1/|x|} = -4\pi \delta
\]
where now \(x \in \mathbb{R}^3\).

**Example 36.19.** Let \(z = x + iy\), and \(\bar{\partial} = \frac{1}{2}(\partial_x + i\partial_y)\). Let \(T = T_{1/z}\), then
\[
\bar{\partial} T = \pi \delta_0 \text{ or imprecisely } \bar{\partial} \frac{1}{z} = \pi \delta(z).
\]

**Proof.** Pointwise we have \(\bar{\partial} \frac{1}{z} = 0\) so we shall work as above. We then have
\[
\langle \bar{\partial} T, \varphi \rangle = \langle -T, \bar{\partial} \varphi \rangle = -\int_{\mathbb{R}^2} \frac{1}{z} \bar{\partial} \varphi(z) dm(z)
= -\lim_{\varepsilon \downarrow 0} \int_{|x|>\varepsilon} \frac{1}{z} \bar{\partial} \varphi(z) dm(z)
= \lim_{\varepsilon \downarrow 0} \int_{|x|>\varepsilon} \frac{1}{z} \bar{\partial} \varphi(z) dm(z)
- \lim_{\varepsilon \downarrow 0} \int_{\partial{|x|>\varepsilon}} \frac{1}{z} \varphi(z) \frac{1}{2} \left( \frac{z}{|z|} \right) d\sigma(z)
= 0 - \lim_{\varepsilon \downarrow 0} \int_{\partial{|x|>\varepsilon}} \frac{1}{z} \varphi(z) d\sigma(z)
\to \frac{1}{2} \lim_{\varepsilon \downarrow 0} \int_{\partial{|x|>\varepsilon}} \frac{1}{|z|} \varphi(z) d\sigma(z)
= \pi \lim_{\varepsilon \downarrow 0} \frac{1}{2\pi \varepsilon} \int_{\partial{|x|>\varepsilon}} \varphi(z) d\sigma(z) = \pi \varphi(0).
\]

---

**36.3 Other classes of test functions**

(For what follows, see Exercises 17.33 and 17.34 of Chapter 44)

**Notation 36.20** Suppose that \(X\) is a vector space and \(\{p_n\}_{n=0}^{\infty}\) is a family of semi-norms on \(X\) such that \(p_n \leq p_{n+1}\) for all \(n\) and with the property that \(p_n(x) = 0\) for all \(n\) implies that \(x = 0\). (We allow for \(p_n = p_0\) for all \(n\) in which case \(X\) is a normed vector space.) Let \(\tau\) be the smallest topology on \(X\) such that \(p_n(x-\cdot): X \to [0,\infty)\) is continuous for all \(n \in \mathbb{N}\) and \(x \in X\). For \(n \in \mathbb{N}\), \(x \in X\) and \(\varepsilon > 0\) let \(B_n(x,\varepsilon) := \{y \in X : p_n(x-y) < \varepsilon\}\).

**Proposition 36.21.** The balls \(B := \{B_n(x,\varepsilon) : n \in \mathbb{N}, x \in X \text{ and } \varepsilon > 0\}\) for a basis for the topology \(\tau\). This topology is the same as the topology induced by the metric \(d\) on \(X\) defined by
\[
d(x,y) = \sum_{n=0}^{\infty} 2^{-n} \frac{p_n(x-y)}{1 + p_n(x-y)}.
\]

Moreover, a sequence \(\{x_k\} \subset X\) is convergent to \(x \in X\) iff \(\lim_{k \to \infty} d(x,x_k) = 0\) iff \(\lim_{n \to \infty} p_n(x,x_k) = 0\) for all \(n \in \mathbb{N}\) and \(\{x_k\} \subset X\) is Cauchy in \(X\) iff \(\lim_{k,l \to \infty} d(x_l,x_k) = 0\) iff \(\lim_{k,l \to \infty} p_n(x_l,x_k) = 0\) for all \(n \in \mathbb{N}\).
Proof. Suppose that \( z \in B_n(x, \varepsilon) \cap B_m(y, \delta) \) and assume with out loss of

generality that \( m \geq n \). Then if \( p_m(w - z) < \alpha \), we have
\[
p_m(w - y) \leq p_m(w - z) + p_m(z - y) < \alpha + p_m(z - y) < \delta
\]
provided that \( \alpha \in (0, \delta - p_m(z - y)) \) and similarly
\[
p_n(w - x) \leq p_m(w - z) + p_m(z - x) < \alpha + p_m(z - x) < \varepsilon
\]
provided that \( \alpha \in (0, \varepsilon - p_m(z - x)) \). So choosing
\[
\delta = \frac{1}{2} \min (\delta - p_m(z - y), \varepsilon - p_m(z - x)),
\]
we have shown that \( B_m(z, \alpha) \subset B_n(x, \varepsilon) \cap B_m(y, \delta) \). This shows that \( B \)
forms a basis for a topology. In detail, \( V \subset \alpha X \) iff for all \( x \in V \) there exists \( n \in \mathbb{N} \)
and \( \varepsilon > 0 \) such that \( B_n(x, \varepsilon) := \{ y \in X : p_n(x - y) < \varepsilon \} \subset V \). Let \( \tau(B) \) be the
topology generated by \( B \). Since \( |p_n(x - y) - p_n(x - z)| \leq p_n(y - z) \), we see that
\( p_n(x - \cdot) \) is continuous on relative to \( \tau(B) \) for each \( x \in X \) and \( n \in \mathbb{N} \). This shows
that \( \tau \subset \tau(B) \). On the other hand, since \( p_n(x - \cdot) \) is \( \tau \) - continuous, it follows that
\( B(x, \varepsilon) = \{ y \in X : p_n(x - y) < \varepsilon \} \in \tau \) for all \( x \in X \), \( \varepsilon > 0 \) and \( n \in \mathbb{N} \).
This shows that \( \tau \subset \tau \). This is continuous. Therefore, there exists \( n \in \mathbb{N} \)
and \( \varepsilon > 0 \) such that \( B_n(x, \varepsilon) \subset B \). Hence \( \tau(B) \) is \( \tau \) - continuous.
Given \( x \in X \) and \( \varepsilon > 0 \), let \( B(x, \varepsilon) = \{ y \in X : d(x, y) < \varepsilon \} \) be a \( \varepsilon \) - ball. Choose \( N \)
large so that \( \sum_{n=N+1}^{\infty} 2^{-n} < \varepsilon/2 \). Then \( y \in B_n(x, \varepsilon/4) \) we have
\[
d(x, y) = p_N(x - y) \sum_{n=0}^{N} 2^{-n} + \varepsilon/2 < 2 \varepsilon/4 + \varepsilon/2 < \varepsilon
\]
which shows that \( B_n(x, \varepsilon/4) \subset B_d(x, \varepsilon) \). Conversely, if \( d(x, y) < \varepsilon \), then
\[
2^{-n} \frac{p_n(x - y)}{1 + p_n(x - y)} < \varepsilon
\]
which implies that
\[
p_n(x - y) < \frac{2^{-n} \varepsilon}{1 - 2^{-n} \varepsilon} =: \delta
\]
when \( 2^{-n} \varepsilon < 1 \) which shows that \( B_n(x, \delta) \) contains \( B_d(x, \varepsilon) \) with \( \delta \) as
above. This shows that \( \tau \) and the topology generated by \( d \) are the same. The
moreover statements are now easily proved and are left to the reader. \( \blacksquare \)

Exercise 36.2. Keeping the same notation as Proposition 36.21 and further assume that \( \{p'_n\}_{n \in \mathbb{N}} \) is another family of semi-norms as in Notation 36.20.
Then the topology \( \tau' \) determined by \( \{p'_n\}_{n \in \mathbb{N}} \) is weaker then the topology \( \tau \) determined by \( \{p_n\}_{n \in \mathbb{N}} \) (i.e. \( \tau' \subset \tau \) iff for every \( n \in \mathbb{N} \) there is an \( m \in \mathbb{N} \) and
\( C < \infty \) such that \( p'_n \leq Cp_m \).
Proposition 36.26. A linear functional $T$ on $C^\infty(U)$ is continuous, i.e. $T \in C^\infty(U)^*$ iff there exists a compact set $K \subset U$, $m \in \mathbb{N}$ and $C < \infty$ such that

$$
|\langle T, \varphi \rangle| \leq C p^K_m(\varphi) \text{ for all } \varphi \in C^\infty(U).
$$

Notation 36.27 Let $\nu_s(x) := (1 + |x|)^s$ (or change to $\nu_s(x) = (1 + |x|^2)^{s/2} = \langle x \rangle^s$) for $x \in \mathbb{R}^n$ and $s \in \mathbb{R}$.

Example 36.28. Let $S$ denote the space of functions $f \in C^\infty(\mathbb{R}^n)$ such that $f$ and all of its partial derivatives decay faster that $(1 + |x|)^{-m}$ for all $m > 0$ as in Definition 34.6. Define

$$
p_m(f) = \sum_{|\alpha| \leq m} \|(1 + |\cdot|)^m \partial^\alpha f(\cdot)\|_\infty,
$$

then $(S, \{p_m\})$ is a Fréchet space. Again the derivative operators $\{\partial_k\}$ and multiplication by function $f \in \mathcal{P}$ are examples of continuous linear operators on $S$. For an example of an element $T \in S^*$, let $\mu$ be a measure on $\mathbb{R}^n$ such that

$$
\int (1 + |x|)^{-N} d|\mu|(x) < \infty
$$

for some $N \in \mathbb{N}$. Then $T(f) := \int_K \partial^\alpha f d\mu$ defines and element of $S^*$.

Proposition 36.29. The Fourier transform $\mathcal{F} : S \rightarrow S$ is a continuous linear transformation.

Proof. For the purposes of this proof, it will be convenient to use the seminorms

$$
p^s_m(f) = \sum_{|\alpha| \leq m} \|(1 + |\cdot|)^m \partial^\alpha f(\cdot)\|_\infty.
$$

This is permissible, since by Exercise 36.24 they give rise to the same topology on $S$. Let $f \in S$ and $m \in \mathbb{N}$, then

$$
(1 + |\xi|^2)^m \hat{f}(\xi) = (1 + |\xi|^2)^m \mathcal{F}((-ix)^m f)(\xi)
$$

and therefore if we let $g = (1 - \Delta)^m ((-ix)^m f) \in S$,

$$
\left| (1 + |\xi|^2)^m \partial^\alpha \hat{f}(\xi) \right| \leq \|g\|_1 = \int_{\mathbb{R}^n} |g(x)| dx
$$

$$
= \int_{\mathbb{R}^n} |g(x)| (1 + |x|^2)^n \frac{1}{(1 + |x|^2)^n} d\xi
$$

$$
\leq C \left\| \|g(\cdot)| (1 + |\cdot|^2)^n \right\|_\infty
$$

where $C = \int_{\mathbb{R}^n} \frac{1}{(1 + |x|^n)^m} d\xi < \infty$. Using the product rule repeatedly, it is not hard to show

$$
\left\| g(\cdot) (1 + |\cdot|^2)^n \right\|_\infty \leq k \sum_{|\beta| \leq 2m} \left( (1 + |\cdot|^2)^n |\Delta|^m f \right)_\infty
$$

for some constant $k < \infty$. Combining the last two displayed equations implies that $p^s_m(f) \leq C p^s_{2m+n}(f)$ for all $f \in S$, and thus $S$ is continuous. $\blacksquare$

Proposition 36.30. The subspace $C^\infty_c(\mathbb{R}^n)$ is dense in $S(\mathbb{R}^n)$.

Proof. Let $\theta \in C^\infty_c(\mathbb{R}^n)$ such that $\theta = 1$ in a neighborhood of 0 and set $\theta_m(x) = \theta(x/m)$ for all $m \in \mathbb{N}$. We will now show for all $f \in S$ that $\theta_m f$ converges to $f$ in $S$. The main point is by the product rule,

$$
\partial^\alpha (\theta_m f - f)(x) = \sum_{|\beta| \leq \alpha} \binom{\alpha}{\beta} \partial^{\alpha-\beta} \theta_m(x) \partial^\beta f(x) - f
$$

$$
= \sum_{|\beta| \leq \alpha} \binom{\alpha}{\beta} \frac{1}{m^{n-|\beta|}} \partial^{\alpha-\beta} \theta(x/m) \partial^\beta f(x).
$$

Since $\max \{ \|\partial^\beta \theta\|_\infty : |\beta| \leq \alpha \}$ is bounded it then follows from the last equation that $\|\mu \partial^\alpha (\theta_m f - f)\|_\infty = O(1/m)$ for all $t > 0$ and $\alpha$. That is to say $\theta_m f \rightarrow f$ in $S$. $\blacksquare$

Lemma 36.31 (Peetre’s Inequality). For all $x, y \in \mathbb{R}^n$ and $s \in \mathbb{R}$,

$$
(1 + |x + y|)^s \leq \min \left\{ (1 + |y|)^s (1 + |x|)^s, (1 + |y|)^s (1 + |x|)^{|s|} \right\}
$$

(36.5)

that is to say $\nu_s(x + y) \leq \nu_s(x) \nu_s(y)$ and $\nu_s(x + y) \leq \nu_s(y) \nu_s(x)$ for all $s \in \mathbb{R}$, where $\nu_s(x) = (1 + |x|)^s$ as in Notation 36.27. We also have the same results for $\langle x \rangle$, namely

$$
\langle x + y \rangle^s \leq 2^{s/2} \min \left\{ \langle x \rangle^{|s|} \langle y \rangle^s, \langle y \rangle^{|s|} \langle x \rangle^s \right\}.
$$

(36.6)

Proof. By elementary estimates,

$$
(1 + |x + y|) \leq 1 + |x| + |y| \leq (1 + |x|)(1 + |y|)
$$

and so for Eq. (36.5) holds if $s \geq 0$. Now suppose that $s < 0$, then

$$
(1 + |x + y|)^s \geq (1 + |x + y|)^s
$$

and we have

$$
\langle x + y \rangle^s \leq (1 + |x|)^s (1 + |y|)^s
$$

and so for Eq. (36.6) holds if $s \geq 0$.
and letting $x \to x - y$ and $y \to -y$ in this inequality implies
\[(1 + |x|^s) \geq (1 + |x + y|^s)(1 + |y|^s).
\]This inequality is equivalent to
\[(1 + |x + y|^s)^s \leq (1 + |x|^s)(1 + |y|^s).
\]By symmetry we also have
\[(1 + |x + y|^s)^s \leq (1 + |x|^s)^s(1 + |y|^s).
\]For the proof of Eq. (36.6)
\[
\langle x + y \rangle^2 = 1 + |x + y|^2 \leq 1 + (|x| + |y|)^2 = 1 + |x|^2 + |y|^2 + 2|x||y|
\leq 1 + 2|x|^2 + 2|y|^2 \leq 2(1 + |x|^2)(1 + |y|^2) = 2\langle x \rangle^2\langle y \rangle^2.
\]From this it follows that $\langle x \rangle^2 \leq 2\langle x + y \rangle^2$ and hence
\[
\langle x + y \rangle^2 \leq 2\langle x \rangle^2\langle y \rangle^2.
\]So if $s \geq 0$, then
\[
\langle x + y \rangle^s \leq 2^{s/2}\langle x \rangle^s\langle y \rangle^s
\]and
\[
\langle x + y \rangle^{-s} \leq 2^{s/2}\langle x \rangle^{-s}\langle y \rangle^{-s}.
\]

**Proposition 36.32.** Suppose that $f, g \in S$ then $f * g \in S$.

**Proof.** First proof. Since $F(f * g) = F[f \hat{g}] \in S$ it follows that $f * g = F^{-1}(F[f \hat{g}]) \in S$ as well. For the second proof we will make use of Peetre’s inequality. We have for any $k, l \in \mathbb{N}$ that
\[
\nu_k(x) |\partial^\alpha(f * g)(x)| = \nu_k(x) |\partial^\alpha f * g(x)| \leq \nu_k(x) \int |\partial^\alpha f(x - y)||g(y)| dy
\leq C \nu_k(x) \int \nu_{-k}(x - y) \nu_{-l}(y) dy \leq C \nu_k(x) \int \nu_{-k}(x) \nu_k(y) \nu_{-l}(y) dy
= C \nu_{-k}(x) \int \nu_{k-l}(y) dy.
\]Choosing $k = t$ and $l > t + n$ we learn that
\[
\nu_t(x) |\partial^\alpha(f * g)(x)| \leq C \int \nu_{k-l}(y) dy < \infty
\]showing $\|\nu_t \partial^\alpha(f * g)\|_\infty < \infty$ for all $t \geq 0$ and $\alpha \in \mathbb{N}^n$.

### 36.4 Compactly supported distributions

**Definition 36.33.** For a distribution $T \in \mathcal{D}'(U)$ and $V \subset_o U$, we say $T|_V = 0$ if $\langle T, \varphi \rangle = 0$ for all $\varphi \in \mathcal{D}(V)$.

**Proposition 36.34.** Suppose that $V := \{V_\alpha\}_{\alpha \in A}$ is a collection of open subset of $U$ such that $T|_{V_\alpha} = 0$ for all $\alpha$, then $T|_W = 0$ where $W = \cup_{\alpha \in A} V_\alpha$.

**Proof.** Let $\{\psi_\alpha\}_{\alpha \in A}$ be a smooth partition of unity subordinate to $V$, i.e. $\text{supp}(\psi_\alpha) \subset V_\alpha$ for all $\alpha \in A$, for each point $x \in W$ there exists a neighborhood $N_x \subset_o W$ such that $\#\{\alpha \in A : \text{supp}(\psi_\alpha) \cap N_x \neq \emptyset\} < \infty$ and $1_W = \sum_{\alpha \in A} \psi_\alpha$. Then for $\varphi \in \mathcal{D}(W)$, we have $\varphi = \sum_{\alpha \in A} \varphi_\alpha$ and there are only a finite number of nonzero terms in the sum since $\text{supp}(\varphi)$ is compact. Since $\varphi_\alpha \in \mathcal{D}(V_\alpha)$ for all $\alpha$
\[
\langle T, \varphi \rangle = \langle T, \sum_{\alpha \in A} \varphi_\alpha \psi_\alpha \rangle = \sum_{\alpha \in A} \langle T, \varphi_\alpha \psi_\alpha \rangle = 0.
\]

**Definition 36.35.** The support, $\text{supp}(T)$, of a distribution $T \in \mathcal{D}'(U)$ is the relatively closed subset of $U$ determined by
\[
U \setminus \text{supp}(T) = \cup \{V \subset_o U : T|_V = 0\}.
\]By Proposition 36.20, $\text{supp}(T)$ may described as the smallest (relatively) closed set $F$ such that $T|_{U \setminus F} = 0$.

**Proposition 36.36.** If $f \in L_1^{loc}(U)$, then $\text{supp}(T_f) = \text{ess sup}(f)$, where
\[
\text{ess sup}(f) := \{x \in U : m(\{y \in V : f(y) \neq 0\}) > 0 \text{ for all neighborhoods } V \text{ of } x\}
\]as in Definition 19.25.

**Proof.** The key point is that $T_f|_V = 0$ iff $f = 0$ a.e. on $V$ and therefore
\[
U \setminus \text{supp}(T_f) = \cup \{V \subset_o U : f|_V = 0 \text{ a.e.}\}.
\]On the other hand,
\[
U \setminus \text{ess sup}(f) = \{x \in U : m(\{y \in V : f(y) \neq 0\}) = 0 \text{ for some neighborhood } V \text{ of } x\}
= \cup \{x \in U : f|_V = 0 \text{ a.e. for some neighborhood } V \text{ of } x\}
= \cup \{V \subset_o U : f|_V = 0 \text{ a.e.}\}.
\]

**Definition 36.37.** Let $\mathcal{E}'(U) := \{T \in \mathcal{D}'(U) : \text{supp}(T) \subset U \text{ is compact}\}$ – the compactly supported distributions in $\mathcal{D}'(U)$.  

Lemma 36.38. Suppose that \( T \in \mathcal{D}'(U) \) and \( f \in C^\infty(U) \) is a function such that \( K := \text{supp}(T) \cap \text{supp}(f) \) is a compact subset of \( U \). Then we may define \( \langle T, f \rangle := \langle T, \theta f \rangle \), where \( \theta \in \mathcal{D}(U) \) is any function such that \( \theta = 1 \) on a neighborhood of \( K \). Moreover, if \( K \subset U \) is a given compact set and \( F \subset U \) is a compact set such that \( K \subset F^\circ \), then there exists \( m \in \mathbb{N} \) and \( C < \infty \) such that

\[
|\langle T, f \rangle| \leq C \sum_{|\beta| \leq m} \|\partial^\beta f\|_{\infty,F}
\]

for all \( f \in C^\infty(U) \) such that \( \text{supp}(T) \cap \text{supp}(f) \subset K \). In particular if \( T \in \mathcal{E}'(U) \) then \( T \) extends uniquely to a linear functional on \( C^\infty(U) \) and there is a compact subset \( F \subset U \) such that the estimate in Eq. \((36.7)\) holds for all \( f \in C^\infty(U) \).

\[\text{Proof.}\] Suppose that \( \tilde{\theta} \) is another such cutoff function and let \( V \) be an open neighborhood of \( K \) such that \( \theta = \tilde{\theta} = 1 \) on \( V \). Setting \( g := (\theta - \tilde{\theta}) f \in \mathcal{D}(U) \) we see that

\[\text{supp}(g) \subset \text{supp}(f) \setminus V \subset \text{supp}(f) \setminus K = \text{supp}(f) \setminus \text{supp}(T) \subset U \setminus \text{supp}(T),\]

see Figure 36.1 below. Therefore,

\[0 = \langle T, g \rangle = \langle T, (\theta - \tilde{\theta}) f \rangle = \langle T, \theta f \rangle - \langle T, \tilde{\theta} f \rangle\]

which shows that \( \langle T, f \rangle \) is well defined. Moreover, if \( F \subset U \) is a compact set such that \( K \subset F^\circ \) and \( \theta \in C^\infty_c(F^0) \) is a function which is 1 on a neighborhood of \( K \), we have

\[|\langle T, f \rangle| = |\langle T, \theta f \rangle| = C \sum_{|\alpha| \leq m} \|\partial^\alpha (\theta f)\|_{\infty} \leq C \sum_{|\beta| \leq m} \|\partial^\beta f\|_{\infty,F}\]

and this estimate holds for all \( f \in C^\infty(U) \) such that \( \text{supp}(T) \cap \text{supp}(f) \subset K \).

Theorem 36.39. The restriction of \( T \in C^\infty(U)^* \) to \( C^\infty_c(U) \) defines an element in \( \mathcal{E}'(U) \). Moreover the map

\[T \in C^\infty(U)^* \rightarrow \text{supp}(T) \subset \mathcal{E}'(U)\]

is a linear isomorphism of vector spaces. The inverse map is defined as follows. Given \( S \in \mathcal{E}'(U) \) and \( \theta \in C^\infty_c(U) \) such that \( \theta = 1 \) on \( K = \text{supp}(S) \) then \( i^{-1}(S)(\theta) = \theta S \), where \( BS \in C^\infty(U)^* \) defined by

\[\langle \theta S, \varphi \rangle = \langle S, \varphi \rangle \quad \text{for all } \varphi \in C^\infty(U)\]

\[\text{Proof.}\] Suppose that \( T \in C^\infty(U)^* \) then there exists a compact set \( K \subset U \) and \( m \in \mathbb{N} \) and \( C < \infty \) such that

\[|\langle T, \varphi \rangle - \langle T, \varphi \rangle| = |\langle T, (\theta - 1) \varphi \rangle| \leq C p^K_m(\varphi)\]

where \( p^K_m \) is defined in Example 36.25. It is clear using the sequential notion of continuity that \( T|_{\mathcal{D}(U)} \) is continuous on \( \mathcal{D}(U) \), i.e. \( T|_{\mathcal{D}(U)} \in \mathcal{D}'(U) \). Moreover, if \( \theta \in C^\infty_c(U) \) such that \( \theta = 1 \) on a neighborhood of \( K \) then

\[|\langle T, \varphi \rangle - \langle T, \varphi \rangle| = |\langle T, (\theta - 1) \varphi \rangle| \leq C p^K_m(\varphi)
\]

which shows \( \theta T = T \). Hence \( \text{supp}(T) = \text{supp}(\theta T) \subset \text{supp}(\theta) \subset U \) showing that \( T|_{\mathcal{D}(U)} \in \mathcal{E}'(U) \). Therefore the map \( i \) is well defined and is clearly linear. I also claim that \( i \) is injective because if \( T \in C^\infty(U)^* \) and \( i(T) = T|_{\mathcal{D}(U)} \equiv 0 \), then \( \langle T, \varphi \rangle = \langle \theta T, \varphi \rangle = \langle T|_{\mathcal{D}(U)}, \varphi \rangle = 0 \) for all \( \varphi \in C^\infty(U) \). To show \( i \) is surjective suppose that \( S \in \mathcal{E}'(U) \). By Lemma 36.38 we know that \( S \) extends uniquely to an element \( \tilde{S} \) of \( C^\infty(U)^* \) such that \( \tilde{S}|_{\mathcal{D}(U)} = S \), i.e. \( i(\tilde{S}) = S \) and \( K = \text{supp}(S) \).

Lemma 36.40. The space \( \mathcal{E}'(U) \) is a sequentially dense subset of \( \mathcal{D}'(U) \).

\[\text{Proof.}\] Choose \( K_n \subset U \) such that \( K_n \subset K_{n+1}^0 \subset K_{n+1} \uparrow U \) as \( n \rightarrow \infty \). Let \( \theta_n \in C^\infty_c(K_{n+1}^0) \) such that \( \theta_n = 1 \) on \( K_n \). Then for \( T \in \mathcal{D}'(U) \) and \( \theta_n T \rightarrow T \) as \( n \rightarrow \infty \).

36.5 Tempered Distributions and the Fourier Transform

The space of tempered distributions \( S'(\mathbb{R}^n) \) is the continuous dual to \( S = \mathcal{S}(\mathbb{R}^n) \). A linear functional \( T \) on \( S \) is continuous iff there exists \( k \in \mathbb{N} \) and \( C < \infty \) such that
for all $\varphi \in S$. Since $\mathcal{D} = \mathcal{D}(\mathbb{R}^n)$ is a dense subspace of $\mathcal{S}$ any element $T \in \mathcal{S}'$ is determined by its restriction to $\mathcal{D}$. Moreover, if $T \in \mathcal{S}'$ it is easy to see that $T|_D \in \mathcal{D}'$. Conversely and element $T \in \mathcal{D}'$ satisfying an estimate of the form in Eq. (36.8) for all $\varphi \in \mathcal{D}$ extend uniquely to an element of $\mathcal{S}'$. In this way we may view $\mathcal{S}'$ as a subspace of $\mathcal{D}'$.

Example 36.41. Any compactly supported distribution is tempered, i.e. $\mathcal{E}'(U) \subset \mathcal{S}'(\mathbb{R}^n)$ for any $U \subset \mathbb{R}^n$.

One of the virtues of $\mathcal{S}'$ is that we may extend the Fourier transform to $\mathcal{S}'$. Recall that for $L^1$ functions $f$ and $g$ we have the identity,

$$\langle \hat{f}, g \rangle = \langle f, \hat{g} \rangle.$$ 

This suggests the following definition.

**Definition 36.42.** The Fourier and inverse Fourier transform of a tempered distribution $T \in \mathcal{S}'$ are the distributions $\hat{T} = FT \in \mathcal{S}'$ and $T^\prime = F^{-1}T \in \mathcal{S}'$ defined by

$$\langle \hat{T}, \varphi \rangle = \langle T, \hat{\varphi} \rangle \text{ and } \langle T', \varphi \rangle = \langle T, \varphi' \rangle \text{ for all } \varphi \in \mathcal{S}.$$ 

Since $F : \mathcal{S} \to \mathcal{S}'$ is a continuous isomorphism with inverse $F^{-1}$, one easily checks that $\hat{T}$ and $T'$ are well defined elements of $\mathcal{S}'$ and $T'$ is the inverse of $F$ on $\mathcal{S}'$.

Example 36.43. Suppose that $\mu$ is a complex measure on $\mathbb{R}^n$. Then we may view $\mu$ as an element of $\mathcal{S}'$ via $\langle \mu, \varphi \rangle = \int \varphi d\mu$ for all $\varphi \in \mathcal{S}'$. Then by Fubini-Tonelli,

$$\langle \mu, \varphi \rangle = \langle \mu, \hat{\varphi} \rangle = \int \hat{\varphi}(x) d\mu(x) = \int \left[ \int \varphi(x) e^{-ix \cdot \xi} d\mu(x) \right] d\xi = \int \left[ \int \varphi(x) e^{-ix \cdot \xi} d\mu(x) \right] d\xi$$

which shows that $\hat{\mu}$ is the distribution associated to the continuous function $\xi \to \int e^{-ix \cdot \xi} d\mu(x)$. We will somewhat abuse notation and identify the distribution $\hat{\mu}$ with the function $\xi \to \int e^{-iz \cdot \xi} d\mu(x)$.

**Corollary 36.44.** Suppose that $\mu$ is a complex measure such that $\hat{\mu} = 0$, then $\mu = 0$. So complex measures on $\mathbb{R}^n$ are uniquely determined by their Fourier transform.

**Proof.** If $\hat{\mu} = 0$, then $\mu = 0$ as a distribution, i.e. $\int \varphi d\mu = 0$ for all $\varphi \in \mathcal{S}$ and in particular for all $\varphi \in \mathcal{D}$. By Example 36.5 this implies that $\mu$ is the zero measure.

More generally we have the following analogous theorem for compactly supported distributions.

**Theorem 36.45.** Let $S \in \mathcal{E}'(\mathbb{R}^n)$, then $\hat{S}$ is an analytic function and $\hat{S}(z) = \langle S(x), e^{-ix \cdot \xi} \rangle$. Also if $\text{supp}(S) \subset B(0, M)$, then $\hat{S}(z)$ satisfies a bound of the form

$$|\hat{S}(z)| \leq C(1 + |z|)^m e^{M|\text{Im}z|}$$

for some $m \in \mathbb{N}$ and $C < \infty$. If $S \in \mathcal{D}(\mathbb{R}^n)$, i.e. if $S$ is assumed to be smooth, then for all $m \in \mathbb{N}$ there exists $C_m < \infty$ such that

$$|\hat{S}(z)| \leq C_m (1 + |z|)^m e^{M|\text{Im}z|}.$$ 

**Proof.** The function $h(z) = \langle S(\xi), e^{-iz \cdot \xi} \rangle$ for $z \in \mathbb{C}^n$ is analytic since the map $z \in \mathbb{C}^n \to e^{-iz \cdot \xi} \in C^\infty(\xi \in \mathbb{R}^n)$ is analytic and $S$ is complex linear. Moreover, we have the bound

$$|h(z)| = \langle S(\xi), e^{-iz \cdot \xi} \rangle \leq C \sum_{|\alpha| \leq m} \|\partial^\alpha e^{-iz \cdot \xi}\|_{\infty, B(0, M)}$$

$$= C \sum_{|\alpha| \leq m} \|z^\alpha e^{-iz \cdot \xi}\|_{\infty, B(0, M)}$$

$$\leq C \sum_{|\alpha| \leq m} |z|^{|\alpha|} \|e^{-iz \cdot \xi}\|_{\infty, B(0, M)} \leq C (1 + |z|)^m e^{M|\text{Im}z|}.$$ 

If we now assume that $S \in \mathcal{D}(\mathbb{R}^n)$, then

$$|z^\alpha \hat{S}(z)| = \left| \int_{\mathbb{R}^n} S(\xi) z^\alpha e^{-iz \cdot \xi} d\xi \right| = \left| \int_{\mathbb{R}^n} S(\xi) (i\partial_\xi)^\alpha e^{-iz \cdot \xi} d\xi \right|$$

$$= \left| \int_{\mathbb{R}^n} (i\partial_\xi)^\alpha S(\xi) e^{-iz \cdot \xi} d\xi \right| \leq e^{M|\text{Im}z|} \left( \int_{\mathbb{R}^n} |\partial_\xi^\alpha S(\xi)| d\xi \right)$$

showing

$$|z^\alpha| \left| \hat{S}(z) \right| \leq e^{M|\text{Im}z|} \left\| \partial_\xi^\alpha S \right\|_1$$

and therefore

$$\left( 1 + |z| \right)^m \left| \hat{S}(z) \right| \leq C e^{M|\text{Im}z|} \sum_{|\alpha| \leq m} \left\| \partial_\xi^\alpha S \right\|_1 \leq C e^{M|\text{Im}z|}.$$
So to finish the proof it suffices to show \( h = \hat{S} \) in the sense of distributions.
For this let \( \varphi \in \mathcal{D} \), \( K \subseteq \mathbb{R}^n \) be a compact set for \( \varepsilon > 0 \) let
\[
\hat{\varphi}_\varepsilon(\xi) = (2\pi)^{-n/2}\varepsilon^n \sum_{x \in \mathbb{Z}^n} \varphi(x)e^{-ix\cdot\xi}.
\]
This is a finite sum and
\[
\sup_{\xi \in K} |\partial^\alpha (\hat{\varphi}_\varepsilon(\xi) - \hat{\varphi}(\xi))| = \sup_{\xi \in K} \left| \sum_{y \in \mathbb{Z}^n} \int_{y+\varepsilon(0,1)^n} ((-iy)^\alpha \varphi(y)e^{-iy\cdot\xi} - (-ix)^\alpha \varphi(x)e^{-ix\cdot\xi}) \, dx \right|
\leq \sum_{y \in \mathbb{Z}^n} \int_{y+\varepsilon(0,1)^n} \sup_{\xi \in K} |y^\alpha \varphi(y)e^{-iy\cdot\xi} - x^\alpha \varphi(x)e^{-ix\cdot\xi}| \, dx
\]
By uniform continuity of \( x^\alpha \varphi(x)e^{-ix\cdot\xi} \) for \( (\xi, x) \in K \times \mathbb{R}^n \) (\( \varphi \) has compact support),
\[
\delta(\varepsilon) = \sup_{\xi \in K \ y \in \mathbb{Z}^n} \sup_{x \in y+\varepsilon(0,1)^n} |y^\alpha \varphi(y)e^{-iy\cdot\xi} - x^\alpha \varphi(x)e^{-ix\cdot\xi}| \to 0 \text{ as } \varepsilon \downarrow 0
\]
which shows
\[
\sup_{\xi \in K} |\partial^\alpha (\hat{\varphi}_\varepsilon(\xi) - \hat{\varphi}(\xi))| \leq C \delta(\varepsilon)
\]
where \( C \) is the volume of a cube in \( \mathbb{R}^n \) which contains the support of \( \varphi \). This shows that \( \hat{\varphi}_\varepsilon \to \hat{\varphi} \) in \( C^\infty(\mathbb{R}^n) \). Therefore,
\[
\langle \hat{S}, \varphi \rangle = \langle S, \varphi \rangle = \lim_{\varepsilon \downarrow 0} \langle S, \varphi_\varepsilon \rangle = \lim_{\varepsilon \downarrow 0} (2\pi)^{-n/2}\varepsilon^n \sum_{x \in \mathbb{Z}^n} \varphi(x)\langle S(\xi), e^{-ix\cdot\xi} \rangle
= \lim_{\varepsilon \downarrow 0} (2\pi)^{-n/2}\varepsilon^n \sum_{x \in \mathbb{Z}^n} \varphi(x)h(x) = \int_{\mathbb{R}^n} \varphi(x)h(x) \, dx = \langle h, \varphi \rangle.
\]

Remark 36.46. Notice that
\[
\partial^\alpha \hat{S}(z) = \langle S(x), \partial^\alpha_x e^{-ix\cdot\xi} \rangle = \langle S(x), (-ix)^\alpha e^{-ix\cdot\xi} \rangle = \langle (-ix)^\alpha S(x), e^{-ix\cdot\xi} \rangle
\]
and \( (-ix)^\alpha S(x) \in \mathcal{E}'(\mathbb{R}^n) \). Therefore, we find a bound of the form
\[
|\partial^\alpha \hat{S}(z)| \leq C(1 + |z|)^{m'} e^{M|\Im z|}
\]
where \( C \) and \( m' \) depend on \( \alpha \). In particular, this shows that \( \hat{S} \in \mathcal{P} \), i.e. \( S' \) is preserved under multiplication by \( \hat{S} \).

The converse of this theorem holds as well. For the moment we only have the tools to prove the smooth converse. The general case will follow by using the notion of convolution to regularize a distribution to reduce the question to the smooth case.

Theorem 36.47. Let \( S \in \mathcal{S}(\mathbb{R}^n) \) and assume that \( \hat{S} \) is an analytic function and there exists an \( M < \infty \) such that for all \( m \in \mathbb{N} \) there exists \( C_m < \infty \) such that
\[
|\hat{S}(z)| \leq C_m(1 + |z|)^{-m} e^{M|\Im z|}.
\]
Then \( \text{supp}(S) \subseteq B(0, M) \).

Proof. By the Fourier inversion formula,
\[
S(x) = \int_{\mathbb{R}^n} \hat{S}(\xi)e^{ix\cdot\xi} \, d\xi
\]
and by deforming the contour, we may express this integral as
\[
S(x) = \int_{\mathbb{R}^n + i\eta} \hat{S}(\xi)e^{ix\cdot\xi} \, d\xi = \int_{\mathbb{R}^n} \hat{S}(\xi + i\eta)e^{i(\xi + i\eta)\cdot x} \, d\xi
\]
for any \( \eta \in \mathbb{R}^n \). From this last equation it follows that
\[
|S(x)| \leq e^{-\eta\cdot x} \int_{\mathbb{R}^n} |\hat{S}(\xi + i\eta)| \, d\xi \leq C_m e^{-\eta\cdot x} e^{M|\eta|} \int_{\mathbb{R}^n} (1 + |\xi|)^{-m} \, d\xi
\leq C_m e^{-\eta\cdot x} e^{M|\eta|} \int_{\mathbb{R}^n} (1 + |\xi|)^{-m} \, d\xi \leq \tilde{C}_m e^{-\eta\cdot x} e^{M|\eta|}
\]
where \( \tilde{C}_m < \infty \) if \( m > n \). Letting \( \eta = \lambda x \) with \( \lambda > 0 \) we learn
\[
|S(x)| \leq \tilde{C}_m \exp\left(-\lambda|x|^2 + M |x| \right) = \tilde{C}_m e^{\lambda|x|(M - |x|)}.
\]
(36.9)

Hence if \( |x| > M \), we may let \( \lambda \to \infty \) in Eq. (36.9) to show \( S(x) = 0 \). That is to say \( \text{supp}(S) \subseteq B(0, M) \).

Let us now pause to work out some specific examples of Fourier transform of measures.
Example 36.48 (Delta Functions). Let \( a \in \mathbb{R}^n \) and \( \delta_a \) be the point mass measure at \( a \), then
\[
\hat{\delta}_a(\xi) = e^{-ia \cdot \xi}.
\]
In particular it follows that
\[
\mathcal{F}^{-1}e^{-ia \cdot \xi} = \delta_a.
\]
To see the content of this formula, let \( \varphi \in S \). Then
\[
\int e^{-ia \cdot \xi} \varphi(\xi) d\xi = \langle e^{-ia \cdot \xi}, \mathcal{F}^{-1} \varphi \rangle = (\mathcal{F}^{-1}e^{-ia \cdot \xi}, \varphi) = \delta_a, \varphi = \varphi(a)
\]
which is precisely the Fourier inversion formula.

Example 36.49. Suppose that \( p(x) \) is a polynomial. Then
\[
\langle \hat{p}, \varphi \rangle = (p, \varphi) = \int p(\xi) \hat{\varphi}(\xi) d\xi.
\]
Now
\[
p(\xi) \hat{\varphi}(\xi) = \int \varphi(x)p(\xi) e^{-ix \cdot \xi} dx = \int \varphi(x)p(i\partial_x) e^{-ix \cdot \xi} dx
\]
\[
= \int p(-i\partial_x) \varphi(x) e^{-ix \cdot \xi} dx = \mathcal{F}(p(-i\partial) \varphi)(\xi)
\]
which combined with the previous equation implies
\[
\langle \hat{p}, \varphi \rangle = \langle \mathcal{F}(p(-i\partial) \varphi)(\xi) d\xi = (\mathcal{F}^{-1}\mathcal{F}(p(-i\partial) \varphi))(0) = p(-i\partial) \varphi(0)
\]
\[
= \langle \delta_0, p(-i\partial) \varphi \rangle = (p(i\partial) \delta_0, \varphi).
\]
Thus we have shown that \( \hat{p} = p(i\partial) \delta_0 \).

Lemma 36.50. Let \( p(\xi) \) be a polynomial in \( \xi \in \mathbb{R}^n \), \( L = p(-i\partial) \) (a constant coefficient partial differential operator) and \( T \in \mathcal{S}' \), then
\[
\mathcal{F}p(-i\partial)T = p\hat{T}.
\]
In particular if \( T = \delta_0 \), we have
\[
\mathcal{F}p(-i\partial)\delta_0 = p \cdot \delta_0 = p.
\]

Proof. By definition,
\[
\langle \mathcal{F}LT, \varphi \rangle = (LT, \hat{\varphi}) = \langle p(-i\partial)T, \hat{\varphi} \rangle = \langle T, p(i\partial)\hat{\varphi} \rangle
\]
and
\[
p(i\partial)\hat{\varphi}(\xi) = p(i\partial) \int \varphi(x)e^{-ix \cdot \xi} dx = \int p(x)\varphi(x)e^{-ix \cdot \xi} dx = \langle p\varphi \rangle.
\]
Thus
\[
\langle \mathcal{F}LT, \varphi \rangle = \langle T, p(i\partial)\hat{\varphi} \rangle = \langle T, \varphi \rangle^* = \langle \hat{T}, \varphi \rangle = \langle p\hat{T}, \varphi \rangle
\]
which proves the lemma.

Example 36.51. Let \( n = 1, -\infty < a < b < \infty \), and \( d\mu(x) = 1_{[a,b]}(x) dx \). Then
\[
\hat{\mu}(\xi) = \int_a^b e^{-ix \cdot \xi} dx = \frac{1}{\sqrt{2\pi}} e^{-i\xi b} - \frac{1}{\sqrt{2\pi}} e^{-ia \cdot \xi} = \frac{1}{\sqrt{2\pi}} \frac{e^{-ia \cdot \xi} - e^{-ib \cdot \xi}}{i\xi}.
\]
So by the inversion formula we may conclude that
\[
\mathcal{F}^{-1}\left( \frac{e^{-ia \cdot \xi} - e^{-ib \cdot \xi}}{i\xi} \right)(x) = 1_{[a,b]}(x) \quad (36.10)
\]
in the sense of distributions. This also true at the Level of \( L^2 \) – functions. When \( a = -b \) and \( b > 0 \) these formula reduce to
\[
\mathcal{F}1_{[-b,b]} = \frac{1}{\sqrt{2\pi}} \frac{e^{ib \cdot \xi} - e^{-ib \cdot \xi}}{i\xi} = \frac{2}{\sqrt{2\pi}} \frac{\sin b\xi}{\xi},
\]
and
\[
\mathcal{F}^{-1}\frac{2}{\sqrt{2\pi}} \frac{\sin b\xi}{\xi} = 1_{[-b,b]}.
\]

Let us pause to work out Eq. [36.10] by first principles. For \( M \in (0, \infty) \) let \( \nu_N \) be the complex measure on \( \mathbb{R}^n \) defined by
\[
d\nu_M(\xi) = \frac{1}{\sqrt{2\pi}} 1_{|\xi| \leq M} \frac{e^{-ia \cdot \xi} - e^{-ib \cdot \xi}}{i\xi} d\xi,
\]
then
\[
\frac{1}{\sqrt{2\pi}} \frac{e^{-ia \cdot \xi} - e^{-ib \cdot \xi}}{i\xi} = \lim_{M \to \infty} \nu_M \text{ in the } \mathcal{S}' \text{ topology.}
\]

Hence
\[
\mathcal{F}^{-1}\left( \frac{1}{\sqrt{2\pi}} \frac{e^{-ia \cdot \xi} - e^{-ib \cdot \xi}}{i\xi} \right)(x) = \lim_{M \to \infty} \mathcal{F}^{-1}\nu_M
\]
and
Let us again pause to try to compute this inverse Fourier transform directly. To this end, let \( f_M(\xi) := \frac{\sin(\xi|\xi|)}{\xi|\xi|} 1[|\xi| \leq M] \). By the dominated convergence theorem, it follows that \( f_M \to \frac{\sin(\xi|\xi|)}{\xi|\xi|} \) in \( S' \), i.e. pointwise on \( S \). Therefore,

\[
\langle F^{-1}\sin t|\xi|/t|\xi|, \varphi \rangle = \langle \sin(t|\xi|/t|\xi|), F^{-1}\varphi \rangle = \lim_{M \to \infty} \langle f_M, F^{-1}\varphi \rangle = \lim_{M \to \infty} \langle F^{-1}f_M, \varphi \rangle
\]

and

\[
(2\pi)^{3/2}F^{-1}f_M(x) = (2\pi)^{3/2} \int_{\mathbb{R}^3} \frac{\sin(t|\xi|/t|\xi|)}{t|\xi|} e^{ib\cdot x} d\xi
\]

By the usual contour methods we find

\[
\lim_{M \to \infty} \frac{1}{2\pi i} \int_{\Gamma_M} e^{iy\xi} e^{i\xi x} d\xi = \begin{cases} 
1 & \text{if } y > 0 \\
0 & \text{if } y < 0
\end{cases}
\]

and therefore we have

\[
F^{-1}\left( \frac{e^{-ia\xi} - e^{-ib\xi}}{i\xi} \right)(x) = \lim_{M \to \infty} F^{-1}\nu_M(x) = 1_{x > a} - 1_{x > b} = 1_{[a,b]}(x).
\]

**Example 36.52.** Let \( \sigma_t \) be the surface measure on the sphere \( S_t \) of radius \( t \) centered at zero in \( \mathbb{R}^3 \). Then

\[
\tilde{\sigma}_t(\xi) = 4\pi t \frac{\sin t|\xi|}{|\xi|}.
\]

Indeed,

\[
\tilde{\sigma}_t(\xi) = \int_{S^2} e^{-ix\cdot \xi} d\sigma(\xi) = t^2 \int_{S^2} e^{-itx\cdot \xi} d\sigma(x)
\]

\[
= t^2 \int_{S^2} e^{-itx\cdot \xi} d\sigma(x) = t^2 \int_0^{2\pi} d\theta \int_0^\pi \sin \varphi e^{-it \cos \varphi} |\xi| d\varphi
\]

\[
= 2\pi t^2 \int_0^1 e^{-itu|\xi|} du = 2\pi t^2 \int_0^1 e^{-itu|\xi|} \bigg|_{u=1}^{u=-1} = 4\pi t^2 \frac{\sin t|\xi|}{t|\xi|}.
\]

By the inversion formula, it follows that

\[
F^{-1}\sin(t|\xi|/t|\xi|) = \frac{t}{4\pi t^2} \sigma_t = t\tilde{\sigma}_t
\]

where \( \tilde{\sigma}_t \) is \( \frac{1}{4\pi t^2} \sigma_t \), the surface measure on \( S_t \) normalized to have total measure one.

**36.6 Wave Equation**

Given a distribution \( T \) and a test function \( \varphi \), we wish to define \( T * \varphi \in C^\infty \) by the formula

\[
T * \varphi(x) = \int T(y)\varphi(x-y)dy = \langle T, \varphi(x-\cdot) \rangle.
\]

As motivation for wanting to understand convolutions of distributions let us reconsider the wave equation in \( \mathbb{R}^n \),
We can arrive at this same solution by more elementary means as follows. We first note in the one dimensional case that wave operator factors, namely
\[ 0 = (\partial_t^2 - \Delta) u(t, x) \]
with
\[ u(0, x) = f(x) \text{ and } u_t(0, x) = g(x). \]

Taking the Fourier transform in the \( x \) variables gives the following equation
\[ 0 = \hat{u}_t(t, \xi) + |\xi|^2 \hat{u}(t, \xi) \]
with \( \hat{u}(0, \xi) = \hat{f}(\xi) \) and \( \hat{u}_t(0, \xi) = \hat{g}(\xi) \).

The solution to these equations is
\[ \hat{u}(t, \xi) = \hat{f}(\xi) \cos(t|\xi|) + \hat{g}(\xi) \frac{\sin t|\xi|}{|\xi|} \]
and hence we should have
\[ u(t, x) = \mathcal{F}^{-1} \left( \hat{f}(\xi) \cos(t|\xi|) + \hat{g}(\xi) \frac{\sin t|\xi|}{|\xi|} \right)(x) \]
\[ = \mathcal{F}^{-1} \cos(t|\xi|) \ast f(x) + \mathcal{F}^{-1} \frac{\sin t|\xi|}{|\xi|} \ast g(x) \]
\[ = \frac{d}{dt} \mathcal{F}^{-1} \frac{\sin t|\xi|}{|\xi|} \ast f(x) + \mathcal{F}^{-1} \frac{\sin t|\xi|}{|\xi|} \ast g(x). \]

The question now is how interpret this equation. In particular what are the inverse Fourier transforms of \( \mathcal{F}^{-1} \cos(t|\xi|) \) and \( \mathcal{F}^{-1} \frac{\sin t|\xi|}{|\xi|} \). Since \( \frac{d}{dt} \mathcal{F}^{-1} \frac{\sin t|\xi|}{|\xi|} \ast f(x) = \mathcal{F}^{-1} \cos(t|\xi|) \ast f(x) \), it really suffices to understand \( \mathcal{F}^{-1} \frac{\sin t|\xi|}{|\xi|} \). This was worked out in Example [36.51] when \( n = 1 \) where we found
\[ (\mathcal{F}^{-1} \xi^{-1} \sin t\xi)(x) = \frac{\pi}{\sqrt{2\pi}} (1_{x+t>0} - 1_{x-t>0}) \]
\[ = \frac{\pi}{\sqrt{2\pi}} (1_{x>-t} - 1_{x>t}) = \frac{\pi}{\sqrt{2\pi}} 1_{[-t,t]}(x) \]
where in writing the last line we have assume that \( t \geq 0 \). Therefore,
\[ (\mathcal{F}^{-1} \xi^{-1} \sin t\xi) \ast f(x) = \frac{1}{2} \int_{-t}^{t} f(x-y)dy \]

Therefore the solution to the one dimensional wave equation is
\[ u(t, x) = \frac{d}{dt} \frac{1}{2} \int_{-t}^{t} f(x-y)dy + \frac{1}{2} \int_{-t}^{t} g(x-y)dy \]
\[ = \frac{1}{2} (f(x-t) + f(x+t)) + \frac{1}{2} \int_{-t}^{t} g(x-y)dy \]
\[ = \frac{1}{2} (f(x-t) + f(x+t)) + \frac{1}{2} \int_{x-t}^{x+t} g(y)dy. \]
The question is what is $\mu * g(x)$ where $\mu$ is a measure. To understand the definition, suppose first that $d\mu(x) = \rho(x)dx$, then we should have

$$\mu * g(x) = \rho * g(x) = \int_{\mathbb{R}^n} g(x-y)\rho(x)dx = \int_{\mathbb{R}^n} g(x-y)d\mu(y).$$

Thus we expect our solution to the wave equation should be given by

$$\begin{align*}
    u(t, x) &= \frac{1}{2\pi} \int_{0}^{2\pi} d\theta \int_{0}^{\pi} d\varphi \sin \varphi g((x, y) + t(\sin \varphi \cos \theta, \sin \varphi \sin \theta)) \\
    &= \frac{1}{2\pi} \int_{0}^{2\pi} d\theta \int_{0}^{\pi/2} d\varphi \sin \varphi g((x, y) + t(\sin \varphi \cos \theta, \sin \varphi \sin \theta))
\end{align*}$$

and letting $u = \sin \varphi$, so that $du = \cos \varphi d\varphi = \sqrt{1 - u^2}du$ we find

$$u(t, x, y) = \frac{1}{2\pi} \int_{0}^{2\pi} d\theta \int_{0}^{1} \frac{du}{\sqrt{1 - u^2}} u g((x, y) + ut(\cos \theta, \sin \theta))$$

and then letting $r = ut$ we learn,

$$u(t, x, y) = \frac{1}{2\pi} \int_{0}^{2\pi} d\theta \int_{0}^{\frac{r}{\sqrt{1 - r^2/t^2}}} dr \frac{r}{t} g((x, y) + r(\cos \theta, \sin \theta))/t$$

that the solution $u(t, x, y, z)$ is again independent of $z$ and hence is a solution to the two dimensional wave equation. See figure below.

Notice that we still have finite speed of propagation but no longer sharp propagation. In fact we can work out the solution analytically as follows. Again for simplicity assume that $f \equiv 0$. Then

$$\begin{align*}
    u(t, x, y) &= \frac{t}{4\pi} \int_{0}^{2\pi} d\theta \int_{0}^{\pi} d\varphi \sin \varphi g((x, y) + t(\sin \varphi \cos \theta, \sin \varphi \sin \theta)) \\
    &= \frac{t}{2\pi} \int_{0}^{2\pi} d\theta \int_{0}^{\pi/2} d\varphi \sin \varphi g((x, y) + t(\sin \varphi \cos \theta, \sin \varphi \sin \theta))
\end{align*}$$

We may also use this solution to solve the two dimensional wave equation using Hadamard’s method of decent. Indeed, suppose now that $f$ and $g$ are function on $\mathbb{R}^2$ which we may view as functions on $\mathbb{R}^3$ which do not depend on the third coordinate say. We now go ahead and solve the three dimensional wave equation using Eq. (36.11) and $f$ and $g$ as initial conditions. It is easily seen

**Fig. 36.2.** The geometry of the solution to the wave equation in three dimensions.

**Fig. 36.3.** The geometry of the solution to the wave equation in two dimensions.
Here is a better alternative derivation of this result. We begin by using
symmetry to find
\[
  u(t, x) = 2t \int_{S^+ t} g(x - y)d\bar{\sigma}(y) = 2t \int_{S^+ t} g(x + y)d\bar{\sigma}(y)
\]
where \( S^+ t \) is the portion of \( S_t \) with \( z \geq 0 \). This sphere is parametrized by
\[
  R(u, v) = (u, v, \sqrt{t^2 - u^2 - v^2}) \quad \text{with} \quad (u, v) \in D_t := \{(u, v) : u^2 + v^2 \leq t^2\}.
\]
In these coordinates we have
\[
  4\pi t^2 d\bar{\sigma} = \left(\frac{-\partial_u \sqrt{t^2 - u^2 - v^2}}{\sqrt{t^2 - u^2 - v^2}}, \frac{-\partial_v \sqrt{t^2 - u^2 - v^2}}{\sqrt{t^2 - u^2 - v^2}}, 1\right) dudv
\]
and therefore,
\[
  u(t, x) = \frac{2t}{4\pi t^2} \int_{S^+ t} g(x + (u, v, \sqrt{t^2 - u^2 - v^2})) \frac{|t|}{\sqrt{t^2 - u^2 - v^2}} dudv
\]
This may be written as
\[
  u(t, x) = \frac{1}{2\pi} \text{sgn}(t) \int_{S^+ t} \frac{g(x + (u, v))}{\sqrt{t^2 - u^2 - v^2}} dudv.
\]
as before. (I should check on the sgn(t) term.)

### 36.7 Appendix: Topology on \( C^\infty_c(U) \)

Let \( U \) be an open subset of \( \mathbb{R}^n \) and
\[
  C^\infty_c(U) = \cup_{K \subset \subset U} C^\infty(K) \quad (36.12)
\]
denote the set of smooth functions on \( U \) with compact support in \( U \). Our goal is to topologize \( C^\infty(U) \) in a way which is compatible with the topologies defined in Example 36.24 above. This leads us to the inductive limit topology which we now pause to introduce.

**Definition 36.53 (Inductive Limit Topology).** Let \( X \) be a set, \( X_\alpha \subset X \) for \( \alpha \in A \) (\( A \) is an index set) and assume that \( \tau_\alpha \subset 2^{X_\alpha} \) is a topology on \( X_\alpha \) for each \( \alpha \). Let \( i_\alpha : X_\alpha \rightarrow X \) denote the inclusion maps. The inductive limit topology on \( X \) is the largest topology \( \tau \) on \( X \) such that \( i_\alpha \) is continuous for all \( \alpha \in A \).

Notice that \( C \subset X \) is closed iff \( C \cap X_\alpha \) is closed in \( X_\alpha \) for all \( \alpha \). Indeed, \( C \subset X \) is closed iff \( C^\infty = X \setminus C \subset X \) is open, iff \( C^\infty \cap X_\alpha = X_\alpha \setminus (X_\alpha \setminus C) \) is open in \( X_\alpha \) for all \( \alpha \in A \).

**Definition 36.54.** Let \( D(U) \) denote the set of smooth functions on \( U \). Then \( C^\infty_c(U) \) is a closed subset of \( D(U) \). Indeed, if \( F \) is another compact subset of \( U \), then \( C^\infty(K) \cap C^\infty(F) = C^\infty(K \cap F) \), which is a closed subset of \( C^\infty(F) \). The set \( U \subset D(U) \) defined by
\[
  U = \left\{ \psi \in D(U) : \sum_{|\alpha| \leq m} \| \partial^\alpha (\psi - \varphi) \|_\infty < \varepsilon \right\}
\]
for some \( \varphi \in D(U) \) and \( \varepsilon > 0 \) is an open subset of \( D(U) \). Indeed, if \( K \subset \subset U \), then
\[
  U \cap C^\infty(K) = \left\{ \psi \in C^\infty(K) : \sum_{|\alpha| \leq m} \| \partial^\alpha (\psi - \varphi) \|_\infty < \varepsilon \right\}
\]
is easily seen to be open in \( C^\infty(K) \).

**Proposition 36.55.** Let \( (X, \tau) \) be as described in Definition 36.53 and \( f : X \rightarrow Y \) be a function where \( Y \) is another topological space. Then \( f \) is continuous iff \( f \circ i_\alpha : X_\alpha \rightarrow Y \) is continuous for all \( \alpha \in A \).

**Proof.** Since the composition of continuous maps is continuous, it follows that \( f \circ i_\alpha : X_\alpha \rightarrow Y \) is continuous for all \( \alpha \in A \) if \( f : X \rightarrow Y \) is continuous. Conversely, if \( f \circ i_\alpha \) is continuous for all \( \alpha \in A \), then for all \( V \subset Y \) we have
\[
  \tau_\alpha \supset (f \circ i_\alpha)^{-1}(V) = i_\alpha^{-1}(f^{-1}(V)) = f^{-1}(V) \cap X_\alpha \quad \text{for all} \quad \alpha \in A
\]
showing that \( f^{-1}(V) \in \tau \).

**Lemma 36.56.** Let us continue the notation introduced in Definition 36.53. Suppose further that there exists \( \alpha_k \in A \) such that \( X'_{k} := X_{\alpha_k} \uparrow X \) as \( k \rightarrow \infty \) and for each \( \alpha \in A \) there exists an \( k \in \mathbb{N} \) such that \( X_\alpha \subset X'_{k} \) and the inclusion
map is continuous. Then $\tau = \{ A \subset X : A \cap X' \subset X'_k \text{ for all } k \}$ and a function $f : X \to Y$ is continuous iff $f|_{X'_k} : X'_k \to Y$ is continuous for all $k$. In short the inductive limit topology on $X$ arising from the two collections of subsets $(X_\alpha)_{\alpha \in A}$ and $(X'_k)_{k \in \mathbb{N}}$ are the same.

**Proof.** Suppose that $A \subset X$, if $A \in \tau$ then $A \cap X'_k = A \cap X_{\alpha_k} \subset X'_k$ by definition. Now suppose that $A \cap X'_k \subset X'_k$ for all $k$. For $\alpha \in A$ choose $k$ such that $X_\alpha \subset X'_k$, then $A \cap X_\alpha = (A \cap X'_k) \cap X_\alpha \subset X_\alpha$ since $A \cap X'_k$ is open in $X'_k$ and by assumption that $X_\alpha$ is continuously embedded in $X'_k$. Since $X_\alpha \subset X'_k$ for all $V \subset X'_k$. The characterization of continuous functions is prove similarly. ■

Let $K_k \subset U$ for $k \in \mathbb{N}$ such that $K_k^n \subset K_{k+1} \subset K_{k+1}$ for all $k$ and $K_k \uparrow U$ as $k \to \infty$. Then it follows for any $K \subset U$, there exists an $k$ such that $K \subset K_k^n \subset K_k$. One now checks that the map $C^\infty(K)$ embeds continuously into $C^\infty(K_k)$ and moreover, $C^\infty(K)$ is a closed subset of $C^\infty(K_{k+1})$. Therefore we may describe $D(U)$ as $C^\infty(U)$ with the inductively limit topology coming from $\cup_{k \in \mathbb{N}} C^\infty(K_k)$.

**Lemma 36.57.** Suppose that $\{ \varphi_k \}_{k=1}^\infty \subset D(U)$, then $\varphi_k \to \varphi \in D(U)$ iff $\varphi_k - \varphi \to 0 \in D(U)$.

**Proof.** Let $\varphi \in D(U)$ and $U \subset D(U)$ be a set. We will begin by showing that $U$ is open in $D(U)$ iff $U - \varphi$ is open in $D(U)$. To this end let $K_k$ be the compact sets described above and choose $k_0$ sufficiently large so that $\varphi \in C^\infty(K_k)$ for all $k \geq k_0$. Now $U - \varphi \subset D(U)$ is open iff $(U - \varphi) \cap C^\infty(K_k)$ is open in $C^\infty(K_k)$ for all $k \geq k_0$. Because $\varphi \in C^\infty(K_k)$, we have $(U - \varphi) \cap C^\infty(K_k) = U \cap C^\infty(K_k) - \varphi$ which is open in $C^\infty(K_k)$ if $U \cap C^\infty(K_k)$ is open $C^\infty(K_k)$. Since this is true for all $k \geq k_0$ we conclude that $U - \varphi$ is an open subset of $D(U)$ iff $U$ is open in $D(U)$. Now $\varphi_k \to \varphi$ in $D(U)$ iff for all $\varphi_k \in D(U)$, $\varphi_k \in U$ for almost all $k$ which happens iff $\varphi_k - \varphi \in U - \varphi$ for almost all $k$. Since $U - \varphi$ ranges over all open neighborhoods of $\varphi$, the result follows. ■

**Lemma 36.58.** A sequence $\{ \varphi_k \}_{k=1}^\infty \subset D(U)$ converges to $\varphi \in D(U)$, iff there is a compact set $K \subset U$ such that $\supp(\varphi_k) \subset K$ for all $k$ and $\varphi_k \to \varphi$ in $C^\infty(K)$.

**Proof.** If $\varphi_k \to \varphi$ in $C^\infty(K)$, then for any open set $V \subset D(U)$ with $\varphi \in V$ we have $\forall \subset C^\infty(K)$ is open in $C^\infty(K)$ and hence $\varphi_k \in \forall \subset C^\infty(K) \subset \forall$ for almost all $k$. This shows that $\varphi_k \to \varphi \in D(U)$. For the converse, suppose that there exists $\{ \varphi_k \}_{k=1}^\infty \subset D(U)$ which converges to $\varphi \in D(U)$ yet there is no compact set $K$ such that $\supp(\varphi_k) \subset K$ for all $k$. Using Lemma 36.57, we may replace $\varphi_k$ by $\varphi_k - \varphi$ if necessary so that we may assume $\varphi_k \to 0 \in D(U)$. By passing to a subsequences of $\{ \varphi_k \}$ and $\{ K_k \}$ if necessary, we may also assume there $x_k \in K_{k+1} \setminus K_k$ such that $\varphi_k(x_k) \neq 0$ for all $k$. Let $p$ denote the semi-norm on $C^\infty(U)$ defined by

$$p(\varphi) = \sum_{k=0}^\infty \sup \left\{ \frac{|\varphi(x)|}{|\varphi_k(x_k)|} : x \in K_{k+1} \setminus K_k \right\}.$$ 

One then checks that

$$p(\varphi) \leq \left( \sum_{k=0}^N \frac{1}{|\varphi_k(x_k)|} \right) \|\varphi\|_\infty$$

for $\varphi \in C^\infty(K_{N+1})$. This shows that $p|_{C^\infty(K_{N+1})}$ is continuous for all $N$ and hence $p$ is continuous on $D(U)$. Since $p$ is continuous on $D(U)$ and $\varphi_k \to 0$ in $D(U)$, it follows that $\lim_{k \to \infty} p(\varphi_k) = p(\lim_{k \to \infty} \varphi_k) = p(0) = 0$. While on the other hand, $p(\varphi_k) \geq 1$ by construction and hence we have arrived at a contradiction. Thus for any convergent sequence $\{ \varphi_k \}_{k=1}^\infty \subset D(U)$ there is a compact set $K \subset U$ such that $\supp(\varphi_k) \subset K$ for all $k$. We will now show that $\{ \varphi_k \}_{k=1}^\infty$ is convergent to $\varphi$ in $C^\infty(K)$. To this end let $U \subset D(U)$ be the open set described in Eq. (36.13), then $\varphi_k \in U$ for almost all $k$ and in particular, $\varphi_k \in U \cap C^\infty(K)$ for almost all $k$. (Letting $\varepsilon > 0$ tend to zero that shows $\supp(\varphi) \subset K$, i.e. $\varphi \in C^\infty(K)$.) Since sets of the form $U \cap C^\infty(K)$ with $U$ as in Eq. (36.13) form a neighborhood base for the $C^\infty(K)$ at $\varphi$, we concluded that $\varphi_k \to \varphi$ in $C^\infty(K)$.

**Definition 36.59 (Distributions on $U \subset \mathbb{R}^n$).** A generalized function on $U \subset \mathbb{R}^n$ is a continuous linear functional on $D(U)$. We denote the space of generalized functions by $D'(U)$.

**Proposition 36.60.** Let $f : D(U) \to \mathbb{C}$ be a linear functional. Then the following are equivalent.

1. $f$ is continuous, i.e. $f \in D'(U)$.
2. For all $K \subset U$, there exist $n \in \mathbb{N}$ and $C < \infty$ such that $|f(\varphi)| \leq C \varphi_n(\varphi)$ for all $\varphi \in C^\infty(K)$.
3. For all sequences $\{ \varphi_k \} \subset D(U)$ such that $\varphi_k \to 0$ in $D(U)$, $\lim_{k \to \infty} f(\varphi_k) = 0$.

**Proof.** 1) $\iff$ 2). If $f$ is continuous, then by definition of the inductive limit topology $f|_{C^\infty(K)}$ is continuous. Hence an estimate of the type in Eq. (36.14) must hold. Conversely if estimates of the type in Eq. (36.14) hold for all compact sets $K$, then $f|_{C^\infty(K)}$ is continuous for all $K \subset U$ and again by the definition of the inductive limit topologies, $f$ is continuous on $D'(U)$. 1) $\iff$ 3) By Lemma 36.58 the assertion in item 3. is equivalent to saying that $f|_{C^\infty(K)}$ is sequentially continuous for all $K \subset U$. Since the topology on $C^\infty(K)$ is first countable (being a metric topology), sequential continuity and continuity are the same think. Hence item 3. is equivalent to the assertion that $f|_{C^\infty(K)}$ is continuous for all $K \subset U$ which is equivalent to the assertion that $f$ is continuous on $D'(U)$.
Proposition 36.61. The maps \((\lambda, \varphi) \in C \times D(U) \to \lambda \varphi \in D(U)\) and \((\varphi, \psi) \in D(U) \times D(U) \to \varphi + \psi \in D(U)\) are continuous. (Actually, I will have to look up how to decide to this.) What is obvious is that all of these operations are sequentially continuous, which is enough for our purposes.
Convolutions involving distributions

37.1 Tensor Product of Distributions

Let $X \subset_{o} \mathbb{R}^{n}$ and $Y \subset_{o} \mathbb{R}^{m}$ and $S \in \mathcal{D}'(X)$ and $T \in \mathcal{D}'(Y)$. We wish to define $S \otimes T \in \mathcal{D}'(X \times Y)$. Informally, we should have

$$
\langle S \otimes T, \phi \rangle = \int_{X \times Y} S(x)T(y)\phi(x,y)dxdy = \int_{X} dx S(x) \int_{Y} dy T(y) \phi(x,y).
$$

Of course we should interpret this last equation as follows,

$$
\langle S \otimes T, \phi \rangle = \langle S(x), \langle T(y), \phi(x,y) \rangle \rangle = \langle T(y), \langle S(x), \phi(x,y) \rangle \rangle.
$$

This formula takes on particularly simple form when $\phi = u \otimes v$ with $u \in \mathcal{D}(X)$ and $v \in \mathcal{D}(Y)$ in which case

$$
\langle S \otimes T, u \otimes v \rangle = \langle S, u \rangle \langle T, v \rangle.
$$

We begin with the following smooth version of the Weierstrass approximation theorem which will be used to show Eq. (37.2) uniquely determines $S \otimes T$.

**Theorem 37.1 (Density Theorem).** Suppose that $X \subset_{o} \mathbb{R}^{n}$ and $Y \subset_{o} \mathbb{R}^{m}$, then $\mathcal{D}(X) \otimes \mathcal{D}(Y)$ is dense in $\mathcal{D}(X \times Y)$.

**Proof.** First let us consider the special case where $X = (0,1)^{n}$ and $Y = (0,1)^{m}$ so that $X \times Y = (0,1)^{m+n}$. To simplify notation, let $m+n = k$ and $\Omega = (0,1)^{k}$ and $\pi_{i}: \Omega \to (0,1)$ be projection onto the $i^{th}$ factor of $\Omega$. Suppose that $\phi \in C_{c}^{\infty}(\Omega)$ and $K = \text{supp}(\phi)$. We will view $\phi \in C_{c}^{\infty}(\mathbb{R}^{k})$ by setting $\phi = 0$ outside of $\Omega$. Since $K$ is compact $\pi_{i}(K) \subset [a_{i}, b_{i}]$ for some $0 < a_{i} < b_{i} < 1$. Let $a = \min \{a_{i}: i = 1, \ldots, k\}$ and $b = \max \{b_{i}: i = 1, \ldots, k\}$ . Then supp($\phi$) $\subset [a, b]^{k} \subset \Omega$. As in the proof of the Weierstrass approximation theorem, let $q_{n}(t) = c_{n}(1-t^{2})^{\frac{1}{2}}$ where $c_{n}$ is chosen so that $\int_{\mathbb{R}^{k}} q_{n}(t)dt = 1$. Also set $Q_{n} = q_{n} \otimes \cdots \otimes q_{n}$, i.e. $Q_{n}(x) = \prod_{i=1}^{k} q_{n}(x_{i})$ for $x \in \mathbb{R}^{k}$. Let

$$
f_{n}(x) := Q_{n} * \phi(x) = c_{n}^{k} \int_{\mathbb{R}^{k}} \phi(y) \prod_{i=1}^{k} (1 - (x_{i} - y_{i})^{2})^{\frac{1}{2}} dy_{i}.
$$

By standard arguments, we know that $\partial^{\alpha} f_{n} \to \partial^{\alpha} \phi$ uniformly on $\mathbb{R}^{k}$ as $n \to \infty$. Moreover for $x \in \Omega$, it follows from Eq. (37.3) that

$$
f_{n}(x) := c_{n}^{k} \int_{\mathbb{R}^{k}} \phi(y) \prod_{i=1}^{k} (1 - (x_{i} - y_{i})^{2})^{\frac{1}{2}} dy_{i} = p_{n}(x)
$$

where $p_{n}(x)$ is a polynomial in $x$. Notice that $p_{n} \in C_{c}^{\infty}((0,1)) \otimes \cdots \otimes C_{c}^{\infty}((0,1))$ so that we are almost there.\footnote{One could also construct $f_{n} \in C_{c}^{\infty}(\mathbb{R})^{\otimes k}$ such that $\partial^{\beta} f_{n} \to \partial^{\beta} \phi$ uniformly as $n \to \infty$ using Fourier series. To this end, let $\tilde{\phi}$ be the 1–periodic extension of $\phi$ to $\mathbb{R}^{k}$. Then $\tilde{\phi} \in C_{c}^{\infty}(\mathbb{R}^{k})$ and hence it may be written as

$$
\tilde{\phi}(x) = \sum_{m \in \mathbb{Z}^{k}} c_{m} e^{2\pi i m x},
$$

where the $\{c_{m} : m \in \mathbb{Z}^{k}\}$ are the Fourier coefficients of $\tilde{\phi}$ which decay faster than $(1 + |m|)^{-1}$ for any $l > 0$. Thus $f_{n}(x) := \sum_{m \in \mathbb{Z}^{k}} c_{m} e^{2\pi i m x} \in C_{c}^{\infty}(\mathbb{R})^{\otimes k}$ and $\partial^{\alpha} f_{n} \to \partial^{\alpha} \phi$ uniformly on $\Omega$ as $n \to \infty$.}

\[37.3\]
Let $K_2 = \pi_2(K) \subseteq Y$ where $\pi_1$ and $\pi_2$ are projections from $X \times Y$ to $X$ and $Y$ respectively. Then $K \subseteq K_1 \times K_2 \subseteq X \times Y$. Let $\{V_i\}_{i=1}^{n}$ and $\{U_j\}_{j=1}^{b}$ be finite covers of $K_1$ and $K_2$ respectively by open sets $V_i = (a_i, b_i)$ and $U_j = (c_j, d_j)$ with $a_i, b_i \in X$ and $c_j, d_j \in Y$. Also let $\alpha_i \in C_c^{\infty}(V_i)$ for $i = 1, \ldots, a$ and $\beta_j \in C_c^{\infty}(U_j)$ for $j = 1, \ldots, b$ be functions such that $\sum_{i=1}^{a} \alpha_i = 1$ on a neighborhood of $K_1$ and $\sum_{j=1}^{b} \beta_j = 1$ on a neighborhood of $K_2$. Then $\phi = \sum_{i=1}^{a} \sum_{j=1}^{b} (\alpha_i \otimes \beta_j) \phi$ and by what we have just proved (after scaling and translating) each term in this sum, $(\alpha_i \otimes \beta_j) \phi$, may be written as a limit of elements in $D(X) \otimes D(Y)$ in the $D(X \times Y)$ topology. $
$
\textbf{Theorem 37.2 (Distribution-Fubini-Theorem).} Let $S \in D'(X)$, $T \in D'(Y)$, $h(x) := \langle T(y), \phi(x, y) \rangle$ and $g(y) := \langle S(x), \phi(x, y) \rangle$. Then $h = h_\phi \in D(X)$, $g = g_\phi \in D(Y)$, $\partial^\alpha h(x) = \langle T(y), \partial^\alpha \phi(x, y) \rangle$ and $\partial^\beta g(y) = \langle S(x), \partial^\beta \phi(x, y) \rangle$ for all multi-indices $\alpha$ and $\beta$. Moreover
\begin{equation}
\langle S(x), \langle T(y), \phi(x, y) \rangle \rangle = \langle S, h \rangle = \langle T, g \rangle = \langle T, (S, \phi(x, y)) \rangle. \tag{37.5}
\end{equation}
We denote this common value by $\langle S \otimes T, \phi \rangle$ and call $S \otimes T$ the tensor product of $S$ and $T$. This distribution is uniquely determined by its values on $D(X) \otimes D(Y)$ and for $u \in D(X)$ and $v \in D(Y)$ we have
\begin{equation}
\langle S \otimes T, u \otimes v \rangle = \langle S, u \rangle \langle T, v \rangle. \tag{37.6}
\end{equation}

\textbf{Proof.} Let $K = \text{supp}(\phi) \subseteq X \times Y$ and $K_1 = \pi_1(K)$ and $K_2 = \pi_2(K)$. Then $K_1 \subseteq X$ and $K_2 \subseteq Y$ and $K \subseteq K_1 \times K_2 \subseteq X \times Y$. If $x \in X$ and $y \notin K_2$, then $\phi(x, y) = 0$ and more generally $\partial^\alpha \phi(x, y) = 0$ so that $\{y : \partial^\alpha \phi(x, y) \neq 0 \} \subseteq K_2$. Thus for all $x \in X$, $\text{supp}(\partial^\alpha \phi(x, \cdot)) \subseteq K_2 \subseteq Y$. By the fundamental theorem of calculus,
\begin{equation}
\partial^\beta \phi(x + v, y) - \partial^\beta \phi(x, y) = \int_0^1 \partial^\alpha \partial^\beta \phi(x + t \tau v, y) d\tau \tag{37.6}
\end{equation}
and therefore
\begin{align*}
\|\partial^\beta \phi(x + \nu, \cdot) - \partial^\beta \phi(x, \cdot)\|_{\infty} & \leq |\nu| \int_0^1 \|\partial^\alpha \partial^\beta \phi(x + t \tau v, \cdot)\|_{\infty} d\tau \\
& \leq |\nu| \|\partial^\alpha \partial^\beta \phi\|_{\infty} \to 0 \quad \text{as} \quad \nu \to 0.
\end{align*}
This shows that $x \in X \to \phi(x, \cdot) \in D(Y)$ is continuous. Thus $h$ is continuous being the composition of continuous functions. Letting $v = te_i$ in Eq. (37.6) we find
\begin{align*}
\frac{\partial^\beta \phi(x + te_i, y) - \partial^\beta \phi(x, y)}{t} - \frac{\partial}{\partial x_i} \partial^\beta \phi(x, y) \\
= \int_0^1 \left[ \frac{\partial}{\partial x_i} \partial^\beta \phi(x + t\tau e_i, y) - \frac{\partial}{\partial x_i} \partial^\beta \phi(x, y) \right] d\tau
\end{align*}
and hence
\begin{align*}
\left\| \frac{\partial^\beta \phi(x + te_i, \cdot) - \partial^\beta \phi(x, \cdot)}{t} - \frac{\partial}{\partial x_i} \partial^\beta \phi(x, \cdot) \right\|_{\infty} \\
\leq \int_0^1 \left\| \frac{\partial}{\partial x_i} \partial^\beta \phi(x + t\tau e_i, \cdot) - \frac{\partial}{\partial x_i} \partial^\beta \phi(x, \cdot) \right\|_{\infty} d\tau
\end{align*}
which tends to zero as $t \to 0$. Thus we have checked that
\begin{equation}
\frac{\partial}{\partial x_i} \phi(x, \cdot) = D'(Y) \lim_{t \to 0} \frac{\phi(x + te_i, \cdot) - \phi(x, \cdot)}{t}
\end{equation}
and therefore,
\begin{equation}
\frac{h(x + te_i) - h(x)}{t} = \langle T, \frac{\phi(x + te_i, \cdot) - \phi(x, \cdot)}{t} \rangle \to \langle T, \frac{\partial}{\partial x_i} \phi(x, \cdot) \rangle
\end{equation}
as $t \to 0$ showing $\partial_i h(x)$ exists and is given by $\langle T, \frac{\partial}{\partial x_i} \phi(x, \cdot) \rangle$. By what we have proved above, it follows that $\partial_i h(x) = \langle T, \frac{\partial}{\partial x_i} \phi(x, \cdot) \rangle$ is continuous in $x$. By induction on $|\alpha|$, it follows that $\partial^\alpha h(x)$ exists and is continuous and $\partial^\alpha h(x) = \langle T(y), \partial^\alpha \phi(x, y) \rangle$ for all $\alpha$. Now if $x \notin K_1$, then $\phi(x, \cdot) \equiv 0$ showing that $\{x : h(x) \neq 0 \} \subseteq K_1$ and hence $\text{supp}(h) \subseteq K_1 \subseteq X$. Thus $h$ has compact support. This proves all of the assertions made about $h$. The assertions pertaining to the function $g$ are proved analogously. Let $\langle \Gamma, \phi \rangle = \langle S(x), \langle T(y), \phi(x, y) \rangle \rangle = \langle S, h_\phi \rangle$ for $\phi \in D(X \times Y)$. Then $\Gamma$ is clearly linear and we have
\begin{equation}
|\langle \Gamma, \phi \rangle| = |\langle S, h_\phi \rangle| \leq C \sum_{|\alpha| \leq m} \|\partial^\alpha h_\phi\|_{\infty, K_1} = C \sum_{|\alpha| \leq m} \|\langle T(y), \partial^\alpha \phi(\cdot, y) \rangle\|_{\infty, K_1}
\end{equation}
which combined with the estimate
\begin{equation}
\|\langle T(y), \partial^\alpha \phi(x, y) \rangle\| \leq C \sum_{|\beta| \leq p} \|\partial^\beta \partial^\alpha \phi(x, y)\|_{\infty, K_2}
\end{equation}
shows
\begin{equation}
|\langle \Gamma, \phi \rangle| \leq C \sum_{|\alpha| \leq m} \sum_{|\beta| \leq p} \|\partial^\beta \partial^\alpha \phi(x, y)\|_{\infty, K_1 \times K_2}.
\end{equation}
So $\Gamma$ is continuous, i.e. $\Gamma \in D'(X \times Y)$, i.e.
\begin{equation}
\phi \in D(X \times Y) \to \langle S(x), \langle T(y), \phi(x, y) \rangle \rangle
\end{equation}
defines a distribution. Similarly,
\[ \phi \in \mathcal{D}(X \times Y) \rightarrow \langle T(y), \{S(x), \phi(x,y)\} \rangle \]

also defines a distribution and since both of these distributions agree on the dense subspace \( \mathcal{D}(X) \otimes \mathcal{D}(Y) \), it follows they are equal. \( \blacksquare \)

**Theorem 37.3.** If \((T, \phi)\) is a distribution test function pair satisfying one of the following three conditions

1. \( T \in \mathcal{E}'(\mathbb{R}^n) \) and \( \phi \in C^\infty(\mathbb{R}^n) \)
2. \( T \in \mathcal{D}'(\mathbb{R}^n) \) and \( \phi \in \mathcal{D}(\mathbb{R}^n) \) or
3. \( T \in \mathcal{S}'(\mathbb{R}^n) \) and \( \phi \in \mathcal{S}(\mathbb{R}^n) \),

let

\[ T \ast \phi(x) = \int T(y)\phi(x-y)dy'' = \langle T, \phi(x-) \rangle. \tag{37.7} \]

Then \( T \ast \phi \in C^\infty(\mathbb{R}^n) \), \( \partial^\alpha (T \ast \phi) = (\partial^\alpha T \ast \phi) = (T \ast \partial^\alpha \phi) \) for all \( \alpha \) and \( \text{supp}(T \ast \phi) \subset \text{supp}(T) + \text{supp}(\phi) \). Moreover if \( (3) \) holds then \( T \ast \phi \in \mathcal{P} - \text{the space of smooth functions with slow decrease}. \)

**Proof.** I will supply the proof for case (3) since the other cases are similar and easier. Let \( h(x) := T \ast \phi(x) \). Since \( T \in \mathcal{S}'(\mathbb{R}^n) \), there exists \( m \in \mathbb{N} \) and \( C < \infty \) such that \( |\langle T, \phi \rangle| \leq C p_m(\phi) \) for all \( \phi \in \mathcal{S} \), where \( p_m \) is defined in Example [36.28]. Therefore,

\[ |h(x) - h(y)| = |\langle T, \phi(x-) - \phi(y-) \rangle| \leq C p_m(\phi(x-) - \phi(y-)) \]

\[ = C \sum_{|\alpha| \leq m} \|\mu_m (\partial^\alpha \phi(x-) - \partial^\alpha \phi(y-))\|_\infty. \]

Let \( \psi := \partial^\alpha \phi \), then

\[ \psi(x-z) - \psi(y-z) = \int_0^1 \nabla \psi(y + \tau(x-y) - z) \cdot (x-y) d\tau \tag{37.8} \]

and hence

\[ |\psi(x-z) - \psi(y-z)| \leq |x-y| \cdot \int_0^1 |\nabla \psi(y + \tau(x-y) - z)| d\tau \]

\[ \leq C |x-y| \int_0^1 \mu_M(y + \tau(x-y) - z)d\tau \]

for any \( M < \infty \). By Peetre’s inequality,

\[ \mu_M(y + \tau(x-y) - z) \leq \mu_M(z) \mu_M(y + \tau(x-y)) \]

so that

\[ |\partial^\alpha \phi(x-z) - \partial^\alpha \phi(y-z)| \leq C |x-y| \mu_M(z) \int_0^1 \mu_M(y + \tau(x-y) - z)d\tau \]

\[ \leq C(x,y)|x-y|\mu_M(z) \tag{37.9} \]

where \( C(x,y) \) is a continuous function of \((x,y)\). Putting all of this together we see that

\[ |h(x) - h(y)| \leq C(x,y)|x-y| \rightarrow 0 \text{ as } x \rightarrow y, \]

showing \( h \) is continuous. Let us now compute a partial derivative of \( h \). Suppose that \( v \in \mathbb{R}^n \) is a fixed vector, then by Eq. (37.8),

\[ \frac{\phi(x + tv - z) - \phi(x-z)}{t} - \partial_v \phi(x-z) \]

\[ = \int_0^1 \nabla \phi(x + \tau tv - z) \cdot vd\tau - \partial_v \phi(x-z) \]

\[ = \int_0^1 [\partial_v \phi(x + \tau tv - z) - \partial_v \phi(x-z)] d\tau. \]

This then implies

\[ \left| \partial^\alpha_v \left\{ \frac{\phi(x + tv - z) - \phi(x-z)}{t} - \partial_v \phi(x-z) \right\} \right| \]

\[ = \int_0^1 \partial^\alpha_v [\partial_v \phi(x + \tau tv - z) - \partial_v \phi(x-z)] d\tau \]

\[ \leq \int_0^1 |\partial^\alpha_v [\partial_v \phi(x + \tau tv - z) - \partial_v \phi(x-z)]| d\tau. \]

But by the same argument as above, it follows that

\[ |\partial^\alpha_v [\partial_v \phi(x + \tau tv - z) - \partial_v \phi(x-z)]| \leq C(x + \tau tv, x) |\tau tv| \mu_M(z) \]

and thus

\[ \left| \partial^\alpha_v \left\{ \frac{\phi(x + tv - z) - \phi(x-z)}{t} - \partial_v \phi(x-z) \right\} \right| \]

\[ \leq t \mu_M(z) \int_0^1 C(x + \tau tv, x) |\tau v| \mu_M(z). \]

Putting this all together shows

\[ \left\| \mu_M \partial^\alpha_v \left\{ \frac{\phi(x + tv - z) - \phi(x-z)}{t} - \partial_v \phi(x-z) \right\} \right\|_\infty = O(t) \]

\[ \rightarrow 0 \text{ as } t \rightarrow 0. \]
That is to say
\[ \partial_v(T * \phi)(x) = \partial_v(T, \phi(x - \cdot)) = \lim_{t \to 0} \frac{T, \phi(x + tv - \cdot) - \phi(x - \cdot)}{t} \]
\[ = (T, \partial_v \phi(x - \cdot)) = T * \partial_v \phi(x). \]
By the first part of the proof, we know that \( \partial_v(T * \phi) \) is continuous and hence by induction it now follows that \( T * \phi \) is \( C^\infty \) and \( \partial^\alpha T * \phi = \partial^\alpha \phi \). Since
\[ T * \partial^\alpha \phi(x) = (T(z), (\partial^\alpha \phi)(x - z)) = (\partial^\alpha (T(z), \partial^\alpha \phi(x - z)) \]
\[ = (\partial^\alpha T(z), \phi(x - z)) = \partial^\alpha T * \phi (x) \]
the proof is complete except for showing \( T * \phi \in \mathcal{P} \). For the last statement, it suffices to prove \( |T * \phi(x)| \leq C \mu_M(x) \) for some \( C < \infty \) and \( \mu \leq M < \infty \). This goes as follows
\[ |h(x)| = |(T, \phi(x - \cdot))| \leq C \mu_m(\phi(x - \cdot)) = C \sum_{|\alpha| \leq m} \|\mu_m(\partial^\alpha \phi(x - \cdot))\|_\infty \]
and using Peetre’s inequality, \( |\partial^\alpha \phi(x - z)| \leq C \mu_{m-\alpha}(x - z) \leq C \mu_{m-\alpha}(z) \mu_m(x) \) so that
\[ \mu_m(\partial^\alpha \phi(x - \cdot)) \leq C \mu_m(x). \]
Thus it follows that \( |T * \phi(x)| \leq C \mu_m(x) \) for some \( C < \infty \). If \( x \in \mathbb{R}^n \setminus (\text{supp}(T) + \text{supp}(\phi)) \) and \( y \in \text{supp}(\phi) \) then \( x - y \notin \text{supp}(T) \) for otherwise \( x = x - y + y \in \text{supp}(T) + \text{supp}(\phi) \). Thus
\[ \text{supp}(\phi(x - \cdot)) = x - \text{supp}(\phi) \subset \mathbb{R}^n \setminus \text{supp}(T) \]
and hence \( h(x) = (T, \phi(x - \cdot)) = 0 \) for all \( x \in \mathbb{R}^n \setminus (\text{supp}(T) + \text{supp}(\phi)) \). This implies that \( \{h \neq 0\} \subset \text{supp}(T) + \text{supp}(\phi) \) and hence
\[ \text{supp}(h) = \{h \neq 0\} \subset \text{supp}(T) + \text{supp}(\phi). \]
As we have seen in the previous theorem, \( T * \phi \) is a smooth function and hence may be used to define a distribution in \( D'(\mathbb{R}^n) \) by
\[ \langle T * \phi, \psi \rangle = \int T * \phi(x) \psi(x) dx = \int \langle T, \phi(x - \cdot) \rangle \psi(x) dx. \]
Using the linearity of \( T \) we might expect that
\[ \int \langle T, \phi(x - \cdot) \rangle \psi(x) dx = \langle T, \int \phi(x - \cdot) \psi(x) dx \rangle \]
or equivalently that
\[ \langle T * \phi, \psi \rangle = \langle T, \tilde{\phi} * \psi \rangle \]
(37.10)
where \( \tilde{\phi}(x) := \phi(-x) \).

Theorem 37.4. Suppose that if \((T, \phi)\) is a distribution test function pair satisfying one the three condition in Theorem [37.3] then \( T * \phi \) as a distribution may be characterized by
\[ \langle T * \phi, \psi \rangle = \langle T, \tilde{\phi} * \psi \rangle \]
(37.11)
for all \( \psi \in D(\mathbb{R}^n) \). Moreover, if \( T \in \mathcal{S}' \) and \( \phi \in \mathcal{S} \) then Eq. (37.11) holds for all \( \psi \in \mathcal{S} \).

Proof. Let us first assume that \( T \in \mathcal{D}' \) and \( \phi, \psi \in \mathcal{D} \) and \( \theta \in \mathcal{D} \) be a function such that \( \theta = 1 \) on a neighborhood of the support of \( \psi \). Then
\[ \langle T * \phi, \psi \rangle = \int_{\mathbb{R}^n} \langle T, \phi(x - \cdot) \rangle \psi(x) dx = \langle \psi(x), (T(y), \phi(x - y)) \rangle \]
\[ = \langle \theta(x) \psi(x), (T(y), \phi(x - y)) \rangle \]
\[ = \langle \psi(x), \theta(x)(T(y), \phi(x - y)) \rangle \]
\[ = \langle \psi(x), (T(y), \theta(x)\phi(x - y)) \rangle \]
Now the function, \( \theta(x) \phi(x - y) \in D(\mathbb{R}^n \times \mathbb{R}^n) \), so we may apply Fubini’s theorem for distributions to conclude that
\[ \langle T * \phi, \psi \rangle = \langle \psi(x), (T(y), \theta(x)\phi(x - y)) \rangle \]
\[ = \langle \theta(x) \psi(x), (T(y), \phi(x - y)) \rangle \]
\[ = \langle \psi(x), \theta(x)(T(y), \phi(x - y)) \rangle \]
\[ = \langle \psi(x), (T(y), \theta(x)\phi(x - y)) \rangle \]
\[ = \langle \psi(x), (T(y), \psi \phi(y)) \rangle = \langle T, \psi \phi \rangle \]
as claimed. If \( T \in \mathcal{S}' \), let \( \alpha \in \mathcal{D}(\mathbb{R}^n) \) be a function such that \( \alpha = 1 \) on a neighborhood of \( \text{supp}(T) \), then working as above,
\[ \langle T * \phi, \psi \rangle = \langle \psi(x), (T(y), \theta(x)\phi(x - y)) \rangle \]
\[ = \langle \psi(x), (T(y), \theta(x)\phi(x - y)) \rangle \]
\[ = \langle \psi(x), (T(y), \alpha(y)\theta(x)\phi(x - y)) \rangle \]
and since \( \alpha(y)\theta(x)\phi(x - y) \in D(\mathbb{R}^n \times \mathbb{R}^n) \) we may apply Fubini’s theorem for distributions to conclude again that
\[ \langle T * \phi, \psi \rangle = \langle T(y), \langle \psi(x), (\alpha(y)\theta(x)\phi(x - y)) \rangle \rangle \]
\[ = \langle \alpha(y) T(y), \langle \theta(x) \psi(x), \phi(x - y) \rangle \rangle \]
\[ = \langle T(y), \langle \psi(x), \phi(x - y) \rangle \rangle = \langle T, \psi \phi \rangle. \]
Now suppose that \( T \in \mathcal{S}' \) and \( \phi, \psi \in \mathcal{S} \). Let \( \phi_n, \psi_n \in \mathcal{D} \) be a sequences such that \( \phi_n \to \phi \) and \( \psi_n \to \psi \) in \( \mathcal{S} \), then using arguments similar to those in the proof of Theorem [37.3] one shows
\[ \langle T * \phi, \psi \rangle = \lim_{n \to \infty} \langle T * \phi_n, \psi_n \rangle = \lim_{n \to \infty} \langle T, \psi_n * \tilde{\phi}_n \rangle = \langle T, \psi \phi \rangle. \]
\[ \blacksquare \]
**Theorem 37.5.** Let \(U \subset \mathbb{R}^n\), then \(\mathcal{D}(U)\) is sequentially dense in \(\mathcal{E}'(U)\). When \(U = \mathbb{R}^n\) we have \(\mathcal{E}'(\mathbb{R}^n)\) is a dense subspace of \(\mathcal{S}'(\mathbb{R}^n) \subset \mathcal{D}'(\mathbb{R}^n)\). Hence, we have the following inclusions,

\[\mathcal{D}(U) \subset \mathcal{E}'(U) \subset \mathcal{D}'(U),\]
\[\mathcal{D}(\mathbb{R}^n) \subset \mathcal{E}'(\mathbb{R}^n) \subset \mathcal{S}'(\mathbb{R}^n) \subset \mathcal{D}'(\mathbb{R}^n)\]
\[\mathcal{D}(\mathbb{R}^n) \subset \mathcal{S}(\mathbb{R}^n) \subset \mathcal{S}'(\mathbb{R}^n) \subset \mathcal{D}'(\mathbb{R}^n)\]

with all inclusions being dense in the next space up.

**Proof.** The key point is to show \(\mathcal{D}(U)\) is dense in \(\mathcal{E}'(U)\). Choose \(\theta \in C_c^\infty(\mathbb{R}^n)\) such that \(\text{supp}(\theta) \subset B(0,1)\), \(\theta = \theta\) and \(\int \theta(x)\,dx = 1\). Let \(\theta_m(x) = m^{-n}\theta(mx)\) so that \(\text{supp}(\theta_m) \subset B(0,1/m)\). An element in \(\mathcal{E}'(U)\) may be viewed as an element in \(\mathcal{E}'(\mathbb{R}^n)\) in a natural way. Namely if \(\chi \in C_c^\infty(U)\) such that \(\chi = 1\) on a neighborhood of \(\text{supp}(T)\), and \(\phi \in C_c^\infty(\mathbb{R}^n)\), let \((T,\phi) = (T,\chi\phi)\). Define \(T_m = T \ast \theta_m\). It is easily seen that \(\text{supp}(T_m) \subset \text{supp}(T) + B(0,1/m) \subset U\) for all \(m\) sufficiently large. Hence \(T_m \in \mathcal{D}(U)\) for large enough \(m\). Moreover, if \(\psi \in \mathcal{D}(U)\), then

\[\langle T_m, \psi \rangle = \langle T \ast \theta_m, \psi \rangle = \langle T, \theta_m \ast \psi \rangle = \langle T, \theta_m \ast \psi \rangle \rightarrow \langle T, \psi \rangle\]

since \(\theta_m \ast \psi \rightarrow \psi\) in \(\mathcal{D}(U)\) by standard arguments. If \(U = \mathbb{R}^n, T \in \mathcal{E}'(\mathbb{R}^n) \subset \mathcal{S}'(\mathbb{R}^n)\) and \(\psi \in \mathcal{S}\), the same argument goes through to show \((T_m, \psi) \rightarrow (T, \psi)\) provided we show \(\theta_m \ast \psi \rightarrow \psi\) in \(\mathcal{S}(\mathbb{R}^n)\) as \(m \rightarrow \infty\). This latter is proved by showing for all \(\alpha\) and \(t > 0\),

\[\|\mu_t(\partial^\alpha \theta_m \ast \psi - \partial^\alpha \psi)\|_\infty \rightarrow 0\] as \(m \rightarrow \infty\),

which is a consequence of the estimates:

\[|\partial^\alpha \theta_m \ast \psi(x) - \partial^\alpha \psi(x)| = |\theta_m \ast \partial^\alpha \psi(x) - \partial^\alpha \psi(x)|\]

\[\leq \left| \int \theta_m(y) [\partial^\alpha \psi(x-y) - \partial^\alpha \psi(x)] \,dy \right|\]

\[\leq \sup_{|y| \leq 1/m} |\partial^\alpha \psi(x-y) - \partial^\alpha \psi(x)|\]

\[\leq \frac{1}{m} \sup_{|y| \leq 1/m} |\nabla \partial^\alpha \psi(x-y)|\]

\[\leq \frac{1}{m} C \sup_{|y| \leq 1/m} \mu_{-\ell}(x-y)\]

\[\leq \frac{1}{m} C \sup_{|y| \leq 1/m} \mu_{-\ell}(x-y)\]

\[\leq \frac{1}{m} C \left(1 + m^{-1}\right)^\ell \mu_{-\ell}(x)\].

\[\square\]

**Definition 37.6 (Convolution of Distributions).** Suppose that \(T \in \mathcal{D}'\) and \(S \in \mathcal{E}'\), then define \(T \ast S \in \mathcal{D}'\) by

\[\langle T \ast S, \phi \rangle = \langle T, (S(y), \phi(x+y)) \rangle = \langle S(y), (T(x), \phi(x+y)) \rangle\]

where \(\phi_+(x,y) = \phi(x+y)\) for all \(x,y \in \mathbb{R}^n\). More generally we may define \(T \ast S\) for any two distributions having the property that \(\text{supp}(T \otimes S) \cap \text{supp}(\phi_+) = \text{supp}(T) \times \text{supp}(S) \cap \text{supp}(\phi_+)\) is compact for all \(\phi \in \mathcal{D}\).

**Proposition 37.7.** Suppose that \(T \in \mathcal{D}'\) and \(S \in \mathcal{E}'\) then \(T \ast S\) is well defined and

\[\langle T \ast S, \phi \rangle = \langle T(x), (S(y), \phi(x+y)) \rangle = \langle S(y), (T(x), \phi(x+y)) \rangle\]

Moreover, if \(T \in \mathcal{S}'\) then \(T \ast S \in \mathcal{S}'\) and \(\mathcal{F}(T \ast S) = \mathcal{F}T \ast \mathcal{F}S\). Recall from Remark \[36.46\] that \(S \in \mathcal{P}\) so that \(\mathcal{F}T \ast \mathcal{F}S\).

**Proof.** Let \(\theta \in \mathcal{D}\) be a function such that \(\theta = 1\) on a neighborhood of \(\text{supp}(S)\), then by Fubini’s theorem for distributions,

\[\langle T \otimes S, \phi_+ \rangle = \langle T \otimes S(x,y), \theta(y)\phi(x+y) \rangle = \langle T(x)S(y), \theta(y)\phi(x+y) \rangle\]

\[= \langle T(x), (S(y), \theta(y)\phi(x+y)) \rangle = \langle T(x), (S(y), \phi(x+y)) \rangle\]

and

\[\langle T \otimes S, \phi_+ \rangle = \langle T(x)S(y), \theta(y)\phi(x+y) \rangle = \langle S(y), (T(x), \theta(y)\phi(x+y)) \rangle\]

\[= \langle S(y), \theta(y)\langle T(x), \phi(x+y) \rangle \rangle \rangle = \langle S(y), \langle T(x), \phi(x+y) \rangle \rangle\]

proving Eq. (37.12). Suppose that \(T \in \mathcal{S}'\), then

\[|\langle T \ast S, \phi \rangle | = |\langle T(x), (S(y), \phi(x+y)) \rangle | \leq C \sum_{|\alpha| \leq m} \|\mu_m \partial^\alpha \langle S(y), \phi(\cdot+y) \rangle \|_\infty\]

\[= C \sum_{|\alpha| \leq m} \|\mu_m \langle S(y), \partial^\alpha \phi(\cdot+y) \rangle \|_\infty\]

and

\[\langle S(y), \partial^\alpha \phi(x+y) \rangle | \leq C \sum_{|\beta| \leq p} \sup_{y \in K} \|\partial^\beta \partial^\alpha \phi(x+y) \|

\[\leq C \mu_{m+p}(\phi) \sup_{y \in K} \|\mu_{-m-p}(x+y) \|

\[\leq C \mu_{m+p}(\phi) \mu_{-m-p}(x+y) \sup_{y \in K} \mu_{m+p}(y)\]

\[= \tilde{C} \mu_{-m-p}(x)p_{m+p}(\phi)\].
Combining the last two displayed equations shows

\[ |\langle T \ast S, \phi \rangle| \leq Cp_{m+p}(\phi) \]

which shows that \( T \ast S \in S' \). We still should check that

\[ \langle T \ast S, \phi \rangle = \langle T(x), \langle S(y), \phi(x+y) \rangle \rangle = \langle S(y), \langle T(x), \phi(x+y) \rangle \rangle \]

still holds for all \( \phi \in S \). This is a matter of showing that all of the expressions are continuous in \( S \) when restricted to \( D \). Explicitly, let \( \phi_m \in D \) be a sequence of functions such that \( \phi_m \to \phi \) in \( S \), then

\[ \langle T \ast S, \phi \rangle = \lim_{n \to \infty} \langle T \ast S, \phi_n \rangle = \lim_{n \to \infty} \langle T(x), \langle S(y), \phi_n(x+y) \rangle \rangle \]

and

\[ \langle T \ast S, \phi \rangle = \lim_{n \to \infty} \langle T \ast S, \phi_n \rangle = \lim_{n \to \infty} \langle S(y), \langle T(x), \phi_n(x+y) \rangle \rangle \].

(37.14)

So it suffices to show the map \( \phi \in S \to \langle S(y), \phi(\cdot+y) \rangle \in S \) is continuous and \( \phi \in S \to \langle T(x), \phi(x+\cdot) \rangle \in C^\infty(\mathbb{R}^n) \) are continuous maps. These may verified by methods similar to what we have been doing, so I will leave the details to the reader. Given these continuity assertions, we may pass to the limits in Eq. (37.13) and (37.14) to learn

\[ \langle T \ast S, \phi \rangle = \langle T(x), \langle S(y), \phi(x+y) \rangle \rangle = \langle S(y), \langle T(x), \phi(x+y) \rangle \rangle \]

still holds for all \( \phi \in S \). The last and most important point is to show \( \mathcal{F}(T \ast S) = \hat{ST} \). Using

\[ \hat{\phi}(x+y) = \int_{\mathbb{R}^n} \phi(\xi)e^{-i\xi \cdot (x+y)}d\xi = \int_{\mathbb{R}^n} \phi(\xi)e^{-i\xi \cdot y}e^{-i\xi \cdot x}d\xi \]

and the definition of \( \mathcal{F} \) on \( S' \) we learn

\[ \langle \mathcal{F}(T \ast S), \phi \rangle = \langle T \ast S, \hat{\phi} \rangle = \langle S(y), \langle T(x), \hat{\phi}(x+y) \rangle \rangle \]

\[ = \langle S(y), \langle T(x), \mathcal{F}(\hat{\phi}(\xi)e^{-i\xi \cdot y}) \rangle \rangle \]

\[ = \langle S(y), \langle \hat{T}(\xi), \phi(\xi)e^{-i\xi \cdot y} \rangle \rangle \].

(37.15)

Let \( \theta \in D \) be a function such that \( \theta = 1 \) on a neighborhood of \( \text{supp}(S) \) and assume \( \phi \in D \) for the moment. Then from Eq. (37.15) and Fubini's theorem for distributions we find

\[ \langle \mathcal{F}(T \ast S), \phi \rangle = \langle S(y), \theta(y)\langle \hat{T}(\xi), \phi(\xi)e^{-i\xi \cdot y} \rangle \rangle \]

\[ = \langle S(y), \langle \hat{T}(\xi), \phi(\xi)\theta(y)e^{-i\xi \cdot y} \rangle \rangle \]

\[ = \langle \hat{T}(\xi), \langle S(y), \phi(\xi)\theta(y)e^{-i\xi \cdot y} \rangle \rangle \]

\[ = \langle \hat{T}(\xi), \phi(\xi)\langle S(y), e^{-i\xi \cdot y} \rangle \rangle \]

\[ = \langle \hat{T}(\xi), \phi(\xi)\hat{S}(\xi) \rangle = \langle \hat{S}(\xi)\hat{T}(\xi), \phi(\xi) \rangle \].

(37.16)

Since \( \mathcal{F}(T \ast S) \in S' \) and \( \hat{ST} \in S' \), we conclude that Eq. (37.16) holds for all \( \phi \in S \) and hence \( \mathcal{F}(T \ast S) = \hat{ST} \) as was to be proved.

37.2 Elliptic Regularity

Theorem 37.8 (Hypoellipticity). Suppose that \( p(x) = \sum_{|\alpha| \leq m} a_\alpha x^\alpha \) is a polynomial on \( \mathbb{R}^n \) and \( L \) is the constant coefficient differential operator

\[ L = p(\frac{i}{\partial}) = \sum_{|\alpha| \leq m} a_\alpha (\frac{i}{\partial})^\alpha = \sum_{|\alpha| \leq m} a_\alpha (-i\partial)^\alpha. \]

Also assume there exists a distribution \( T \in \mathcal{D}'(\mathbb{R}^n) \) such that \( R := \delta - LT \in C^\infty(\mathbb{R}^n) \) and \( T|_{\mathbb{R}^n \setminus \{0\}} \in C^\infty(\mathbb{R}^n \setminus \{0\}) \). Then if \( v \in C^\infty(U) \) and \( u \in \mathcal{D}'(U) \) solves \( Lu = v \) then \( u \in C^\infty(U) \). In particular, all solutions \( u \) to the equation \( Lu = 0 \) are smooth.

Proof. We must show for each \( x_0 \in U \) that \( u \) is smooth on a neighborhood of \( x_0 \). So let \( x_0 \in U \) and \( \theta \in \mathcal{D}(U) \) such that \( 0 \leq \theta \leq 1 \) and \( \theta = 1 \) on neighborhood \( V \) of \( x_0 \). Also pick \( \alpha \in \mathcal{D}(V) \) such that \( 0 \leq \alpha \leq 1 \) and \( \alpha = 1 \) on a neighborhood of \( x_0 \). Then

\[ \theta u = \delta \ast (\theta u) = (LT + R) \ast (\theta u) = (LT) \ast (\theta u) + R \ast (\theta u) \]

\[ = T \ast L(\theta u) + R \ast (\theta u) \]

\[ = T \ast \{\alpha L(\theta u) + (1 - \alpha)L(\theta u)\} + R \ast (\theta u) \]

\[ = T \ast \{\alpha Lu + (1 - \alpha)L(\theta u)\} + R \ast (\theta u) \]

\[ = T \ast (\alpha u + R \ast (\theta u) + T \ast [(1 - \alpha)L(\theta u)] \].

Since \( \alpha \theta \in \mathcal{D}(U) \) and \( T \in \mathcal{D}'(\mathbb{R}^n) \) it follows that \( R \ast (\theta u) \in C^\infty(\mathbb{R}^n) \). Also since \( R \in C^\infty(\mathbb{R}^n) \) and \( \theta u \in \mathcal{E}'(U) \), \( R \ast (\theta u) \in C^\infty(\mathbb{R}^n) \). So to show \( \theta u \), and hence \( u \), is smooth near \( x_0 \) it suffices to show \( T \ast g \) is smooth near \( x_0 \) where \( g := (1 - \alpha)\mathcal{L}(\theta u) \). Working formally for the moment,

\[ T \ast g(x) = \int_{\mathbb{R}^n} T(x-y)g(y)dy = \int_{\mathbb{R}^n \setminus \{x_0\}} T(x-y)g(y)dy \]
which should be smooth for $x$ near $x_0$ since in this case $x - y \neq 0$ when $g(y) \neq 0$. To make this precise, let $\delta > 0$ be chosen so that $\alpha = 1$ on a neighborhood of $B(x_0, \delta)$ so that $\text{supp}(g) \subset B(x_0, \delta)$. For $\phi \in D(B(x_0, \delta/2)$,

$$(T \ast g, \phi) = \langle T(x), (g(y), \phi(x + y)) \rangle = \langle T, h \rangle$$

where $h(x) := \langle g(y), \phi(x + y) \rangle$. If $|x| \leq \delta/2$

$\text{supp}(\phi(x + \cdot)) = \text{supp}(\phi) - x \subset B(x_0, \delta/2) - x \subset B(x_0, \delta)$

so that $h(x) = 0$ and hence $\text{supp}(h) \subset B(x_0, \delta/2)^c$. Hence if we let $\gamma \in D(B(0, \delta/2))$ be a function such that $\gamma = 1$ near 0, we have $\gamma h \equiv 0$, and thus

$$(T \ast g, \phi) = \langle T, h \rangle = \langle T, h - \gamma h \rangle = \langle (1 - \gamma)T, h \rangle = \langle (1 - \gamma)T \ast g, \phi \rangle.$$

Since this last equation is true for all $\phi \in D(B(x_0, \delta/2))$, $T \ast g = [(1 - \gamma)T] \ast g$ on $B(x_0, \delta/2)$ and this finishes the proof since $[(1 - \gamma)T] \ast g \in C^\infty(\mathbb{R}^n)$ because $(1 - \gamma)T \in C^\infty(\mathbb{R}^n)$.

**Definition 37.9.** Suppose that $p(x) = \sum_{|\alpha| \leq m} a_\alpha \xi^\alpha$ is a polynomial on $\mathbb{R}^n$ and $L$ is the constant coefficient differential operator

$$L = p(\frac{1}{i} \partial) = \sum_{|\alpha| \leq m} a_\alpha (\frac{1}{i} \partial)^\alpha = \sum_{|\alpha| \leq m} a_\alpha (-i \partial)^\alpha.$$

Let $\sigma_p(L)(\xi) := \sum_{|\alpha| = m} a_\alpha \xi^\alpha$ and call $\sigma_p(L)$ the principle symbol of $L$. The operator $L$ is said to be elliptic provided that $\sigma_p(L)(\xi) \neq 0$ if $\xi \neq 0$.

**Theorem 37.10 (Existence of Parametrix).** Suppose that $L = p(\frac{1}{i} \partial)$ is an elliptic constant coefficient differential operator, then there exists a distribution $T \in D'(\mathbb{R}^n)$ such that $R := \delta - LT \in C^\infty(\mathbb{R}^n)$ and $T|_{\mathbb{R}^n \setminus \{0\}} \in C^\infty(\mathbb{R}^n \setminus \{0\})$.

**Proof.** The idea is to try to find $T$ such that $LT = \delta$. Taking the Fourier transform of this equation implies that $\hat{p}(\xi)\hat{T}(\xi) = 1$ and hence we should try to define $\hat{T}(\xi) = 1/p(\xi)$. The main problem with this definition is that $p(\xi)$ may have zeros. However, these zeros cannot occur for large $\xi$ by the ellipticity assumption. Indeed, let $q(\xi) := \sigma_p(L)(\xi) = \sum_{|\alpha| = m} a_\alpha \xi^\alpha$, $r(\xi) = p(\xi) - q(\xi) = \sum_{|\alpha| < m} a_\alpha \xi^\alpha$ and let $c = \min \{|q(\xi)| : |\xi| = 1\} \leq \max \{|q(\xi)| : |\xi| = 1\} =: C$. Then because $|q(\xi)|$ is a nowhere vanishing continuous function on the compact set $S := \{\xi \in \mathbb{R}^n : |\xi| = 1\}$, $0 < c \leq C < \infty$. For $\xi \in \mathbb{R}^n$, let $\xi = \xi/|\xi|$ and notice

$$|p(\xi)| = |q(\xi)| - |r(\xi)| \geq c|\xi|^m - |r(\xi)| = |\xi|^m (c - \frac{|r(\xi)|}{|\xi|^m}) > 0$$

for all $|\xi| \geq M$ with $M$ sufficiently large since $\lim_{|\xi| \to \infty} \frac{|r(\xi)|}{|\xi|^m} = 0$. Choose $\theta \in D(\mathbb{R}^n)$ such that $\theta = 1$ on a neighborhood of $B(0, M)$ and let

$$h(\xi) = \frac{1 - \theta(\xi)}{p(\xi)} = \frac{\beta(\xi)}{p(\xi)} \in C^\infty(\mathbb{R}^n)$$

where $\beta = 1 - \theta$. Since $h(\xi)$ is bounded (in fact $\lim_{|\xi| \to \infty} h(\xi) = 0$, $h \in S'(\mathbb{R}^n)$) so there exists $T := F^{-1} h \in S'(\mathbb{R}^n)$ is well defined. Moreover,

$$F(\delta - LT) = 1 - p(\xi)h(\xi) = 1 - \beta(\xi) = \theta(\xi) \in D(\mathbb{R}^n)$$

which shows that

$$R := \delta - LT \in S'(\mathbb{R}^n) \subset C^\infty(\mathbb{R}^n).$$

So to finish the proof it suffices to show

$$T|_{\mathbb{R}^n \setminus \{0\}} \in C^\infty(\mathbb{R}^n \setminus \{0\}).$$

To prove this recall that

$$F(x^\alpha T) = (i\partial)^\alpha T = (i\partial)^\alpha h.$$

By the chain rule and the fact that any derivative of $\beta$ is has compact support in $B(0, M)$ and any derivative of $\frac{1}{p}$ is non-zero on this set,

$$\partial^\alpha h = \beta \partial^\alpha \frac{1}{p} + r_\alpha$$

where $r_\alpha \in D(\mathbb{R}^n)$. Moreover,

$$\partial_i \frac{1}{p} = -\frac{\partial p}{p^2} \text{ and } \partial_j \partial_i \frac{1}{p} = -\frac{\partial p}{p^2} + \frac{\partial^2 p}{p^3} + 2 \frac{\partial p}{p^3}$$

from which it follows that

$$|\beta(\xi)\partial_i \frac{1}{p}(\xi)| \leq C |\xi|^{-(m+1)} \text{ and } |\beta(\xi)\partial_j \partial_i \frac{1}{p}(\xi)| \leq C |\xi|^{-(m+2)}.$$}

More generally, one shows by inductively that

$$|\beta(\xi)\partial^\alpha \frac{1}{p}(\xi)| \leq C |\xi|^{-(m+|\alpha|)}.$$  \hspace{1cm} (37.17)

In particular, if $k \in \mathbb{N}$ is given and $\alpha$ is chosen so that $|\alpha| + m > n + k$, then $|\xi|^k \partial^\alpha h(\xi) \in L^1(\xi)$ and therefore

$$x^\alpha T = F^{-1} [(i\partial)^\alpha h] \in C^k(\mathbb{R}^n).$$
This indeed turns out to be the case but is a bit painful to prove. The next

Here is the induction argument that proves Eq. (37.17). Let \( q_\alpha := \frac{p^{\alpha+1}}{p^{\alpha+1}} \partial p^\alpha \) p \(-\alpha \) with \( q_0 = 1 \), then

so that

It follows by induction that \( q_\alpha \) is a polynomial in \( \xi \) and letting \( d_{\alpha} := \text{deg}(q_\alpha) \), we have \( d_{\alpha + \epsilon} \leq d_\alpha + m - 1 \) with \( d_0 = 1 \). Again by induction this implies \( d_\alpha \leq |\alpha| (m - 1) \). Therefore

as claimed in Eq. (37.17).

*** Beginning of WORK material. ***

### 37.3 Appendix: Old Proof of Theorem 37.4

This indeed turns out to be the case but is a bit painful to prove. The next theorem is the key ingredient to proving Eq. (37.10).

**Theorem 37.11.** Let \( \psi \in D \ (\psi \in \mathcal{S}) \ d\lambda(y) = \psi(y)dy \), and \( \phi \in C^\infty(\mathbb{R}^n) \ (\phi \in \mathcal{S}) \). For \( \varepsilon > 0 \) we may write \( \mathbb{R}^n = \bigcup_{m \in \mathbb{Z}^n} (m + \varepsilon \mathbb{Q}) \) where \( Q = (0,1]^n \). For \( y \in (m + \varepsilon \mathbb{Q}) \), let \( y_\varepsilon \in m + \varepsilon \mathbb{Q} \) be the point closest to the origin in \( m + \varepsilon \mathbb{Q} \). (This will be one of the corners of the translated cube.) In this way we define a function \( y \in \mathbb{R}^n \rightarrow y_\varepsilon \in \mathbb{Z}^n \) which is constant on each cube \( \varepsilon (m + Q) \). Let

\[
F_\varepsilon(x) := \int \phi(x - y_\varepsilon) d\lambda(y) = \sum_{m \in \mathbb{Z}^n} \phi(x - (m + \varepsilon)) \lambda(\varepsilon (m + Q)),
\]

then the above sum converges in \( C^\infty(\mathbb{R}^n) \) (\( S \)) and \( F_\varepsilon \rightarrow \phi \ast \psi \) in \( C^\infty(\mathbb{R}^n) \) (\( S \)) as \( \varepsilon \downarrow 0 \). (In particular if \( \phi, \psi \in \mathcal{S} \) then \( \phi \ast \psi \in \mathcal{S} \).)

**Proof.** First suppose that \( \psi \in D \) the measure \( \lambda \) has compact support and hence the sum in Eq. (37.18) is finite and so is certainly convergent in \( C^\infty(\mathbb{R}^n) \). To show \( F_\varepsilon \rightarrow \phi \ast \psi \) in \( C^\infty(\mathbb{R}^n) \), let \( K \) be a compact set and \( m \in \mathbb{N} \). Then for \( |\alpha| \leq m \),

\[
|\partial^\alpha F_\varepsilon(x) - \partial^\alpha \phi \ast \psi(x)| = \left| \int [\partial^\alpha \phi(x - y_\varepsilon) - \partial^\alpha \phi(x - y)] d\lambda(y) \right| \leq \int |\partial^\alpha \phi(x - y_\varepsilon) - \partial^\alpha \phi(x - y)| |\psi(y)| dy
\]

and therefore,

\[
\|\partial^\alpha F_\varepsilon - \partial^\alpha \phi \ast \psi\|_{\infty,K} \leq \int \|\partial^\alpha \phi(-y_\varepsilon) - \partial^\alpha \phi(-y)\|_{\infty,K} |\psi(y)| dy
\]

\[
\leq \sup_{y \in \text{supp}(\psi)} \|\partial^\alpha \phi(-y_\varepsilon) - \partial^\alpha \phi(-y)\|_{\infty,K} \int |\psi(y)| dy.
\]

Since \( \psi(y) \) has compact support, we may use the uniform continuity of \( \partial^\alpha \phi \) on compact sets to conclude

\[
\sup_{y \in \text{supp}(\psi)} \|\partial^\alpha \phi(-y_\varepsilon) - \partial^\alpha \phi(-y)\|_{\infty,K} \rightarrow 0 \quad \text{as} \quad \varepsilon \downarrow 0.
\]

This finishes the proof for \( \psi \in D \) and \( \phi \in C^\infty(\mathbb{R}^n) \). Now suppose that both \( \psi \) and \( \phi \) are in \( \mathcal{S} \) in which case the sum in Eq. (37.18) is now an infinite sum in general so we need to check that it converges to an element in \( \mathcal{S} \). For this we estimate each term in the sum. Given \( s, t > 0 \) and a multi-index \( \alpha \), using Peetre’s inequality and simple estimates,

\[
|\partial^\alpha \phi(x - (m + \varepsilon))\lambda(\varepsilon (m + Q))| \leq C_{\nu,s}(x - (m + \varepsilon)) \int_{\varepsilon (m + Q)} |\psi(y)| dy
\]

\[
\leq C_{\nu,s}(x) \nu_s((m + \varepsilon)) K \int_{\varepsilon (m + Q)} \nu_s(y) dy
\]

for some finite constants \( K \) and \( C \). Making the change of variables \( y = m + \varepsilon z \), we find

\[
\int_{\varepsilon (m + Q)} \nu_s(y) dy = \varepsilon^n \int_{Q} \nu_s(m + \varepsilon z) dz
\]

\[
\leq \varepsilon^n \nu_s(m) \int_{Q} \nu_s(z) dz
\]

\[
= \varepsilon^n \nu_s(m) \int_{Q} \frac{1}{(1 + \varepsilon |z|)^s} dy
\]

\[
\leq \varepsilon^n \nu_s(m).
\]

Combining these two estimates shows

\[
\|\partial^\alpha \phi \ast (m + \varepsilon)\lambda(\varepsilon (m + Q))\|_{\infty} \leq C_{\nu,s}(m + \varepsilon) \varepsilon^n \nu_s(m + \varepsilon)
\]

\[
\leq C_{\nu,s}(m) \nu_s(m) \varepsilon^n
\]

\[
= C_{\nu,s}(m + \varepsilon) \varepsilon^n
\]
and therefore for some (different constant $C$)

$$\sum_{m \in \mathbb{Z}^n} p_k (\phi(c - (m \varepsilon) \varepsilon) \lambda(\varepsilon(m + Q))) \leq \sum_{m \in \mathbb{Z}^n} C \nu_{k-s}(m \varepsilon) \varepsilon^n$$

$$= \sum_{m \in \mathbb{Z}^n} C \frac{1}{(1 + \varepsilon |m|)^{k-s} \varepsilon^n}$$

which can be made finite by taking $s > k + n$ as can be seen by an comparison with the integral $\int (1 + \varepsilon x)^k dx$. Therefore the sum is convergent in $S$ as claimed. To finish the proof, we must show that $F_{\varepsilon} \to \phi \ast \psi$ in $S$. From Eq. (37.19) we still have

$$|\partial^s F_{\varepsilon}(x) - \partial^s \phi \ast \psi(x)| \leq \int |\partial^s \phi(x - y_{\varepsilon}) - \partial^s \phi(x - y)| |\psi(y)| dy.$$  

The estimate in Eq. (37.9) gives

$$|\partial^s \phi(x - y_{\varepsilon}) - \partial^s \phi(x - y)| \leq C \int_0^1 \nu_M(y_{\varepsilon} + \tau(y - y_{\varepsilon})) d\tau |y - y_{\varepsilon}| \nu_{-M}(x)$$

$$\leq C \varepsilon \nu_{-M}(x) \int_0^1 \nu_M(y_{\varepsilon} + \tau(y - y_{\varepsilon})) d\tau$$

$$\leq C \varepsilon \nu_{-M}(x) \int_0^1 \nu_M(y) d\tau = C \varepsilon \nu_{-M}(x) \nu_M(y)$$

where in the last inequality we have used the fact that $|y_{\varepsilon} + \tau(y - y_{\varepsilon})| \leq |y|$. Therefore,

$$\|\nu_M (\partial^s F_{\varepsilon}(x) - \partial^s \phi \ast \psi)\|_2 \leq C \varepsilon \int_{\mathbb{R}^n} \nu_M(y) |\psi(y)| dy \to 0 \text{ as } \varepsilon \to \infty$$

because $\int_{\mathbb{R}^n} \nu_M(y) |\psi(y)| dy < \infty$ for all $M < \infty$ since $\psi \in S$.

We are now in a position to prove Eq. (37.10). Let us state this in the form of a theorem.

**Theorem 37.12.** Suppose that if $(T, \phi)$ is a distribution test function pair satisfying one the three condition in Theorem 37.3 then $T \ast \phi$ as a distribution may be characterized by

$$\langle T \ast \phi, \psi \rangle = \langle T, \tilde{\phi} \ast \psi \rangle$$

(37.20)

for all $\psi \in D(\mathbb{R}^n)$ and all $\psi \in S$ when $T \in S'$ and $\phi \in S$.  

**Proof.** Let

$$\tilde{F}_{\varepsilon} = \int \tilde{\phi}(x - y_{\varepsilon}) d\lambda(y) = \sum_{m \in \mathbb{Z}^n} \tilde{\phi}(x - (m \varepsilon) \varepsilon) \lambda(\varepsilon(m + Q))$$

then making use of Theorem 37.12 in all cases we find

$$\langle T, \tilde{\phi} \ast \psi \rangle = \lim_{\varepsilon \downarrow 0} \langle T, \tilde{F}_{\varepsilon} \rangle$$

$$= \lim_{\varepsilon \downarrow 0} \langle T(x), \sum_{m \in \mathbb{Z}^n} \tilde{\phi}(x - (m \varepsilon) \varepsilon) \lambda(\varepsilon(m + Q)) \rangle$$

$$= \lim_{\varepsilon \downarrow 0} \sum_{m \in \mathbb{Z}^n} \langle T(x), \phi((m \varepsilon) \varepsilon - x) \lambda(\varepsilon(m + Q)) \rangle$$

$$= \lim_{\varepsilon \downarrow 0} \sum_{m \in \mathbb{Z}^n} \langle T \ast \phi((m \varepsilon) \varepsilon) \lambda(\varepsilon(m + Q)) \rangle.$$  

(37.21)

To compute this last limit, let $h(x) = T \ast \phi(x)$ and let us do the hard case where $T \in S'$. In this case we know that $h \in \mathcal{P}$, and in particular there exists $k < \infty$ and $C < \infty$ such that $|\nu_k h|_\infty < \infty$. So we have

$$\left| \int_{\mathbb{R}^n} h(x) d\lambda(x) - \sum_{m \in \mathbb{Z}^n} \langle T \ast \phi((m \varepsilon) \varepsilon) \lambda(\varepsilon(m + Q)) \rangle \right|$$

$$= \left| \int_{\mathbb{R}^n} [h(x) - h(x_{\varepsilon})] d\lambda(x) \right|$$

$$\leq \int_{\mathbb{R}^n} |h(x) - h(x_{\varepsilon})||\psi(x)| dx.$$  

Now

$$|h(x) - h(x_{\varepsilon})| \leq C \nu_k(x) + \nu_k(x_{\varepsilon}) \leq 2C \nu_k(x)$$

and since $\nu_k |\psi| \in L^1$ we may use the dominated convergence theorem to conclude

$$\lim_{\varepsilon \downarrow 0} \left| \int_{\mathbb{R}^n} h(x) d\lambda(x) - \sum_{m \in \mathbb{Z}^n} \langle T \ast \phi((m \varepsilon) \varepsilon) \lambda(\varepsilon(m + Q)) \rangle \right| = 0$$

which combined with Eq. (37.21) proves the theorem.  

**\square**
Part IX

Functional Analysis
Polar Decomposition of an Operator

**Definition 38.1.** An operator \( A \in B(H) \) is said to be **positive** (more precisely, **non-negative**) if \( A^* = A \) and \((x, Ax) \geq 0\) for all \( x \in H \). We say \( A \) is strictly **positive** if \( A \) is positive and \((x, Ax) = 0\) iff \( x = 0 \). If \( A, B \in B(H) \) are two self-adjoint operators, we write \( A \leq B \) if \( B - A \geq 0 \).

**Remark 38.2.** If \( A, B \in B(H) \) are two self-adjoint operators then \( A \leq B \) iff \((x, Ax) \leq (x, Bx)\) for all \( x \in H \).

**Lemma 38.3.** Suppose \( A \in B(H) \) is a positive operator, then

1. \( \text{Nul}(A) = \{ x \in H : (x, Ax) = 0 \} \).
2. \( \text{Nul}(A) = \text{Nul}(A^2) \).
3. If \( A, B \in B(H) \) are two positive operators then \( \text{Nul}(A + B) = \text{Nul}(A) \cap \text{Nul}(B) \).

**Proof.** Items 2. and 3. are fairly easy and will be left to the reader. To prove Item 1., it suffices to show \( \{ x \in H : (x, Ax) = 0 \} \subset \text{Nul}(A) \) since the reverse inclusion is trivial. For sake of contradiction suppose there exists \( x \neq 0 \) such that \( y = Ax \neq 0 \) and \((x, Ax) = 0\). Using \( x \perp y \), we have for \( \lambda \in \mathbb{R} \) that

\[
((x + \lambda y), A(x + \lambda y)) = (x + \lambda y, A(y + \lambda Ay) = (x, Ay) + \lambda \|y\|^2 + \lambda^2(Ay, y)
\]

\[
= \lambda(Ax, y) + \lambda \|y\|^2 + \lambda^2(Ay, y) = 2\lambda \|y\|^2 + \lambda^2(Ay, y)
\]

and therefore \((x + \lambda y), A(x + \lambda y)) < 0\) for all \( \lambda < 0 \) sufficiently close to zero. But this contradicts the positivity of \( A \).

The next few results are taken from Reed and Simon [22], see Theorem VI.9 on p. 196 and problems 14 and 15 on p. 217 of [22].

**Proposition 38.4 (Square Roots).** Suppose \( A \in L(H) \) and \( A \geq 0 \). Then there exist a unique \( B \in L(H) \) such that \( B \geq 0 \) and \( B^2 = A \). Moreover, if \( C \in L(H) \) commutes with \( A \) then \( C \) commutes with \( B \) as well. (We write \( \sqrt{A} \) for \( B \) and call \( B \) the **square root** of \( A \).)

**Proof.** Existence of \( B \). By replacing \( A \) by \( A/\|A\| \) we may assume \( \|A\| \leq 1 \). Letting \( T = I - A \) and \( x \in H \) we have \((x, Tx) = \|x\|^2 - (Ax, x)\) from which it follows that \( \|x\|^2 \geq (x, Tx) \geq \|x\|^2 - \|A\| \|x\|^2 \geq 0 \).

Hence \( T \in B(H) \), \( 0 \leq T \leq I \), \( A = I - T \) and \( \|T\| \leq 1 \) by Theorem 29.8. Recall from Exercise 4.9 that there are \( c_i > 0 \) such that \( \sum_{i=1}^{\infty} c_i = 1 \).

\[
\sqrt{1 - x} = 1 - \sum_{i=1}^{\infty} c_i x^i \quad \text{for all } |x| \leq 1.
\]

(38.1)

Hence let

\[
\sqrt{A} = \sqrt{I - T} := I - \sum_{i=1}^{\infty} c_i T^i
\]

where the sum is convergent in \( B(H) \). Since

\[
1 \leq \|T\| \leq \|T^n\| \leq \|T\|^n \|x\|^2 \leq \|x\|^2,
\]

\[
(x, \sqrt{A} x) = \|x\|^2 - \sum_{i=1}^{\infty} c_i (x, T^i x) \geq \|x\|^2 \left( 1 - \sum_{i=1}^{\infty} c_i \right) = 0
\]

which shows \( \sqrt{A} \geq 0 \). Similarly, since \( (x, T^2 x) = (T^i x, T^i x) \geq 0 \) and \( (x, T^2 x) = (T^i x, TT^i x) \geq 0 \) for all \( i \) it follows that

\[
(x, \sqrt{A} x) = \|x\|^2 - \sum_{i=1}^{\infty} c_i (x, T^i x) \leq \|x\|^2
\]

so that \( 0 \leq \sqrt{A} \leq I \). Letting \( c_0 = -1 \) and squaring the identity in Eq. (38.1) shows

\[
1 - x = \left( - \sum_{i=0}^{\infty} c_i x^i \right)^2 = \sum_{i,j=0}^{\infty} c_i c_j x^{i+j} = \sum_{k=0}^{\infty} \left( \sum_{i+j=k} c_i c_j \right) x^k
\]

where the sums are absolutely and uniformly convergent for \( |x| \leq 1 \). From this we conclude that

\[
\left( \sum_{i+j=k} c_i c_j \right) = \begin{cases} 
1 & \text{if } k = 0 \\
-1 & \text{if } k = 1 \\
0 & \text{otherwise.}
\end{cases}
\]
Hence
\[
(\sqrt{A})^2 = \left( -\sum_{i=0}^{\infty} c_i T^i \right)^2 = \sum_{i,j=0}^{\infty} c_i c_j T^{i+j} = \sum_{k=0}^{\infty} \left( \sum_{i+j=k} c_i c_j \right) T^k = I - T = A
\]
as desired and \( \sqrt{A} \) commutes with any operator commuting with \( A \). **Uniqueness.** Suppose \( B \geq 0 \) and \( B^2 = A \). Then \([B,A] = [B,B^2] = 0\) and \([B,\sqrt{A}] = 0\). Therefore,
\[
0 = B^2 - (\sqrt{A})^2 = (B - \sqrt{A})(B + \sqrt{A})
\]
from which it follows \((B - \sqrt{A}) = 0\) on \( \operatorname{Ran}(C) \) where \( C := B + \sqrt{A} \). Using Lemma 38.3
\[
\operatorname{Ran}(C)^\perp = \operatorname{Nul}(C^*) = \operatorname{Nul}(B) \cap \operatorname{Nul}(\sqrt{A})
\]
and hence \( B - \sqrt{A} = 0 \) on \( \operatorname{Ran}(C)^\perp \). Therefore \( B - \sqrt{A} = 0 \) on \( \operatorname{Ran}(C) \perp \operatorname{Ran}(C)^\perp = H \) and this completes the proof.

**Second proof of uniqueness.** This proof is more algebraic and avoids using Lemma 38.3. As before,
\[
0 = [C^2 - B^2] (C - B) = (C - B) (C + B) (C - B)
= (C - B) C - (C - B) B (C - B)
\]
and since both terms in the last line of this equation are positive it follows that each term individually is zero, see Theorem 29.8 Subtracting these two terms then shows \((C - B)^3 = 0\) which implies \((C - B)^i = 0\). This completes the proof since, by Proposition 16.16 \( \|C - B\|^4 = \|(C - B)^4\| = 0 \).

**Remark 38.5.** Other constructions of square roots may be given as well. For example see the Spectral Theorem 40.66 below or by the quadratic form methods used in the proof of von Neumann’s theorem, see Corollary ?? below. This later method is perhaps the best.

**Definition 38.6.** The **absolute value** of an operator \( A \in L(H,B) \) is defined to be
\[
|A| := \sqrt{A^* A} \in L(H).
\]

**Proposition 38.7 (Properties of the Square Root).** Suppose that \( A_n \) and \( A \) are positive operators on \( H \) and \( \|A - A_n\|_{B(H)} \to 0 \) as \( n \to \infty \), then \( \sqrt{A_n} \to \sqrt{A} \) in \( B(H) \) also. Moreover, \( A_n \) and \( A \) are general bounded operators on \( H \) and \( A_n \to A \) in the operator norm then \( |A_n| \to |A| \).

**Proof.** With out loss of generality, assume that \( \|A_n\| \leq 1 \) for all \( n \). This implies also that \( \|A\| \leq 1 \). Then
\[
\sqrt{A} - \sqrt{A_n} = \sum_{i=1}^{\infty} c_i \{(A_n - I)^i - (A - I)^i\}
\]
and hence
\[
\|\sqrt{A} - \sqrt{A_n}\| \leq \sum_{i=1}^{\infty} c_i \|(A_n - I)^i - (A - I)^i\|.
\]

For the moment we will make the additional assumption that \( A_n \geq \varepsilon I \), where \( \varepsilon \in (0, 1) \). Then \( 0 \leq I - A_n \leq (1 - \varepsilon)I \) and in particular \( \|I - A_n\|_{B(H)} \leq (1 - \varepsilon) \).

Now suppose that \( Q, R, S, T \) are operators on \( H \), then \( QR - ST = (Q - S)R + S(R - T) \) and hence
\[
\|QR - ST\| \leq \|Q - S\||R\| + |S||R - T|.
\]

Setting \( Q = A_n - I, R := (A_n - I)^{-1}, S := (A - I) \) and \( T = (A - I)^{-1} \) in this last inequality gives
\[
\|(A_n - I)^i - (A - I)^i\|
\leq \|A_n - A\||(A_n - I)^{-1}||A - I|||A_n - I|^{-1} - (A - I)|^{-1}|
\leq \|A_n - A\|\|(1 - \varepsilon)^{-1} + (1 - \varepsilon)\||(A_n - I)^{-1} - (A - I)^{-1}||.
\]

It now follows by induction that
\[
\|(A_n - I)^i - (A - I)^i\| \leq i(1 - \varepsilon)^{-1}\|A_n - A\|.
\]

Inserting this estimate into (38.2) shows that
\[
\|\sqrt{A} - \sqrt{A_n}\| \leq \sum_{i=1}^{\infty} c_i \|(1 - \varepsilon)^{-1}\|A_n - A\|
\leq \frac{1}{2} \left( \frac{1}{\sqrt{1 - (1 - \varepsilon)}} \right) \|A_n - A\| = \frac{1}{2} \sqrt{\varepsilon} \|A_n - A\| \to 0.
\]

Therefore we have shown if \( A_n \geq \varepsilon I \) for all \( n \) and \( A_n \to A \) in norm then \( \sqrt{A_n} \to \sqrt{A} \) in norm. For the general case where \( A_n \geq 0 \), we find that for all \( \varepsilon > 0 \)
\[
\lim_{n \to \infty} \sqrt{A_n + \varepsilon} = \sqrt{A + \varepsilon}.
\]

By the spectral theorem\[1\]
\[1\] It is possible to give a more elementary proof here. Indeed, assume further that \( \|A\| \leq \alpha < 1 \), then for \( \varepsilon \in (0, 1 - \alpha) \), \( \|\sqrt{A + \varepsilon} - \sqrt{A}\| \leq \sum_{i=1}^{\infty} c_i \|(A + \varepsilon)^i - A^i\| \).
\[
\|\sqrt{A + \varepsilon} - \sqrt{A}\| \leq \max_{x \in \sigma(A)} |\sqrt{x + \varepsilon} - \sqrt{x}| \\
\leq \max_{0 \leq x \leq \|A\|} |\sqrt{x + \varepsilon} - \sqrt{x}| \to 0 \text{ as } \varepsilon \to 0.
\]

Since the above estimates are uniform in \( A \geq 0 \) such that \( \|A\| \) is bounded, it is now an easy matter to conclude that Eq. \([38.4]\) holds even when \( \varepsilon = 0 \).

Now suppose that \( A_n \to A \) in \( B(H) \) and \( A_n \) and \( A \) are general operators. Then \( A_n^*A_n \to A^*A \) in \( B(H) \). So by what we have already proved,

\[|A_n| := \sqrt{A_n^*A_n} \to |A| := \sqrt{A^*A} \text{ in } B(H) \text{ as } n \to \infty.\]

**Definition 38.8.** An operator \( u \in L(H, B) \) is a partial isometry if \( u|_{\text{Nul}(u)^\perp} : \text{Nul}(u)^\perp \to B \) is an isometry. We say \( \text{Nul}(u)^\perp \) is the initial space and \( \text{Ran}(u) \) is the final subspace of \( u \). (The reader should verify that \( \text{Ran}(u) \) is a closed subspace.) Let \( P_f \) denote orthogonal projections onto the initial subspace of \( u \).

**Lemma 38.9.** Let \( u \in L(H, B) \), then \( u \) is a partial isometry iff \( uu^* \) and \( uu^* \) map are orthogonal projections. Moreover if \( u \) is a partial isometry then \( uu^* = P_f \) and \( u^*u = P_f \).

**Proof.** Suppose \( u \) is a partial isometry then relative to the decompositions of \( H \) and \( B \) as \( H = \text{Nul}(u)^\perp \oplus \text{Nul}(u) \) and \( B = \text{Ran}(u) \oplus \text{Ran}(u)^\perp \), \( u \) has the block diagonal form

\[u = \begin{pmatrix} u_0 & 0 \\ 0 & 0 \end{pmatrix}\]

where \( u_0 : \text{Nul}(u)^\perp \to \text{Ran}(u) \) is a unitary map. Hence

\[uu^* = \begin{pmatrix} u_0 & 0 \\ 0 & 0 \end{pmatrix} \begin{pmatrix} u_0^* & 0 \\ 0 & 0 \end{pmatrix} = \begin{pmatrix} I_{\text{Ran}(u)} & 0 \\ 0 & 0 \end{pmatrix} = P_f\]

and similarly,

\[P_f = \begin{pmatrix} I_{\text{Ran}(u)^\perp} & 0 \\ 0 & 0 \end{pmatrix} = uu^*\]

Therefore by Proposition \([38.4]\), \( B = |A| \).

Now suppose that \( u \in L(H, B) \) and \( P_f := u^*u \in L(H) \) and \( P_f := uu^* \in L(B) \) are orthogonal projection maps. Notice that

\[\text{Ran}(P_f) = \text{Nul}(P_f)^\perp = \text{Nul}(u)^\perp.\]

Hence if \( h \in \text{Nul}(u)^\perp \),

\[\|uh\|^2 = (h, u^*uh) = (h, P_f h) = \|h\|^2\]

which shows \( u \) is a partial isometry.

**Theorem 38.10 (Polar Decomposition).** Let \( A \in L(H, B) \). Then

1. there exists a partial isometry \( u \in L(H, B) \) such that \( A = uu^* \) and \( u \) is unique if we further require \( \text{Nul}(u) = \text{Nul}(A) \).
2. If \( B \in L(H) \) is a positive operator and \( u \in L(H, B) \) is a partial isometry such that \( A = uu^* \) and \( \text{Nul}(u)^\perp = \text{Ran}(B) \), then \( B = |A| \) and \( u \) is the isometry in item 1.

**Proof.** Suppose that \( B \) and \( u \) are as in item 2., then

\[A^*A = Bu^*uB = BP_fPB = B^2.\]

Since \( \|Ah\|^2 = (A^*Ah, h) = ||A||^2 \|h\|^2 \) it follows that defining \( u \) on \( \text{Ran}(|A|) \) by Eq. \([38.5]\) is well defined and \( u : \text{Ran}(|A|) \to B \) is an isometry. By the B.L.T. Theorem, we may extend \( u \) uniquely to an isometry from \( \text{Ran}(|A|) \to B \) and make \( u \) into a partial isometry by setting \( u = 0 \) on \( \text{Ran}(|A|)^\perp \). Since this uniquely determines \( u \), \( \text{Nul}(u) = \text{Ran}(|A|)^\perp \) and

\[\text{Ran}(|A|)^\perp = \text{Nul}(|A|) = \text{Nul}(|A|^2) = \text{Nul}(A^*A) = \text{Nul}(A)\]

the proof is complete.

**Remark 38.11.** When \( B = H \), we will see using the spectral theorem that \( u \) is a strong limit of polynomials in \( A \) and \( A^* \), i.e. \( u \) is the von Neumann algebra generated by \( A \). To prove this let \( f_n(x) := \min(x^{-1}, n^{-1}) \) for \( x \geq 0 \). Then notice that \( u_n := A_{f_n}(|A|) \) converges strongly to \( u \) as \( n \to \infty \). Since \( f_n \) may be uniformly approximated by polynomials, \( u_n \) is the norm limit of polynomials in \( A \) and \( A^* \). Finally \( |A| \) is the norm limit of polynomials in \( A^*A \) and so \( u_n \) is the norm limit of polynomials in \( A \) and \( A^* \). Moreover these polynomials are of the form \( Ap_n(A^*A) \).
Corollary 38.12. If $K \in L(H, B)$ then $|K|$ is compact.

Proof. Since $K$ is compact then any polynomial in $K^*K$ is compact. Since $|K|$ is the norm limit of polynomials in $K^*K$, it follows that $|K|$ is compact as well. ■
Trace Class & Fredholm Operators

In this section $H$ and $B$ will be Hilbert spaces. Typically $H$ and $B$ will be separable, but we will not assume this until it is needed later.

39.1 Trace Class Operators

See B. Simon \[26\] for more details and ideals of compact operators.

**Theorem 39.1.** Let $A \in B(H)$ be a non-negative operator, $\{e_n\}_{n=1}^{\infty}$ be an orthonormal basis for $H$ and

$$\text{tr}(A) := \sum_{n=1}^{\infty} \langle Ae_n | e_n \rangle.$$ 

Then $\text{tr}(A) = \| \sqrt{A} \|_{HS}^2 \in [0, \infty]$ is well-defined independent of the choice of orthonormal basis for $H$. Moreover if $\text{tr}(A) < \infty$, then $A$ is a compact operator.

**Proof.** Let $B := \sqrt{A}$, then

$$\text{tr}(A) = \sum_{n=1}^{\infty} \langle Ae_n | e_n \rangle = \sum_{n=1}^{\infty} \langle B^2 e_n | e_n \rangle = \sum_{n=1}^{\infty} \langle B e_n | B e_n \rangle = \| B \|_{HS}^2.$$ 

This shows $\text{tr}(A)$ is well-defined and that $\text{tr}(A) = \| \sqrt{A} \|_{HS}^2.$ If $\text{tr}(A) < \infty$ then $\sqrt{A}$ is Hilbert Schmidt and hence compact. Therefore $A = \left( \sqrt{A} \right)^2$ is compact as well.

**Definition 39.2.** An operator $A \in L(H, B)$ is **trace class** if $\text{tr}(|A|) = \text{tr}(\sqrt{A^* A}) < \infty$.

**Proposition 39.3.** If $A \in L(H, B)$ is trace class then $A$ is compact.

**Proof.** By the polar decomposition Theorem 38.10 $A = u |A|$ where $u$ is a partial isometry and by Corollary 38.12 $|A|$ is also compact. Therefore $A$ is compact as well.

**Proposition 39.4.** If $A \in L(B)$ is trace class and $\{e_n\}_{n=1}^{\infty}$ is an orthonormal basis for $H$, then

$$\text{tr}(A) := \sum_{n=1}^{\infty} \langle Ae_n | e_n \rangle$$

is absolutely convergent and the sum is independent of the choice of orthonormal basis for $H$.

**Proof.** Let $A = u |A|$ be the polar decomposition of $A$ and $\{\phi_m\}_{m=1}^{\infty}$ be an orthonormal basis of eigenvectors for $\text{Nul}(|A|)^\perp = \text{Nul}(A)^\perp$ such that

$$|A| \phi_m = \lambda_m \phi_m$$

with $\lambda_m \downarrow 0$ and $\sum_{m=1}^{\infty} \lambda_m < \infty$. Then

$$\sum_{n} \langle Ae_n | e_n \rangle = \sum_{n} \| |A| e_n | u^* e_n \| = \sum_{m} \sum_{n} \| |A| e_n \langle \phi_m | u^* e_n \rangle \|$$

$$= \sum_{m} \sum_{n} \lambda_m \langle e_n | \phi_m \langle u \phi_m | e_n \rangle$$

$$\leq \sum_{m} \lambda_m \sum_{n} \| e_n \langle \phi_m | u \phi_m \rangle \| \leq \sum_{m} \lambda_m < \infty.$$ 

Moreover,

$$\sum_{n} \langle Ae_n | e_n \rangle = \sum_{n} \| |A| e_n | u^* e_n \| = \sum_{m} \sum_{n} \lambda_m \langle e_n | \phi_m \langle u \phi_m | e_n \rangle$$

$$= \sum_{m} \lambda_m \sum_{n} \langle u \phi_m | e_n \rangle \langle e_n | \phi_m \rangle$$

$$= \sum_{m} \lambda_m \langle u \phi_m | \phi_m \rangle$$

showing $\sum_{n} \langle Ae_n | e_n \rangle = \sum_{m} \lambda_m \langle u \phi_m | \phi_m \rangle$ which proves $\text{tr}(A)$ is well-defined independent of basis.
Remark 39.5. Suppose \( K \) is a compact operator written in the form
\[
Kf = \sum_{n=1}^{N} \lambda_n \langle f | \phi_n \rangle \psi_n \quad \text{for all } f \in H.
\] (39.1)
where \( \{ \phi_n \}_{n=1}^{\infty} \subset H, \{ \psi_n \}_{n=1}^{\infty} \subset B \) are bounded sets and \( \lambda_n \in \mathbb{C} \) such that \( \sum_{n=1}^{\infty} |\lambda_n| < \infty \). Then \( K \) is trace class and
\[
\text{tr}(K) = \sum_{n=1}^{N} \lambda_n \langle \psi_n | \phi_n \rangle.
\]

We will say \( K \in K(H) \) is trace class if
\[
\text{tr}(\sqrt{K^*K}) := \sum_{n=1}^{N} \lambda_n < \infty
\]
in which case we define
\[
\text{tr}(K) = \sum_{n=1}^{N} \lambda_n \langle \psi_n | \phi_n \rangle.
\]
Notice that if \( \{ e_m \}_{m=1}^{\infty} \) is any orthonormal basis in \( H \) (or for the \( \text{Ran}(K) \) if \( H \) is not separable) then
\[
\sum_{m=1}^{M} \langle Ke_m | e_m \rangle = \sum_{m=1}^{M} \left( \sum_{n=1}^{N} \lambda_n \langle e_m | \phi_n \rangle \psi_n \right) e_m
\]
\[
= \sum_{n=1}^{N} \lambda_n \langle P_M \psi_n | \phi_n \rangle
\]
where \( P_M \) is orthogonal projection onto \( \text{Span}(e_1, \ldots, e_M) \). Therefore by dominated convergence theorem,
\[
\sum_{m=1}^{\infty} \langle Ke_m | e_m \rangle = \lim_{M \to \infty} \sum_{n=1}^{N} \lambda_n \langle P_M \psi_n | \phi_n \rangle
\]
\[
= \sum_{n=1}^{N} \lambda_n \langle \psi_n | \phi_n \rangle = \text{tr}(K).
\]

39.2 Fredholm Operators

Lemma 39.6. Let \( M \subset H \) be a closed subspace and \( V \subset H \) be a finite dimensional subspace. Then \( M + V \) is closed as well. In particular if \( \text{codim}(M) := \dim(H/M) < \infty \) and \( W \subset H \) is a subspace such that \( M \subset W \), then \( W \) is closed and \( \text{codim}(W) < \infty \).

Proof. Let \( P : H \to M \) be orthogonal projection and let \( V_0 := (I - P) V \). Since \( \dim(V_0) \leq \dim(V) < \infty \), \( V_0 \) is still closed. Also it is easily seen that \( M + V = M \oplus V_0 \) from which it follows that \( M + V \) is closed because \( \{ z_n = m_n + v_n \} \subset M \oplus V_0 \) is convergent iff \( \{ m_n \} \subset M \) and \( \{ v_n \} \subset V_0 \) are convergent. If \( \text{codim}(M) < \infty \) and \( M \subset W \), there is a finite dimensional subspace \( V \subset H \) such that \( W = M + V \) and so by what we have just proved, \( W \) is closed as well. It should also be clear that \( \text{codim}(W) \leq \text{codim}(M) < \infty \). \( \blacksquare \)

Lemma 39.7. If \( K : H \to B \) is a finite rank operator, then there exists \( \{ \phi_n \}_{n=1}^{k} \subset H \) and \( \{ \psi_n \}_{n=1}^{k} \subset B \) such that
1. \( Kx = \sum_{n=1}^{k} \langle x | \phi_n \rangle \psi_n \) for all \( x \in H \).
2. \( K^*y = \sum_{n=1}^{k} \langle y | \psi_n \rangle \phi_n \) for all \( y \in B \), in particular \( K^* \) is still finite rank.
3. \( \dim(\text{Null}(I + K)) < \infty \).
4. \( \dim(\text{coker}(I + K)) < \infty \), \( \text{Ran}(I + K) \) is closed and
\[
\text{Ran}(I + K) = \text{Null}(I + K^*)^\bot.
\]

Proof.
1. Choose \( \{ \psi_n \}_{n=1}^{k} \) to be an orthonormal basis for \( \text{Ran}(K) \). Then for \( x \in H \),
\[
Kx = \sum_{n=1}^{k} \langle x | \phi_n \rangle \psi_n = \sum_{n=1}^{k} \langle x | K^* \psi_n \rangle \phi_n = \sum_{n=1}^{k} \langle x | \phi_n \rangle \psi_n
\]
where \( \phi_n := K^* \psi_n \).
2. Item 2. is a simple computation left to the reader.
3. Since \( \text{Null}(I + K) = \{ x \in H \mid x = -Kx \} \subset \text{Ran}(K) \) it is finite dimensional.
4. Since \( x = (I + K)x \in \text{Ran}(I + K) \) for \( x \in \text{Nul}(K) \), \( \text{Nul}(K) \subseteq \text{Ran}(I + K) \). Since \( \{ \phi_1, \phi_2, \ldots, \phi_k \}^\perp \subseteq \text{Nul}(K) \), \( H = \text{Nul}(K) + \text{span}\{\{\phi_1, \phi_2, \ldots, \phi_k\}\} \) and thus \( \text{codim}(\text{Nul}(K)) < \infty \). From these comments and Lemma 39.6, \( \text{Ran}(I + K) \) is closed and \( \text{codim}(\text{Ran}(I + K)) \leq \text{codim}(\text{Nul}(K)) < \infty \). The assertion that \( \text{Ran}(I + K) = \text{Nul}(I + K^*) \) is a consequence of Lemma 16.17 below.

**Definition 39.8.** A bounded operator \( F : H \rightarrow B \) is Fredholm if the \( \dim \text{Nul}(F) < \infty \), \( \dim \text{coker}(F) < \infty \) and \( \text{Ran}(F) \) is closed in \( B \). (Recall: \( \text{coker}(F) := B/\text{Ran}(F) \).) The index of \( F \) is the integer,

\[
\text{index}(F) = \dim \text{Nul}(F) - \dim \text{coker}(F) \tag{39.3}
\]

Notice that equations (39.3) and (39.4) are the same since, (using \( \text{Ran}(F) \) is closed)

\[
B = \text{Ran}(F) \oplus \text{Ran}(F)^\perp = \text{Ran}(F) \oplus \text{Nul}(F^*)
\]

so that \( \text{coker}(F) = B/\text{Ran}(F) \cong \text{Nul}(F^*) \).

**Lemma 39.9.** The requirement that \( \text{Ran}(F) \) is closed in Definition 39.8 is redundant.

**Proof.** By restricting \( F \) to \( \text{Nul}(F)^\perp \), we may assume without loss of generality that \( \text{Nul}(F) = \{0\} \). Assuming \( \dim \text{coker}(F) < \infty \), there exists a finite dimensional subspace \( V \subseteq B \) such that \( B = \text{Ran}(F) \oplus V \). Since \( V \) is finite dimensional, \( V \) is closed and hence \( B = V \oplus V^\perp \). Let \( \pi : B \rightarrow V^\perp \) be the orthogonal projection operator onto \( V^\perp \) and let \( G := \pi F : H \rightarrow V^\perp \). Then \( G \) is a bounded operator. To this end we assume without loss of generality that \( \lim_{n \rightarrow \infty} F(h_n) = b \) exists in \( B \). Then by composing this last equation with \( \pi \), we find that \( \lim_{n \rightarrow \infty} G(h_n) = \pi(b) \) exists in \( V^\perp \). Composing this equation with \( G^{-1} \) shows that \( h := \lim_{n \rightarrow \infty} h_n = G^{-1}(\pi(b)) \) exists in \( H \). Therefore, \( F(h_n) \rightarrow F(h) \in \text{Ran}(F) \), which shows that \( \text{Ran}(F) \) is closed.

**Remark 39.10.** It is essential that the subspace \( M := \text{Ran}(F) \) in Lemma 39.9 is the image of a bounded operator, for it is not true that every finite codimensional subspace \( M \) of a Banach space \( B \) is necessarily closed. To see this suppose that \( B \) is a separable infinite dimensional Banach space and let \( A \subset B \) be an algebraic basis for \( B \), which exists by a Zorn’s lemma argument. Since \( \dim(B) = \infty \) and \( B \) is complete, \( A \) must be uncountable. Indeed, if \( A \) were countable we could write \( B = \bigcup_{n=1}^{\infty} B_n \) where \( B_n \) are finite dimensional (necessarily closed) subspaces of \( B \). This shows that \( B \) is the countable union of nowhere dense closed subsets which violates the Baire Category theorem.

By separability of \( B \), there exists a countable subset \( A_0 \subset A \) such that the closure of \( M_0 := \text{span}(A_0) \) is equal to \( B \). Choose \( x_0 \in A \setminus A_0 \), and let \( M := \text{span}(A \setminus \{x_0\}) \). Then \( M_0 \subset M \) so that \( B = M_0 = M \), while \( \dim(M) = 1 \). Clearly this \( M \) can not be closed.

**Example 39.11.** Suppose that \( H \) and \( B \) are finite dimensional Hilbert spaces and \( F : H \rightarrow B \) is Fredholm. Then

\[
\text{index}(F) = \dim(B) - \dim(H). \tag{39.5}
\]

The formula in Eq. (39.5) may be verified using the rank nullity theorem,

\[
\dim(H) = \dim \text{Nul}(F) + \dim \text{Ran}(F),
\]

and the fact that

\[
\dim(B/\text{Ran}(F)) = \dim(B) - \dim(\text{Ran}(F)).
\]

**Theorem 39.12.** A bounded operator \( F : H \rightarrow B \) is Fredholm iff there exists a bounded operator \( A : B \ightarrow H \) such that \( AF - I \) and \( FA - I \) are both compact operators. (In fact we may choose \( A \) so that \( AF - I \) and \( FA - I \) are both finite rank operators.)

**Proof.** \((\Rightarrow) \) Suppose \( F \) is Fredholm, then \( F : \text{Nul}(F)^\perp \rightarrow \text{Ran}(F) \) is a bijective bounded linear map between Hilbert spaces. (Recall that \( \text{Ran}(F) \) is a closed subspace of \( B \) and hence a Hilbert space.) Let \( \bar{F} \) be the inverse of this map—a bounded map by the open mapping theorem. Let \( P : H \rightarrow \text{Ran}(F) \) be orthogonal projection and set \( A := \bar{F}P \). Then \( AF - I = \bar{F}PF - I = FF - I = -Q \) where \( Q \) is the orthogonal projection onto \( \text{Nul}(F) \). Similarly, \( FA - I = \bar{F}FP - I = -(I - P) \) because \( I - P \) and \( Q \) are finite rank projections and hence compact, both \( AF - I \) and \( FA - I \) are compact. \((\Leftarrow) \) We first show that the operator \( A : B \rightarrow H \) may be modified so that \( AF - I \) and \( FA - I \) are both finite rank operators. To this end let \( G := AF - I \) (\( G \) is compact) and choose a finite rank approximation \( G_1 \) to \( G \) such that \( G = G_1 + \mathcal{E} \) where \( \|\mathcal{E}\| < 1 \). Define \( A_L : B \rightarrow H \) to be the operator \( A_L := (I + \mathcal{E})^{-1}A \). Since \( AF = (I + \mathcal{E}) + G_1 \),

\[
A_LF = (I + \mathcal{E})^{-1}AF = I + (I + \mathcal{E})^{-1}G_1 = I + K_L
\]

where \( K_L \) is a finite rank operator. Similarly there exists a bounded operator \( A_R : B \rightarrow H \) and a finite rank operator \( K_R \) such that \( FA_R = I + K_R \). Notice that \( A_LFA_R = A_R + K_LA_R \) on one hand and \( A_LFA_R = A_L + A_LK_R \) on the
other. Therefore, $A_L - A_R = A_L K_R - K_L A_R =: S$ is a finite rank operator. Therefore $F A_L = F (A_R + S) = I + K_R + F S$, so that $F A_L - I = K_R - F S$ is still a finite rank operator. Thus we have shown that there exists a bounded operator $A : B \to H$ such that $A F - I$ and $F A - I$ are both finite rank operators. We now assume that $A$ is chosen such that $A F - I = G_1$, $F A - I = G_2$ are finite rank. Clearly $\text{Nul}(F) \subset \text{Nul}(AF) = \text{Nul}(I + G_1)$ and $\text{Ran}(F) \supset \text{Ran}(FA) = \text{Ran}(I + G_2)$. The theorem now follows from Lemma 39.6 and Lemma 39.7. ■

**Corollary 39.13.** If $F : H \to B$ is Fredholm then $F^*$ is Fredholm and $\text{index}(F) = - \text{index}(F^*)$.

**Proof.** Choose $A : B \to H$ such that both $A F - I$ and $F A - I$ are compact. Then $F^* A^* - I$ and $A^* F^* - I$ are compact which implies that $F^*$ is Fredholm. The assertion, $\text{index}(F) = - \text{index}(F^*)$, follows directly from Eq. (39.4). ■

**Lemma 39.14.** A bounded operator $F : H \to B$ is Fredholm if and only if there exists orthogonal decompositions $H = H_1 \oplus H_2$ and $B = B_1 \oplus B_2$ such that

1. $H_1$ and $B_1$ are closed subspaces,
2. $H_2$ and $B_2$ are finite dimensional subspaces, and
3. $F$ has the block diagonal form

$$F = \begin{pmatrix} F_{11} & F_{12} \\ F_{21} & F_{22} \end{pmatrix} : H_1 \oplus H_2 \longrightarrow B_1 \oplus B_2 \quad (39.6)$$

with $F_{11} : H_1 \to B_1$ being a bounded invertible operator.

Furthermore, given this decomposition, $\text{index}(F) = \dim(H_2) - \dim(B_2)$.

**Proof.** If $F$ is Fredholm, set $H_1 = \text{Nul}(F)^\perp$, $H_2 = \text{Nul}(F)$, $B_1 = \text{Ran}(F)$, and $B_2 = \text{Ran}(F)^\perp$. Then $F = \begin{pmatrix} F_{11} & 0 \\ 0 & 0 \end{pmatrix}$, where $F_{11} := F|_{H_1} : H_1 \to B_1$ is invertible. For the converse, assume that $F$ is given as in Eq. (39.6). Let $A := \begin{pmatrix} F_{11} & 0 \\ 0 & 0 \end{pmatrix}$ then

$$AF = \begin{pmatrix} I & F_{11}^{-1} F_{12} \\ 0 & 0 \end{pmatrix} = \begin{pmatrix} I & 0 \\ 0 & F_{11}^{-1} F_{12} \end{pmatrix} + \begin{pmatrix} 0 & F_{11}^{-1} F_{12} \\ 0 & -I \end{pmatrix},$$

so that $A F - I$ is finite rank. Similarly one shows that $F A - I$ is finite rank, which shows that $F$ is Fredholm. Now to compute the index of $F$, notice that

$$\begin{pmatrix} x_1 \\ x_2 \end{pmatrix} \in \text{Nul}(F) \iff$$

$$F_{11} x_1 + F_{12} x_2 = 0$$

$$F_{21} x_1 + F_{22} x_2 = 0$$

which happens iff $x_1 = -F_{11}^{-1} F_{12} x_2$ and $(-F_{21} F_{11}^{-1} F_{12} + F_{22}) x_2 = 0$. Let $D := (F_{22} - F_{21} F_{11}^{-1} F_{12}) : H_2 \to B_2$, then the mapping

$$x_2 \in \text{Nul}(D) \to \left(\begin{array}{c} -F_{11}^{-1} F_{12} x_2 \\ x_2 \end{array}\right) \in \text{Nul}(F)$$

is a linear isomorphism of vector spaces so that $\text{Nul}(F) \cong \text{Nul}(D)$. Since

$$F^* = \begin{pmatrix} F_{11}^* & F_{12}^* \\ F_{21}^* & F_{22}^* \end{pmatrix} : B_1 \oplus B_2 \longrightarrow H_1 \oplus H_2$$

similar reasoning implies $\text{Nul}(F^*) \cong \text{Nul}(D^*)$. This shows that $\text{index}(F) = \text{index}(D)$. But we have already seen in Example 39.11 that $\text{index}(D) = \dim H_2 - \dim B_2$. ■

**Proposition 39.15.** Let $F$ be a Fredholm operator and $K$ be a compact operator from $H \to B$. Further assume $T : B \to X$ (where $X$ is another Hilbert space) is also Fredholm. Then

1. the Fredholm operators form an open subset of the bounded operators. Moreover if $\mathcal{E} : H \to B$ is a bounded operator with $\|\mathcal{E}\|$ sufficiently small we have $\text{index}(F + \mathcal{E}) = \text{index}(F + \mathcal{E})$.
2. $F + K$ is Fredholm and $\text{index}(F + K) = \text{index}(F) + \text{index}(K)$.
3. $T F$ is Fredholm and $\text{index}(T F) = \text{index}(T) + \text{index}(F)$

**Proof.**

1. We know $F$ may be written in the block form given in Eq. (39.6) with $F_{11} : H_1 \to B_1$ being a bounded invertible operator. Decompose $\mathcal{E}$ into the block form as

$$\mathcal{E} = \begin{pmatrix} \mathcal{E}_{11} & \mathcal{E}_{12} \\ \mathcal{E}_{21} & \mathcal{E}_{22} \end{pmatrix}$$

and choose $\|\mathcal{E}\|$ sufficiently small such that $\|\mathcal{E}_{11}\|$ is sufficiently small to guarantee that $F_{11} + \mathcal{E}_{11}$ is still invertible. (Recall that the invertible operators form an open set.) Thus $F + \mathcal{E} = \begin{pmatrix} F_{11} + \mathcal{E}_{11} & * \\ * & * \end{pmatrix}$ has the block form of a Fredholm operator and the index may be computed as:

$$\text{index}(F + \mathcal{E}) = \dim H_2 - \dim B_2 = \text{index}(F).$$
2. Given \( K : H \to B \) compact, it is easily seen that \( F + K \) is still Fredholm. Indeed if \( A : B \to H \) is a bounded operator such that \( G_1 := AF - I \) and \( G_2 := FA - I \) are both compact, then \( A(F + K) - I = G_1 + AK \) and \( (F + K)A - I = G_2 + KA \) are both compact. Hence \( F + K \) is Fredholm by Theorem 39.12. By item 1., the function \( f(t) := \text{index}(F + tK) \) is a continuously locally constant function of \( t \in \mathbb{R} \) and hence is constant. In particular, \( \text{index}(F) = \text{index}(F + 1) = \text{index}(F) \).

3. It is easily seen, using Theorem 39.12 that the product of two Fredholm operators is again Fredholm. So it only remains to verify the index formula in item 3. For this let \( H_1 := \text{Nul}(F) \perp, H_2 := \text{Nul}(F), B_1 := \text{Ran}(T) = T(H_1), \) and \( B_2 := \text{Ran}(T)^\perp = \text{Nul}(T^*) \). Then \( F \) decomposes into the block form:

\[
F = \begin{pmatrix}
\tilde{F} & 0 \\
0 & 0
\end{pmatrix} : H_1 \oplus H_2 \to B_1 \oplus B_2,
\]

where \( \tilde{F} = F|_{H_1} : H_1 \to B_1 \) is an invertible operator. Let \( Y_1 := T(B_1) \) and \( Y_2 := Y_1^\perp = T(B_1)^\perp \). Notice that \( Y_1 = T(B_1) = TQ(B_1), \) where \( Q : B \to B_1 \subset B \) is orthogonal projection onto \( B_1 \). Since \( B_1 \) is closed and \( B_2 \) is finite dimensional, \( Q \) is Fredholm. Hence \( TQ \) is Fredholm and \( Y_1 = TQ(B_1) \) is closed in \( Y \) and is of finite codimension. Using the above decompositions, we may write \( T \) in the block form:

\[
T = \begin{pmatrix}
T_{11} & T_{12} \\
T_{21} & T_{22}
\end{pmatrix} : B_1 \oplus B_2 \to Y_1 \oplus Y_2.
\]

Since \( R = \begin{pmatrix}
0 & T_{12} \\
T_{21} & T_{22}
\end{pmatrix} : B \to Y \) is a finite rank operator and hence \( RF : H \to Y \) is finite rank, \( \text{index}(T - R) = \text{index}(T) \) and \( \text{index}(TF - RF) = \text{index}(TF) \). Hence without loss of generality we may assume that \( T \) has the form \( T = \begin{pmatrix}
\tilde{T} & 0 \\
0 & 0
\end{pmatrix}, (\tilde{T} = T_{11}) \) and hence

\[
TF = \begin{pmatrix}
\tilde{T}F & 0 \\
0 & 0
\end{pmatrix} : H_1 \oplus H_2 \to Y_1 \oplus Y_2.
\]

We now compute the \( \text{index}(T) \). Notice that \( \text{Nul}(T) = \text{Nul}(\tilde{T}) \oplus B_2 \) and \( \text{Ran}(T) = \tilde{T}(B_1) = Y_1 \). So

\[
\text{index}(T) = \text{index}(\tilde{T}) + \text{dim}(B_2) - \text{dim}(Y_2).
\]

Similarly,

\[
\text{index}(TF) = \text{index}(\tilde{T}F) + \text{dim}(H_2) - \text{dim}(Y_2),
\]

and as we have already seen

\[
\text{index}(F) = \text{dim}(H_2) - \text{dim}(B_2).
\]

Therefore,

\[
\text{index}(TF) - \text{index}(T) - \text{index}(F) = \text{index}(\tilde{T}F) - \text{index}(\tilde{T}).
\]

Since \( \tilde{T} \) is invertible, \( \text{Ran}(\tilde{T}) = \text{Ran}(\tilde{T}F) \) and \( \text{Nul}(\tilde{T}) \cong \text{Nul}(\tilde{T}F) \). Thus

\[
\text{index}(\tilde{T}F) - \text{index}(\tilde{T}) = 0 \text{ and the theorem is proved.}
\]

3.9.3 Tensor Product Spaces

References for this section are Reed and Simon [22] (Volume I, Chapter VI.5), Simon [27], and Schatten [24]. See also Reed and Simon [21] (Volume 2 § IX.4 and §XIII.17).

Let \( H \) and \( K \) be separable Hilbert spaces and \( H \otimes K \) will denote the usual Hilbert completion of the algebraic tensors \( H \otimes K \). Recall that the inner product on \( H \otimes K \) is determined by \( \langle h \otimes k | h' \otimes k' \rangle = \langle h | h' \rangle \langle k | k' \rangle \). The following proposition is well known.

**Proposition 39.16 (Structure of \( H \otimes K \)).** There is a bounded linear map \( T : H \otimes K \to B_{\text{anti}}(H,K) \) (the space of bounded anti-linear maps from \( K \) to \( H \)) determined by

\[
T(h \otimes k)k' := \langle k | k' \rangle h \text{ for all } k,k' \in K \text{ and } h \in H.
\]

Moreover \( T(H \otimes K) = HS(K,H) \) — the Hilbert Schmidt operators from \( K \) to \( H \). The map \( T : H \otimes K \to HS(K,H) \) is unitary equivalence of Hilbert spaces. Finally, any \( A \in H \otimes K \) may be expressed as

\[
A = \sum_{n=1}^{\infty} \lambda_n h_n \otimes k_n, \quad (39.7)
\]

where \( \{h_n\} \) and \( \{k_n\} \) are orthonormal sets in \( H \) and \( K \) respectively and \( \{\lambda_n\} \subset \mathbb{R} \) such that \( |A|^2 = \sum |\lambda_n|^2 < \infty \).

**Proof.** Let \( A := \sum a_{ij} h_i \otimes k_j \), where \( \{h_i\} \) and \( \{k_j\} \) are orthonormal bases for \( H \) and \( K \) respectively and \( \{a_{ij}\} \subset \mathbb{R} \) such that \( |A|^2 = \sum |a_{ij}|^2 < \infty \). Then evidently, \( T(A)k := \sum a_{ij} h_i \langle k_j | k \rangle \) and
In the future we will identify

\[ \|T(A)k\|^2 = \sum_j \left| \sum_i a_{ji} \langle k_i | k \rangle \right|^2 \leq \sum_j \sum_i |a_{ji}|^2 \|k_i\|^2 \]

\[ \leq \sum_j \sum_i |a_{ji}|^2 \|k\|^2. \]

Thus \( T : H \otimes K \to B(K, H) \) is bounded. Moreover,

\[ \|T(A)\|^2_{HS} := \sum_j \|T(A)k_j\|^2 = \sum_j |a_{jj}|^2 = \|A\|^2, \]

which proves the \( T \) is an isometry. We will now prove that \( T \) is surjective and at the same time prove Eq. \((39.7)\). To motivate the construction, suppose that \( Q = T(A) \) where \( A \) is given as in Eq. \((39.7)\). Then

\[ Q^*Q = T \left( \sum_{n=1}^{\infty} \lambda_n k_n \otimes h_n \right) T \left( \sum_{n=1}^{\infty} \lambda_n h_n \otimes k_n \right) = T \left( \sum_{n=1}^{\infty} \lambda_n^2 k_n \otimes k_n \right). \]

That is \( \{k_n\} \) is an orthonormal basis for \((\text{Null} Q^*Q)\) with \( Q^*Qk_n = \lambda_n^2 k_n \). Also \( Qk_n = \lambda_n h_n \), so that \( h_n = \lambda_n^{-1} Qk_n \). We will now reverse the above argument. Let \( Q \in HS(K, H) \). Then \( Q^*Q \) is a self-adjoint compact operator on \( K \). Therefore there is an orthonormal basis \( \{k_n\}_{n=1}^\infty \) for the \((\text{Null} Q^*Q)\) which consists of eigenvectors of \( Q^*Q \). Let \( \lambda_n \in (0, \infty) \) such that \( Q^*Qk_n = \lambda_n^2 k_n \) and set \( h_n = \lambda_n^{-1} Qk_n \). Notice that

\[ \langle h_n | h_m \rangle = \langle \lambda_n^{-1} Qk_n | \lambda_m^{-1} Qk_m \rangle = \langle \lambda_n^{-1} k_n | \lambda_m^{-1} Q^* Qk_m \rangle = \langle \lambda_n^{-1} k | \lambda_m^{-1} \lambda_n^2 k_m \rangle = \delta_{mn}, \]

so that \( \{h_n\} \) is an orthonormal set in \( H \). Define

\[ A = \sum_{n=1}^{\infty} \lambda_n h_n \otimes k_n \]

and notice that \( T(A)k_n = \lambda_n h_n = Qk_n \) for all \( n \) and \( T(A)k = 0 \) for all \( k \in \text{Null} Q = \text{Null} Q^*Q \). That is \( T(A) = Q \). Therefore \( T \) is surjective and Eq. \((39.7)\) holds.

**Notation 39.17** In the future we will identify \( A \in H \otimes K \) with \( T(A) \in HS(K, H) \) and drop \( T \) from the notation. So with this notation we have the \((h \otimes k)k' = \langle k | k' \rangle h\).

Let \( A \in H \otimes H \), we set \( \|A\|_1 := \text{tr} \sqrt{A^*A} := \text{tr} \sqrt{T(A)^*T(A)} \) and we let

\[ H \otimes_1 H := \{ A \in H \otimes H : \|A\|_1 < \infty \}. \]

We will now compute \( \|A\|_1 \) for \( A \in H \otimes H \) described as in Eq. \((39.7)\). First notice that \( A^* = \sum_{n=1}^{\infty} \lambda_n k_n \otimes h_n \) and

\[ A^* A = \sum_{n=1}^{\infty} \lambda_n^2 k_n \otimes k_n. \]

Hence \( \sqrt{A^*A} = \sum_{n=1}^{\infty} |\lambda_n| k_n \otimes k_n \) and hence \( \|A\|_1 = \sum_{n=1}^{\infty} |\lambda_n| \). Also notice that \( \|A\|^2 = \sum_{n=1}^{\infty} |\lambda_n|^2 \) and \( \|A\|_{op} = \max_n |\lambda_n| $. Since

\[ \|A\|^2 = \left( \sum_{n=1}^{\infty} |\lambda_n| \right)^2 \geq \sum_{n=1}^{\infty} |\lambda_n|^2 = \|A\|_1^2, \]

we have the following relations among the various norms,

\[ \|A\|_{op} \leq \|A\| \leq \|A\|_1. \]

**Proposition 39.18.** There is a continuous linear map \( C : H \otimes_1 H \to \mathbb{R} \) such that \( C(h \otimes k) = (h, k) \) for all \( h, k \in H \). If \( A \in H \otimes_1 H \), then

\[ CA = \sum_{m=1}^{\infty} \langle e_m | e_m \rangle A, \]

where \( \{e_m\} \) is any orthonormal basis for \( H \). Moreover, if \( A \in H \otimes_1 H \) is positive, i.e. \( T(A) \) is a non-negative operator, then \( \|A\|_1 = CA \).

**Proof.** Let \( A \in H \otimes_1 H \) be given as in Eq. \((39.7)\) with \( \sum_{n=1}^{\infty} |\lambda_n| = \|A\|_1 < \infty \). Then define \( CA := \sum_{n=1}^{\infty} \lambda_n (h_n, k_n) \) and notice that \( |CA| \leq \sum_{n=1}^{\infty} |\lambda_n| = \|A\|_1 \), which shows that \( C \) is a contraction on \( H \otimes_1 H \). (Using the universal property of \( H \otimes_1 H \) it is easily seen that \( C \) is well defined.) Also notice that for \( M \in \mathbb{Z}_+ \) that

\[ \sum_{m=1}^{M} \langle e_m \otimes e_m | A \rangle = \sum_{n=1}^{\infty} \sum_{m=1}^{M} \langle e_m \otimes e_m, \lambda_n h_n \otimes k_n \rangle, \]

\[ = \sum_{n=1}^{\infty} \lambda_n \langle P_M h | k_n \rangle, \]

where \( P_M \) denotes orthogonal projection onto \( \text{span}\{e_m\}_{m=1}^{M} \). Since \( |\lambda_n \langle P_M h_n | k_n \rangle| \leq |\lambda_n| \) and \( \sum_{n=1}^{\infty} |\lambda_n| = \|A\|_1 < \infty \), we may let \( M \to \infty \) in Eq. \((39.11)\) to find that

\[ \sum_{m=1}^{\infty} \langle e_m \otimes e_m | A \rangle = \sum_{n=1}^{\infty} \lambda_n \langle h_n | k_n \rangle = CA. \]

This proves Eq. \((39.9)\). For the final assertion, suppose that \( A \geq 0 \). Then there is an orthonormal basis \( \{k_n\}_{n=1}^{\infty} \) for \((\text{Null} A)^\perp \) which consists of eigenvectors of \( A \). That is \( A = \sum \lambda_n k_n \otimes k_n \) and \( \lambda_n \geq 0 \) for all \( n \). Thus \( CA = \sum \lambda_n \) and \( \|A\|_1 = \sum \lambda_n \).
Proposition 39.19 (Noncommutative Fatou’s Lemma). Let $A_n$ be a sequence of positive operators on a Hilbert space $H$ and $A_n 	o A$ weakly as $n \to \infty$, then

$$\text{tr} A \leq \liminf_{n \to \infty} \text{tr} A_n. \quad (39.12)$$

Also if $A_n \in H \otimes_1 H$ and $A_n \to A$ in $B(H)$, then

$$\|A\|_1 \leq \liminf_{n \to \infty} \|A_n\|_1. \quad (39.13)$$

Proof. Let $A_n$ be a sequence of positive operators on a Hilbert space $H$ and $A_n \to A$ weakly as $n \to \infty$ and $\{e_k\}_{k=1}^\infty$ be an orthonormal basis for $H$. Then by Fatou’s lemma for sums,

$$\text{tr} A = \sum_{k=1}^\infty \langle A e_k | e_k \rangle = \sum_{k=1}^\infty \lim_{n \to \infty} \langle A_n e_k | e_k \rangle \leq \liminf_{n \to \infty} \sum_{k=1}^\infty \langle A_n e_k | e_k \rangle = \liminf_{n \to \infty} \text{tr} A_n.$$ 

Now suppose that $A_n \in H \otimes_1 H$ and $A_n \to A$ in $B(H)$. Then by Proposition 39.7 $|A_n| \to |A|$ in $B(H)$ as well. Hence by Eq. (39.12),

$$\|A\|_1 := \text{tr} |A| \leq \liminf_{n \to \infty} \text{tr}|A_n| \leq \liminf_{n \to \infty} \|A_n\|_1.$$ 

Proposition 39.20. Let $X$ be a Banach space, $B : H \times K \to X$ be a bounded bi-linear form, and

$$\|B\| := \sup \{ |B(h, k)| : \|h\| \|k\| \leq 1 \}.$$ 

Then there is a unique bounded linear map $\tilde{B} : H \otimes_1 K \to X$ such that $\tilde{B}(h \otimes k) = B(h, k)$. Moreover $\|\tilde{B}\|_{\text{op}} = \|B\|$.

Proof. Let $A = \sum_{n=1}^\infty \lambda_n h_n \otimes k_n \in H \otimes_1 K$ as in Eq. (39.7). Clearly, if $\tilde{B}$ is to exist we must have $\tilde{B}(A) := \sum_{n=1}^\infty \lambda_n B(h_n, k_n)$. Notice that

$$\sum_{n=1}^\infty |\lambda_n| \|B(h_n, k_n)\| \leq \sum_{n=1}^\infty |\lambda_n| \|B\| = \|A\|_1 \cdot \|B\|.$$ 

This shows that $\tilde{B}(A)$ is well defined and that $\|\tilde{B}\|_{\text{op}} \leq \|\tilde{B}\|$. The opposite inequality follows from the trivial computation:

$$\|B\| = \sup \{ |B(h, k)| : \|h\| \|k\| = 1 \} \sup \{ |\tilde{B}(h \otimes k)| : \|h \otimes k\|_1 = 1 \} \leq \|\tilde{B}\|_{\text{op}}.$$ 

Lemma 39.21. Suppose that $P \in B(H)$ and $Q \in B(K)$, then $P \otimes Q : H \otimes K \to H \otimes K$ is a bounded operator. Moreover, $P \otimes Q(H \otimes_1 K) \subset H \otimes_1 K$ and we have the norm equalities

$$\|P \otimes Q\|_{B(H \otimes K)} = \|P\|_{B(H)} \|Q\|_{B(K)}$$

and

$$\|P \otimes Q\|_{B(H \otimes_1 K)} = \|P\|_{B(H)} \|Q\|_{B(K)}.$$ 

Proof. We will give essentially the same proof of $\|P \otimes Q\|_{B(H \otimes K)} = \|P\|_{B(H)} \|Q\|_{B(K)}$ as the proof on p. 299 of Reed and Simon [22]. Let $A \in H \otimes K$ as in Eq. (39.7).

$$(P \otimes I)A = \sum_{n=1}^\infty \lambda_n Ph_n \otimes k_n$$ 

and hence

$$(P \otimes I)A((P \otimes I)A)^* = \sum_{n=1}^\infty \lambda_n^2 Ph_n \otimes Ph_n.$$ 

Therefore,

$$\| (P \otimes I)A \|^2 = \text{tr} (P \otimes I)A((P \otimes I)A)^* = \sum_{n=1}^\infty \lambda_n^2 (Ph_n \otimes Ph_n) \leq \|P\|^2 \sum_{n=1}^\infty \lambda_n^2 = \|P\|^2 \|A\|^2,$$

which shows that Thus $\|P \otimes I\|_{B(H \otimes K)} \leq \|P\|$. By symmetry, $\|I \otimes Q\|_{B(H \otimes K)} \leq \|Q\|$. Since $P \otimes Q = (P \otimes I)(I \otimes Q)$, we have

$$\|P \otimes Q\|_{B(H \otimes K)} \leq \|P\|_{B(H)} \|Q\|_{B(K)}.$$ 

The reverse inequality is easily proved by considering $P \otimes Q$ on elements of the form $h \otimes k \in H \otimes K$. Now suppose that $A \in H \otimes_1 K$ as in Eq. (39.7). Then

$$\|(P \otimes Q)A\|_1 \leq \sum_{n=1}^\infty |\lambda_n| \|Ph_n \otimes Qk_n\|_1 \leq \|P\| \|Q\| \sum_{n=1}^\infty |\lambda_n| = \|P\| \|Q\| \|A\|,$$

which shows that

$$\|P \otimes Q\|_{B(H \otimes_1 K)} \leq \|P\|_{B(H)} \|Q\|_{B(K)}.$$ 

Again the reverse inequality is easily proved by considering $P \otimes Q$ on elements of the form $h \otimes k \in H \otimes_1 K$. 

\end{document}
Lemma 39.22. Suppose that $P_m$ and $Q_m$ are orthogonal projections on $H$ and $K$ respectively which are strongly convergent to the identity on $H$ and $K$ respectively. Then $P_m \otimes Q_m : H \otimes_1 K \to H \otimes_1 K$ also converges strongly to the identity in $H \otimes_1 K$.

Proof. Let $A = \sum_{n=1}^{\infty} \lambda_n h_n \otimes k_n \in H \otimes_1 K$ as in Eq. (39.7). Then

$$ \| P_m \otimes Q_m A - A \|_1 \\ \leq \sum_{n=1}^{\infty} |\lambda_n| \| P_m h_n \otimes Q_m k_n - h_n \otimes k_n \|_1 \\ = \sum_{n=1}^{\infty} |\lambda_n| \| (P_m h_n - h_n) \otimes Q_m k_n + h_n \otimes (Q_m k_n - k_n) \|_1 \\ \leq \sum_{n=1}^{\infty} |\lambda_n| \{ \| P_m h_n - h_n \| \| Q_m k_n \| + \| h_n \| \| Q_m k_n - k_n \| \} \\ \leq \sum_{n=1}^{\infty} |\lambda_n| \{ \| P_m h_n - h_n \| + \| Q_m k_n - k_n \| \} \to 0 \text{ as } m \to \infty $$

by the dominated convergence theorem. \(\blacksquare\)
Proposition 40.3. Let $\mathcal{A}$ be an abelian $*$–subalgebra of $B(H)$ which is norm closed.

Example 40.1. Suppose $(X, M, \mu)$ is a $\sigma$–finite measure space, then $\mathcal{A} := L^\infty(\mu)$ is an abelian $*$–algebra where we view elements of $\mathcal{A}$ as acting on $L^2(\mu)$ by multiplication. Furthermore, if we suppose $\{a_i\}_{i=1}^n \subset \mathcal{A}$, then the norm closure of the $*$–algebra generated by $\{a_i\}_{i=1}^n$ consists of
\[
\{f(a_1, \ldots, a_n) : f \in C(\text{essran}_\mu((a_1, \ldots, a_n)))\}
\]
and the strong closure of the $*$–algebra generated by $\{a_i\}_{i=1}^n$ is
\[
\{f(a_1, \ldots, a_n) : f \in BM(\text{essran}_\mu((a_1, \ldots, a_n)))\}.
\]

Definition 40.2. The spectrum of an element $a \in \mathcal{A}$ is
\[
\sigma(a) = \{\lambda \in \mathbb{C} : a - \lambda \text{ is not invertible}\}.
\]
The resolvent set of $a$ is
\[
\rho(a) = \{\lambda \in \mathbb{C} : a - \lambda \text{ is invertible}\}.
\]
The spectral radius of $a$ is
\[
r(a) := \sup\{\|\lambda\| : \lambda \in \sigma(a)\}.
\]
(Note: We will show later that $\sigma(a) \neq \emptyset$.)

Proposition 40.3. For all $a \in \mathcal{A}$, $\sigma(a)$ is compact and $r(a) \leq \|a\|$.

Proof. Since $\lambda \in \mathbb{C} \rightarrow a - \lambda \in \mathcal{A}$ is continuous and $\rho(a) = \{\lambda : a - \lambda \in \mathcal{U}\}$, $\rho(a)$ is open and hence $\sigma(a) = \rho(a)^c$ is closed. If $|\lambda| > \|a\|$, then $\|\lambda^{-1}a\| < 1$ and hence $a - \lambda = (\lambda - 1)a - 1 \in \mathcal{U}$. Therefore if $|\lambda| > \|a\|$ then $\lambda \in \rho(a)$ from which we conclude that $r(a) \leq \|a\|$ and $\sigma(a)$ is compact.

Definition 40.4. The resolvent of $a$ is the function $R(\lambda) = (a - \lambda)^{-1}$ defined for $\lambda \in \rho(a)$.

Definition 40.5. A function $\varphi$ from an open set $V \subset \mathbb{C}$ to a complex Banach space is weakly analytic on $V$ if $\xi \circ \varphi$ is analytic on $V$ for every $\xi \in \mathcal{A}^*$.

Theorem 40.6. Let $\mathcal{A}$ be a complex Banach algebra with identity and let $a \in \mathcal{A}$. Then $R(\lambda) = (a - \lambda)^{-1}$ is weakly analytic on $\rho(a)$ and $\|R(\lambda)\| \rightarrow 0$ as $\lambda \rightarrow \infty$.

Proof. For $\lambda_0 \in \rho(a)$, $\xi \in \mathcal{A}^*$ and $\lambda \in \mathbb{C}$,
\[
a - \lambda = (a - \lambda_0)(1 - (a - \lambda_0)^{-1}(\lambda - \lambda_0)).
\]
So $a - \lambda$ is invertible when $\|(a - \lambda_0)^{-1}(\lambda - \lambda_0)\| < 1$ in which case
\[
R(\lambda) = (a - \lambda)^{-1} = \sum_{n=0}^{\infty} (a - \lambda_0)^{-n}(\lambda - \lambda_0)n(a - \lambda_0)^{-1}.
\]
Hence
\[
\xi(R(\lambda)) = \sum_{n=0}^{\infty} \xi((a - \lambda_0)^{-n-1})(\lambda - \lambda_0)^n
\]
which shows that $\xi(R(\lambda))$ is analytic near $\lambda_0$ and since $\lambda_0 \in \rho(a)$ and $\xi \in \mathcal{A}^*$ are arbitrary, $R(\lambda)$ is weakly analytic on $\rho(a)$. Since
\[
(a - \lambda)^{-1} = (\lambda - 1)^{-1} = (\lambda - 1)^{-1}(\lambda - 1)^{-1}
\]
and
\[
\|((\lambda - 1)^{-1})^{-1}\| \leq \frac{1}{1 - \|\lambda^{-1}\|}\rightarrow 1 \text{ as } \lambda \rightarrow \infty
\]
it follows that $\|R(\lambda)\| = O(\lambda^{-1}) \rightarrow 0$ as $\lambda \rightarrow \infty$.

Corollary 40.7. Let $\mathcal{A}$ be a complex Banach algebra with unit. Then $\sigma(x) \neq \emptyset$ for every $x \in \mathcal{A}$.

Proof. Suppose $\sigma(x)$ is empty. Then for any $\xi \in \mathcal{A}^*$, $\lambda \rightarrow \xi((x - \lambda)^{-1})$ is an entire function which vanishes as $\lambda \rightarrow \infty$. So by Liouville’s theorem, $\xi((x - \lambda)^{-1}) \equiv 0$ for all $\xi \in \mathcal{A}^*$ and $\lambda \in \mathbb{C}$. Taking $\lambda = 0$, we conclude that $x^{-1} = 0$ which is impossible.

Remark 40.8. Suppose that $a, b$ are commuting elements of $\mathcal{A}$, then $ab \in \mathcal{U}$ iff $a, b \in \mathcal{U}$. More generally if $a_i \in \mathcal{A}$ for $i = 1, 2, \ldots, n$ are commuting elements then $\prod_{i=1}^{n} a_i \in \mathcal{U}$ iff $a_i \in \mathcal{U}$ for all $i$. To prove this suppose that $c := ab \in \mathcal{U}$, then $c$ commutes with both $a$ and $b$ and hence $c^{-1}$ also commutes with $a$ and $b$. Therefore $1 = (c^{-1}a)b = b(c^{-1}a)$ which shows that $b \in \mathcal{U}$ and $b^{-1} = c^{-1}a$. Similarly one shows that $a \in \mathcal{U}$ as well and $a^{-1} = c^{-1}b$. The more general version is easily proved in the same way or by induction on $n$.
Theorem 40.9 (Spectral Mapping Theorem). If \( p : \mathbb{C} \to \mathbb{C} \) is a polynomial and \( a \in \mathbb{A} \) then \( p(\sigma(a)) = \sigma(p(a)) \).

**Proof.** Let \( \lambda_0 \in \sigma(a) \) and write \( p(\lambda) - p(\lambda_0) = (\lambda - \lambda_0)q(\lambda) \) where \( q \) is a polynomial of deg \( q = \deg p - 1 \). Since \( p(\lambda) - p(\lambda_0) = (a - \lambda_0)q(a) \) and \( a - \lambda_0 \) is not invertible, it follows by Remark 40.8 that \( p(\lambda) - p(\lambda_0) \notin \mathcal{U} \) and hence \( p(\lambda_0) \in p(\mathcal{U}) \). Thus \( p(\sigma(a)) \subseteq p(\sigma(a)) \). For the reverse inclusion, suppose \( \lambda_0 \in p(\sigma(a)) \) and write

\[
p(\lambda) - \lambda_0 = \alpha(\lambda - \lambda_1) \cdots (\lambda - \lambda_n)
\]

with \( \{\lambda_i\}_{i=1}^n \) being the roots of \( p(\lambda) - \lambda_0 = 0 \) and \( \alpha \in \mathbb{C}^\times \). Then

\[
\alpha(\lambda - \lambda_1)(\lambda - \lambda_2) \cdots (\lambda - \lambda_n) = p(\lambda) - p(\lambda_0) \notin \mathcal{U}
\]

implies by Remark 40.8 that \( \alpha - \lambda_1 \) is not invertible for some \( j \). That is \( \lambda_j \in \sigma(a) \) and therefore, \( \lambda_0 \in p(\lambda_j) \in p(\sigma(a)) \).

**Corollary 40.10.** For each \( n \in \mathbb{N} \) and \( a \in \mathbb{A} \), \( r(a^n) = r(a)^n \).

**Proof.** Using Theorem 40.9 and the definition of \( r \),

\[
r(a^n) = \sup\{|\lambda| : \lambda \in \sigma(a^n)\} = \sup\{|\lambda| : \lambda \in \sigma(a)^n\} = \sup\{|\lambda^n| : \lambda \in \sigma(a)\} = [\sup\{|\lambda| : \lambda \in \sigma(a)\}]^n = r(a)^n.
\]

**Corollary 40.11.** The spectral radius \( r(a) \) may be computed as

\[
r(a) = \lim_{n \to \infty} \|a^n\|^{1/n}.
\]

**Proof.** For \( \lambda \) sufficiently small:

\[
(1 - \lambda a)^{-1} = \sum_{n=0}^{\infty} a^n \lambda^n \quad \text{and} \quad \xi((1 - \lambda a)^{-1}) = \sum_{n=0}^{\infty} \xi(a^n) \lambda^n.
\]

By Theorem 40.6, \( \xi((1 - \lambda a)^{-1}) \) is analytic for \( \frac{1}{\lambda} \notin \sigma(a) \). Hence \( \sum_{n=0}^{\infty} \xi(a^n) \lambda^n \) converges when \( \frac{1}{\lambda} > r(a) \), i.e. when \( |\lambda| < 1/r(a) \). Thus \( \{|\lambda^n| : |\xi(a^n)| : n = 0, 1, 2, \ldots\} \) is a bounded set for each \( \xi \in \mathcal{A}^\times \) and so by the uniform boundedness principle \( K = \sup_{n \geq 0} ||a^n||^n \in \mathbb{R} \). Therefore, \( \|\lambda\| ||a^n||^n \leq K^{1/n} \) and letting \( n \to \infty \) we learn \( \lim \sup_{n} \|a^n\|^{1/n} = 1/|\lambda| \). Since this is true whenever \( r(a) < \frac{1}{|\lambda|} \), it follows

\[
\lim \sup_{n} \|a^n\|^{1/n} \leq r(a).
\]

Since \( r(a^n) = r(a^n) \leq \|a^n\| \) or \( r(a) \leq \|a^n\|^{1/n} \) we also have \( r(a) \leq \lim \inf \|a^n\|^{1/n} \). Consequently \( \lim \|a^n\|^{1/n} \) exists and \( r(a) = \lim \|a^n\|^{1/n} \).

**Theorem 40.12 (Gelfand – Mazur).** The only complex Banach algebra with unit which is a division algebra is \( \mathbb{C} \).

**Proof.** Let \( x \in \mathbb{A} \) and \( \lambda \in \sigma(x) \). Then \( x - \lambda 1 \) is not invertible. Thus \( x - \lambda 1 = 0 \) so \( x = \lambda 1 \). Therefore every element of \( \mathbb{A} \) is a complex multiple of 1, i.e. \( \mathbb{A} = \mathbb{C} \cdot 1 \).

Henceforth \( \mathcal{B} \) will denote a commutative Banach algebra with identity. (A good reference is Vol II of Dunford and Schwartz.)

**Definition 40.13.** An ideal \( I \subseteq \mathcal{B} \) is a maximal ideal if \( I \neq \mathcal{B} \) and there is no proper ideal in \( \mathcal{B} \) containing \( I \).

**Lemma 40.14.** Every proper ideal \( J \subseteq \mathcal{B} \) is contained in a (not necessarily unique) maximal ideal.

**Proof.** Let \( \mathcal{F} \) denote the collection of proper ideals of \( \mathcal{B} \) which contain \( J \). Order \( \mathcal{F} \) by set inclusion and notice that if \( \{J_a\}_{a \in \mathcal{A}} \) is a totally ordered subset of \( \mathcal{F} \) then \( I := \cup_{a \in \mathcal{A}} J_a \) is a proper ideal \( 1 \notin J_a \) for all \( \alpha \) containing \( J \), i.e. \( I \in \mathcal{F} \). So by Zorn’s Lemma, \( \mathcal{F} \) contains a maximal element \( I \) which is the desired maximal ideal.

**Definition 40.15.** 1. The radical of \( \mathcal{B} \) is the intersection of all the maximal ideals in \( \mathcal{B} \),

\[
\text{rad} (\mathcal{B}) = \cap \{I : I \text{ is a maximal ideal in } \mathcal{B}\}.
\]

2. \( \mathcal{B} \) is called semisimple if \( \text{rad} (\mathcal{B}) = \{0\} \).

3. A character of \( \mathcal{B} \) is a nonzero multiplicative linear functional on \( \mathcal{B} \), i.e. \( \alpha : \mathcal{B} \to \mathbb{C} \) is an algebra homomorphism so in particular \( \alpha(ab) = \alpha(a)\alpha(b) \).

(Note well that we do not assume \( \alpha \) is bounded.)

4. The spectrum of \( \mathcal{B} \) is the set \( \overline{\mathcal{B}} \) of all characters of \( \mathcal{B} \).

5. Let singular elements of \( \mathcal{B} \) be the set

\[
\mathcal{S} := \{x \in \mathcal{B} : x \text{ is not invertible}\} = \mathcal{B} \setminus \mathcal{B}^\times.
\]

Notice that \( \mathcal{S} \) is a closed subset of \( \mathcal{B} \).

**Lemma 40.16.** Suppose that \( T \in \text{End}(V) \) where \( V \) is a finite dimensional vector space over \( \mathbb{F} \). If \( T^{-1} \) exists, then \( T^{-1} = q(T) \) for some polynomial \( q(t) \in \mathbb{F}[t] \).

**Proof.** Let \( p(t) := \det (T - tI) \). Since \( p(0) = \det (T) \) we know that \( t \) divides \( p(t) - \det (T) \), i.e. there exists \( p_1(t) \in \mathbb{F}[t] \) such that

\[
p(t) = \det (T) + t \cdot p_1(t).
\]

We now make use of the standard fact that \( p(T) = 0 \) to learn, \( 0 = \det (T)I + Tp_1(T) \) or equivalently that \( T^{-1} = q(T) \) where \( q(t) := -p_1(t)/\det (T) \).
Remark 40.17 (Motivation for the term spectrum of a ring). Suppose that $V$ is a finite dimensional vector space over $F$ and $F[T] = \{ p(T) : p(t) \in F[t]\}$. Any element, $\Delta$, of $\text{spec}(A)$ is uniquely determined by $\lambda := \Delta(T) \in F$. Since $\Delta(I) = 1$ we have $\Delta(T - \lambda I) = 0$ and therefore $T - \lambda I$ is not invertible in $A$ which by Lemma 40.16 is equivalent to $T$ not being invertible in $\text{End}(V)$, i.e. $\lambda \in \sigma(T)$. Conversely if $\lambda \in \sigma(T)$, there exists $v \in V^\times$ such that $Tv = \lambda v$. Since $p(T)v = p(\lambda)v$, it follows that $\Delta(p(T)) := p(\lambda)$ for all $p(t) \in F[t]$ is well defined. It is clear that $\Delta(\lambda) \in \text{spec}(F[T])$ and therefore we have proved,

$$\text{spec}(F[T]) = \{ \Delta(\lambda) : \lambda \in \sigma(T) \} \cong \sigma(T).$$

Remarks 40.18 Let $B$ be a commutative Banach algebra with identity.

1. If $\{0\}$ is the only proper ideal in $B$ then $B$ is a field. Indeed if $a \in B$ let $(a)$ denote the ideal generated by $a$. If $a \neq 0$ we must have $(a) = B$ and in particular $a$ must be invertible. Moreover if $\mathbb{C} = \mathbb{C}$ we must have $B \cong \mathbb{C}$ by Theorem 40.12.

2. If $I$ is a maximal ideal in $B$ then $B/I$ is a field. This follows from 1. and the fact the ideals in $B/I$ are in one to one correspondence with ideals $J \subset B$ such that $I \subset J$.

3. If $B$ is complex and $I \subset B$ is a maximal ideal, then $B = I \oplus \mathbb{C} \cdot 1$. To prove this use 2. to see that $B/I$ is a field and then use Theorem 40.12 to conclude this field is isomorphic to $\mathbb{C}$, i.e. $B/I = \{ \lambda [1] : \lambda \in \mathbb{C} \}$, where $[b] := b + I$. Therefore if $b \in B$ we have $[b] = [\lambda] [1]$ for some $\lambda \in \mathbb{C}$, i.e. $[b - \lambda] = 0$, i.e. $b - \lambda \in I$, i.e. $B = I \oplus \mathbb{C} \cdot 1$. Finally notice that if $a \in I$ and $a + \lambda = 0$, then $a = -\lambda 1$ would be invertible if $\lambda \neq 0$ which is impossible as $I \subset S$. Therefore $\lambda = 0$ and $a = 0$ and hence $B = I \oplus \mathbb{C} \cdot 1$.

4. An element $a \in B$ is invertible iff $a$ does not belong to any maximal ideal. Indeed, if $a^{-1}$ exists then every ideal containing $a$ would contain $1 = a^{-1}a$ and hence would have to be $B$. Conversely, let $0 \neq a \in B$. If $(a) \subset B$ were a proper ideal then by Lemma 40.11 $a$ would be contained in a maximal ideal. Therefore we must have $(a) = B$ and hence $a$ is invertible.

5. We may summarize remark 4. by the identity, $S = \cup$ (maximal ideals).

6. If $a \in B$ then $\alpha(1) = 1$ because $\alpha(1^2) = \alpha(1)^2$ so $\alpha(1) = 0$ or $\alpha(1) = 1$. If $\alpha(1) = 0$ then $\alpha \equiv 0$ so $\alpha(1) = 1$.

7. If $I$ is a proper ideal in $B$ then $\bar{I}$ is a proper ideal. Here $\bar{I}$ denotes the closure of $I$. Proof: If $I$ is a subspace and if $b \in B$, $a \in \bar{I}$ and $a_n \to a$ then $ba = \lim b_a n \in \bar{I}$. Hence $\bar{I}$ is an ideal. Since $I \subset S$ and $S$ is closed, therefore $\bar{S} \subset S$ so $\bar{I}$ is proper. (Alternatively, if $\bar{I}$ then there would exist $a \in I$ such that $\|1 - a\| < 1$ in which case we would have $a \in B^\times$ and hence $B = (a) \subset I$. So $I$ was not a proper ideal to begin with.)

8. If $I$ is a maximal ideal then $I = \bar{I}$.

9. The radical of $B$ is closed.

Exercise 40.1. (BRUCE: This is done in detail in Subsection 31.1.2 below.) Let $B$ be a Banach space and $K$ a closed subspace.

1. On the quotient space $B/K$ define $\|x + K\| = \inf \{ \|y\| : y \in x + K \}$. Prove this is a norm on $B/K$ and that $B/K$ is a Banach space in this norm.

2. Suppose further that $B$ is a Banach algebra with identity and $K$ is a closed proper two sided ideal in $B$. Show that $B/K$ is a Banach algebra in the norm described in part (1).

Exercise 40.2. Prove that if $B$ is a Banach space and $\xi$ is a linear functional on $B$ then $\xi$ is continuous $\Leftrightarrow$ $\text{Null} \xi$ is closed.

Proposition 40.19. Every character $\alpha$ of $B$ is continuous and moreover $\|\alpha\| \leq 1$ with equality if $\|1\| = 1$.

Proof. If $\|\alpha\| > 1$, then there exists $a \in B$ such that $\|a\| < 1$ while $\alpha(a) = \lambda \geq 1$. Since $\|\lambda^{-1}a\| < 1$, $1 - \lambda^{-1}a$ is invertible and therefore, because $\alpha$ is multiplicative,

$$0 \neq \alpha(1 - \lambda^{-1}a) = 1 - \lambda^{-1} \alpha(a).$$

But this is a contradicts $\alpha(a) = \lambda$.

Alternative proof. If $\alpha$ is a character of $B$ then $I := \{ a : \alpha(a) = 0 \} = \text{Null}(\alpha)$ is an ideal which is proper since $\alpha(1) = 1$. For any $a \in B$ we have:

$$a = (a - \alpha(1)) + \alpha(a)1 \in I \oplus \mathbb{C}1. \quad (40.1)$$

This shows that $I$ has codimension 1 (i.e., $\dim(B/I) = 1$). So $I$ is maximal and thus $I$ is closed. Hence $\alpha$ is continuous by Exercise 40.2. Let $a \in B$, then

$$\|\alpha(a)\|^n = |\alpha(a^n)| \leq \|\alpha\| \|a^n\| \leq \|\alpha\| \|a\|^n.$$  

Hence

$$|\alpha(a)| \leq \|a\|^{1/n} \|a\| \to \|a\| \quad \text{as} \quad n \to \infty,$$

which shows $\|\alpha\| \leq 1$.  

Corollary 40.20. $\bar{B}$ is a $w^*$ closed subset of the unit ball in $B^*$. In particular, $\bar{B}$ is a compact Hausdorff space in the $w^*$ topology.  

\footnote{Alternatively, $\alpha$ descends to an algebra isomorphism of $B/I \to \mathbb{C}$ showing that $\dim(B/I) = 1$.}
Proof. Since \( \{ \xi \in \mathcal{B}^* : \xi(ab) = \xi(a)\xi(b) \} \) for \( a, b \in \mathcal{B} \) fixed and \( \{ \xi \in \mathcal{B}^* : \xi(1) = 1 \} \) are closed in the \( w^* \)-topology,

\[
\tilde{B} = \{ \xi \in \mathcal{B}^* : \xi(1) = 1 \} \cap \bigcap_{a,b \in B} \{ \xi \in \mathcal{B}^* : \xi(ab) = \xi(a)\xi(b) \}
\]

is \( w^* \) - closed – being the intersection of closed sets. Since \( \tilde{B} \) is a closed subset of a compact Hausdorff space (namely the unit ball in \( \mathcal{B}^* \) with the \( w^* \) - topology), \( \tilde{B} \) is a compact Hausdorff space as well.

**Remark 40.21.** If \( \mathcal{B} \) is a commutative Banach algebra without identity and we define a character as a continuous nonzero homomorphism \( \alpha : \mathcal{B} \to \mathbb{C} \). Then the preceding arguments show that \( \tilde{B} \subseteq \text{(unit ball of } \mathcal{B}^*) \) but may not be closed because 0 is a limit point of \( \tilde{B} \). In this case \( \tilde{B} \) is locally compact.

**Lemma 40.22.** There is a one to one correspondence between characters and maximal ideals given by \( \alpha \to \text{Nul } \alpha \).

**Proof.** If \( \alpha \) is a character of \( \mathcal{B} \) then \( I = \text{Nul } \alpha \) is an ideal which is proper since \( \alpha(1) = 1 \). It is maximal since \( \alpha \) descends to an algebra isomorphism of \( \mathcal{B}/I \to \mathbb{C} \) showing that \( \dim (\mathcal{B}/I) = 1 \). (Alternatively, Eq. 40.1) shows that \( I \) has codimension 1, i.e., \( \dim (\mathcal{B}/I) = 1 \). Since \( \mathcal{B}/I \) has not proper ideals \( I = \text{Nul } \alpha \) is maximal. Conversely if \( I \subseteq \mathcal{B} \) is a maximal ideal, then the map \( [\lambda] \in \mathcal{B}/I \mapsto \lambda \in \mathbb{C} \) is an isomorphism of fields. Let \( \alpha := \beta \circ \pi : \mathcal{B} \to \mathbb{C} \) where \( \pi : \mathcal{B} \to \mathcal{B}/I \) is the canonical projection. By Exercise 40.1, \( \pi \) is algebra homomorphism and hence \( \alpha \) is a character with \( \text{Nul } \alpha = I \). Finally notice that if \( \alpha \) and \( \beta \) are characters of \( \mathcal{B} \) with \( \text{Nul } \alpha = \text{Nul } \beta \), then \( \alpha = \beta \). Indeed, every element \( a \in \mathcal{B} \) is of the form \( a = \lambda 1 \text{mod } I \), so \( \alpha(a) = \lambda = \beta(a) \) on such an element.

**Notation 40.23** Terminology: \( \tilde{B} \) is sometimes called the maximal ideal space of \( \mathcal{B} \).

**Definition 40.24.** Let \( \alpha \in \mathcal{B} \), \( \alpha \in \tilde{B} \). Define \( \hat{\alpha}(\alpha) = \alpha(a) \). Then \( \hat{\alpha} \) is a continuous function on \( \tilde{B} \). The map \( a \to \hat{\alpha} \) is called the canonical mapping of \( \mathcal{B} \) into \( C(\tilde{B}) \).

**Theorem 40.25 (Gelfand).** Let \( \mathcal{B} \) be a commutative Banach algebra with identity. The canonical mapping \( \hat{\alpha} : \mathcal{B} \to C(\tilde{B}) \) is a contractive homomorphism from \( \mathcal{B} \) into \( C(\tilde{B}) \) with kernel equal to \( \text{rad} (\mathcal{B}) \) – the radical of \( \mathcal{B} \).

**Proof.** Let \( a, b \in \mathcal{B} \) and \( \alpha \in \tilde{B} \). Since

\[
\hat{\alpha}(ab) = \alpha(ab) = \alpha(a)\alpha(b) = \hat{\alpha}(\alpha)(a),
\]

\( \hat{\alpha} \) is a homomorphism. Moreover, \( |\hat{\alpha}(\alpha)| = |\alpha(a)| \leq \|a\| \) for all \( \alpha \in \tilde{B} \). Hence \( \|\hat{\alpha}\|_\infty \leq \|a\| \), i.e. canonical mapping is a contraction. Finally, \( \hat{\alpha} = 0 \) iff \( \alpha(a) = 0 \) for all \( \alpha \in \tilde{B} \) iff \( a \) is in every maximal ideal, i.e. iff \( a \in \text{rad} (\mathcal{B}) \).

**Remarks 40.26 (Continuation of Remarks 40.18)** Let \( \mathcal{B} \) be a commutative Banach algebra with identity. Then:

1. \( \hat{\alpha}(1) = \alpha(1) = 1 \) for all \( \alpha \in \tilde{B} \), so \( \hat{\alpha} \) is the constant function \( 1 \in C(\tilde{B}) \).
2. Let \( \mathcal{R}(\hat{\alpha}) = \hat{\alpha}(\mathcal{B}) = \{ \alpha(a) : a \in \mathcal{B} \} \) be the range of \( \hat{\alpha} \), then

\[
\sigma(a) = \mathcal{R}(\hat{\alpha}) = \{ \alpha(a) : a \in \tilde{B} \}.
\]

(Poetically this says the spectrum of \( a \in \mathcal{B} \) is \( \hat{\alpha} \) applied to the spectrum of \( \mathcal{B} \), so \( \mathcal{B} \) is the “mother” of all spectrums.) To prove this assertion, notice that \( a \in \mathcal{B}^* \) iff \( a \) is not in any maximal ideal which is equivalent to \( \alpha(a) = \hat{\alpha}(\alpha) \neq 0 \) for each \( \alpha \in \tilde{B} \). Therefore,

\[
\lambda \in \sigma(a) \iff a - \lambda 1 \text{ is in some maximal ideal}
\]

\[
\iff \exists \alpha \in \tilde{B} \ni a - \lambda 1 = 0
\]

i.e., \( \hat{\alpha}(\alpha) = \alpha(a) = \lambda \) for some \( \alpha \in \tilde{B} \).

3. Noting that if \( p \) is a polynomial and \( a \in \mathcal{B} \) and \( \alpha \in \tilde{B} \),

\[
\hat{\alpha}(p(a)) = p(\hat{\alpha}(a)) = p(\alpha(a)),
\]

the Spectral Mapping Theorem 40.7 is a consequence of item 2 as follows:

\[
\sigma(p(a)) = \mathcal{R}(\hat{\alpha}(p(a))) = \mathcal{R}(\hat{\alpha}(p)) = p(\mathcal{R}(\hat{\alpha})) = p(\sigma(a)).
\]

4. Item 2 also implies \( r(a) = \|\hat{\alpha}\|_\infty \leq \|a\| \) which then shows \( r \) satisfies

\[
r(a + b) \leq r(a) + r(b) \text{ and } r(ab) \leq r(a)r(b).
\]

5. Since \( a \in \text{rad} (\mathcal{B}) \) iff \( \hat{\alpha}(a) = 0 \) iff \( \|\hat{\alpha}\|_\infty = 0 \) iff \( r(a) = 0 \), we find

\[
\text{rad}(\mathcal{B}) = \{ a \in \mathcal{B} : r(a) = 0 \} = \{ a \in \mathcal{B} : \sigma(a) = \{ 0 \} \}.
\]

6. The canonical map \( \hat{\alpha} : \mathcal{B} \to C(\tilde{B}) \) is an isometry (i.e. \( \|\hat{\alpha}\|_\infty = \|a\| \) for all \( a \in \mathcal{B} \) iff \( \|a\|^2 = \|a\|^2 \) for all \( a \in \mathcal{B} \). To prove this notice that, by item 4., recall \( \|\hat{\alpha}\|_\infty = \|a\| \) is equivalent to \( r(a) = \|a\| \). Now if \( \|a\|^2 = \|a\|^2 \) for all \( a \in \mathcal{B} \), then \( \|a\|^2 = \|a\|^2 \) for all \( a \in \mathcal{B} \) and hence \( \|a\| = \|a\|^{2^n} \) for all \( n \) and hence \( \|a\| = \|a\|^2 = \|a\|^2 \) for all \( a \in \mathcal{B} \).

Remind \( n \to \infty \) then shows \( \|a\| = r(a) = r(a) \) for all \( a \in \mathcal{B} \). Conversely, if \( r(a) = \|a\| \) for all \( a \in \mathcal{B} \) then

\[
\|a\|^2 = r(a^2) = r(a)^2 = \|a\|^2
\]

for all \( a \in \mathcal{B} \).

**Remark 40.27.** If \( \mathcal{B} \) does not have a unit then a similar theory can be developed in which \( \tilde{B} \) is locally compact.
40.1 ∗-Algebras (over complexes)

Definition 40.28. An involution ∗ on a Banach algebra B is a map a ∈ B → a* ∈ B satisfying:
1. involutory \( a^{**} = a \)
2. additive \( (a + b)^* = a^* + b^* \)
3. conjugate homogeneous \( (\lambda a)^* = \overline{\lambda} a^* \)
4. anti-automorphic \( (ab)^* = b^* a^* \)

Notice that we automatically have 1* = 1 because applying * to the equation \( 1 \cdot 1^* = 1^* \cdot 1 = 1^{**} \). Thus \( 1 \cdot 1^* = 1 \). So \( 1^* = 1 \).

For now on let B be a Banach algebra with involution, ∗.

Definition 40.29. An element a is Hermitian if \( a = a^* \), strongly positive if \( a = b^* b \) for some b, positive if \( \sigma(a) \subset [0, \infty) \) and real if \( \sigma(a) \subset \mathbb{R} \) is real.

Definition 40.30. An involution ∗ in a Banach algebra B with unit is symmetric if \( 1 + a^* a \) is invertible for all \( a \in B \). A Banach algebra B equipped with a symmetric involution will be called a symmetric Banach algebra.

Proposition 40.31. Let B be a symmetric Banach algebra and \( a \in B \).

1. If \( a \) is Hermitian then \( a \) is real.
2. If \( a \) is strongly positive then \( a \) is positive.

Proof. (1) Suppose \( a \) is Hermitian \( (a^* = a) \) and \( \lambda = \alpha + \beta i \in \mathbb{C} \) with \( \beta \neq 0 \).

We must show \( a - \lambda \) is invertible. Since
\[
a - \lambda = (a - \alpha) - \beta i = \beta \left( \frac{a - \alpha}{\beta} - i \right),
\]
we must show that \( a = a^* \) implies \( a - i \) is invertible. But
\[
(a - i)(a + i)(1 + a^* a)^{-1} = 1 \quad \text{and} \quad (1 + a^* a)^{-1}(a - i)(a - i) = 1
\]
which shows \( a - i \) is invertible. (2) Suppose that \( a \) is strongly positive, \( a = b^* b \).

Then \( a^* = b^* b = a \) showing that \( a \) is Hermitian and hence by (1) that \( \sigma(a) \subset \mathbb{R} \).

Let \( a < 0 \), then
\[
b^* b - a = -\alpha \left( \frac{b^* b}{-\alpha} + 1 \right) = -\alpha \left( \frac{b}{\sqrt{-\alpha}} \right)^* \left( \frac{b}{\sqrt{-\alpha}} \right) + 1
\]
which is invertible showing \( \sigma(a) \subset [0, \infty) \).

Proposition 40.32. Let B be a commutative ∗ algebra with unit. The following are equivalent:

1. \( B \) is symmetric
2. Hermitian ⇒ real
3. \( a^* (a) = \overline{(a)} (a) \)
4. Every maximal ideal of \( B \) is a ∗- ideal, i.e. an ideal closed under the involution ∗.

Proof. 1) ⇒ 2) This is Proposition 40.31. 2) ⇒ 3) Let \( a \in B, \; b = a + a^* \) and \( c = i(a - a^*) \). Then \( b \) and \( c \) are Hermitian and hence \( \sigma(b) \subset \mathbb{R} \) and \( \sigma(c) \subset \mathbb{R} \).

Therefore by Remark 40.26 if \( \alpha \) is a character then \( \alpha(b) \) and \( \alpha(c) \) are real numbers. Hence
\[
\overline{\alpha(a)} + \alpha(a^*) = \alpha(a) + \alpha(a^*),
\]
and
\[
-\overline{i(\alpha(a) - \alpha(a^*))} = i(\alpha(a) - \alpha(a^*)),
\]
or equivalently
\[
\overline{\alpha(a)} - \alpha(a^*) = -\alpha(a) + \alpha(a^*).
\]

Adding Eqs. (40.2) and (40.3) shows \( \overline{\alpha(a)} = \alpha(a^*) \). 3) ⇒ 4) Let \( I \) be a maximal ideal and \( \alpha \) be the character whose kernel is \( I \). Then \( a \in I \) implies \( \alpha(a) = 0 \) and therefore \( \alpha(a^*) = \alpha(a) = 0 \), i.e. \( a^* \subset \overline{I} \).

1) Let \( a \in B \). We first prove that if \( \alpha \) is a character then \( \alpha(a^*) = \overline{\alpha(a)} \). To see this let \( b = a - \alpha(a) \) so that \( \alpha(b) = \alpha(a) - \alpha(a) = 0 \). This shows \( b \in \text{Nul}(\alpha) \) and since \( \text{Nul}(\alpha) \) is a maximal ideal, \( a^* - \alpha(a) = b^* \in \text{Nul}(\alpha) \). Hence \( 0 = \alpha(a^*) - \overline{\alpha(a)} \) which shows \( \alpha(a^*) = \overline{\alpha(a)} \).

Because of what we just proved,
\[
\alpha(a^*) = \alpha(a^*) \alpha(a) = \overline{\alpha(a)} \alpha(a) = |\alpha(a)|^2
\]
for any character \( \alpha \) and thus
\[
\alpha(1 + a^* a) = 1 + |\alpha(a)|^2 \neq 0.
\]

Therefore \( 1 + a^* a \) is not in any maximal ideal and hence \( 1 + a^* a \) is invertible.

Remark 40.33 (Stone–Weierstrass theorem). Recall if \( T \) is a compact Hausdorff space and \( B \) is a norm closed ∗ subalgebra contained in \( C(T) \) such that given \( \xi_1, \xi_2, t_1 \neq t_2 \) there exists \( x \in B \) such that \( x(t_1) = \xi_1, x(t_2) = \xi_2 \), then \( B = C(T) \) (∗ = conjugation).

Theorem 40.34. If \( B \) is commutative, symmetric (with unit), the image of \( B \) under the canonical map is dense in \( C(B) \).

Proof. Let \( \xi_1, \xi_2 \in \mathbb{C} \) and \( \alpha_1 \neq \alpha_2 \in \overline{B} \). Choose \( a \in B \) so that \( \alpha_1(a) \neq \alpha_2(a) \) and let \( \lambda, \mu \in \mathbb{C} \) solve the equations
\[
\lambda \alpha_1(a) + \mu = \xi_1, \quad \lambda \alpha_2(a) + \mu = \xi_2.
\]
Hence if \( b := \lambda a + \mu \), then \( \tilde{b}(\alpha_1) = \xi_1 \) and \( \tilde{b}(\alpha_2) = \xi_2 \). This shows \( \bar{B} \subset C\left(\tilde{B}\right) \) separates points and since \( \tilde{B} \) is also closed under conjugation by Proposition 40.32, the theorem follows from the Stone–Weierstrass theorem.

**Definition 40.35.** A Banach * algebra \( B \) is

1. * multiplicative if \( \|a^*a\| = \|a\|^2 \|a\| \)
2. * isometric if \( \|a^*\| = \|a\| \)
3. * quadratic if \( \|a^*a\| = \|a\|^2 \)

**Remark 40.36.** Conditions 1) and 2) in Definition 40.35 are equivalent to condition 3), i.e. * is multiplicative & isometric iff * is quadratic.

**Proof.** Clearly * is multiplicative & isometric implies that * is quadratic. For the reverse implication we have

\[
\|a\|^2 = \|a^*a\| \leq \|a\|^2 \|a\|. \tag{40.4}
\]

Replacing \( a \) by \( a^* \) in \( \|a\| \leq \|a^*\| \) then shows that \( \|a^*\| = \|a\| \), i.e. condition 2) holds. Using this identity in Eq. (40.4) shows that the inequality in Eq. (40.4) must be an equality, i.e. condition 1) holds as well.

**Definition 40.37.** A \( B^\ast – \) algebra is a quadratic * algebra. So \( B \) is a \( B^\ast – \) algebra if \( B \) is a Banach algebra with involution * such that \( \|a^*a\| = \|a\|^2 \) for all \( a \in B \). (In current language, this is now called a \( C^\ast – \) algebra.)

**Lemma 40.38.** If \( B \) is a commutative *–multiplicative Banach algebra with identity then

\( \|a\| = r(a) \) for all \( a \in B \).

**Proof.** If \( b \) is Hermitian, then \( \|b^2\| = \|b\|^2 \|b^2\| = \|b\|^2 \). Hence \( r(b) = \|b\| \).

Let \( a \) be arbitrary. Since \( a^*a \) is Hermitian we have

\[
r(a^*a) = \|a^*a\| = \|a^*\| \|a\|
\]

\( \|a^*\| \|a\| = r(a^*a) \leq r(a^*)r(a) \) by Remark 40.26

So

\[
\|a^*\| \|a\| \leq \|a\|^2 \|r(a)\|.
\]

Hence \( \|a\| \leq r(a) \) and since, by Remark 40.26 \( r(a) \leq \|a\| \) we have \( \|a\| = r(a) \).

**Lemma 40.39.** A commutative \( B^\ast \) algebra with identity is symmetric and semi–simple.

**Proof.** We show \( a^* = a \Rightarrow \sigma(a) \) real. As in Proposition 40.31 it suffices to prove \( a - i \) is invertible, i.e., \( 1 + ia \) is invertible, i.e., \( 1 \notin \sigma(-ia) \). This is equivalent to \( \lambda + 1 \notin \sigma(\lambda - ia) \) for some real \( \lambda \). But if \( \lambda + 1 \in \sigma(\lambda - ia) \), then

\[
(\lambda + 1)^2 \leq \|\lambda - ia\|^2 = \|\lambda + ia\|^2 \leq \lambda^2 + a^2 \leq \lambda^2 + \|a\|^2.
\]

Hence \( 2\lambda + 1 \leq \|a\|^2 \). But, this inequality fails for \( \lambda \) large enough. The semi–

**Theorem 40.40.** If \( B \) is a commutative \( B^\ast \) algebra with identity, then the canonical map \( : B \to C(\tilde{B}) \), is an isometric isomorphism onto \( C(\tilde{B}) \).

**Proof.** (Proof of Theorem 40.40.) By Lemma 40.39 and Theorem 40.34 the image of \( B \) is dense in \( C(\tilde{B}) \) under the canonical map. By Lemma 40.38 the image is complete, hence closed, hence equal to \( C(\tilde{B}) \) and the canonical map is therefore an isometric isomorphism onto \( C(\tilde{B}) \).

**Corollary 40.41.** A commutative \( B^\ast \) algebra with identity is isometrically isomorphic to the algebra of complex valued continuous functions on a compact Hausdorff space.

Should put here Corollary 11 of Dunford and S. Vol II on p. 877 here. This is more natural when dealing with a single \( a \in \mathcal{B} \). The corollary states:

**Corollary 40.42.** Let \( a \) be an element of a commutative \( B^\ast \) algebra with identity \( \mathcal{B} \) and let \( B^\ast(a) \) be the smallest closed \( B^\ast – \) subalgebra containing \( a \) and 1 \( \in \mathcal{B} \). Then \( B^\ast(a) \) is isometrically * equivalent to the algebra \( C(\mathcal{B}) \).
homomorphisms. To understand this map more explicitly, suppose $p(w, z)$ is a polynomial on $\mathbb{C}^2$, then by Eq. (40.5),

$$
\hat{p}(\hat{a}, \hat{a}^*) = p(\hat{a}, \hat{a}^*) = (z \rightarrow p(z, \bar{z})) \circ \hat{a}.
$$

This shows the map described above is determined by

$$
p(a, a^*) \in B^*(a) \rightarrow (z \in \sigma(A) \rightarrow p(z, \bar{z})) \in C(\sigma(a))
$$

for all polynomials $p$ on $\mathbb{C}^2$.

### 40.1.1 Exercises

In each of the following two problems a commutative $*$ algebra $A$ with identity is given. In each case

1. Find the spectrum of $A$.
2. Determine whether $A$ is semi–simple or symmetric or a $B^*$ algebra, or several of these.
3. Determine whether the Gelfand map is one to one, or onto or both or neither or has dense range.

**Exercise 40.3.** $A = $ all $2 \times 2$ complex matrices of the form $A = \begin{pmatrix} a & b \\ 0 & a \end{pmatrix}$. Define $A^* = \begin{pmatrix} \bar{a} & \bar{b} \\ 0 & \bar{a} \end{pmatrix}$. Define $\|A\|$ to be the operator norm where $\mathbb{C}^2$ is given the norm $\|\begin{pmatrix} c \\ d \end{pmatrix}\| = (|c|^2 + |d|^2)^{1/2}$.

**Exercise 40.4.** $A = \ell^1(\mathbb{Z})$ where $\mathbb{Z}$ is the set of all integers. For $f$ and $g$ in $A$ define

$$
(fg)(x) = \sum_{n=-\infty}^{\infty} f(x-n)g(n)
$$

and $f^*(x) = \overline{f(-x)}$. Show first that $A$ is a commutative $*$ Banach algebra with identity. You may cite any results from Rudin’s “Real and Complex Analysis”.

**Exercise 40.5.** Let $X$ be a compact Hausdorff space. Show that $C(X)$ in sup norm and pointwise multiplication is a $B^*$ algebra with respect to the $*$ operation given by $f^*(x) = \overline{f(x)}$. For each $x \in X$ let

$$
\alpha_x(f) = f(x), \quad f \in C(X).
$$

Prove that the map $x \rightarrow \alpha_x$ is a homeomorphism of $X$ onto the spectrum of $C(X)$.

**Exercise 40.6.** Using the previous problem show that if $X$ and $Y$ are compact Hausdorff spaces and $\varphi: C(X) \rightarrow C(Y)$ is an algebraic, $*$ preserving, isomorphism of these algebras then there exists a unique homeomorphism $T: Y \rightarrow X$ which induces $\varphi$. I.e., such that

$$(\varphi f)(y) = f(Ty), \quad y \in Y, \quad f \in C(X).$$

**Exercise 40.7.** If $A$ is an $n$–dimensional commutative $B^*$ algebra with identity show that the spectrum of $A$ consists of exactly $n$ points ($n < \infty$).
40.2 The Spectral Theorem

Let $A$ be a bounded operator on a complex Hilbert space $H$. If $y$ is in $H$, the map $x \rightarrow (Ax, y)$ is a continuous linear functional on $H$. Hence, by the Riesz representation theorem, there exists a unique element $z$ in $H$ such that $(Ax, y) = (x, z)$ for all $x$ in $H$. Define $A^*$ by $A^*y = z$. Thus $A^*$ is defined for all $y$ in $H$ and satisfies

$$(Ax, y) = (x, A^*y) \quad x, y \in H. \quad (40.6)$$

If $\alpha, \beta$ are scalars then for all $x$

$$(x, A^*(\alpha y_1 + \beta y_2)) = (Ax, \alpha y + \beta y_2) \quad \text{by } (40.6)$$

$$= \overline{\alpha}(Ax, y_1) + \overline{\beta}(Ax, y_2)$$

$$= (x, \alpha A^*y_1 + \beta A^*y_2) \quad \text{by } (40.6) \text{ again.}$$

Therefore $A^*$ is linear.

Put $x = A^*y$ in $(40.6)$ to get

$$||A^*y||^2 = (AA^*y, y) \leq ||A|| ||A^*y|| ||y||$$

Therefore

$$||A^*y|| \leq ||A|| ||y||.$$ 

Hence $A^*$ is bounded with $||A^*|| \leq ||A||$. Now $A^*$ is uniquely determined by equation $(40.6)$ and taking the complex conjugate of $(40.6)$, we see $A^{**} = A$. Hence $||A|| \leq ||A^*||$. Thus we have the following properties.

Properties 40.43

1. $A^*$ is linear and bounded and $||A^*|| = ||A||$
2. $A^{**} = A$
3. $(\alpha A + \beta B)^* = \overline{\alpha}A^* + \overline{\beta}B^*$ (exercise).
   a) $||AB|| \leq ||A|| ||B||$
   b) $(AB)^* = B^*A^*$
5. Recall: The set $B(X)$ of all bounded operators on $X$ is a Banach algebra in operator norm whenever $X$ is a Banach space.

Definition 40.44. A $C^*$ algebra on a Hilbert space is a subalgebra $A$ of $B(H)$ which is closed in norm and such that $A \subset A \Rightarrow A^* \subset A$. $A$ subalgebra closed under taking adjoints is called a $*$ subalgebra of $B(H)$.

Example 40.45. $B(H)$ is a $C^*$ algebra. (It is now known that every $B^*$ algebra (see Definition 40.37) may be faithfully represented as a $C^*$ algebra. Definition 40.44 is now referred to as a concrete $C^*$ algebra.

Definition 40.46. A maximal abelian self-adjoint (m.a.s.a.) algebra on $H$ is a commutative algebra $A \subset B(H)$ which is not contained in any larger commutative subalgebra and such that $A$ is a $*$ subalgebra.

Notation 40.47. The commutator algebra of a subset $S \subset B(H)$ is the subalgebra (as the reader should verify) $S'$ of $B(H)$ defined by

$$S' = \{A \in B(H) : [A, B] = 0 \forall B \in S\}$$

Proposition 40.48. For any subset $S \subset B(H)$, $S'$ is w.o.t. closed. If $S$ is $*$ closed then so is $S'$. Indeed if $A \in S'$ then, since $S$ is $*$ closed,

Proof. Since

$$([A, B] x, y) = (ABx, y) - (Ax, B^*y),$$

then map $A \rightarrow ([A, B] x, y)$ is w.o.t. continuous. Hence the set $\{A \in B(H) : ([A, B] x, y) = 0\}$ is w.o.t. closed and therefore so is

$$S' = \cap_{x,y \in H} \cap_{B \in S} \{A \in B(H) : ([A, B] x, y) = 0\}.$$

If $S$ is a $*$ closed subset of $B(H)$ and $A \in S'$, then

$$[A^*, B] = [B^*, A]^* = 0$$

for all $B \in S$ which shows $S'$ is also $*$ closed.

Definition 40.49 (von Neumann Algebra). A von Neumann algebra is a $*$ closed and w.o.t. closed sub-algebra $A$ of $B(H)$.

By Proposition 40.48, $A = S'$ is a von Neumann algebra for any $*$ closed subset, $S$, of $B(H)$. The next theorem shows that these are the only examples.

Theorem 40.50 (von Neumann's double commutant theorem). Suppose $A \subset B(H)$ is a $*$ closed sub-algebra. Then the following are equivalent.

1. $A = A''$.
2. $A$ is a von-Neumann algebra, i.e. $A$ is w.o.t. closed.
3. $A$ is self closed.

Proof. Since $A$ is $*$ closed, $A'$ is $*$ closed and therefore as we have just observed $A''$ is a von-Neumann algebra so 1 $\implies$ 2. Since every w.o.t. closed set is also self closed, 2 $\implies$ 3. 3 $\implies$ 2. By definition every element of $A$ commutes with every element of $A'$ and thus $A$ is always a subset of $A''$. So to prove $A = A''$, it suffices to show $A$ is self-closed in $A''$ because then
A = \tilde{A}' = A''. Thus we must show for every \(A \in A''\), \(\{x_i\}_{i=1}^n \subset H\) and \(\varepsilon > 0\) there exists a \(B \in A\) such that

\[
\sum_{i=1}^n \|Ax_i - Bx_i\|^2 < \varepsilon^2. \tag{40.7}
\]

To indicate the idea of the proof let us first assume \(n = 1\) and write \(x = x_1\) and let \(H_x := \overline{Ax^H}\). Notice that for \(A \in A\) we have

\[
A(Ax) \subset Ax \subset H_x
\]

and hence \(Ax \subset A^{-1}(Ax)\) which implies

\[
H_x = \overline{Ax} \subset A^{-1}(H_x)
\]

since \(A^{-1}(H_x)\) is closed because \(A\) is continuous and \(H_x\) is closed. Thus we have shown \(AH_x \subset H_x\) for all \(A \in A\), i.e. \(H_x\) is invariant under the action of \(A\). Since \(A\) is a *-algebra, it follows that \(H_x^{\perp}\) is also \(A\) invariant. Letting \(e_x : H \to H_x\) be orthogonal projection, we have shown \(e_x \in A'\). Hence if \(A \in A''\), then \([A, e_x] = 0\) which implies \(A \in A''\) leaves \(H_x\) invariant. Therefore given \(\varepsilon > 0\), there exists \(B \in A\) such that \(\|Ax - Bx\| < \varepsilon\). For the general case, let \(x = (x_1, \ldots, x_n) \in H^n\) and for \(A \in B(H)\) let \(\hat{A} : H^n \to H^n\) be given by \(\hat{A}x = (Ax_1, \ldots, Ax_n)\). Further let \(\hat{A}x := \{\hat{A}x : A \in A\}\), \(H_x := \overline{Ax}\) and \(e_x : H^n \to H^n\) be orthogonal projection onto \(H_x\). Working as above we again see that \(H_x\) and \(H_x^{\perp}\) are \(A\) - invariant subspaces and therefore \([A, e_x] = 0\) for all \(A \in A\). Writing \(e_x\) in block diagonal form as \(e_x = (e_{ij})_{i,j=1}^n\) so that

\[
(e_{xy})_{ij} = \sum_{j=1}^n e_{ij}y_j
\]

for \(y = (y_1, \ldots, y_n)\). The condition \([\hat{A}, e_x] = 0\) is equivalent to

\[
0 = (\hat{A}e_{xy} - e_x \hat{Ay})_i = \sum_{j=1}^n A(e_{ij}y_j - e_{ij}Ay_j) = \sum_{j=1}^n [A, e_{ij}] y_j \text{ for all } i \text{ and } y \in H^n.
\]

That is \([\hat{A}, e_x] = 0\) iff \([A, e_{ij}] = 0\) for all \(i, j\), i.e. \(e_{ij} \in A'\). Hence if \(A \in A''\), we will have \([\hat{A}, e_x] = 0\) and therefore \(\hat{A}\) leaves \(H_x\) - invariant. Working analogously as above this implies there exists \(B \in A\) such that \(\|Ax - Bx\|_{H^n} < \varepsilon\) which is precisely Eq. \(40.7\).
Therefore then $\in A$. \( H \) subspace of Definition 40.57.

If $\notin$ has no infinite atoms.

Prove that the spectrum of Exercise 40.8.

Together the result to get the general case.

\( \{ \)

with $X = \cup_{j=1}^{\infty}X_j$, where the $X_j$ are disjoint subsets of finite measure. If $T$ is in $M'$ it commutes with $M_{x_j}$ and therefore leaves invariant the subspace $L^2(X_j)$ which we identify with $\{ f \in L^2(X) : f = 0 \text{ off } X_j \}$. Apply the finite measure case and piece together the result to get the general case.

**Definition 40.56.** Let $D(w, \varepsilon) = \{ z \in \mathbb{C} : |z - w| < \varepsilon \}$, then if $f \in L^\infty(X, \mu)$ the essential range of $f$ is

$$\{ w \in \mathbb{C} : \mu(f^{-1}(D(w, \varepsilon))) > 0 \text{ for all } \varepsilon > 0 \}.$$ 

**Exercise 40.8.** Prove that the spectrum of $M_f = \text{essential range of } f$ when $X$ has no infinite atoms.

**Definition 40.57.** If $\mathcal{A}$ is a subalgebra of $\mathcal{B}(H)$ a vector $x$ in $H$ is called a cyclic vector for $\mathcal{A}$ if $Ax := \{ Ax : A \in A \}$ is dense in $H$.

**Remark 40.58.** Let $\mathcal{A}$ be any $\ast$ subalgebra of $\mathcal{B}(H)$. Suppose $K$ is a closed subspace of $H$ and $P$ is the projection on $K$. Then $K$ is invariant under $\mathcal{A}$ iff $P \in \mathcal{A}'$.

**Proof.** $(\Rightarrow)$ If $P \in \mathcal{A}'$, $x \in K$ then $Ax = APx = PAPx \notin K$. $(\Rightarrow)$ If $AK \subset K$ then $APx \in K$. Therefore $APx = PAPx$. Also, $A^\ast P = P A^\ast$. Therefore $PA = P A = (A^\ast P)^\ast = (PA^\ast P)^\ast = PAP = AP$. Hence $P \in \mathcal{A}'$.

**Lemma 40.59.** If $H$ is separable and $\mathcal{A}$ is a m.a.s.a. on $H$ then $\mathcal{A}$ has a cyclic vector.

**Proof.** For any $x \in H$, let $\overline{Ax}$ be the closed subspace containing $Ax$. Since $I \in A$, $x \in Ax$. Since $Ax$ is invariant under $\mathcal{A}$, so is $\overline{Ax}$. Note that if $y \perp Ax$ then $Ay \perp Ax$ since $(Ay, Bx) = (y, A^\ast Bx) = 0$. Let $E = \{ x_\alpha \}$ be an orthonormal set such that $Ax_\alpha \perp Ax_\beta$ if $\alpha \neq \beta$. Each such set exists (e.g. singletons). Zorn’s lemma gives us a maximal such set. For this $E$, $H = \text{closed span}_n \{ Ax_\alpha \}$ for otherwise we could adjoin $E$ to $\text{span}_n \{ Ax_\alpha \}$ in (span$\{Ax_\alpha\}$)$. Now, since $H$ is separable, $E$ is countable; $E = \{ x_1, x_2, \ldots \}$ put $z = \sum_{n=1}^{\infty} 2^{-n}x_n$. Claim: $z$ is a cyclic vector for $\mathcal{A}$. The projection $P_n$ onto $\overline{Ax_n}$ is in $\mathcal{A}'$ by the above remark. Therefore $P_n \in \mathcal{A} = \mathcal{A}'$.

\[ \begin{align*}
\therefore \quad Ax \supset AP_n z &= A2^{-n}x_n = Ax_n \forall n \\
\therefore \quad \overline{Ax} \supset \text{closed span}_n \{ Ax_n \} = H.
\end{align*} \]

**Definition 40.60.** A unitary operator $U$ from Hilbert space $H$ to Hilbert space $K$ is a linear operator from $H$ onto $K$ such that $\|Ux\| = \|x\|$ for all $x \in H$.

We may emphasize that $U : H \rightarrow K$ is surjective by writing $U : H \rightarrow K$.

**Theorem 40.61.** Let $\mathcal{A}$ be a m.a.s.a. on separable Hilbert space $H$. Then there exists finite measure space $(X, \mu)$ and a unitary operator $U : H \rightarrow L^2(X, \mu)$ such that $U A U^{-1} = \mathcal{M}(X, \mu)$.

**Proof.** Let $z$ be a unit cyclic vector for $\mathcal{A}$. Then $z$ is also a separating vector for $\mathcal{A}$ (i.e., if $A \in \mathcal{A}$ and $Az \neq 0$ then $A = 0$) since if $Az = 0$ then for all $B \in \mathcal{A}$, $ABz = BAZz = 0$. Therefore $AAz = 0$. But $Az$ is dense. Therefore $A = 0$. We have seen that $\mathcal{A}$ is a $B^\ast$ algebra. Let $X = \text{spectrum}(\mathcal{A})$. Then the Gelfand map $A \in \mathcal{A} \rightarrow \hat{A} \in C(X)$ is an isometric isomorphism. Define $A$ on $C(X)$ by

$$A(\hat{A}) = (Az, z)$$

$A$ is clearly a bounded linear functional on $C(X)$. Indeed, $|A(\hat{A})| \leq \|A\| = \|\hat{A}\|$. $A$ is positive since

$$A(\hat{A}\hat{A}) = (A^\ast Az, z) = \|Az\|^2 \geq 0$$

Therefore there exists a unique regular Borel measure $\mu$ on $X$ such that

$$A(\hat{A}) = \int \hat{A}d\mu$$

$\mu(X)$ is finite because

$$\mu(X) = \int 1d\mu = A(1) = \|z\|^2 = 1.$$ 

Define $U_0$ on $Az$ by

$$U_0Az = \hat{A}.$$ 

$U_0$ is well defined since $Az = 0$ implies $A = 0$. Therefore $U_0$ is linear and densely defined. Moreover

$$\|U_0Az\|^2 = \int \hat{A}\hat{A}d\mu = A(\hat{A}\hat{A}) = (Az, Az) = \|Az\|^2.$$ 

Hence $U_0$ is isometric from $Az$ into $L^2(X, \mu)$. Since $U_0$ is continuous it extends by continuity to an operator $U : H \rightarrow L^2(X, \mu)$ such that

$$\|Ux\| = \|x\| \quad \forall x \in H$$

Since range$(U)$ is a complete (therefore closed) subspace of $L^2(\mu)$ which contains $C(X)$ it is all of $L^2(\mu)$. Now, if $A, B \in \mathcal{A}$ then
\[ UAU^{-1}B = UABz = \hat{A}B = M_{\hat{A}}B. \]

Therefore
\[ UAU^{-1} = M_{\hat{A}} \]  
(40.8)
on a dense set and thus, on all of \( L^2(\mu) \). Let \( N = UAU^{-1} \) and let \( M \) be the multiplication algebra of \( (X, \mu) \). Clearly \( N \subset M \) by (40.8). If \( T \in M \) then \( T \in N \), therefore \( U^{-1}TU \in A' \). But \( A' = A \) implies \( U^{-1}TU \in A \) which implies \( T \in N \). Thus \( M \subset N \) so that \( M = N \). \( \blacksquare \)

**Definition 40.62.** A bounded operator \( A : H \to H \) is

1. normal if \( A^*A = AA^* \)
2. Hermitian if \( A = A^* \)
3. unitary if \( A \) is onto and \( \|Ax\| = \|x\| \) for all \( x \in H \)
4. orthogonal if \( H \) is real and \( A \) is unitary.

**Proposition 40.63.** Let \( H \) be a Hilbert space. Suppose \( A : H \to H \) is linear and \((Ax, x) = 0\) for all \( x \in H \) then

(a) if \( H \) is complex then \( A = 0 \)
(b) if \( H \) is real and \( A^* = A \) then \( A = 0 \).

**Proof.** Polarization identity:
\[(A(x + y), x + y) - (A(x - y), (x - y)) = 2(Ax, y) + 2(Ay, x)\]
Therefore
\[(Ax, y) + (Ay, x) = 0 \quad \forall x, y \]  
(40.9)
If \( H \) is real and \( A^* = A \) then
\[(Ay, x) = (y, Ax) = (Ax, y). \]
Therefore \((Ax, y) = 0\) for all \( x, y \). Therefore \( Ax = 0 \), for all \( x \). If \( H \) is complex, replace \( x \) by \( ix \) in (40.9) to get
\[i(Ax, y) - i(Ay, x) = 0\]
Divide by \( i \) and add to (40.9) to get:
\[(Ax, y) = 0 \quad \forall x, y \quad \therefore Ax = 0 \quad \forall x. \]  
(40.10)

**Corollary 40.64.** An operator \( U : H \to H \) is unitary iff \( U \) is bounded and
\[ U^*U = UU^* = I \]  
(40.10)

**Proof.** Assume \( U \) is bounded and that (40.10) holds. Then \( \|Ux\|^2 = (U^*Ux, x) = \|x\|^2 \). Since \( U(U^*x) = x, U \) is onto. Therefore \( U \) is unitary. Assume \( U \) is unitary. Then
\[((U^*U - I)x, x) = \|Ux\|^2 - \|x\|^2 = 0\]
Therefore \( U^*U - I = 0 \). Since \( U \) is onto, \( (\forall x \in H)(\exists y \in H)(x = Uy) \). Therefore \( UU^*x = UU^*Uy = Uy = x \). Therefore \( UU^* = I \). \( \blacksquare \)

**Corollary 40.65.** Let \( (X, \mu) \) be a \( \sigma \)-finite measure space. Let \( f \in L^\infty(\mu) \). Then

1. \( M_f \) is normal
2. \( (M_f \text{ is Hermitian}) \iff (f \text{ is real a.e.}) \)
3. \( (M_f \text{ is unitary}) \iff (|f| = 1 \text{ a.e.}) \)

**Proof.** (1) \( M_f^*M_f = M_fM_f^* = M_fM_f^* \). Therefore \( M_f \) normal. (2) \( M_f^* = M_f \) \iff \( M_f = \overline{f} \text{ a.e.} \) (3) \( M_f^*M_f = I \) \iff \( M_fM_f^* = I \) \iff \( (\overline{f}f = 1 \text{ a.e.}) \)

**Theorem 40.66 (Spectral Theorem).** Let \( \{A_\alpha\}_{\alpha \in I} \) be a family of bounded normal operators on a complex separable Hilbert space. Assume that the family is a commuting set in the sense that:
\[ A_\alpha A_\beta = A_\beta A_\alpha \quad \forall \alpha, \beta \]
and
\[ A_\alpha A_\beta^* = A_\beta^* A_\alpha \quad \forall \alpha, \beta \]
Then there exists a finite measure space \( (X, \mu) \) and a unitary operator \( U : H \to L^2(X, \mu) \) and for each \( \alpha \) there exists a function \( f_\alpha \in L^\infty \) such that
\[ UA_\alpha U^{-1} = M_{f_\alpha}. \]

**Proof.** Let \( A_0 \) be the algebra generated by the \( \{A_\alpha, A_\alpha^*\}_{\alpha \in I} \). Then \( A_0 \) is a commutative * algebra. Order the set of all commuting self-adjoint algebras containing \( A_0 \) by inclusion. By Zorn’s lemma there exists a largest such algebra, \( A \). We assert that \( A = A' \). Indeed if \( B \in A' \) then \( B^* \in A' \) also because \( A \) is self-adjoint. Hence \( C := B + B^* \in A' \). But the algebra generated by \( A \) and \( C \) is commutative and self-adjoint. Therefore \( C \in A \). Similarly \( i(B - B^*) \in A \). Hence \( B \in A \). So \( A' = A \). Therefore \( A \) is maximal abelian and self-adjoint. Now by the preceding theorem there exists \( (X, \mu) \) with \( \mu(X) = 1 \) and a unitary \( U : H \to L^2(X) \) such that \( UAU^{-1} = M(X, \mu) \). Therefore \( UA_\alpha U^{-1} = M_{f_\alpha} \) for some \( f_\alpha \in L^\infty \). \( \blacksquare \)
40.2.1 Problems on the Spectral Theorem (Multiplication Operator Form)

Exercise 40.9. If \( A \) is a Hermitian operator on an \( n \)-dimensional unitary space \((n < \infty)\) \( V \) prove that there is an orthonormal basis of \( V \) which diagonalizes \( A \) by applying the theorem that a m.a.s.a. algebra is unitarily equivalent to a multiplication algebra.

Exercise 40.10. Let \( H \) be a Hilbert space with O. N. basis \( e_1, e_2, \ldots \). Let \( \theta_j \) be a sequence of real numbers in \((0, \pi/2)\). Let

\[
x_j = (\cos \theta_j)e_{2j} + (\sin \theta_j)e_{2j-1} \quad j = 1, 2, \ldots
\]

and

\[
y_j = -(\cos \theta_j)e_{2j} + (\sin \theta_j)e_{2j-1} \quad j = 1, 2, \ldots
\]

Let

\[
M_1 = \text{closedspan } \{x_j\}_{j=1}^{\infty} \quad \text{and} \quad M_2 = \text{closedspan } \{y_j\}_{j=1}^{\infty}.
\]

1. Show that the closed span of \( M_1 \) and \( M_2 \) (i.e., the closure of \( M_1 + M_2 \)) is all of \( H \).
2. Show that if \( \theta_j = 1/j \) then the vector

\[
z = \sum_{j=1}^{\infty} j^{-1} e_{2j-1}
\]

is not in \( M_1 + M_2 \), so that \( M_1 + M_2 \neq H \).

Exercise 40.11. Let

\( H = \ell^2(Z) = \{ \text{all square summable } 2\text{-sided complex sequences } a \text{ with } \|a\|^2 = \sum_{j=-\infty}^{\infty} |a_j|^2 \} \)

Define \( U : H \to L^2(-\pi, \pi) \) by

\[
(Ua)(\theta) = \frac{1}{\sqrt{2\pi}} \sum_{n=-\infty}^{\infty} a_n e^{in\theta}.
\]

It is well known that \( U \) is unitary. For \( f \) in \( \ell^1(Z) \) define

\[
(C_f a)_n = \sum_{k=-\infty}^{\infty} f(n-k)a_k.
\]

1. Show that \( C_f \) is a bounded operator on \( H \).
2. Find \( C_f^* \) explicitly and show that \( C_f \) is normal for any \( f \) in \( \ell^1(Z) \).
3. Show that \( UC_f U^{-1} \) is a multiplication operator.
4. Find the spectrum of \( C_f \), where

\[
f(j) = \begin{cases} 1 & \text{if } |j| = 1 \\ 0 & \text{otherwise} \end{cases}
\]

Exercise 40.12. Define \( f \) on \([0, 1]\) by

\[
f(x) = \begin{cases} 2 & \text{if } x \text{ is rational} \\ x & \text{if } x \text{ is irrational} \end{cases}
\]

Find the spectrum of \( M_f \) as an operator on \( L^2(0, 1) \).

Exercise 40.13. Find a bounded Hermitian operator \( A \) with both of the following properties:

1. \( A \) has no eigenvectors
2. \( \sigma(A) \) is set of Lebesgue measure zero in \( \mathbb{R} \).

Hint 1: Such an operator is said to have singular continuous spectrum.

Hint 2: Consider the Cantor set. See Rudin, 3rd Edition, Section 7.16.

Lemma 40.67. Suppose \( \pi : \mathcal{A} \to \mathcal{B} \) is a non-zero \( C^* \) – homomorphism, then \( \pi \) is automatically bounded and in fact \( \|\pi\| = 1 \). Moreover if \( \pi \) is injective then \( \pi \) is isometric.

Proof. By replacing \( \mathcal{A} \) by \( \mathcal{A}^\sim \) and \( \mathcal{B} \) with \( \mathcal{B}^\sim \) if necessary, we may assume that both \( \mathcal{A} \) and \( \mathcal{B} \) are unital. If \( a \in \mathcal{A} \) and \( \lambda \notin \sigma(a) \), then

\[
[\pi(a) - \lambda 1]^{-1} = \pi ((a - \lambda)^{-1}) \text{ exists in } \mathcal{B}
\]

and hence \( \lambda \notin \sigma(\pi(a)) \). Therefore, \( \sigma(\pi(a)) \subset \sigma(a) \) for all \( a \in \mathcal{A} \). In particular this implies \( r(\pi(a)) \leq r(a) \) for all \( a \in \mathcal{A} \) and hence

\[
\|\pi(a)\|^2 = \|\pi(a^*)\| = \|\pi(a^*a)\| = r(\pi(a^*a)) \leq r(a^*a) = \|a^*a\| = \|a\|^2
\]

which shows \( \|\pi\| \leq 1 \). Now suppose that \( \pi \) is injective yet there exists \( a \in \mathcal{A} \) such that \( \|\pi(a)\| < \|a\| \). This would imply

\[
s := \|\pi(a)\|^2 = \|\pi(a^*a)\| < \|a^*a\| = \|a\|^2 = : t.
\]

Let \( f(\tau) := (t-s)^{-1} \max(\tau-s, 0) \) so that \( f = 0 \) on \([0, s] \) and \( f(t) = 1 \). Then by approximating \( f \) by polynomials it follows that
\[ \pi(f(a^*) f(a)) = f(\pi(a) \pi(a^*)) = 0 \]

where the last equality follows because \( f|_{\sigma(\pi(a^*) a)} = 0 \). On the other hand \( f(a^* a) \neq 0 \) because \( f|_{\sigma(\pi(a))} \neq 0 \). But this contradicts the injectivity of \( \pi \). ■

Let \( a \in A \) be an element of a unital \( C^* \) algebra and \( C^*(a) \) the smallest \( C^* \) subalgebra of \( A \) containing \( a \), i.e. \( C^*(a) \) is the closure of the non-commutative polynomials in \( a \) and \( a^* \). Recall that \( a \) is normal then \( C^*(a) \) is a commutative \( C^* \) algebra and we have a \( C^* \) algebra isomorphism

\[ f \in C(\sigma(a)) \mapsto f(a) \in C^*(a) \]

defined by

\[ f(a) = \lim_{n \to \infty} p_n(a, a^*) \]

where \( p_n(z, w) \) are polynomials on \( \mathbb{C}^2 \) such that \( \lim_{n \to \infty} \sup_{z \in \sigma(a)} |f(z) - p_n(z, \bar{z})| = 0 \) which exist by the Weierstrass theorem. This is well defined and isometric because the spectral mapping theorem implies

\[ \|p(a)\| = \sup_{z \in \sigma(a)} |f(z) - p_n(z, \bar{z})| = \sup_{z \in \sigma(a)} |f(z)| = \|f\|_{\sigma(a)} \]

**Proposition 40.68.** Let \( A \) be a unital \( C^* \) algebra. If \( a \in A \) is invertible then \( a^{-1} \in C^*(a) \).

**Proof.** If \( a = a^* \) or \( a \) is normal, this follows from the spectral theorem described above. Indeed, \( 0 \notin \sigma(a) \) and therefore \( a^{-1} = f(a) \in C^*(a) \) where \( f(x) = 1/x \). For general \( a \in A \) invertible, \( a^* a \) is invertible and \( (a^* a)^{-1} = a^{-1} (a^{-1})^* \). By what we have just said,

\[ a^{-1} (a^{-1})^* = (a^* a)^{-1} \in C^*(a^* a) \subset C^*(a) \]

and therefore \( a^{-1} = a^{-1} (a^{-1})^* a^* \in C^*(a) \) as well. ■

### 40.3 Spectral Theory in Hilbert Space

Let \( H \) be a separable Hilbert space and \( A : H \to H \) be a bounded operator. The main point of this chapter is to show that if \( A = A^* \) (i.e. \( A \) is self-adjoint) then \( A \) unitarily equivalent to a multiplication operator. We also wish to develop the functional calculus of self-adjoint operators. Since we will eventually be considering unbounded operators here, let us begin with the relevant notions here.

**Definition 40.69.** If \( X \) and \( Y \) are Banach spaces and \( D \) is a subspace of \( X \), then a linear transformation \( T \) from \( D \) into \( Y \) is called a linear transformation (or operator) from \( X \) to \( Y \) with domain \( D \). If \( D \) is dense in \( X \), \( T \) is said to be densely defined.

**Notation 40.70** If \( S \) and \( T \) are operators from \( X \) to \( Y \) with domains \( D_S \) and \( D_T \) and if \( D_S \subset D_T \) and \( Sx = Tx \) for \( x \in D_S \), then we say \( T \) is an extension of \( S \) and write \( S \subset T \).

**Definition 40.71.** Let \( H \) be a Hilbert space. Let \( T : H \to H \) be linear and densely defined with domain \( D \). Define \( D_{T^*} \) as follows: \( y \in D_{T^*} \iff \text{the map } x \to (Tx, y) \text{ is continuous from } D \text{ to } \mathbb{C} \). For such \( y \) there exists a unique \( y^* \in H \) such that \( (Tx, y) = (x, y^*) \). We define \( T^* y = y^* \). Thus

\[ (Tx, y) = (x, T^* y) \quad \forall x \in D_T, \quad y \in D_{T^*}. \]

**Properties 40.72** \( D_{T^*} \) is a linear subspace. \( T^* \) is linear. (Same proof as for bounded case.) Even though \( D_{T^*} \) is dense, \( D_{T^*} \) need not be dense.

**Exercise 40.14.** Let \( H = L^2(0,1), \ D = C([0,1]) \). Let \( (Tf)(x) := f(0) = \text{constant function}. \) Then \( T \) is densely defined. \( T : D \to H \). Prove that \( D_{T^*} \) is not dense.

**Definition 40.73.** If \( A \) and \( B \) are operators on \( H \) define \( A + B \) on \( D_{A+B} := D_A \cap D_B \) by \( (A + B)x = Ax + Bx \) and \( AB \) on

\[ D_{AB} := \{ x \in D_B : Bx \in D_A \} = B^{-1}(D_A) \]

by \( (AB)x = A(Bx) \).

**Proposition 40.74 (Properties of sums and products).** Let \( A, B \) and \( C \) be operators on \( H \), then

1. \( A(BC) = (AB)C \)
2. \( (A + B)C = AC + BC \)
3. \( AB + AC \subset A(B + C) \) with equality if \( A \) is everywhere defined.

**Proof.** The only real issue to check in each of these assertions is that the domains of the operators on both sides of the equations are the same because it is easily checked that equality holds on the intersection of the domains of the operators on each side of the equation. For item 1. we have

\[ D_{(A(BC))} = \{ h \in D_{BC} : BCh \in D_A \} = \{ h \in D_C : Ch \in D_B \subset D_A \} \]

while

\[ D_{(AB)C} = \{ h \in D_C : Ch \in D_{AB} \} \subset \{ h \in D_C : Ch \in D_A \} \subset \{ h \in D_C : Ch \in D_B \} \]

For item 2.,

\[ D_{(A+B)C} = \{ h \in D_C : Ch \in D_{A+B} \} = \{ h \in D_C : Ch \in D_A \cap D_B \} = C^{-1}(D_A \cap D_B) \]

\[ (A+B)C \subset A(B+C) \]

while

\[ \mathcal{D}_{AC+BC} = \mathcal{D}_{AC} \cap \mathcal{D}_{BC} = \{ h \in \mathcal{D}_C : Ch \in \mathcal{D}_A \cap \mathcal{D}_B \} = C^{-1} (\mathcal{D}_A \cap \mathcal{D}_B). \]

For item 3.,

\[ \mathcal{D}_{AB+AC} = \mathcal{D}_{AB} \cap \mathcal{D}_{AC} = \{ h \in \mathcal{D}_B \cap \mathcal{D}_C : Bh \in \mathcal{D}_A \text{ and } Ch \in \mathcal{D}_A \} = B^{-1} (\mathcal{D}_A) \cap C^{-1} (\mathcal{D}_A) \]

\[ \subset \{ h \in \mathcal{D}_B \cap \mathcal{D}_C : Bh + Ch \in \mathcal{D}_A \} = \mathcal{D}_{A(B+C)}. \]

If we further assume that \( A \) is everywhere defined then

\[ \mathcal{D}_{AB+AC} = \mathcal{D}_B \cap \mathcal{D}_C = \mathcal{D}_{(B+C)}. \]

Let us end by remarking that the inclusion in item 3. may be strict. For example, suppose \( A = B = -C = \frac{d}{dx} \) with common domains being \( C^1_c(\mathbb{R}) \subset L^2(\mathbb{R}) \). Then

\[ \mathcal{D}_{AB+AC} = \{ h \in C^1_c(\mathbb{R}) : h' \in C^1_c(\mathbb{R}) \} = C^2_c(\mathbb{R}) \subsetneq C^1_c(\mathbb{R}) = \mathcal{D}_{A(B+C)}. \]

\[ \Box \]

**Proposition 40.75 (Properties of \(*\)).** Let \( A, B \) be densely defined operators and \( c \in \mathbb{C} \), then

1. \((cA)^* = cA^* \) if \( c \neq 0 \).
2. \((A^* + B^*) \subset (A + B)^* \) if \( A + B \) is densely defined.
3. \((AB)^* \supseteq B^*A^* \) if \( AB \) is densely defined.
4. If \( A \subset B \), then \( B^* \subset A^* \).
5. If \( A^* \) is densely defined then \( A \) is closed.
6. If \( A \) is closed then \( \text{Nul}(A) \) is closed.
7. \( \text{Nul}(A^*) = \text{ran}(A)^\perp \).
8. Suppose that \( A \) is closable then \( \text{ran}(A^*)^\perp = \text{Nul}(\bar{A}) \) or equivalently \( \text{ran}(A^*) = \text{Nul}(A)^\perp \).

**Proof.** Item 1. is easy and is left to the reader.

Item 2. \( x \in \mathcal{D}_{(A + B)^*} = \mathcal{D}_{A^*} \cap \mathcal{D}_{B^*} \), then for \( y \in \mathcal{D}_{A+B} = \mathcal{D}_A \cap \mathcal{D}_B \),

\[ ((A^* + B^*)x, y) = (A^*x, y) + (B^*x, y) = (x, Ay) + (x, By) = (x, (A + B)y). \]

This shows \( x \in \mathcal{D}_{(A + B)^*} \), and that \( (A^* + B^*)x = (A^* + B^*)x \).

Item 3. Let \( x \in \mathcal{D}_{B^*A^*} \) and \( z \in \mathcal{D}_{AB} \),

\[ (B^*A^*z, x) = (A^*x, Bz) \quad \text{(since } z \in \mathcal{D}_B) \]

\[ = (x, ABz) \quad \text{(since } Bz \in \mathcal{D}_A). \]

This shows, \( x \in \mathcal{D}_{(AB)^*} \), and \((AB)^*x = B^*A^*x \).

Item 4. Let \( x \in \mathcal{D}_{B^*} \) and \( y \in \mathcal{D}_A \subset \mathcal{D}_B \) then

\[ (B^*x, y) = (x, By) = (x, Ay) \]

which shows \( x \in \mathcal{D}_{A^*} \) and \( A^*x = B^*x \).

Item 5. Suppose that \( x_n \in \mathcal{D}_{A^*} \) such that \( x_n \to x \) and \( A^*x_n \to y \). Let \( z \in \mathcal{D}_A \), then

\[ (y, z) = \lim_{n \to \infty} (A^*x_n, z) = \lim_{n \to \infty} (x_n, Az) = (x, Az) \]

which shows \( x \in \mathcal{D}_{A^*} \) and \( A^*x = y \).

Item 6. If \( x_n \in \text{Nul}(A) \) and \( x_n \to x \), then \( Ax_n = 0 \to 0 \) as \( n \to \infty \) and therefore \( x \in \mathcal{D}_A \) and \( Ax = 0 \).

Item 7. \( y \in \text{ran}(A)^\perp \) iff \( (y, Ax) = 0 \) for all \( x \in \mathcal{D}_A \) iff \( y \in \text{Nul}(A^*) \).

Item 8. \( y \in \text{ran}(A^*)^\perp \) iff \( 0 = (y, A^*x) \) for all \( x \in \mathcal{D}_A^* \). This implies that \( y \in \mathcal{D}_{A^*}^\perp \) and \( A^{**}y = 0 \). Since \( A^{**} = A \), it follows that \( y \in \text{Nul}(A) \). Conversely if \( y \in \text{Nul}(A = A^{**}) \), then for all \( x \in \mathcal{D}_{A^*} \), we have

\[ (y, A^*x) = \langle \bar{A}y, x \rangle = 0, \]

i.e. \( y \in \text{ran}(A^*)^\perp \).

\[ \Box \]

**Exercise 40.15.** Prove Items 2. and 3. of Proposition 40.75 are equalities if \( A \) is bounded and everywhere defined.

### 40.3.1 Multiplication operators

Let \((X, M, \mu)\) be a \( \sigma \)-finite measure space and \( q : X \to \mathbb{C} \) be a measurable function. We will define \( M_q : L^2(\mu) \to L^2(\mu) \) to be the possibly unbounded operator defined by \( M_q f = q f \) for

\[ f \in \mathcal{D}(M_q) := \{ f \in L^2(\mu) : qf \in L^2(\mu) \}. \]

**Lemma 40.76.** Let \((X, M, \mu)\) and \( q \) be as above, then

1. \( M_q \) is bounded iff \( q \in L^\infty \) in which case \( \|M_q\| = \|q\|_{L^\infty(\mu)} \).
2. \( M_q^{-1} \) exists as a bounded operator iff \( q^{-1} \in L^\infty(\mu) \).
3. \( \sigma(M_q) = \text{essran}_\mu(q) \).
4. \( M_q \) is closed and \( M_q^* = M_{q^{-1}} \).
5. The following are equivalent:
   a) \( M_q^{-1} : L^2(\mu) \to L^2(\mu) \) exists in the algebraic sense, i.e. \( M_q : L^2(\mu) \to L^2(\mu) \) is a bijection.
The spectral radius \( \rho(A) \) is defined as the maximum value of the resolvent set \( \sigma(A) \).

**Theorem 40.77.** Suppose \( (X, \mathcal{M}, \mu) \) and \( (Y, \mathcal{N}, \nu) \) are two \( \sigma \)-finite measure spaces \( q : X \to \mathbb{C} \) and \( p : Y \to \mathbb{C} \) are two bounded measurable functions. Assume further there exists a unitary map \( U : L^2(\mu) \to L^2(\nu) \) such that \( UM_q = M_p U \), then

1. \( \text{essran}_\mu(q) = \text{essran}_\nu(p) := K \)
2. \( UM_{f(q)} = M_{f(p)} U \) for all bounded measurable functions \( f : K \to \mathbb{C} \)
3. If \( q \) and \( p \) are real valued we may drop the assumption that \( q \) and \( p \) are bounded.

**Proof.** Item (1) is a consequence of the fact that

\[
\text{essran}_\mu(q) = \sigma(M_q) = \sigma(M_p) = \text{essran}_\nu(p).
\]

When \( f \) is a polynomial on \( \mathbb{R} \), \( M_{f(q)} = f(M_q) \) and therefore

\[
UM_{f(q)} U^{-1} = Up(M_q) U^{-1} = p(U M_q U^{-1}) = p(M_p) = M_{f(p)}.
\]

An application of the Stone – Weierstrass theorem shows

\[
UM_{f(q)} U^{-1} = M_{f(p)} \quad (40.11)
\]

for all \( f \in C(K) \). If Eq. (40.11) holds for \( f_n : K \to \mathbb{C} \) and \( f_n \to f \) boundedly then \( M_{f_n(p)} \to M_{f(p)} \) and \( M_{f_n(q)} \to M_f(q) \) strongly so

\[
UM_{f_n(q)} U^{-1} = s- \lim_{n \to \infty} U M_{f_n(q)} U^{-1} = s- \lim_{n \to \infty} M_{f_n(p)} = M_{f(p)}.
\]

So by a standard measure – theoretic argument (See Theorem 40.83 below), item (2) is valid. For item (3), apply the results in items (1) and (2) to \( (q - i)^{-1} \) and \( (p - i)^{-1} \) respectively.

**40.3.2 Spectrum**

Let us recall Definition 40.2 in this setting.

**Definition 40.78.** Let \( A \in L(H) \). The spectrum of \( A \) is

\[
\sigma(A) = \{ \lambda \in \mathbb{C} : A - \lambda \text{ is not invertible} \}.
\]

The resolvent set of \( A \) is

\[
\rho(A) = \{ \lambda \in \mathbb{C} : A - \lambda \text{ is invertible} \}.
\]

The spectral radius of \( A \) is

\[
r(A) := \sup \{ |\lambda| : \lambda \in \sigma(A) \}.
\]
Recall that \( \sigma(A) \subset \mathcal{C}_0(\|A\|) \) and \( \sigma(A) \) is closed by the usual geometric series argument. Also recall by the open mapping Theorem \([31.20]\) if \((A - \lambda I)\) is invertible then \((A - \lambda I)^{-1}\) is bounded.

**Lemma 40.79.** Suppose that \( A \in L(H) \) is a normal operator, i.e. \([A, A^*] = 0\). Then \( \lambda \in \sigma(A) \) iff
\[
\inf_{\|\psi\|=1} \| (A - \lambda I)\psi \| = 0.
\]

**Proof.** By replacing \( A \) by \( A - \lambda I \) we may assume that \( \lambda = 0 \). If \( 0 \notin \sigma(A) \), then
\[
\inf_{\|\psi\|=1} \| A\psi \| = \inf_{\|\psi\|=1} \| A\psi \| = \inf_{\|\psi\|=1} \| \psi \| = 1/\|A^{-1}\| > 0.
\]

Now suppose that \( \inf_{\|\psi\|=1} \| A\psi \| = \varepsilon > 0 \) or equivalently we have
\[
\|A\psi\| \geq \varepsilon \|\psi\|
\]
for all \( \psi \in H \). Because \( A \) is normal,
\[
\|A\psi\|^2 = (A^*A\psi, \psi) = (AA^*\psi, \psi) = (A^*A\psi, A\psi) = \|A^*\psi\|^2.
\]
Therefore we also have
\[
\|A^*\psi\| = \|A\psi\| \geq \varepsilon \|\psi\| \quad \forall \psi \in H.
\]
This shows in particular that \( A \) and \( A^* \) are injective, Ran(\( A \)) is closed and
\[
\text{Ran}(A) = \overline{\text{Ran}(A)} = \text{Null}(A^*)^\perp = \{0\}^\perp = H.
\]
Therefore \( A \) is invertible. \( \blacksquare \)

**Example 40.80.** Let \( A \in L(H) \) be a (not necessarily) normal operator. The proof of Lemma \([40.79]\) gives \( \lambda \in \sigma(A) \) if Eq. \([40.12]\) holds. However the converse is not always valid unless \( A \) is normal. For example (Masha Gordina’s example), let \( S : \ell^2 \to \ell^2 \) be the shift, \( S(\omega_1, \omega_2, \ldots) = (0, \omega_1, \omega_2, \ldots) \), then for any \( \lambda \in \mathbb{D} := \{ z \in \mathbb{C} : |z| < 1 \} \),
\[
\| (S - \lambda) \psi \| = \| S\psi - \lambda \psi \| \geq \| S\psi \| - |\lambda| \| \psi \| = (1 - |\lambda|) \| \psi \|.
\]
However \( \sigma(S) = \mathbb{D} \). To see this it suffices to show \( \sigma(S^*) = \mathbb{D} \) where \( S^* \) is the adjoint of \( S \) given by
\[
S^*(\omega_1, \omega_2, \ldots) = (\omega_2, \omega_3, \ldots).
\]
Let us look for eigenfunctions of \( S^* \),
\[
(S^* - \lambda)(\omega_1, \omega_2, \ldots) = (\omega_2 - \lambda \omega_1, \omega_3 - \lambda \omega_2, \ldots)
\]
which is zero when \( \omega_2 = \lambda \omega_1, \omega_3 = \lambda \omega_2, \ldots \) \( \omega_n = \lambda^{n-1} \omega_1 \). Therefore we have produced an eigenvector, namely
\[
S^*(1, \lambda, \lambda^2, \ldots) = \lambda(1, \lambda, \lambda^2, \ldots).
\]

Since \((1, \lambda, \lambda^2, \ldots) \in \ell^2 \) if \(|\lambda| < 1 \), it follows that \( D \subset \sigma(S^*) \) and since \( \sigma(S^*) \) is closed, \( D \subset \sigma(S^*) \). Since \( \|S^*\| = 1 \), it then follows that \( \sigma(S^*) = D \) and hence \( \sigma(S) = D \).

**Lemma 40.81.** Suppose that \( A \in L(H) \) is self-adjoint (i.e. \( A = A^* \)) then \( \sigma(A) \subset \mathbb{R} \).

**Proof.** Suppose that \( A = A^* \) and \( \lambda = \alpha + i\beta \) with \( \alpha, \beta \in \mathbb{R} \), then
\[
\|(A + \alpha + i\beta) \psi \|^2 = \|(A + \alpha)\psi\|^2 + |\beta|^2 \| \psi \|^2 + 2 \text{Re}((A + \alpha) \psi, i\beta\psi)
\]
\[
= \|(A + \alpha)\psi\|^2 + |\beta|^2 \| \psi \|^2
\]
(40.13)

wherein we have used
\[
\text{Re}[i\beta((A + \alpha) \psi, \psi)] = \beta \text{Im}((A + \alpha) \psi, \psi) = 0
\]
since
\[
((A + \alpha) \psi, \psi) = (\psi, (A + \alpha) \psi) = ((A + \alpha) \psi, \psi).
\]
Eq. (40.13) along with Lemma \([40.79]\) shows that \( \lambda \notin \sigma(A) \) if \( \beta \neq 0 \), i.e. \( \sigma(A) \subset \mathbb{R} \). \( \blacksquare \)

**Remark 40.82.** It is not true that \( \sigma(A) \subset \mathbb{R} \) implies \( A = A^* \). For example let \( A = \begin{pmatrix} 0 & 1 \\ 0 & 0 \end{pmatrix} \) on \( \mathbb{C}^2 \), then \( \sigma(A) = \{0\} \) yet \( A \neq A^* \).

**Theorem 40.83.** Suppose that \( (X, d) \) is a metric space and \( \mathcal{M} = \sigma(\tau_d) \) is the Borel \( \sigma \) – algebra on \( X \) and \( \mathcal{H} \) is a subspace of \( \ell^\infty(X, \mathbb{R}) \) such that \( C_b(X, \mathbb{R}) \subset \mathcal{H} \) (\( C_b(X, \mathbb{R}) \) – the bounded continuous functions on \( X \)) and \( \mathcal{H} \) is closed under bounded convergence. Then \( \mathcal{H} \) contains all bounded \( \mathcal{M} \) – measurable real valued functions on \( X \). (This may be paraphrased as follows. The smallest vector space of bounded functions which is closed under bounded convergence and contains \( C_b(X, \mathbb{R}) \) is the space of bounded \( \mathcal{M} \) – measurable real valued functions on \( X \).)

**Corollary 40.84.** If \( X = K \) is a compact subset of \( \mathbb{R}^n \), then Theorem \([40.83]\) may be stated as above with \( C_b(X, \mathbb{R}) \) being replaced by the polynomial functions of \( \mathbb{R}^n \) restricted to \( K \).

**Proof.** Stone – Weierstrass Theorem. \( \blacksquare \)
40.3.3 Spectral Theorem and the Functional Calculus

Theorem 40.85 (Spectral Theorem). Suppose that $A$ is a bounded self-adjoint operator on $H$. Then there exists a probability space $(\Omega, \mathcal{M}, \mu)$, a unitary map $U : L^2(\mu) \to H$ and a real valued Borel – measurable function $q : \Omega \to \sigma(A)$ such that

$$UM_q = AU.$$  

Section 40.3.4 is devoted to the proof of this statement. Given a measurable set $K \subseteq \mathbb{R}$, let $\mathcal{B}^\infty(K)$ denote the bounded complex valued Borel measurable functions on $K$ and let $\mathcal{B}^\infty(K, \mathbb{R})$ denote the subspace of real valued functions. The following theorem is Theorem VII.2 on p.225 of Reed and Simon.

Theorem 40.86 (Functional Calculus). Suppose that $A$ is a bounded self-adjoint operator on $H$. Then there exists a unique map $\phi : \mathcal{B}^\infty(\sigma(A)) \to L(H)$ such that

1. $\phi$ is a $*$ – homomorphism, i.e. $\phi$ is linear, $\phi(fg) = \phi(f)\phi(g)$ and $\phi(f) = \phi(f)^*$ for all $f, g \in \mathcal{B}^\infty(\sigma(A))$.
2. $\|\phi(f)\| \leq \|f\|_\infty$.
3. $\phi(x) = A$ or equivalently $\phi(p) = p(A)$ for all polynomials $p$.
4. If $f_n \in \mathcal{B}^\infty(\sigma(A))$ and $f_n \to f$ pointwise and boundedly, then $\phi(f_n) \to \phi(f)$ strongly.

Moreover this map has the following properties

5. If $A\psi = \lambda \psi$ then $\phi(f)\psi = \phi(\lambda)\psi$.
6. If $f \geq 0$ then $\phi(f) \geq 0$.
7. If $B \in B(H)$ and $[B, A] = 0$ then $[B, \phi(f)] = 0$ for all $f \in \mathcal{B}^\infty(\sigma(A))$.

Proof. Let us begin with the uniqueness assertions. Suppose that $\psi : \mathcal{B}^\infty(\sigma(A)) \to L(H)$ is another map satisfying (1) – (4). Let $\mathcal{H}$ denote the collection of $f \in \mathcal{B}^\infty(\sigma(A), \mathbb{R})$ such that $\psi(f) = \phi(f)$. Then $\mathcal{H}$ is a linear space of bounded real valued functions containing all of the polynomials. By property (4) and the Stone – Weierstrass approximation theorem, it follows that $C(\sigma(A), \mathbb{R}) \subset \mathcal{H}$ as well and hence by Theorem 40.85, $\mathcal{H} = \mathcal{B}^\infty(\sigma(A))$. Therefore $\phi(f) = \psi(f)$ for all $f \in \mathcal{B}^\infty(\sigma(A), \mathbb{R})$. The fact that $\phi(f) = \psi(f)$ holds for all $f \in \mathcal{B}^\infty(\sigma(A))$ follows by linearity. (We do not seem to need to use $\phi(f) = \phi(f)^*$ nor property (2) in proving uniqueness.) To prove existence of $\phi$, let $(\Omega, \mathcal{M}, \mu, U, q)$ be as in the Spectral Theorem 40.85 and define

$$\phi(f) := UM_{f \circ q}U^{-1}$$

for all $f \in \mathcal{B}^\infty(\sigma(A))$.

Then it is routine to check that $\phi$ satisfies properties (1) – (4) of the theorem. If $\|f\| \geq 0$, then $\phi(f) = \phi(\sqrt{f})^2 \geq 0$. If $A\psi = \lambda \psi$ let $\mathcal{H}$ be linear sub-space of $\mathcal{B}^\infty(\sigma(A), \mathbb{R})$ such that $\phi(f)\psi = f(\lambda)\psi$. Then again one checks that $\mathcal{H}$ is closed under bounded convergence and contains all real polynomials and hence $\mathcal{H} = \mathcal{B}^\infty(\sigma(A), \mathbb{R})$. Item (5) now follows for complex $f \in \mathcal{B}^\infty(\sigma(A))$ by linearity. A similar argument works in the proof of item (7). Again one starts by letting $\mathcal{H}$ be linear sub-space of $\mathcal{B}^\infty(\sigma(A), \mathbb{R})$ such that $[B, \phi(f)] = 0$ when $f \in \mathcal{H}$. We then proceed as before to show $\mathcal{H} = \mathcal{B}^\infty(\sigma(A), \mathbb{R})$.

Suppose that $A$ is a bounded self-adjoint operator on $H$. Assuming for the moment that $A$ is a multiplication operator $M_q$ on $H = L^2((\Omega, \mathcal{M}, \mu))$, it is easy to see that for $f \in \mathcal{S}(\mathbb{R})$,

$$\phi(f) = M_{f \circ q} = M\int_{\mathbb{R}} \hat{f}(\xi)e^{i\xi A}d\xi = \int_{\mathbb{R}} \hat{f}(\xi)e^{i\xi A}d\xi$$

where the last two integrals are properly interpreted. There are in fact a number of ways to interpret $\int_{\mathbb{R}} \hat{f}(\xi)e^{i\xi A}d\xi$ and no matter which interpretation one takes we would find that

$$\phi(f) = \int_{\mathbb{R}} \hat{f}(\xi)e^{i\xi A}d\xi.$$  

We are going to use the simplest possible interpretation, namely that of Section 43.5 above. As an application of the identity \[33.13\] if $f, g \in \mathcal{S}$ and $A \in B(H)$ is a self-adjoint operator, then

$$\langle fg \rangle(A) = \int_{\mathbb{R}} \hat{f}(\xi)\hat{g}(\xi)e^{i\xi A}d\xi = \int_{\mathbb{R}} \hat{f}(\xi)\hat{g}(\xi)e^{i\xi A}d\xi = \int_{\mathbb{R}} \hat{f}(\xi)\hat{g}(\xi)e^{i\xi A}d\xi = \int_{\mathbb{R}} \hat{f}(\xi)\hat{g}(\xi)e^{i\xi A}d\xi = \int_{\mathbb{R}} \hat{f}(\xi)e^{i\xi A}d\xi \cdot \int_{\mathbb{R}} \hat{g}(\xi)e^{i\xi A}d\xi = f(A)g(A).$$

40.3.4 Fourier Transform Proof of Theorem 40.85

Now back to the original set up, i.e. $f \in \mathcal{S}$ and $A$ be a self-adjoint operator. Also let us fix an element $v \in H$.

Proposition 40.87. Let $\hat{U} : S \to H$ be defined by $\hat{U} := f(A)v$. Then

$$\|\hat{U}f\|^2 = \langle T_v, |f|^2 \rangle$$

for all $f \in S$ where $T_v = \mathcal{F}(\xi \to (e^{i\xi A}v, v)) \in S'$, i.e. $(T_v, \psi) = \int (e^{i\xi A}v, v) \hat{\psi}(\xi)d\xi$ for all $\psi \in S$. The distribution $T_v$ is real and positive.

Proof. For $v, w \in H$,
\[
(f(A)v, f(A)w) = \int_{\mathbb{R}^2} \left( \hat{f}(\xi)e^{ixA}v, \hat{f}(\eta)e^{i\eta A}w \right) d\xi d\eta = \int_{\mathbb{R}^2} \hat{f}(\xi)\hat{f}(\eta) \left( e^{i\xi A}v, e^{i\eta A}w \right) d\xi d\eta
\]

In particular, taking \( v = w \), we have

\[
(f(A)v, f(A)v) = \int_{\mathbb{R}} |f|^2(\xi) \left( e^{i\xi A}v, v \right) d\xi = \langle T_v, |f|^2 \rangle
\]

where \( T_v := \mathcal{F}(\xi \to (e^{i\xi A}v, v)) \in \mathcal{S}' \). Suppose that \( \psi \in \mathcal{S} \) is a real valued function, then

\[
\langle T_v, \psi \rangle = \int_{\mathbb{R}} (e^{i\xi A}v, v) \hat{\psi}(\xi) d\xi = \int_{\mathbb{R}} (e^{-i\xi A}v, v) \hat{\psi}(\xi) d\xi
\]

so \( T_v \) is real. To show \( T_v \) is positive, let \( p_t(x, t) \) be the usual heat kernel, then \( \sqrt{p_t(x, t)} \) is still a Gaussian function and hence \( \sqrt{p_t(x, t)} \in \mathcal{S} \). Therefore,

\[
\langle T_v, p_t(x, t) \rangle = \langle T_v, \sqrt{p_t(x, t)} \rangle^2 \geq 0 \quad \text{for all } x \in \mathbb{R} \text{ and } t > 0.
\]

Hence we have shown, \( T_v \ast p_t \geq 0 \) for all \( t \). It is known that if \( T \in \mathcal{S}' \), then \( T \ast p_t \to T \) in \( \mathcal{S}' \) as \( t \downarrow 0 \). This is easily proved in our situation as follows. Let \( \psi \in \mathcal{S} \), then

\[
\langle T_v \ast p_t, \psi \rangle = \left( \langle T_v, p_t(x, t) \rangle \right)^2 = \int_{\mathbb{R}} (e^{i\xi A}v, v) \hat{\psi}(\xi) d\xi
\]

and therefore,

\[
\langle T_v \ast p_t, \psi \rangle = \int_{\mathbb{R}} d\xi \langle T_v, \psi \rangle = \int_{\mathbb{R}} d\xi \left( e^{i\xi A}v, v \right) e^{-i\xi \cdot \hat{p}_t(\xi)} d\xi
\]

since \( \hat{p}_t(\xi) = e^{-t|\xi|^2/2} \to 1 \) as \( t \downarrow 0 \). So if \( \psi \geq 0 \), we find

\[
\langle T_v, \psi \rangle = \lim_{t \downarrow 0} \langle T_v \ast p_t, \psi \rangle \geq 0.
\]

\[\blacksquare\]

**Proposition 40.88.** There exists a unique positive radon measure \( \mu = \mu_v \) on \( \mathbb{R} \) such that \( \langle T_v, \psi \rangle = \int_{\mathbb{R}} \psi d\mu \) for all \( \psi \in \mathcal{D} := C_c^\infty(\mathbb{R}) \).

**Proof.** Let \( K \subset \mathbb{R} \) be a compact set and \( \psi \in C_c(\mathbb{R}, [0, \infty)) \) be a function such that \( \psi = 1 \) on \( K \). If \( f \in C_c^\infty(\mathbb{R}, \mathbb{R}) \) is a smooth function with \( \text{supp}(f) \subset K \), then \( 0 \leq \|f\|_\infty \psi - f \in \mathcal{S} \) and hence

\[
0 \leq \langle T_v, \|f\|_\infty \psi - f \rangle = \|f\|_\infty \langle T_v, \psi \rangle - \langle T_v, f \rangle
\]

and therefore \( \langle T_v, f \rangle \leq \|f\|_\infty \langle T_v, \psi \rangle \). Replacing \( f \) by \(-f\) implies, \( -\langle T_v, f \rangle \leq \|f\|_\infty \langle T_v, \psi \rangle \) and hence we have proved

\[
\langle T_v, f \rangle \leq C(\text{supp}(f)) \|f\|_\infty \quad (40.15)
\]

for all \( f \in \mathcal{D} := C^\infty(\mathbb{R}, \mathbb{R}) \) where \( C(K) \) is a finite constant for each compact subset of \( \mathbb{R} \). Because of the estimate in Eq. \((40.15)\), it follows that \( T_v|_{\mathcal{D}} \) has a unique extension \( \hat{T}_v \) to \( C_c(\mathbb{R}, \mathbb{R}) \) still satisfying the estimates in Eq. \((40.15)\) and moreover this extension is still positive. So by the Riesz–Markov theorem, there exists a unique Radon–measure \( \mu_v \) on \( \mathcal{S} \) such that such that \( \langle T_v, f \rangle = \mu_v(f) \) for all \( f \in C_c(\mathbb{R}, \mathbb{R}) \). \[\blacksquare\]

**Theorem 40.89.** Suppose that \( A \) is a bounded self-adjoint operator on a Hilbert space \( H \) and \( v \in H \) is a fixed vector. Let

\[
H_v := \{ p(A)v : p : \mathbb{R} \to \mathbb{R} \text{ is a polynomial} \}.
\]

\[\hspace{1cm} (40.16)\]

\( A_v := A|_{H_v} \) and \( Q := M_v \) where \( x \) is the standard coordinate on \( \mathbb{R} \). Then there exists a unique measure on \( \sigma(A_v) \) such that

\[
\langle p(A)v, v \rangle = \langle U_p, U_1 \rangle = \int_{\sigma(A_v)} p(x) d\mu(x) \quad (40.17)
\]

for all polynomials \( p : \mathbb{R} \to \mathbb{C} \) and a unique unitary map \( U = U_v : L^2(\sigma(A_v), \mu_v) \to H_v \) such that \( U_1 = v \) and \( UQ = AU \). Moreover,

\[
Uf(Q) = f(A)U
\]

for all \( f \in \mathcal{S} \), where \( f(Q) := M_f \).

**Proof.** For the moment let \( H_v := \{ f(A)v : f \in \mathcal{D} \} \) (we will see later this agrees with Eq. \((40.16)\) and define
$U f = \hat{U} f = f(A) v$ for all $f \in D$.

Then by Propositions 40.87 and 40.88 $\|U f\|^2 = \|f\|^2_{L^2(\mu_v)}$ for all $f \in D$. Hence by the B.L.T. theorem, $U$ extends uniquely to an isometry from $L^2(\mu_v)$ to $H$. We will continue to denote this extension by $U$. Let $C_\mu(x) = e^{i\lambda x}$ and $f \in C_c^\infty(\mathbb{R})$, then

$$C_{\lambda} f(\xi) = \int_{\mathbb{R}} e^{i\lambda x} f(x)e^{-i\xi x} dx = \hat{f}(\xi - \lambda)$$

so

$$(C_\lambda f)(A) = \int_{\mathbb{R}} e^{i\lambda x} \hat{f}(\xi - \lambda) d\xi = \int_{\mathbb{R}} e^{i(\xi + \lambda) A} \hat{f}(\xi) d\xi = e^{i\lambda A} f(A).$$

From this it follows by continuity that

$$UC_{\lambda} f = e^{i\lambda A U} f \text{ for all } f \in L^2(\mu_v).$$

A consequence of this formula is that $(i\lambda)^{-1}(C_\lambda f - f)$ is convergent in $L^2(\mu_v)$ as $\lambda \to 0$. Since $\lim_{\lambda \to 0} (i\lambda)^{-1}(C_\lambda f - f)(x) = xf(x)$ for $x \in X$, the $L^2$-limit of $(i\lambda)^{-1}(C_\lambda f - f)$ is equal to $Qf$, where $Q := M_x$. In particular $Qf \in L^2(\mu_v)$ for all $f \in L^2(\mu_v)$ and

$$UQf = H - \lim_{\lambda \to 0} (i\lambda)^{-1}(e^{i\lambda A U} f - f) = AUf \text{ for all } f \in L^2(\mu_v). \tag{40.18}$$

Because $H_v := \text{Ran}(U)$, Eq. (40.18) implies $H_v$ is an invariant subspace for $A$. In particular $A_v := A|_{H_v}$ may be thought of as a self-adjoint operator on $H_v$ and we have shown $U^{-1}A_v U = Q$ where we are now viewing $U$ as a unitary operator from $U \to H_v$. Hence by Theorem 40.77

$$\sigma(Q) = \sigma_v(A) := \sigma(A_v) \subset \sigma(A),$$

where the fact that $\sigma(A_v) \subset \sigma(A)$ is an easy consequence of Lemma 40.79. Since $Q$ is a multiplication operator,

$$\text{supp}(\mu_v) = \text{essran}_\mu(x) = \sigma(Q) = \sigma(A_v) \subset \sigma(A).$$

In particular, $\mu_v$ is actually a finite measure and hence polynomials are dense in $L^2(\mu_v)$. Since $H_v = \{ U f : f \in L^2(\mu_v) \}$ it follows that $H_v$ may be described by Eq. (40.16). Let us now show $U1 = v$. To do this let $\psi \in C_c^\infty(\mathbb{R})$ be a smooth function such that $\psi(0) = 1$ and set $\psi_R(x) := \psi(x/R)$. Then

$$\hat{\psi}_R(\xi) = \int_{\mathbb{R}} \psi(x/R)e^{-i\xi x} dx = R \int_{\mathbb{R}} \psi(x)e^{-i\xi x} dx = R \hat{\psi}(R\xi)$$

so that

$$\hat{\psi}(R\xi) = \int_{\mathbb{R}} \psi(x) e^{i\xi x} dx = R \int_{\mathbb{R}} \hat{\psi}(R\xi) e^{i\xi x} d\xi = \int_{\mathbb{R}} \hat{\psi}(\xi) e^{i\xi/R} d\xi.$$

Therefore using $\int_{\mathbb{R}} \hat{\psi}(\xi) d\xi = \psi(0) = 1$,

$$\|\psi_R(\xi) - I\| \leq \int_{\mathbb{R}} \|\hat{\psi}(\xi)\| e^{i\xi/R} d\xi \to 0 \text{ as } R \to \infty$$

by the dominated convergence theorem. Hence $U1 = \lim_{R \to \infty} \psi_R(\xi)v = v$. Since polynomials are dense in $L^1(\sigma(A_v), \mu_v)$ and

$$\int_{\sigma(A_v)} p(x) d\mu_v(x) = (UM_p1, U1) = (p(A)U1, U1) = (p(A)v, v)$$

the measure $\mu_v$ is uniquely determined by Eq. (40.17).

\[ \cdots \]

40.3.5 Proof of Theorem 40.85

Proof. Let $\{e_k\}_{k=1}^\infty$ be an orthonormal basis for $H$. Let $v_1 = e_1$ and $H_1 := H_{v_1}$. Let $v_2 = Q_1 e_k$ where $Q_1$ is orthogonal projection onto $H_1^\perp$ and $k$ is the first integer such that $Q_1 e_k \neq 0$. Define $H_2 := H_{v_2}$. Notice that $H_1$ and $H_2$ are invariant subspaces under $A$ and therefore

$$(p(A)v_1, q(A)v_2) = (v_1, p(A)q(A)v_2) = 0$$

for all polynomials $p$ and $q$. Hence $H_1$ and $H_2$ are orthogonal. Let $Q_2$ be orthogonal projection onto $(H_1 \oplus H_2)^\perp$ and $v_3 := Q_2 e_k$ where again $k$ is the first integer such that $Q_2 e_k \neq 0$. Let $H_3 = H_{v_3}$ and continue on inductively to find orthogonal direct sum decomposition of $H = \oplus_{i=1}^N H_i$ (with $N = \infty$ possible) into invariant subspaces each of which contains a cyclic vector $v_i \in H_i$. Let $A_i := A|_{H_i}$ and re-normalize $v_i$ so that $\sum_{i=1}^N \|v_i\|^2 = 1$. Let $A := \{1, 2, \ldots, N\} \cap \mathbb{N}$, $\Omega_i := \{i\} \times \sigma(A_i)$ and

$$\Omega := \{ (i, x) \in A \times \sigma(A) : x \in \sigma(A_i) \} = \bigcup_{i=1}^N \Omega_i.$$
Define the $\sigma$– algebra on $\Omega_i$ by identifying $\Omega_i$ with $\sigma(A_i)$ and then let $\mathcal{M}$ be the obvious conglomeration of these $\sigma$– algebras on $\Omega$. Define $\mu(A) = \mu_i(A)$ if $A \subset \Omega_i$, i.e.

$$\mu(A) = \sum_{i=1}^{N} \mu_i(A \cap \Omega_i)$$

for general $A$. Then $\mu$ is a probability measure on $(\Omega, \mathcal{M})$ and we have the Hilbert space isomorphism

$$f \in L^2(\Omega, \mu) \xrightarrow{\sim} \sum_{i=1}^{N} f_i \in \bigoplus_{i=1}^{N} L^2(\sigma(A_i), \mu_i)$$

where $f_i := f(i, \cdot)$. Define $U : L^2(\Omega, \mu) \to H$ by

$$Uf = \sum_{i=1}^{N} U_i f_i \in \bigoplus_{i=1}^{N} H_i = H$$

where $U_i = U_{i\nu}$ are the unitary maps described in Theorem 40.89. Under this unitary map $U$ we have

$$U1 = \sum_{i=1}^{N} \psi_i \in \bigoplus_{i=1}^{N} H_i = H$$

and if $q : \Omega \to \mathbb{R}$ is defined by $q(x, i) = x$, then

$$UM_q f = \sum_{i=1}^{N} U_i (q f)_i = \sum_{i=1}^{N} U_i q_i f_i = \sum_{i=1}^{N} AU_i f_i = AU f.$$ 

This completes the proof of Theorem 40.85. 

Lemma 40.90. Suppose that $A \in L(H)$ is a self-adjoint operator, then the following are equivalent:

1. $A \geq 0$
2. $\sigma(A) \subset [0, \infty)$ and
3. $A = B^2$ for some $B \geq 0$.

Proof. Suppose that $A \geq 0$. By Eq. 40.13 with $\beta = 0$ and $\alpha > 0$,

$$|(A + \alpha \psi)^2| = |A\psi|^2 + 2\alpha (A\psi, \psi) + |\alpha|^2 \|\psi\|^2 \geq |\alpha|^2 \|\psi\|^2$$

which implies by Lemma 40.79 $-\alpha \notin \sigma(A)$. That is to say $\sigma(A) \subset [0, \infty)$ and

$(1) \implies (2)$, $(2) \implies (3)$. Take $B = \sqrt{A}$ which exists by the functional calculus. $(3) \implies (1)$ is easy.

40.3.6 Extensions to commuting self-adjoint operators

Definition 40.91. An operator $N \in B(H)$ is normal if $N$ and $N^*$ commute, i.e. $[N, N^*] = 0$.

Proposition 40.92. Let $N \in B(H)$ then the following are equivalent:

1. $N$ is normal.
2. $N = A + iB$ where $A, B \in B(H)$ are commuting self-adjoint operators.
3. $\|Nh\|^2 = \|N^*h\|^2$ for all $h \in H$.

Moreover, if $N$ is normal, then $\|N\|^2 = \|N^2\|$ and $r(N) = \|N\|$, where $r(N)$ is the spectral radius of $N$.

Proof. 1. $\iff$ 2. For any $N \in B(H)$, $N = A + iB$ with $A = \frac{1}{2}(N + N^*)$ and $B = \frac{1}{2i}(N - N^*)$ being self-adjoint. Since $N$ is normal it follows that $[A, B] = 0$. The converse is a simple consequence of the formula $N^* = A - iB$.

1. $\implies$ 3. If $N$ is normal,

$$\|Nh\|^2 = \langle N^*Nh, h \rangle = \langle NN^*h, h \rangle = \|N^*h\|^2.$$

Conversely, from the above equation if 3. holds then

$$([N^*N - NN^*]h, h) = 0 \quad \forall \ h \in H$$

and since $[N^*N - NN^*]$ is self-adjoint, $N^*N - NN^* = 0$. If $N$ is normal, we have

$$\|N^2\|^2 = \sup_{\|h\|=1} \langle N^2h, N^2h \rangle = \sup_{\|h\|=1} \langle N^*Nh, N^*Nh \rangle = \|N^*N\|^2 = \|N\|^4,$$

i.e. $\|N^2\| = \|N\|^2$. By induction we then have

$$\|N^{2k}\| = \left\| \left( N^{2k-1} \right)^2 \right\| = \left\| N^{2k-1} \right\|^2 = \|N\|^{2k-2} = \|N\|^{2k}$$

and hence

$$r(N) = \lim_{k \to \infty} \left\| N^{2k} \right\|^{1/2k} = \|N\|$$

as claimed.

For this section, suppose that $A = (A_1, A_2, \ldots, A_n)$ is a collection of commuting bounded normal operators on $H$ and define

$$\sigma(A) := \{ \lambda \in \mathbb{R}^n : \sum_{i=1}^{n} (A_i - \lambda_i)^* (A_i - \lambda_i) \text{ is not invertible} \}.$$ 

Let $A \subset B(H)$ be the abelian $*$– algebra generated by $A$, i.e. elements of $A$ are of the form $p(A)$ where $p : \mathbb{C}^n \to \mathbb{C}$ is a polynomial. It will be convenient to also consider the closure, $\bar{A}$, of $A$. 

Page: 478  job: newanal  macro: svmomob.cls  date/time: 6-Jan-2012/17:01
Definition 40.93. A character of \( A \) is an element \( \Delta \in A^* \setminus \{0\} \) \((A^* \text{ being the continuous dual of } A)\) such that \( \Delta \) is multiplicative, i.e. \( \Delta(ab) = \Delta(a)\Delta(b) \). Let \( \sigma(A) \) denote the set of characters. \( \sigma(A) \) is referred to as the spectrum of \( A \), see Lemma [0.97] below for the motivation of this terminology.

Notice that \( \Delta(1) = \Delta(1^2) = \Delta^2(1) \) and hence \( \Delta(1) = 0 \) or 1. If \( \Delta(1) = 0 \) then \( \Delta(a) = \Delta(a)\Delta(1) = 0 \) for all \( a \in A \). Hence \( \Delta(1) = 1 \).

Theorem 40.94. A multiplicative linear functional \( \Delta \) on \( \hat{A} \) – the closure of \( A \) is necessarily continuous with \( \|\Delta\| = 1 \). Moreover, \( a \in A \) is not invertible iff there exists \( \Delta \in \sigma(A) \) such that \( \Delta(a) = 0 \). (Alternatively put, \( a \in A \) is invertible iff \( \Delta(a) \neq 0 \) for all \( a \in A \).)

Proof. Suppose \( a \in \hat{A} \) is an invertible element, If \( \|\Delta\| > 1 \), then there exists \( a \in A \) such that \( |\Delta(a)| < 1 \) while \( \Delta(a) = 1 \). Since \( |\Delta(a)| < 1 \), \( 1 - a \) is invertible and therefore, because \( \Delta \) is multiplicative,

\[
0 \neq \Delta(1 - a) = 1 - \Delta(a).
\]

But this is a contradiction \( \Delta(a) = \lambda \).

Alternative proof. If \( \Delta \) is a character of \( \hat{A} \) then \( I := \{a : \Delta(a) = 0\} = \text{Nul}(\Delta) \) is an ideal which is proper since \( \Delta(1) = 1 \). For any \( a \in \hat{A} \) we have:

\[
a = (a - \Delta(a)1) + \Delta(a)1 \in I \oplus \mathbb{C}.1.
\]

(40.19)

This shows that \( I \) has codimension 1 (i.e., \( \dim(\hat{A}/I) = 1 \)). So \( I \) is maximal and thus \( I \) is closed. Hence \( \Delta \) is continuous by Exercise 40.2. Let \( a \in \hat{A} \), then

\[
|\Delta(a)|^n = |\Delta(a^n)| \leq \|\Delta\| |a^n| \leq \|\Delta\| \|a\|^n.
\]

Hence

\[
|\Delta(a)| \leq \|\Delta\|^{1/n} \|a\| \to \|a\| \quad \text{as } n \to \infty.
\]

which shows \( \|\Delta\| \leq 1 \).

Theorem 40.95. The sets \( \sigma(\hat{A}) \) and \( \sigma(A) \) are not empty. Moreover the map

\[
\Delta \in \sigma(A) = \sigma(\hat{A}) \to (\Delta(A_1), \ldots, \Delta(A_n)) \in \sigma(A)
\]

(40.20)

is a homeomorphism of compact topological spaces.

Proof. Given \( a \in \hat{A} \) we know there exists \( \lambda \in \sigma(a) \neq \emptyset \). So by replacing \( a \) by \( a - \lambda 1 \) we may assume \( a \in A \) and \( a \) is not invertible. Let \( I \) be a maximal ideal of \( \hat{A} \) such that \( a \in I \) and let \( \Delta \) be the associated character, i.e. \( \Delta(I) = \{0\} \).

As \( \Delta(a) = 1 \) \((\text{since } \|\Delta\| = 1)\), this shows \( \Delta(A) \neq \emptyset \). If \( \Delta_1, \Delta_2 \in \sigma(A) \) satisfy \( (\Delta_1(A_1), \ldots, \Delta_1(A_n)) = (\Delta_2(A_1), \ldots, \Delta_2(A_n)) \), then \( \Delta_1 = \Delta_2 \) on \( A \) and hence on \( \hat{A} \) by continuity.

Suppose that \( \lambda = (\lambda_1, \ldots, \lambda_n) \in \sigma(A) \) and so by definition,

\[
a := \sum_{i=1}^{n} (A_i - \lambda_i)^*(A_i - \lambda_i)
\]

is not invertible. Let \( \Delta \in \sigma(A) \) such that \( \Delta(a) = 0 \), then

\[
0 = \sum_{i=1}^{n} \Delta((A_i - \lambda_i)^*(A_i - \lambda_i)) = \sum_{i=1}^{n} |\Delta(A_i) - \lambda_i|^2
\]

which shows that \( \lambda = (\Delta(A_1), \ldots, \Delta(A_n)) \). Hence the map in Eq. (40.20) is bijective. It is clear that it is continuous by definition of the weak-* topology and since \( \sigma(\hat{A}) \) is a compact Hausdorff space the theorem is proved.

Corollary 40.96. Given \( a \in \hat{A} \),

1. \( \sigma(a) = \{\Delta(a) : \Delta \in \sigma(A)\} \).
2. \( \Delta(a^*) = \Delta(a) \).

Proof. If \( \lambda \in \sigma(a) \) then \( a - \lambda \) is invertible and there exists \( \Delta \in \sigma(A) \) such that \( 0 = \Delta(a - \lambda) = \Delta(a) - \lambda \), i.e. \( \lambda \in \{\Delta(a) : \Delta \in \sigma(A)\} \). Conversely if \( \Delta = \Delta(a) \), then \( \Delta(a - \lambda) = 0 \) and hence \( a - \lambda \) is not invertible. Consequently if \( a = a^* \) we know by Proposition 40.31 that \( \sigma(a) \subset \mathbb{R} \) and hence \( \Delta(a) \in \mathbb{R} \) for all \( \Delta \in \sigma(A) \). For general \( c \in A \), write \( c = a + ib \) with \( a = a^* \) and \( b = b^* \). Then

\[
\Delta(c^*) = \Delta(a - ib) = \Delta(a) - i\Delta(b) = \Delta(a) + i\Delta(b) = \Delta(c).
\]

Lemma 40.97. A point \( \lambda \in \mathbb{C}^n \) is in \( \sigma(A) \) iff there exists \( \psi_m \in H \) such that \( \|\psi_m\| = 1 \) and for \( i = 1, 2, \ldots, n \),

\[
(A_i - \lambda_i) \psi_m \to 0 \quad \text{as } m \to \infty.
\]

(40.21)

That is there should simultaneous approximate eigenvectors.

Proof. If \( \lambda \in \sigma(A) \), there exists \( \psi_m \in H \) such that \( \|\psi_m\| = 1 \) and for \( i = 1, 2, \ldots, n \),

\[
\sum_{i=1}^{n} (A_i - \lambda_i)^2 \psi_m \to 0 \quad \text{as } m \to \infty.
\]

This implies that
Theorem 40.99 (The spectral mapping theorem). Given a polynomial $p(z, w)$ in $(z, w) \in \mathbb{C}^n \times \mathbb{C}^n$, we have
\[
\sigma(p(A, A^*)) = \{p(\lambda, \bar{\lambda}) : \lambda \in \sigma(A)\}
\]
and
\[
\|p(A, A^*)\| = \sup \{\|p(\lambda, \bar{\lambda})\| : \lambda \in \sigma(A)\}.
\]

Proof. This is a simple consequence of Theorem 40.95.

\[
\sigma(p(A, A^*)) = \{\Delta(p(A, A^*)) : \Delta \in \sigma(A)\}
\]
\[
= \left\{ \left(\Delta(p(A), \Delta(A))\right) : \Delta \in \sigma(A) \right\} = \{p(\lambda, \bar{\lambda}) : \lambda \in \sigma(A)\}.
\]

Since $p(A, A^*)$ is normal,
\[
\|p(A, A^*)\| = \|p(\lambda, \bar{\lambda})\| : \lambda \in \sigma(A)\}.
\]

Remark 40.100. Here is a more constructive (i.e. non-Zorn’s lemma proof) of the fact that $\sigma(A) \subset p(\sigma(A))$. We will show $p(\sigma(A))^c \subset \sigma(a)^c$. Let $\alpha \notin p(\sigma(A))$, then using the Weirstrass approximation theorem, we may find polynomials $q_n$ of one variable such that $q_n(y) \xrightarrow{y \to \alpha} 1$ uniformly for $y \in p(\sigma(A))$. By the single operator form of the spectral theory, $\|q_n(a) - (a - \alpha)^{-1}\|_{op} \to 0$ as $n \to \infty$. Argh. FIX FIX Suppose that $\alpha \notin A$ more down to earth proof of this (I would like to find a more elementary down to earth proof of this result.)

Lemma 40.101. Suppose $A \in B(H)$ is a self-adjoint operator, then following are equivalent:

1. $A = B^* B$ for some $B \in B(H)$
2. $A \geq 0$, i.e. $(Ah, h) \geq 0$ for all $h \in H$.
3. $\sigma(A) \subset [0, \infty)$.

Proof. 1. $\implies$ 2. If $A = B^2$, then
\[
(Ah, h) = (B^* Bh, h) = \|Bh\|^2 \geq 0.
\]

2. $\implies$ 3. For $\lambda > 0$,
\[
\|(A + \lambda)h\|^2 = \|Ah\|^2 + 2\lambda(Ah, h) + \lambda^2 \|h\|^2
\geq \lambda^2 \|h\|^2.
\]
which shows $(A + \lambda)$ is injective with closed range. Since $\text{Ran}(A + \lambda) = \text{Null}(A + \lambda)^\perp = \{0\}$ we see that $A + \lambda$ is invertible and hence $-\lambda \notin \sigma(A)$.

Choose polynomials $p_n(x)$ for $x \in \mathbb{R}$ such that

$$\lim_{m \to \infty} \sup \left\{ \left| \sqrt{\lambda} - p_m(\lambda) \right| : \lambda \in \sigma(A) \right\} = 0$$

and define $B := \lim_{n \to \infty} p_n(A)$. Then $B^2 = \lim_{n \to \infty} p_n^2(A) = A$ since $p_n^2(x)$ are polynomials on $\mathbb{R}$ which converge uniformly to $x$ for $x \in \sigma(A)$ as $n \to \infty$. It is also clear that $B = B^*$ and hence $A = B^* B$.

**Theorem 40.102 (Continuous Functional Calculus).** Let $A := (A_1, \ldots, A_n)$ be a collection of normal commuting operators in $B(H)$. For $f \in C(\sigma(A))$ define $f(A) := \lim_{m \to \infty} p_m(A, A^*)$ where $p_m(z, w)$ are polynomials in $(z, w) \in \mathbb{C}^n \times \mathbb{C}^n$ such that

$$\lim_{m \to \infty} \sup \left\{ |f(\lambda) - p_m(\lambda, \bar{\lambda})| : \lambda \in \sigma(A) \right\} = 0.$$

Then the map $\hat{A} : C(\sigma(A)) \to B(H)$ given by $\hat{A} \phi := f(A)$ has the following properties:

1. $\hat{A} : C(\sigma(A)) \to B(H)$ is an isometry.
2. $f(A)^* = \bar{f}(A)$ and hence if $f$ is real valued $f(A)$ is self-adjoint.
3. We still have $\sigma(f(A)) = f(\sigma(A))$.
4. If $f \geq 0$ on $\sigma(A)$ then $f(A) \geq 0$.

**Proof.** If $f(\lambda) = p(\lambda, \bar{\lambda})$ is a polynomial we have $f(A) = p(A, A^*)$ and

$$\|f(A)\| = \sup \left\{ |p(\lambda, \bar{\lambda})| : \lambda \in \sigma(A) \right\} = \sup \left\{ |f(\lambda)| : \lambda \in \sigma(A) \right\},$$

from which it follows that $\hat{A} f$ is well defined for $f(\lambda) = p(\lambda, \bar{\lambda})$ and $\hat{A}$ is isometric on polynomials. Thus $\hat{A}$ has a unique extension to an isometric transformation from $C(\sigma(A)) \to B(H)$. Moreover, if $f(\lambda) = p(\lambda, \bar{\lambda})$ then $\bar{f}(\lambda) = \bar{p}(\lambda, \bar{\lambda})$ and hence

$$\bar{f}(A) = \bar{p}(A^*, A) = [p(A, A^*)]^* = f(A)^*$$

If $f(\lambda)$ is the uniform limit of $p_m(\lambda, \bar{\lambda})$, then

$$\sigma(f(A)) = \{ \Delta(f(A)) : \Delta \in \sigma(A) \} = \left\{ \lim_{m \to \infty} \Delta(p_m(A, A^*)) : \Delta \in \sigma(A) \right\} = \left\{ \lim_{m \to \infty} \left(p_m(A, A^*) \right) : \Delta \in \sigma(A) \right\} = \left\{ \lim_{m \to \infty} (p_m(\lambda, \bar{\lambda})) : \lambda \in \sigma(A) \right\} = f(\sigma(A)).$$

Finally if $f \geq 0$ on $\sigma(A)$, then $\sigma(f(A)) \subset [0, \infty)$ and hence $f(A) \geq 0$. ■

**Exercise 40.16.** Let $(X, \mathcal{M}, \mu)$ be a $\sigma$ - finite measure space and $q_1, q_2, \ldots, q_n \in L^\infty$ and let $q = (q_1, q_2, \ldots, q_n)$. Set $A_i = M_{q_i}$ for each $i$, then $\sigma(A) = \text{essran}_\mu(q)$, where

$$\text{essran}_\mu(q) := \{ \lambda \in \mathbb{C}^n : \mu(|q - \lambda| < \varepsilon) > 0 \forall \varepsilon > 0 \}.$$
Normal Operators.

Corollary 40.106.

Proof. Let $A = \frac{1}{2} (T + T^*)$ and $B := \frac{1}{2} (T - T^*)$ so that $A = A^*$, $B = B^*$, $[A, B] = 0$ and $T = A + iB$. By Theorem 40.104 there exists a probability space $(\Omega, \mathcal{M}, \mu)$, a unitary map $U : L^2(\mu) \to H$ and measurable functions $a, b : \Omega \to \mathbb{R}$ such that $UM_a = AU$, $UM_b = BU$ and $(a, b)(\Omega) = \sigma((A, B)) \subset \mathbb{R}^2 \cong \mathbb{C}$. Let $\lambda = \alpha + i\beta \in \mathbb{C}$ and $\psi \in H$, then

$$
\| (T - \lambda) \psi \|^2 = \| (A - \alpha) \psi + i(B - \beta) \psi \|^2
= \| (A - \alpha) \psi \|^2 + \| (B - \beta) \psi \|^2
$$

wherein we have used $((A - \alpha) \psi, (B - \beta) \psi) = ((B - \beta) \psi, (A - \alpha) \psi)$ to see that $\text{Re}(i((A - \alpha) \psi, (B - \beta) \psi)) = 0$. From this identity and Lemma 40.97 it follows that $\sigma(A, B) = \sigma(T)$ provided we identify $\mathbb{C}$ with $\mathbb{R}^2$ in the usual way. Finally, let $q = a + ib$, then

$$
UM_q = U (M_a + iM_b) = AU + iBU = TU
$$
as desired.

40.3.7 Exercises

Exercise 40.17. Problem about cyclic vectors in finite dimensions. If $v = \sum v_i$ with $v_i \in \text{Nul}(A - \lambda_i)$ then $H_v = \text{span}\{v_i\}$.

Exercise 40.18. Write out what happens in the case we let $\{v_i\}$ be an orthonormal basis of eigenvectors of $A$, then show that $\Omega$ is naturally isomorphic to $\{1, 2, \ldots, n\}$ and $\mu(\{i\}) = 1/n$, and $q(i) = \lambda_i$.

Exercise 40.19. Problems defining and exploring notions of support, essential supremums, and essential ranges.

Exercise 40.20. Carry out the proof of Theorems 40.103, 40.104 and 40.105.
40.4 Unbounded Self-Adjoint Operators

**Theorem 40.107 (Spectral Theorem).** Suppose that \( A \) is a self-adjoint operator on \( H \). Then there exists a probability space \((\Omega, \mathcal{M}, \mu)\), a unitary map \( U : L^2(\mu) \to H \) and a real valued Borel – measurable function \( q : \Omega \to \sigma(A) \) such that

\[
UM_q = AU.
\]

**Proof.** Recall that we always have \( \text{Nul}(T^*) = \text{ran}(T)^\perp \) for any densely defined operator \( T \). Applying this to \( T = A \pm i \), we learn

\[
\text{Nul}(A \mp i) = \text{ran}(A \pm i)^\perp.
\]

(40.24)

Now

\[
\|(A \pm i) \psi\|^2 = \|A \psi\|^2 + \|\psi\|^2 \geq \|\psi\|^2 \text{ for all } \psi \in \mathcal{D}_A.
\]

(40.25)

This inequality shows \( \text{Nul}(A \pm i) = \{0\} \) and coupled with the fact that \( A \pm i \) are closed operators also shows that \( \text{ran}(A \pm i) \) is closed. Therefore Eq. (40.24) allows us to conclude \( \text{ran}(A \pm i) = H \), so that

\[
A \pm i : \mathcal{D}_A \to H
\]

are algebraically invertible and then using Eq. (40.25) we conclude that \( (A \pm i)^{-1} \) is bounded. Let \( T := (A + i)^{-1} \). I claim that \( T^* = (A - i)^{-1} \) and \( T \) commutes with \( T^* \). Assuming this for the moment, by Corollary 40.106 there exists a probability space \((\Omega, \mathcal{M}, \mu)\), a unitary map \( U : L^2(\mu) \to H \) and a real valued Borel – measurable function \( q : \Omega \to \sigma(T) \subset \mathbb{C} \) such that

\[
UM_q = TU = (A + i)^{-1} U.
\]

Hence it follows that

\[
UM_{q^{-1}} = (A + i) U = AU + Ui
\]

i.e. we have

\[
AU = U(M_{q^{-1}} - i) = UM_{q^{-1}-i}.
\]

This finishes the proof modulo computing \( T^* \). For this, let \( x, y \in H \) and set \( x' = (A + i)^{-1} x \in \mathcal{D}_A \) and \( y' = (A - i)^{-1} y \in \mathcal{D}_A \), then

\[
(Tx, y) = (x', (A - i) y') = ((A + i) x', y') = (x, (A - i)^{-1} y)
\]

which shows \( T^* = (A - i)^{-1} \) as claimed. To see that \( T \) and \( T^* \) commute, we need to show

\[
(A - i)^{-1} (A + i)^{-1} x = (A + i)^{-1} (A - i)^{-1} x
\]

for all \( x \in H \). First let \( x \in \mathcal{D}_A \) and consider

\[
(A - i)^{-1} (A + i) x = (A - i)^{-1} (A - i + 2i) x = x + 2i (A - i)^{-1} x
\]

while

\[
(A + i) (A - i)^{-1} x = (A - i + 2i) (A - i)^{-1} x = x + 2i (A - i)^{-1} x
\]

and hence

\[
(A - i)^{-1} (A + i) x = (A + i) (A - i)^{-1} x
\]

for all \( x \in \mathcal{D}_A \). Now let \( x = (A + i)^{-1} y \) in this equation, then

\[
(A - i)^{-1} y = (A + i) (A - i)^{-1} (A + i)^{-1} y
\]

and therefore, applying \((A + i)^{-1}\) to both sides of this equation implies

\[
(A + i)^{-1} (A - i)^{-1} y = (A - i)^{-1} (A + i)^{-1} y
\]

for all \( y \in H \) as claimed. \( \square \)

The following theorem is Theorem VIII.5 on p.262 of Reed and Simon.

**Theorem 40.108 (Functional Calculus).** Suppose that \( A \) is a self-adjoint operator on \( H \). Then there exists a unique map \( \phi = \phi_A : B^\infty(\sigma(A)) \to L(H) \) such that

1. \( \phi \) is a \* – homomorphism, i.e. \( \phi \) is linear, \( \phi(fg) = \phi(f)\phi(g) \) and \( \phi(f) = \phi(f)^* \) for all \( f, g \in B^\infty(\sigma(A)) \).
2. \( \|\phi(f)\| \leq \|f\|_\infty \).
3. If \( h_n \in B^\infty(\sigma(A)) \) satisfy \( h_n(x) \to x \) and \( |h_n(x)| \leq |x| \) for all \( x \) and \( n \), then \( \phi(h_n) \psi \to \psi \) for all \( \psi \) in \( \mathcal{D}(A) \).
4. If \( f_n \in B^\infty(\sigma(A)) \) and \( f_n \to f \) pointwise and boundedly, then \( \phi(f_n) \to \phi(f) \) strongly.

Moreover this map has the following properties

5. If \( A \psi = \lambda \psi \) then \( \phi(f) \psi = f(\lambda) \psi \)
6. If \( f \geq 0 \) then \( \phi(f) \geq 0 \).
7. If \( B \in B(H) \) and \([B, e^{itA}] = 0\) for all \( t \) then \([B, \phi(f)] = 0\) for all \( f \in B^\infty(\sigma(A)) \).
8. (Is this one true? if not fix it.) If \( B \in B(H) \) and \( BD(A) \subset \mathcal{D}(A) \) and \([A, B] = 0 \) on \( \mathcal{D}(A) \), then \([B, \phi(f)] = 0\) for all \( f \in B^\infty(\sigma(A)) \).
Indeed, if \( v, w \in f \) collection of \( B \) functions? I think the answer is yes. In order to carry this out let me first prove and \( \lim \) \( U \) a closed operator so that \( \forall \in D(\sigma(A)) \subset H \) and hence that \( 1_{V \cap \sigma(A)} \in \mathcal{H} \) for all \( V \subset \mathcal{H} \) such that \( V \) is compact. Go back to the \( \pi - \lambda \) theorem to finish the proof.) At this point the rest of the proof goes as before. To see \( e^{itx} \in \mathcal{H} \), let \( U_\phi(t) := \phi(x \to e^{itx}) \), then \( U_\phi(t) \) is a strongly continuous one parameter subgroup, moreover,

\[
\frac{U_\phi(t+h) - U_\phi(t)}{ih} = U_\phi(t) \frac{U_\phi(h) - U_\phi(0)}{ih} = \frac{U_\phi(t)\phi(x \to (e^{ithx} - 1))}{ih} = \phi(x \to (e^{ithx} - 1))U_\phi(t).
\]

Since

\[
\left| \frac{e^{ithx} - 1}{ih} \right| = \left| x \int_0^h e^{ithx} dh \right| \leq |x|
\]

and \( \lim_{h \to 0} \frac{e^{ithx} - 1}{ih} = x \), we find

\[
\lim_{h \to 0} \frac{U_\phi(t+h) - U_\phi(t)}{ih} v = U_\phi(t) Av = AU_\phi(t)v
\]

for all \( v \in D(A) \), the last equality being the consequence of the fact that \( A \) is a closed operator so that \( U_\phi(t)v \in D(A) \). Similarly one shows that \( U_\psi \) satisfies the same equation and therefore \( U_\psi = U_\phi \), i.e. \( \mathcal{H} \) contains \( e^{itx} \) for all \( t \in \mathbb{R} \). Indeed, if \( v, w \in D(A) \) then

\[
\frac{d}{dt}(U_\phi(t)v, U_\psi(t)w) = (iAU_\phi(t)v, U_\psi(t)w) + (U_\phi(t)v, iAU_\psi(t)w) = (U_\phi(t)v, -iAU_\psi(t)w) + (U_\phi(t)v, iAU_\psi(t)w) = 0.
\]

Therefore,

\[
(U_\phi(t)v, U_\psi(t)w) = (v, w)
\]

for all \( t \) and hence

\[
U_\phi(-t)U_\psi(t) = U_\phi(t)*U_\psi(t) = Id \text{ for all } t.
\]

(Could this uniqueness be done using \( \frac{1}{x+t} \) and \( \frac{1}{x-t} \) instead of the exponential functions? I think the answer is yes. In order to carry this out let me first prove that \( \phi(f)H \subset D(A) \) when \( f = \frac{1}{x \pm i} \in B^\infty(\sigma(A)) \). In order to do this we will make use of the fact \( A = A^* \) so that \( D(A) \) may be characterized as those \( v \in H \) such that

\[
w \in D(A) \rightarrow (Aw, v) \text{ is continuous.}
\]

Let \( h_n \) be as in Item (3), and set \( B_n = \phi(h_n + i) = \phi(h_n) + i1. \) Then \( B_n v \to (A + i)v \) for \( v \in D(A) \) and

\[
B_n\phi(f) = \phi(((h_n + i) f) \rightarrow (A + i) \phi(f)u) \in D(A)
\]

so if \( u \in H \) and \( v \in D(A) \), then

\[
(u, v) \leftrightarrow (B_n\phi(f)u, w) = (\phi(f)u, B_n^*v) \rightarrow (\phi(f)u, (A - i)v)
\]

i.e. \( (u, v) = (\phi(f)u, (A - i)v) \). We have used the fact that \( B_n^* = \phi(h_n - i) \to A - i \) on \( D(A) \) in the last equation. Thus \( \phi(f)u \in D(A) \) and at the same time

\[
(A + i) \phi(f)u = u
\]

for all \( u \in H \). Thus we have verified

\[
\phi(\frac{1}{x + i}) = (A + i)^{-1}
\]

and similarly we have \( \phi(\frac{1}{x - i}) = (A - i)^{-1} \). It now follows that \( \mathcal{H} \) contains all polynomials in \( (x \pm i)^{-1} \) and so by locally compact version of the Stone Weirstrass theorem, \( \mathcal{H} \) contains \( C_0(\sigma(A)) \) and by a simple pointwise approximations it follows that \( \mathcal{H} \) contains \( C_b(\sigma(A)) \) as well. To prove existence of \( \phi \), let \( (\Omega, \mathcal{M}, \mu, U, q) \) be as in the Spectral Theorem 40.85 and define

\[
\phi(f) := UM_{foq}U^{-1} \text{ for all } f \in B^\infty(\sigma(A)).
\]

Then it is routine to check that \( \phi \) satisfies properties (1) – (4) of the theorem.

**Item 5.** If \( A := \lambda \psi \) and \( \phi := U^{-1} \psi \) then \( q\phi = \lambda \phi, \mu - a.e. \) or equivalently \( (q - \lambda) \phi = 0, \mu - a.e. \). From this we conclude that \( q = \lambda, \mu - a.e. \) on the set \( \{ \phi \neq 0 \} \) and so \( f \circ q = f(\lambda), \mu - a.e. \) on the set \( \{ \phi \neq 0 \} \) and this implies \( M_{foq} \phi = f(\lambda) \phi \) and therefore

\[
\phi(f) \psi = UM_{foq}U^{-1} \psi = UM_{foq}f = f(\lambda) \phi = (f(\lambda)) \psi.
\]

**Item 6.** If \( f \geq 0 \) then \( M_{foq} \geq 0 \) and therefore \( \phi(f) = UM_{foq}U^{-1} \geq 0. \) **Item 7.** Let \( \mathcal{H} \) be linear sub-space of \( B^\infty(\sigma(A), \mathbb{C}) \) such that \( |B, \phi(f)| = 0 \) when \( f \in \mathcal{H} \). Then again one checks that \( \mathcal{H} \) is closed under bounded convergence and by assumption contains all trigonometric polynomials and hence \( \mathcal{H} = B^\infty(\sigma(A), \mathbb{C}) \).

**Item 8.** (To be done.)
Corollary 40.109. Let $A : H \to H$ be a densely defined operator and $U : H \to K$ be a unitary operator. Then

1. $[UAU^*]^* = UAU^*$, in particular if $A$ is self-adjoint the so is $UAU^*$,
2. $\sigma(UAU^*) = \sigma(A)$ and
3. if we further assume $A = A^*$, then $\phi_{UAU^*}(f) = U\phi_A (f) U^*$ for all $f \in B^\infty(\sigma(A))$.

Proof. 1. By definition of the adjoint, $k \in D \bigl([UAU^*]^*\bigr)$ and $[UAU^*]^* k = l$ iff

$$(U^* k, U^* l)_H = (k, l)_K \Rightarrow (k, UAU^* l)_K = (U^* k, A^* U^* l)_H$$

for all $k' \in D (UAU^*) = UD(A)$ which is equivalent (by setting $h = A^* k'$ in the above equation) to

$$(U^* k, h)_H = (U^* k, Ah)_H \quad \text{for all } h \in D(A).$$

The latter condition is equivalent to $U^* k \in D(A^*)$ and $A^* U^* k = U^* l$, i.e. $k \in D(U^*AU^*)$ and $UAU^* k = l = [UAU^*]^* k$ and hence we have proven $[UAU^*]^* = UAU^*$. 2. We have $\lambda \in \sigma(UAU^*)$ iff $U (A - \lambda I_H) U^* = UAU^* - \lambda K$ is not invertible which happens iff $A - \lambda H$ is not invertible, i.e. iff $\lambda \in \sigma(A)$. 3. Let $\psi(f) := U\phi_A (f) U^*$ for all $f \in B^\infty(\sigma(A)) = B^\infty(\sigma(UAU^*))$ and suppose $h_n \in B^\infty(\sigma(A))$ satisfies $h_n(x) \to x$ and $|h_n(x)| \leq |x|$ for all $x$ and $n$. Then for $v \in D(UAU^*) = UD(A)$ we have

$$\psi(h_n)v = U\phi_A (h_n) U^* v \to UAU^* v$$

which shows $\psi$ satisfies property 3. of Theorem 40.108 with $A$ replaced by $UAU^*$. Similarly it is easily checked that $\psi$ satisfies properties 1., 2., and 4. of Theorem 40.108 and so by the uniqueness assertion of that theorem we must have $\phi_{UAU^*}(f) = U\phi_A (f) U^*$ for all $f \in B^\infty(\sigma(A))$. \hfill $\blacksquare$

Definition 40.110 (Extension of the functional calculus to unbounded functions). Suppose $A$ is a self-adjoint operator on $H$ and let $(\Omega, \mathcal{M}, \mu, U, q)$ be as in the Spectral Theorem [40.83]. Then for any Borel measurable function $f : \sigma(A) \to \mathbb{C}$ we define $\phi_A(f) := UMF_{f q} U^{-1}$. Notice that $\phi_A(f)$ is in general an unbounded operator on $H$.

Notation 40.111 In the future we will often denote $\phi_A(f)$ by $f(A)$.

Theorem 40.112. Suppose $A$ is a self-adjoint operator on $H$, $f : \sigma(A) \to \mathbb{C}$ is a Borel measurable function, $f_n := 1_{|f| \leq n} f$ and $\phi_A(f)$ is defined as in Definition 40.110. Then:

1. $f(A) = \phi_A (f)$ is a closed densely defined operator.
2. $[\phi_A(f)]^* = \phi_A (f^*)$, i.e. $[f(A)]^* = f(A)$.
3. $D(\phi_A(f)) = \{ h \in H : \sup_n \| \phi_A(f_n) h \|_H < \infty \}$ and for $h \in D(\phi_A(f))$ we have

$$f(A) h = \phi_A (f) h = \lim_{n \to \infty} \phi_A(f_n) h = \lim_{n \to \infty} f_n(A) h.$$  

4. Given any unitary operator $U : H \to K$, we have $f(UAU^*) = U f(A) U^*$.

Note well: because of Item 3. along with Theorem 40.108 it follows that $f(A)$ is independent of the possible choices made in Definition 40.110 in diagonalizing $A$.

Proof. 1. Since $f(A)$ is unitarily equivalent to $M_{f q}$ which is densely defined and closed, $f(A)$ is closed and densely defined as well. 2. The following computation,

$$[\phi_A(f)]^* = [UM_{f q} U^* U^* U_{M_{f q}} U^* U^* = \phi_A (f),$$

proves item 2. 3. By definition

$$D(\phi_A(f)) = U^{-1} D(M_{f q}) = U^{-1} \{ g \in L^2 (\mu) : (f \circ q) g \in L^2 (\mu) \}.$$

But by the monotone convergence theorem we find for any $g \in L^2 (\mu)$ that

$$\| (f \circ q) g \|_{L^2(\mu)} \leq \lim_{n \to \infty} \| (f_n \circ q) g \|_{L^2(\mu)} = \sup_n \| (f_n \circ q) g \|_{L^2(\mu)}$$

and so

$$D(M_{f q}) = \left\{ g \in L^2 (\mu) : \sup_n \| (f_n \circ q) g \|_{L^2(\mu)} < \infty \right\}.$$ 

Furthermore by the dominated convergence theorem we have

$$(f \circ q) g = L^2 (\mu) - \lim_{n \to \infty} (f_n \circ q) g \text{ for all } g \in D(M_{f q}).$$

Hence if $h \in H$ we have $h \in D(\phi_A(f))$ iff $Uh \in D(M_{f q})$ iff

$$\sup_n \| f_n (A) h \|_H = \sup_n \| U^* (f_n \circ q) U h \|_H = \sup_n \| (f_n \circ q) U h \|_{L^2(\mu)} < \infty$$

and if $h \in D(\phi_A(f))$ we have

$$\| f_n (A) h - f(A) h \|_H = \| (f_n \circ q - f \circ q) U h \|_{L^2(\mu)} \to 0 \text{ as } n \to \infty.$$

4. By repeated use of Corollary 40.109 and item 3 just proved, $k \in D(f(UAU^*))$ iff

$$\sup_n \| f_n (A) U^* k \|_H = \sup_n \| Uf_n (A) U^* k \|_K = \sup_n \| f_n (UAU^*) k \|_K < \infty$$

which happens iff $U^* k \in D(f(A))$. This shows $D(f(UAU^*)) = UD(f(A)) = D(Uf(A) U^*)$ and moreover for $k \in D(f(UAU^*)) = UD(f(A))$,

$$f(UAU^*) k = \lim_{n \to \infty} f_n(UAU^*) k = \lim_{n \to \infty} Uf_n(A) U^* k = Uf(A) U^* k.$$  \hfill $\blacksquare$
Theorem 40.113. If $A$ is a non-negative self-adjoint operator on $H$ there exists a unique non-negative self-adjoint operator $B$ on $H$ such that $A = B^2$. As usual the operator $B$ is called the square root of $A$ and is denoted by $\sqrt{A}$.

Proof. Let $f(x) = \sqrt{x}$, then by the spectral theorem it follows that $B := f(A)$ is a square root of $A$, i.e. $B \geq 0$ and $A = B^2$. Conversely if $B \geq 0$ is a square root of $A$, we may use the spectral theorem to write $B = UM_b U^*$, i.e. $B$ is unitarily equivalent to a multiplication operator. The positivity of $B$ implies $b \geq 0$ a.e. and since

$$A = B^2 = U (M_b)^2 U^* = UM_b U^*$$

it follows that $f(A) = UM_f U^* = B$.

Exercise 40.21. Suppose $H$ and $K$ are Hilbert spaces, $S : H \to H$ and $T : K \to K$ are two (unbounded) operators and

$$C := \begin{pmatrix} S & 0 \\ 0 & T \end{pmatrix}$$

i.e. $\mathcal{D}(C) = \mathcal{D}(S) \oplus \mathcal{D}(T) \subset H \oplus K$ and for $(h,k) \in \mathcal{D}(C), C(h,k) = (Sh,Tk)$.

Show

1. $C^* = \begin{pmatrix} S^* & 0 \\ 0 & T^* \end{pmatrix}$, i.e. $\mathcal{D}(C^*) = \mathcal{D}(S^*) \oplus \mathcal{D}(T^*) \subset H \oplus K$ and for $(h,k) \in \mathcal{D}(C), C^*(h,k) = (S^*h,T^*k)$.

2. $C$ is closed iff $S$ and $T$ are closed.

3. Show $\sigma(C) = \sigma(S) \cup \sigma(T)$.

4. Now assume further that $S = S^*$ and $T = T^*$ (so by 1, $C = C^*$). Given $f \in \mathcal{B}^\infty(\sigma(C))$ show

$$f(C) = \begin{pmatrix} f(S) & 0 \\ 0 & f(T) \end{pmatrix}$$

or equivalently

$$\phi_C(f) = \begin{pmatrix} \phi_S(f) & 0 \\ 0 & \phi_T(f) \end{pmatrix}$$

Hint: define $\psi(f) := \begin{pmatrix} \phi_S(f) & 0 \\ 0 & \phi_T(f) \end{pmatrix}$.

Theorem 40.114 (von Neumann’s Theorem). Suppose $H$ and $K$ are Hilbert spaces and $D : H \to K$ is a closed operator. Then $A = D^*D$ is a positive self-adjoint operator on $H$.

Proof. In this proof we will make use of von Neumann’s trick, see Corollary ?? for another proof of this theorem. Von Neumann’s trick is to define the operator

$$B := \begin{pmatrix} 0 & D^* \\ D & 0 \end{pmatrix}$$

acting on $H \oplus K$

via $\mathcal{D}(B) = \mathcal{D}(D) \oplus \mathcal{D}(D^*)$ and for $(h,k) \in \mathcal{D}(B)$ we set $B(h,k) = (D^*k, Dh)$. The operator $B$ is self-adjoint for $(h,k) \in \mathcal{D}(B^*)$ and $B^*(h,k) = (h',k')$ iff

$$(h',k')_H + (k',k'')_K = ((h',k'), (h'',k'')) = ((h,k), B(h'',k'')) = ((h,k), (D^*k'', Dh'')) = (h, D^*k'')_H + (k, Dh'')_K$$

for all $(h'',k'') \in \mathcal{D}(B) = \mathcal{D}(D) \oplus \mathcal{D}(D^*)$.

But the latter condition happens iff $h \in \mathcal{D}(D^*D) = \mathcal{D}(D), Dh = D^*h = k'$ and $k \in \mathcal{D}(D^*)$ with $D^*k = h'$, i.e. iff $(h,k) \in \mathcal{D}(B)$ and $B^*(h,k) = (h,k)$. Since $B^* = B$, it follows by the spectral theorem that $B^2$ is also self-adjoint. A simple computation now shows that

$$B^2 = \begin{pmatrix} D^*D & 0 \\ 0 & DD^* \end{pmatrix}$$

and so by Exercise [40.21] it follows that $D^*D$ and $DD^*$ are self-adjoint operators.

Definition 40.115. If $D : H \to K$ is a closed operator we define $|D| := \sqrt{D^*D}$.

Proposition 40.116. If $D : H \to K$ is a closed operator, then $|D| : H \to H$ is self-adjoint, $\mathcal{D}(|D|) = \mathcal{D}(D)$ and

$$\|Dh\|_K = \|Dh\|_K \text{ for all } h \in \mathcal{D}(|D|) = \mathcal{D}(D).$$

Proof. Let $B$ be the operator as defined in the proof of Theorem [40.114]. It follows from the spectral theorem along with the dominated convergence theorem that $\mathcal{D}(B^2)$ is a core for $B^2$ and from this it is easy to see that $\mathcal{D}(|D|^2) = \mathcal{D}(D^*D)$ is a core for $D$. Now for $h \in \mathcal{D}(D^*D)$ we have

$$\|Dh\|^2_K = (D^*Dh, Dh)_H = (|D|^2h, h)_H = (|D|h, |D|h)_H = \|D|h\|^2_H$$

(40.27)

wherein the second to last equality we have used the fact that $|D| = \sqrt{D^*D}$ is self-adjoint and $\mathcal{D}(|D|^2) \subset \mathcal{D}(|D|)$. For $h \in \mathcal{D}(D)$, choose $h_n \in \mathcal{D}(D^*D)$ such that $h_n \to h$ and $Dh_n \to Dh$, then from Eq. (40.27) it follows that $\{|D|h_n\}_n$ is a Cauchy sequence. Because $|D|$ is closed it now follows that $h \in \mathcal{D}(|D|)$, $|D|h_n \to |D|h$ and so

$^4$ i.e. for all $\xi \in \mathcal{D}(B)$ there exists $\xi_n \in \mathcal{D}(B^2)$ such that $\xi_n \to \xi$ and $B\xi_n \to B\xi$ as $n \to \infty$. 

\[ \begin{align*} \|Dh\|^2_K &= (D^*Dh, Dh)_H = (|D|^2h, h)_H = (|D|h, |D|h)_H = \|D|h\|^2_H \
&= \end{align*} \]
\[ \| Dh \|_K = \lim_{n \to \infty} \| Dh_n \|_K = \lim_{n \to \infty} \| D \| h_n \|_H = \| D \| h \|_H. \]

Hence we shown Eq. \((40.27)\) holds for all \( h \in D(\mathcal{D}) \subset \mathcal{D}(\|D\|) \). A similar argument using \( \mathcal{D} \left( \|D\|^2 \right) = \mathcal{D}(\mathcal{D}^*D) \) is a core for \( |D| \) shows \( \mathcal{D}(\|D\|) \subset \mathcal{D}(\mathcal{D}) \) which completes the proof.

**Definition 40.117 (Polar Decomposition).** If \( D : H \to K \) is a closed operator we let \( u_D : K \to K \) be the partial isometry determined by,

\[ \text{Nul}(u_D) = \text{Ran}(\|D\|) = \text{Nul}(D) \]

and \( u_D \|D\| h = Dh \) for all \( h \in \mathcal{D}(\mathcal{D}) \). (Note: \( u_D \) is well defined, \( u_D \) is a partial isometry and \( D = u_D \|D\| \) because of Eq. \((40.26)\).) Writing \( D \) as \( u_D \|D\| \)

is called the **polar decomposition** of \( D \).

**Lemma 40.118.** We may express \( u_D \) as the sot – \( \lim_{\varepsilon \downarrow 0} D(\|D\| + \varepsilon I_H)^{-1} \).

**Proof.** Letting \( u_{\varepsilon} := D(\|D\| + \varepsilon I_H)^{-1} \) we have

\[ u_{\varepsilon} = u_D \|D\| \|D\| + \varepsilon I_H \|D\| + \varepsilon I_H \] ^{-1} = u_D \|D\| + \varepsilon I_H \|D\| + \varepsilon I_H \] ^{-1} = u_D \left( I_H - I_H \right) = u_{\varepsilon} \left( I_H - I_H \right). \]

By the spectral theorem, \( \varepsilon (\|D\| + \varepsilon I_H)^{-1} \) is a bounded operator with operator norm bounded by 1,

\[ \varepsilon (\|D\| + \varepsilon I_H)^{-1} h = h \] for all \( h \in \text{Nul}(\|D\|) = \text{Nul}(D) \)

and for \( h \in \mathcal{D}(\mathcal{D)(\|D\|)} \),

\[ u_{\varepsilon} \|D\| h = u_D \|D\| \|D\| + \varepsilon I_H \|D\| + \varepsilon I_H \|D\| \to u_D \|D\| h \] as \( \varepsilon \downarrow 0 \)

because \( (\|D\| + \varepsilon I_H)^{-1} \|D\| \leq 1 \) for all \( \varepsilon > 0 \). Thus \( \{ u_{\varepsilon} : \varepsilon > 0 \} \) is a sequence of uniformly bounded operators, \( \|u_{\varepsilon}\|_{B(H,K)} \leq 2 \), such that \( u_{\varepsilon} h = 0 \) for all \( h \in \text{Nul}(D) \) and \( u_{\varepsilon} |D| h \to u_D |D| h \) for all \( h \in \mathcal{D}(\mathcal{D)(\|D\|)} \). From these observations and the fact that \( \text{Nul}(\|D\|) \oplus \text{Ran}(\|D\|) \) is dense in \( H \), it is easy to conclude that \( u_{\varepsilon} \to u_D \) in the sot topology and \( \varepsilon \downarrow 0 \).

**Proposition 40.119.** Suppose \( D : H \to K \) is a closed operator and \( U : H \to K \) is a unitary operator, then

\[ |UDU^*| = U |D| U^* \text{ and } U|UDU^*| = UDuU^*. \]

**Proof.** Using Corollary \(40.109\) and Theorem \(40.112\) with \( f(x) = \sqrt{x} \),

\[ |UDU^*| = \sqrt{(UDU^*)^*UDU^*} = \sqrt{UDU^*U^*UDU^*} = \sqrt{UDU^*U^*UDU^*} = U \sqrt{D^*D}U^* = U |D| \]

Furthermore,

\[ \text{Nul}(UuDU^*) = U \text{Nul}(u_D) = U \text{Nul}(D) = \text{Nul}(UDU^*) \]

and

\[ UuDU^* |UDU^*| = UuDU^*U |D|U^* = UuDU |D|U^* = UDU^*, \]

i.e. \( UuDU^* \) is a partial isometry such that

\[ [UuDU^*]|UDU^*| = UDU^* \text{ and } \text{Nul}(UuDU^*) = \text{Nul}(UDU^*). \]

From this observation it follows that \( UuDU^* = u_{U^*DU^*} \) as claimed. Alternatively one could give a proof of \( u_{U^*DU^*} = UuDU^* \) based on Lemma \(40.118\) and the fact that \( |UDU^*| = U |D| U^* \).

**Proposition 40.120.** Suppose that \( D : H \to K \) is a closed operator, \( B : H \to H \) is a self-adjoint non-negative operator and \( u : H \to K \) is a partial isometry such that \( \text{Nul}(u) = \text{Nul}(B) \) and \( D = uB \), then \( u = u_D \) and \( B = |D| \).

**Proof.** Since

\[ D^*D = Bu^*uB = BP_{\text{Nul}(u)}B = BP_{\text{Nul}(D)}B = BP_{\text{Ran}(B)}B = B^2 \]

and square-roots are unique it follows that \( B = |D| \). Hence we now know that \( D = u |D| \) and \( \text{Nul}(u) = \text{Nul}(D) = \text{Nul}(D) \) and hence that \( u = u_D \).

**Proposition 40.121.** Suppose \( D : H \to K \) is a closed operator, then \( u_D^* = u_D^* \).

**Proof.** Since \( H = \text{Nul}(D)^\perp \oplus \text{Nul}(D) \) and \( K = \overline{\text{Ran}(D)} \oplus \text{Ran}(D)^\perp = \text{Nul}(D)^\perp \oplus \text{Nul}(D^*) \), \( D \) may be written in block matrix form relative to these decomposition as \( D = \begin{pmatrix} d & 0 \\ 0 & 0 \end{pmatrix} \) where \( d := D|\text{Nul}(D)^\perp : \text{Nul}(D)^\perp \to \overline{\text{Ran}(D)} = \text{Nul}(D^*)^\perp \). Moreover it is easily seen that in this notation

\[ |D| = \begin{pmatrix} |d| & 0 \\ 0 & 0 \end{pmatrix} u_D = \begin{pmatrix} u_d & 0 \\ 0 & 0 \end{pmatrix} \]

\[ D^* = \begin{pmatrix} d^* & 0 \\ 0 & 0 \end{pmatrix}, \text{ and } |D^*| = \begin{pmatrix} |d^*| & 0 \\ 0 & 0 \end{pmatrix} \]

where now both \( u_d : \text{Nul}(D)^\perp \to \overline{\text{Ran}(D)} = \text{Nul}(D^*)^\perp \) and \( u_{d^*} : \overline{\text{Ran}(D)} = \text{Nul}(D^*)^\perp \to \text{Nul}(D)^\perp \) are unitary operators. Because \( d = u_d |d| \) (as the reader should show) \( d^* = |d| u_{d^*} \) and therefore
**40.5 Bounded Self-Adjoint Operators**

(This section is pretty rough!) Suppose that \( H \) is an inner product space and \( A : H \rightarrow H \) is an operator such that \( A^* \) exists then

\[
\|Ax\|^2 = (A^*Ax, x) \leq \|A^*Ax\| \|x\|
\]

which implies

\[
\|Ax\| \leq \|A^*Ax\|^{1/2} \|x\|^{1/2}.
\]

(40.29)

If we further assume that \([A, A^*] = 0\), then

\[
\|A^*Ax\|^2 = (Ax, AA^*Ax) = (Ax, A^*AxAx) = (AAx, AAx) = \|A^2x\|^2
\]

so that Eq. (40.29) may be written as

\[
\|Ax\| \leq \|A^2x\|^{1/2} \|x\|^{1/2}
\]

(40.30)

and this equation generalizes.

**Lemma 40.125.** Suppose that \( A : H \rightarrow H \) is an operator such that \( A^* \) exists and \([A, A^*] = 0\), i.e. \( A \) is normal. Then for each \( x \in H \) and \( n \in \mathbb{N} \),

\[
\|Ax\| \leq \|A^n x\|^{1/n} \|x\|^{n-1/n}.
\]

(40.31)

In particular,

\[
\|A\| = \|A^n\|^{1/n} \quad \text{for all } n \in \mathbb{N},
\]

where the possibility of \( \|A\| = \infty \) is allowed in the statement.

**Proof.** As we have already seen the result holds for \( n = 1 \) and \( 2 \). Now suppose Eq. (40.31) holds for a given \( n \in \mathbb{N} \). Replacing \( x \) by \( Ax \) in Eq. (40.31) gives

\[
\|A^2x\| \leq \|A^{n+1}x\|^{1/n} \|A^n x\|^{n-1/n}.
\]

This equation along with Eq. (40.30) implies

\[
\|Ax\|^2 \leq \|A^{n+1}x\|^{1/n} \|A^n x\|^{1-1/n} \|x\|
\]

or equivalently

\[
\|Ax\|^{n+1} = \|Ax\|^{1+1/n} \leq \|A^{n+1}x\|^{1/n} \|x\|.
\]

Raising this equation to the \( \frac{n}{n+1} \) power shows Eq. (40.31) holds with \( n \) replaced by \( n+1 \), thus proving the Eq. (40.31) by induction. For the last assertion,
Eq. (40.31) implies $\|A\| \leq \|A^n\|^{1/n}$ while on the other hand $\|A^n\| \leq |A|^n$ implies $\|A^n\|^{1/n} \leq |A|$. 

Now suppose that $A$ is a bounded normal operator on a Hilbert space. Putting the previous results together, we find $r(A) = \|A\|$ and if $p : \mathbb{C} \to \mathbb{C}$ is a polynomial then

$$\|p(A)\| = \sup |p(\lambda)| = \sup |p(\sigma(A))| = \|p\|_{L^\infty(\sigma(A))}.$$  

Because of Eq. (40.32) and the Stone-Weierstrass theorem, the mapping

$$p \in \{\text{Polynomials on } \sigma(A)\} \mapsto p(A) \in L(H)$$

extends uniquely to an isometry, $\hat{A} : \sigma(C(A)) \to L(H)$, i.e. for $f \in C(\sigma(A))$

$$\hat{A}f = \lim_{n \to \infty} p_n(A)$$

where $p_n : \mathbb{C} \to \mathbb{C}$ are polynomials such that $\lim_{n \to \infty} \|f - p_n\|_{L^\infty(\sigma(A))} = 0$.

**Notation 40.126** In the future we will often write $f(A)$ for $\hat{A}f$.

Let us now show that we still have the relation $\sigma(f(A)) = f(\sigma(A))$. Suppose that $\lambda \notin f(\sigma(A))$ and set $g := \frac{1}{f - \lambda} \in C(\sigma(A))$. Then since $g(\lambda - f) = 1$, it follows that

$$g(A)(\lambda - f(A)) = 1 = (\lambda - f(A))g(A)$$

that is to say $g(A) = (\lambda - f(A))^{-1}$. This shows $\lambda \notin \sigma(f(A))$. Now suppose that $\lambda = f(\sigma(A))$, we must show $\lambda \in \sigma(f(A))$, i.e. that $\lambda - f(A)$ is not invertible. Let $\varepsilon > 0$ be given, choose a polynomial $p$ such that $\|f - p\| < \varepsilon$. Since we know $\sigma(p(A)) = \sigma(p(\lambda))$, $\sigma(p(A))$ and so by Lemma 40.79 there exists $\psi \in H$ with $\|\psi\| = 1$ such that

$$\|p(A) - p(\lambda)\| \psi \| \leq \varepsilon.$$ 

From this we find

$$\|f(A) - f(\lambda)\| \psi \| \leq \|p(A) - p(\lambda)\| \psi \| + \|f(A) - p(A) + f(\lambda) - p(\lambda)\| \psi \| < \varepsilon + \|f(A) - p(A)\| + |f(\lambda) - p(\lambda)| < 3\varepsilon.$$ 

So another application of Lemma 40.79 below shows that $\lambda - f(A) \notin \sigma(f(A))$.

The reader should note that $\sigma(A^*) = \overline{\sigma(A)}$ because $\lambda \in \sigma(A^*)$ iff $A^* - \lambda I$ is not invertible iff $A - \overline{\lambda} I = (A^* - \lambda I)^*$ is not invertible, i.e. iff $\overline{\lambda} \in \sigma(A)$. Given $f \in C(\sigma(A))$, let $\hat{f}(\zeta) := \overline{f}(\zeta)$ so that $\hat{f} \in C(\sigma(A^*))$. It is easily seen that $f(A)^* = \hat{f}(A)$ when $f$ is polynomial and so by passage to the limit this equation holds for general $f \in C(\sigma(A))$. In particular if $A = A^*$, then $\sigma(A) \subset \mathbb{R}$ so $\hat{f} = f$ we find $f(A)^* = f(A)$ so that $f(A)$ is self-adjoint iff $f$ is real.

It would have been more natural in the case where $A$ is normal to consider functions of the form $f(A,A^*)$ where $f \in C(\sigma(A) \times \sigma(A^*))$ by starting with polynomials $p : \mathbb{C}^2 \to \mathbb{C}$ and showing

$$\|p(A,A^*)\| = \|z \to p(z, \bar{z})\|_{C(\sigma(A))}$$

and then using the fact that $p(z, \bar{z})$ is dense in $C(\sigma(A))$. I think this is done in the abstract setting culminating at the ends of Section ?? above. The key point to doing this directly is to prove the following version of the spectral mapping theorem,

$$\sigma(p(A,A^*)) = \{p(z, \bar{z}) : z \in \sigma(A)\}.$$ 

Put in here the stuff from Simon, Theorem VII.2=Problem 13. Extend the results to commuting operators following problem 4.

(See problems 14 and 15 on 217 of Reed Simon for the continuity properties of $\sqrt{A}$ and $|A|$. We carry out these results here.) Recall that $\sqrt{\lambda - \varepsilon} = 1 - \sum_{i=1}^{\infty} c_i z^i$ for $|z| < 1$, where $c_i \geq 0$ and $\sum_{i=1}^{\infty} c_i < \infty$. For an operator $A$ on $H$ such that $A \geq 0$ and $\|A\|_{B(H)} \leq 1$, the square root of $A$ is given by

$$\sqrt{A} = I - \sum_{i=1}^{\infty} c_i(A - I)^i.$$ 

**Proposition 40.127 (Square Root).** Suppose that $A_n$ and $A$ are positive operators on $H$ and $\|A - A_n\|_{B(H)} \to 0$ as $n \to \infty$, then $\sqrt{A_n} \to \sqrt{A}$ in $B(H)$ also. Moreover, $A_n$ and $A$ are general bounded operators on $H$ and $A_n \to A$ in the operator norm then $|A_n| \to |A|$.

**Proof.** With out loss of generality, assume that $\|A_n\| \leq 1$ for all $n$. This implies also that $\|A\| \leq 1$. Then

$$\sqrt{A} - \sqrt{A_n} = \sum_{i=1}^{\infty} c_i((A_n - I)^i - (A - I)^i)$$

and hence

$$\|\sqrt{A} - \sqrt{A_n}\| \leq \sum_{i=1}^{\infty} c_i\|(A_n - I)^i - (A - I)^i\|.$$  

(40.33)

For the moment we will make the additional assumption that $A_n \geq \varepsilon I$, where $\varepsilon \in (0,1)$. Then $0 \leq I - A_n \leq (1 - \varepsilon)I$ and in particular $\|I - A_n\|_{B(H)} \leq (1 - \varepsilon)$. Now suppose that $Q, R, S, T$ are operators on $H$, then $QR - ST = (Q - S)R + S(R - T)$ and hence
Setting $Q = A_n - I$, $R := (A_n - I)^{i-1}$, $S := (A - I)$ and $T = (A - I)^{i-1}$ in this last inequality gives
\[
\| (A_n - I)^i - (A - I)^i \| \leq \| A_n - A \| (A_n - I)^{i-1} + \| (A - I) \| (A_n - I)^{i-1} - (A - I)^{i-1} \|
\]
\[
\leq \| A_n - A \| (1 - \epsilon)^{i-1} + (1 - \epsilon) (A_n - I)^{i-1} - (A - I)^{i-1}.
\]
\[
\text{(40.34)}
\]

It now follows by induction that
\[
\| (A_n - I)^i - (A - I)^i \| \leq i(1 - \epsilon)^{i-1} \| A_n - A \|.
\]

Inserting this estimate into (40.33) shows that
\[
\| \sqrt{A} - \sqrt{A_n} \| \leq \sum_{i=1}^{\infty} c_i (1 - \epsilon)^{i-1} \| A_n - A \| = \frac{1}{2} \frac{1}{\sqrt{1 - (1 - \epsilon)}} \| A - A_n \| = \frac{1}{2} \frac{1}{\sqrt{\epsilon}} \| A - A_n \| \to 0.
\]

Therefore we have shown if $A_n \geq \epsilon I$ for all $n$ and $A_n \to A$ in norm then $\sqrt{A_n} \to \sqrt{A}$ in norm. For the general case where $A_n \geq 0$, we find that for all $\epsilon > 0$
\[
\lim_{n \to \infty} \sqrt{A_n} + \epsilon = \sqrt{A} + \epsilon.
\]
\[
\text{(40.35)}
\]

By the spectral theorem\footnote{It is possible to give a more elementary proof here. Indeed, assume further that $\| A \| \leq \alpha < 1$, then for $\epsilon \in (0, 1 - \alpha)$, $\| \sqrt{A} + \epsilon - \sqrt{A} \| \leq \sum_{0 \leq k \leq \| A \|} c_k \| (A + \epsilon)^i - A \|$. But
\[
\| (A + \epsilon)^i - A \| \leq \sum_{k=1}^{i} \binom{i}{k} \epsilon^k \| A^{i-k} \| \leq \sum_{k=1}^{i} \binom{i}{k} \epsilon^k \| A \|^{i-k} = \| (A + \epsilon)^i - A \|,
\]
so that $\| \sqrt{A} + \epsilon - \sqrt{A} \| \leq \sqrt{\| A \| + \epsilon - \sqrt{\| A \|}} \to 0$ as $\epsilon \to 0$ uniformly in $A \geq 0$ such that $\| A \| \leq \alpha < 1$.}
\[
\| \sqrt{A} + \epsilon - \sqrt{A} \| \leq \max_{x \in \sigma(A)} | \sqrt{x + \epsilon - \sqrt{x}} | \leq \max_{0 \leq x \leq \| A \|} | \sqrt{x + \epsilon - \sqrt{x}} | \to 0 \text{ as } \epsilon \to 0.
\]

Since the above estimates are uniform in $A \geq 0$ such that $\| A \|$ is bounded, it is now an easy matter to conclude that Eq. (40.35) holds even when $\epsilon = 0$. \hfill \blacksquare

Now suppose that $A_n \to A$ in $B(H)$ and $A_n$ and $A$ are general operators. Then $A_n^*A_n \to A^*A$ in $B(H)$. So by what we have already proved,
\[
\| A_n \| := \| A_n^*A_n \| \to \| A \| := \| A^*A \| \text{ in } B(H) \text{ as } n \to \infty.
\]

Old Stuff

Moreover, to each $f : \sigma(A) \to \mathbb{C}$, there exists polynomials $p_n$ such that $p_n(A) \to f(A)$ strongly. To show this let $\lambda := q, \mu$ a probability measure on $\sigma(A)$. Then choose $f_n \in C(\sigma(A))$ such that $f_n \to f$, $\lambda$ - a.e. and such that $\| f_n \|_{\infty} \leq \| f \|_{\infty}$ for all $n$. Then choose polynomials $p_n$ such that $\| f_n - p_n \|_{\infty} \leq 1/n$. Then we have $p_n \to f$, $\lambda$ - a.e. and the $p_n$ are all bounded. Therefore, $p_n \circ q \to f \circ q$, $\lambda$ - a.e. and boundedly so that $p_n(Q) \to f(Q)$ as $n \to \infty$. Hence it follows that $p_n(A) \to f(A)$ as $n \to \infty$. One can use this to prove that $f(A)$ is well defined since if we are given two such measure spaces and let $\lambda = \lambda_1 + \lambda_2 = q_1 \mu_1 + q_2 \mu_2$ and go through the above argument to find polynomials $p_n \to f$, $\lambda$ - a.e., then $p_n(Q_1) \to f(Q_1)$ in each case therefore $p_n(A)$ converges to both $U_1f(Q_1)U_1^{-1}$ and to $U_2f(Q_2)U_2^{-1}$ showing $f(A)$ is well defined.

\begin{proof}
Note that if $f \in \mathcal{S}$, then
\[
M_f h(x) = \int \hat{f}(\xi)e^{i\xi x} d\xi \cdot h(x) = \int \hat{f}(\xi)e^{i\xi Q}h(x)d\xi
\]
so that $M_f = f(Q)$ as defined previously. Therefore using
\[
U e^{i\xi Q} = \sum_{n=0}^{\infty} \frac{(i\xi)^n}{n!} UQ^n = \sum_{n=0}^{\infty} \frac{(i\xi)^n}{n!} A^n U = e^{i\xi A} U
\]
we find
\[
UM_fh = U \int \hat{f}(\xi)e^{i\xi Q}hd\xi = \int \hat{f}(\xi)Ue^{i\xi Q}hd\xi = \int \hat{f}(\xi)e^{i\xi A}Uhd\xi
\]
from which we see that we must define
\[
f(A) = \int \hat{f}(\xi)e^{i\xi A}d\xi \text{ for all } f \in \mathcal{S}.
\]
\end{proof}
40.6 The Structure of Abelian Banach Algebras

Based on Len Gross’ notes on functional analysis.

As above suppose that $X$ is a compact Hausdorff space and let $A = C(X, \mathbb{R})$ and $\|f\| = \sup_{x \in X} |f(x)|$. Then we have $\|fg\| \leq \|f\| \|g\|$ for all $f, g \in A$.

Definition 40.128. A real (abelian) Banach algebra $A$ is an algebra (with identity) over $\mathbb{R}$ equipped with a norm $\|\cdot\|$ such that $(A, \|\cdot\|)$ is a Banach space and $\|fg\| \leq \|f\| \|g\|$ for all $f, g \in A$.

Our goal in this section is to show every such Banach algebra isomorphic to $C(X, \mathbb{R})$ for some compact Hausdorff space $X$. An ideal $I$ of $A$ is a subspace of $A$ such that $fg \in I$ for all $f \in A$ and $g \in I$. So in particular, $I \subset A$ is a subalgebra of $A$.

Example 40.129. Suppose that $A = C(X, \mathbb{R})$.

1. Let $A \subset X$ be a set, then $\mathcal{I}_A := \{f \in A : f|_A \equiv 0\}$ is an ideal of $A$.
2. Suppose that $V \subset_0 X$ is an open subset of $X$, then $\mathcal{I} = \{f \in A : \text{supp}(f) \subset V\}$ is also an ideal in $A$.

Lemma 40.130. Let $A$ be a Banach algebra then the invertible elements $A^\times \subset A$ is an open set.

Proof. We first begin by showing $1 \in (A^\times)^\circ$. Suppose that $f \in A$ and $\alpha := \|1 - f\| < 1$. Since

$$\sum_{n=0}^{\infty} \|(1 - f)^n\| \leq \sum_{n=0}^{\infty} \|1 - f\|^n = \frac{\alpha}{1 - \alpha} < \infty, \tag{40.36}$$

$\sum_{n=0}^{\infty} (1 - f)^n$ is convergent in $A$, let $g = \sum_{n=0}^{\infty} (f - 1)^n$. Then

$$fg = f \cdot \lim_{N \to \infty} \sum_{n=0}^{N} (f - 1)^n = \lim_{N \to \infty} \sum_{n=0}^{N} (1 + (1 - f)) \cdot (1 - f)^n = \lim_{N \to \infty} \left(1 - (1 - f)^{N+1}\right) = 1$$

showing that $f \in A^\times$. Hence we have shown that $B_1(1) \subset A^\times$. Now for general $f \in A^\times$, let $g \in A$ be close to $A$. Then

$$g = f + (g - f) = f \left(1 - f^{-1}(g - f)\right)$$

which shows that $g \in A^\times$ provided that $(1 - f^{-1}(g - f))$ is invertible and this will happen if

$$\|f^{-1}(g - f)\| < 1.$$

Since

$$\|f^{-1}(g - f)\| \leq \|g - f\| \|f^{-1}\|$$

which can be assured by assuming that $\|g - f\| < \|f^{-1}\|^{-1}$. So we have shown that $B_f(\|f^{-1}\|^{-1}) \subset A^\times$ showing that $A^\times$ is open.

Lemma 40.131. Suppose that $\mathcal{I} \subset A$ is a proper ideal, then $\overline{\mathcal{I}}$ is also a proper ideal.

Proof. Because that algebra operations are continuous it is easily checked that $\overline{\mathcal{I}}$ is still an ideal of $A$. So we need only shows that $\overline{\mathcal{I}} \neq A$. If $\mathcal{I} = A$, then there exists $f \in \mathcal{I}$ such that $\|1 - f\| < 1$. By Lemma 40.130 it then follows that $f \in A^\times$ and therefore $1 = f^{-1}f \in \mathcal{I}$ which then implies that $\mathcal{I} = A$ contradicting the fact $\mathcal{I}$ is a proper ideal of $A$.

Definition 40.132. A character of $A$ is a homomorphism $\Delta : A \to \mathbb{C}$ such that $\Delta(1) = 1$. Let $\mathcal{M}$ denote the set of characters of $A$.

Theorem 40.133. Let $A$ be a commutative Banach algebra. Then

1. All maximal ideals $\mathcal{I}$ in $A$ are closed.
2. The map $\alpha \in \mathcal{M} \to \text{Nul}(\alpha) \subset A$ is a bijection from $\mathcal{M}$ to maximal ideals inside of $A$.
3. All characters are continuous, i.e. $\mathcal{M} \subset A^\times$. Moreover all characters have norm equal to one in $A^\times$.

Proof.

1. Suppose that $\mathcal{I}$ is a maximal ideal, then by Lemma 40.131 $\overline{\mathcal{I}}$ is a proper ideal containing $\mathcal{I}$ and hence $\mathcal{I} = \overline{\mathcal{I}}$.
2. Suppose that $\alpha \in \mathcal{M}$ and let $\mathcal{I} = \text{Nul}(\alpha)$. Then $\mathcal{I}$ is an ideal and is in fact maximal. Indeed, let $\tilde{\alpha} : A/\mathcal{I} \to \mathbb{C}$ be the homomorphism defined by $\tilde{\alpha}(a + \mathcal{I}) = \alpha(a)$ and $\pi : A \to A/\mathcal{I}$ be the projection map. Then $\alpha = \tilde{\alpha} \circ \pi$. If $\mathcal{I}$ were not maximal, there would exist a proper ideal, $\mathcal{J}$, such that $\mathcal{I} \subset \mathcal{J}$. Then $\pi(\mathcal{J})$ would be proper ideal $A/\mathcal{I} \cong \mathbb{C}$, but $\mathbb{C}$ has no proper ideals in a maximal ideal. Therefore $\mathcal{I}$ is a maximal ideal. Since $1 \notin \mathcal{I}$ and $\alpha(1) = 1$, given $\mathcal{I}$ we may recover $\alpha$ by the formula

$$\alpha_{\mathcal{I}}(a + \lambda \mathcal{I}) = \lambda \text{ for all } a \in \mathcal{I} \text{ and } \lambda \in \mathbb{C}. \quad (40.37)$$

It also easy to check that if $\mathcal{I}$ is a maximal ideal in $A$, then $\alpha_{\mathcal{I}}$ defined by Eq. (40.37) is in $\mathcal{M}$.
3. Let $\alpha \in \mathcal{M}$ and $\mathcal{I} = \text{Nul}(\alpha)$. Let $\phi : \mathcal{I} \times \mathbb{C} \to A$ be defined by $\phi((a, \lambda)) = a + \lambda \mathcal{I}$, then $\phi$ is a bounded linear map which is bijective. By the open mapping theorem, it follows that $\phi^{-1}$ is bounded as well, therefore $\alpha = \phi^{-1} \circ \pi_{\mathbb{C}}$ is
In this topology, \( M \) is a compact subset of \( A \). The condition that \( \|f^*f\| = \|f\|^2 \) for all \( f \in A \) is equivalent to the two conditions: 1) \( \|f^*\| = \|f\| \) and 2) \( \|f^*f\| = \|f\| \|f\| \). Indeed if \( \|f^*f\| = \|f\|^2 \), then

\[
\|f\|^2 = \|f^*f\| \leq \|f\| \|f^*\|
\]

so that \( \|f\| \leq \|f^*\| \) and by replacing \( f \) by \( f^* \) we find that \( \|f^*\| \leq \|f\| \), so that \( f^* = f \) verifying 1). For 2), we now have \( \|f^*f\| = \|f\|^2 = \|f\| \|f\| \).

**Theorem 40.135.** Suppose that \( A \) is an abelian \( B^* \) algebra, then the map \( \tilde{\phi} : A \to C(M) \) is an isometric isomorphism of \( B^* \) algebras.

Suppose that \( X \) and \( Y \) are compact Hausdorff spaces such that there exists \( \phi : C(X) \to C(Y) \) which is an isometric isomorphism. Then there exists a homeomorphism \( T : Y \to X \) such that \( \phi(f) = f \circ T \). To prove this let \( M_X \) be the characters on \( C(X) \) and \( M_Y \) be the characters on \( C(Y) \). Then by the Stone-Weierstrass theorem,

\[
M_X = \{ \alpha_x : x \in X \}
\]

where \( \alpha_x(f) = f(x) \) with similar relation for \( M_Y \). Now given \( \phi \), let \( \tilde{\phi} : M_Y \to M_X \) be defined by \( \tilde{\phi}(\alpha_y) = \alpha_y \circ \phi \). Clearly \( \tilde{\phi} \) is a bijection. We claim that this bijection is continuous.\footnote{A better proof of this assertion is as follows. Suppose that \( f \in C(X) \), to show that \( \phi \) is continuous it suffices to show that \( \pi_f \circ \phi \) is continuous. That is the map \( \alpha \to \pi_f \circ \phi(\alpha) = \alpha(\phi(f)) = \pi_{\phi(f)}(\alpha) \) is continuous. But \( \pi_{\phi(f)} \) is continuous on \( M_Y \) as desired.}

Indeed, a basic open set \( M_X \) is of the form \( V = \{ \alpha_x \in M_X : |\alpha_x(-\beta)| < \varepsilon \} \) for some \( \beta \in M_X \), \( f \in C(X) \) and \( \varepsilon > 0 \). Now

\[
\gamma \in \tilde{\phi}^{-1}(V) \iff \gamma \circ \phi \in V \iff |\gamma(\phi(f)) - \beta| < \varepsilon
\]

which shows that

\[
\tilde{\phi}^{-1}(V) = \{ \gamma \in M_Y : |\gamma(\phi(f)) - \beta| < \varepsilon \}
\]

which is a basic open set in \( M_Y \). Therefore \( \tilde{\phi} \) is continuous and hence a homeomorphism since \( M_Y \) is compact and \( M_X \) is Hausdorff. We also have the maps

\[
x \in X \to \alpha_x \in M_X
\]

is a homeomorphism. Indeed, the map is bijective and easily seen to be continuous (and hence homeomorphism), since if \( \pi_f \) is a projection map \( x \to \pi_f(\alpha_x) = \alpha_x(f) = f(x) \) is continuous. Therefore we may define the \( T(y) = x \) where \( \alpha_y \circ \phi = \alpha_x \).

\[\text{Page: 492} \quad \text{job: newanal} \quad \text{macro: svmonob.cls} \quad \text{date/time: 6-Jan-2012/17:01}\]
**Notation 40.136** Suppose that $X$ is a compact Hausdorff space and $\mathcal{A} := C(X, \mathbb{C})$ be the algebra of continuous function on $X$. To an set $E \subset X$, let $I(E) := \{ f \in \mathcal{A} : f|_E \equiv 0 \}$ be the closed ideal in $\mathcal{A}$ of functions vanishing on $E$. To any subset $T \subset \mathcal{A}$, let $Z(T) := \{ x \in X : f(x) = 0 \text{ for all } f \in T \}$ denote the subset of $X$ consisting of the common zeros of functions from $T$. When $E = \{ x \}$ with $x \in X$, we will write $m_x := I(\{x\}).$

**Lemma 40.137.** If $I \subset \mathcal{A}$ is a proper ideal, then the closure of $I$, $\bar{I}$, is also a proper ideal. If $I$ is a closed ideal in $\mathcal{A}$ then $\bar{I}$ is closed under conjugation.

**Proof.** Suppose $I$ is an ideal such that $I \subset \bar{I}$. Then there exists $f \in I$ such that $\|f - 1\| < 1$ from which it follows $f$ is never zero. Hence $f$ is invertible and hence $I = \bar{I}$. Now suppose $f \in I$ and $\bar{I}$ is a closed ideal. To show $f \in I$ we would like to say $f = g f \in I$ where $g = f/\bar{f}$. However, $g$ is a well defined element of $\mathcal{A}$ since $Z(f) = \{ f = 0 \}$ is necessarily non-empty. To fix this, for any $\varepsilon > 0$ let $\phi_\varepsilon \in C(X, [0, 1]) \subset \mathcal{A}$ be chosen so that $\phi_\varepsilon = 0$ in a neighborhood of $Z(f)$ and $\phi_\varepsilon = 1$ on $\{|f| \geq \varepsilon\}$. Then $g_\varepsilon := \phi_\varepsilon f / f$ now makes sense as an element in $\mathcal{A}$ and therefore $g_\varepsilon f \in I$ for all $\varepsilon > 0$. Since $g_\varepsilon f = \phi_\varepsilon f \to f$ in $\mathcal{A}$ as $\varepsilon \downarrow 0$, we learn $f \in I$.

**Proposition 40.138.** Suppose that $X$ is a compact Hausdorff space and $\mathcal{A} := C(X, \mathbb{C})$. Then

1. For any subset $E \subset X$, $Z(I(E)) = \bar{E}$.
2. For any $T \subset \mathcal{A}$, $I(Z(T)) = \bar{T}$ is the closed ideal in $\mathcal{A}$ generated by $T$.
   (Items 1. and 2. implies that closed subsets $E \subset X$ are in one to one correspondence with closed ideals in $\mathcal{A}$ via $E \rightarrow I(E)$ and $J \rightarrow Z(J)$.)
3. For each $x \in X$, $m_x := I(\{x\})$ is a maximal (necessarily closed) ideal in $\mathcal{A}$.
4. Let $m$ denote the collection of maximal ideals in $\mathcal{A}$, then the map $\psi : X \rightarrow m$ defined by $\psi(x) = m_x$ is bijective.
5. If we view $m$ as a topological space by transferring the topology on $X$ to $m$ using $\psi$, the closed sets in $m$ consist precisely of the sets

$$C_J := \{ m \in m : J \subset m \}$$

where $J$ is a closed ideal in $\mathcal{A}$.

**Proof.**

1. Since $Z(T) \subset X$ is closed for any $T \subset \mathcal{A}$ and $E \subset Z(I(E)), \bar{E} \subset Z(I(E))$. If $x \notin \bar{E}$, then by Uryhson’s lemma, there exists $f \in \mathcal{A}$ such that $f(x) \neq 0$ while $f|_E = 0$, i.e. $f \notin I(E)$. This shows $x \notin Z(I(E))$ and we have proved the first assertion.

2. Since $I(E)$ is a closed ideal for any subset $E \subset X$ and $(T)$ is easily seen to be a subset of $I(Z(T))$, it follows that $(T) \subset I(Z(T))$. The closed ideal in $\mathcal{A}$ generated by $T$. Let $X_0 := X \setminus Z(T)$, a locally compact space. If $f \in I(Z(T))$ then $f|_{X_0} \in C_0(X_0, \mathbb{C})$ and if $f|_{X_0} \equiv 0$ then $f \equiv 0$ since by assumption $f = 0$ on $Z(T)$. So using this identification we have

$$\bar{(T)} \subset I(Z(T)) \subset C_0(X_0, \mathbb{C})$$

and in particular $\bar{(T)}$ is a closed ideal in $C_0(X_0, \mathbb{C})$. Suppose there exists $x \neq y$ in $X_0$ such that $f(x) = f(y)$ for all $f \in \bar{(T)}$. Let $\psi \in C_0(X_0, \mathbb{C})$ be chosen so that $\psi(x) = 1$ while $\psi(y) = 0$, then for $f \in \bar{(T)}$, $\psi f \in \bar{(T)}$ and so

$$f(x) = (\psi f)(x) = (\psi f)(0) = 0$$

which shows $f(x) = 0$ for all $f \in \bar{T}$. But this is impossible because of the definition of $X_0 = X \setminus Z(T)$. So the locally compact form of the Stone-Weierstrass theorem is applicable and implies $(\bar{T}) = C_0(X_0, \mathbb{C})$. Hence by Eq. (40.38), $(\bar{T}) = I(Z(T)) = C_0(X_0, \mathbb{C})$.

3. Suppose $x \in X$ and $f \in \mathcal{A} \setminus m_x$ and let $I$ be the closed ideal generated by $f$ and $m_x$. It is easily checked that $I$ separates points and $Z(I) = \emptyset$ and hence by the Stone-Weierstrass theorem $I = \mathcal{A}$. This shows that $m_x$ is a maximal ideal which is necessarily closed by the comments at the start of the proof.

4. Clearly the map $\psi : X \rightarrow m$ is injective. To prove surjectivity, suppose $m \in m$ is a maximal ideal. Using the same sort of argument to the proof of item 2. above, it follows that $m$ separates points. Since $m$ is a closed proper subalgebra of $\mathcal{A}$, the Stone-Weierstrass theorem implies $m = m_x$ for some $x \in X$.

5. For a closed subset $E \subset X$, $\psi(E) = \{ m_x \in m : x \in E \} = \{ m \in m : I(\bar{E}) = I(E) \subset m \}$.

Therefore the closed subsets of $m$ are precisely sets of the form

$$C_J := \{ m \in m : J \subset m \}$$

where $J$ is a closed ideal in $\mathcal{A}$. 

---

Footnote 7: Old Proof: Any proper ideal is necessarily contained in the set $S$ of “singular elements” in $\mathcal{A}$ where $S$ is the set of non-invertible elements of $\mathcal{A}$.

$$S = \cup_{x \in X} m_x = \{ f \in \mathcal{A} : f(x) = 0 \text{ for some } x \in X \}.$$ 

The complement of $S$ is

$$S^c = \{ f \in \mathcal{A} : f \text{ is never 0} \},$$

which is the open subset of $\mathcal{A}$ consisting of invertible elements in $\mathcal{A}$. So $I \subset S$ and $S'$ is closed implies $I \subset S$ and therefore $I$ is still proper.
Corollary 40.139. Suppose $X$ and $Y$ are compact Hausdorff spaces, then the map

$$T \in C(X, Y) \to T^\dagger \in \text{Hom}_{\text{C–algebra}}(C(Y, \mathbb{C}), C(X, \mathbb{C}))$$

(40.39)

is a one to one correspondence where $T^\dagger(f) := f \circ T \in C(X, \mathbb{C})$ for $f \in C(Y, \mathbb{C})$.

Proof. Suppose $\psi \in \text{Hom}_{\text{C–algebra}}(C(Y, \mathbb{C}), C(X, \mathbb{C}))$ and there exists a map $T : X \to Y$ (not necessarily continuous) such that $\psi = T^\dagger$. Given $x \in X$ and $V \subset Y$ such that $T(x) \in V$, let $g \in C_c(V, [0, 1])$ such that $g(T(x)) = 1$. By assumption $g \circ T = T^\dagger g = \psi(g) \in C(X, \mathbb{C})$ and therefore, $U := \{x \in X : g(T(x)) > 1/2\}$ is an open subset of $X$. By construction, $T(U) \subset V$ showing $T : X \to Y$ is continuous. Similar reasoning shows that if $T, S \in C(X, Y)$ and $T^\dagger = S^\dagger$, i.e. $f \circ T = f \circ S$ for all $f \in C(Y, \mathbb{C})$ then $T = S$. Therefore the map in Eq. (40.39) is injective. So it only remains to show that to every $\psi \in \text{Hom}_{\text{C–algebra}}(C(Y, \mathbb{C}), C(X, \mathbb{C}))$ is of the form $T^\dagger$ for some map $T : X \to Y$. If such a $T$ exists, observe

$$\psi^{-1}(m^X_x) = (T^\dagger)^{-1}(m^X_x) = \{f \in C(Y, \mathbb{C}) : f(T(x)) = 0\} =: m^Y_{T(x)}$$

where $m^X_x := \{g \in C(X, \mathbb{C}) : g(x) = 0\}$. Thus if $T$ is going to exist we must define it by $m^Y_{T(x)} = \psi^{-1}(m^X_x)$. For this to make sense we need only show $\psi^{-1}(m^X_x)$ is a maximal ideal in $C(Y, \mathbb{C})$. It is easily seen $\psi^{-1}(m^X_x)$ is an ideal. To see it is maximal, suppose $g \in C(Y, \mathbb{C}) \setminus \psi^{-1}(m^X_x)$ and let $\lambda := \psi(g)(x) \neq 0$. Then $\psi(g - \lambda 1) = \psi(g) - \lambda 1 \in m^X_x$ and thus $g - \lambda 1 \in \psi^{-1}(m^X_x)$ and hence 1 is in the span of $g$ and $\psi^{-1}(m^X_x)$. This shows $\psi^{-1}(m^X_x)$ is a maximal ideal in $C(Y, \mathbb{C})$ and therefore is equal to $m_y$ for some unique $y := T(x) \in Y$. For $g \in C(Y, \mathbb{C})$ and $x \in X$,

$$\psi(g) = \psi(g - g(T(x))1) + \psi(g(T(x))1) = \psi(g - g(T(x))1) + g(T(x))1$$

with $g - g(T(x))1 \in m_{T(x)} = \psi^{-1}(m_x)$. So evaluating the above identity at $x$ shows

$$\psi(g)(x) = g(T(x))$$

for all $x \in X$,

i.e. $\psi(g) = T^\dagger(g)$ as desired. ■
Topological Vector Spaces

(See Rudin’s Functional analysis for more details.) In this section \((X, \tau = \tau(X))\) will denote a topological vector space and \(\tau_0 = \tau_0(X)\) will denote the open neighborhoods of 0. By assumption all vector space operations are continuous in this topology and one point sets are closed. The reader should check that if \(Y \subset X\) is a subspace then \(Y\) is also a topological vector space when equipped with the relative topology coming from \(\tau\) on \(X\).

Definition 41.1. A subset \(E \subset X\) is bounded if for every \(V \in \tau_0(X)\), there exists \(s > 0\) such that \(E \subset tV\) for all \(t > s\).

41.1 Basic Facts

Theorem 41.2. Let \(X\) be a topological vector space.

1. To every \(V \in \tau_0(X)\), there exists \(V_0 \in \tau_0(X)\) which is balanced (i.e. \(\alpha V_0 \subset V_0\) for all \(|\alpha| \leq 1\)) and \(V_0 \subset V\). In particular \(X\) has a balanced local base at 0.
2. Every convex neighborhood of 0 contains a balanced convex neighborhood of 0.
3. If \(V \in \tau_0(X)\) and \(\{r_n\}_{n=1}^\infty \subset (0, \infty)\) with \(r_n \uparrow \infty\), then \(X = \bigcup_{n=1}^\infty r_n V\).
4. If \(V\) is a bounded open neighborhood of 0 and \(\{\delta_n\}_{n=1}^\infty \subset (0, \infty)\) with \(\delta_n \downarrow 0\), then \(\{\delta_n V\}_{n=1}^\infty\) is a neighborhood base for 0 \(\in X\).
5. Any compact set \(K\) is bounded.

Proof.

1. Choose \(U \in \tau_0(X)\) and \(\delta > 0\) such that \(\alpha U \subset V\) for all \(|\alpha| \leq \delta\), then \(V_0 \in \tau_0(X)\) defined by

\[
V_0 := \bigcup_{|\alpha| \leq \delta} \alpha U
\]

will work.
2. Suppose \(V\) is a convex neighborhood of 0 and let \(V_0 \subset V\) be as in item 1. Then \(V_0 \subset A := \cap_{|\alpha| = 1} (\alpha V)\) and hence \(A\) is a neighborhood of 0, i.e. 0 \(\in A\). We now claim that \(A\) is the desired convex and balanced neighborhood of \(A\). To see that it is convex, let \(t \in (0, 1)\), then

\[
tA + (1-t)A \subset tA + (1-t)A \subset A
\]

which shows that \(tA + (1-t)A \subset A\). To see that \(A\) is balanced, again let \(r \in [0, 1]\) and \(|\beta| = 1\), then

\[
\beta A = \bigcap_{|\alpha| = 1} (\beta \alpha V) = \bigcap_{|\alpha| = 1} (\alpha V) \subset \bigcap_{|\alpha| = 1} (\alpha V) = A
\]

wherein the last inclusion we have used the fact that \(\alpha V\) is a convex set which contains 0.
3. Let \(x \in X\), since \(0x = 0\) and scalar multiplication is continuous, there exists \(\varepsilon > 0\) such that \(B(0, \varepsilon) x \subset V\). Hence whenever, \(n\) is so large that \(|r_n^{-1}| < \varepsilon\) we have \(r_n^{-1}x \in V\), i.e. \(x \in r_n V\).
4. Let \(V\) be bounded neighborhood of 0, \(U \in \tau_0(X)\) and \(s > 0\) be chosen so that \(V \subset tU\) for all \(t > s\). Then \(V \subset \delta_n^{-1} U\) for a.a. \(n\), i.e. \(\delta_n V \subset U\) for a.a. \(n\).
5. Let \(V \in \tau_0(X)\) and \(V_0\) be a balanced neighborhood of 0 with \(V_0 \subset V\). Notice that \(tV \uparrow t^{-1}\), so that \(\{tV\}_{t=1}^\infty\) is an increasing sequence. By Item 3., \(K \subset \bigcup_{n=1}^\infty nV_0\) and since \(K\) is compact there exists \(n \in \mathbb{N}\) such that for all \(t > n\),

\[
K \subset \bigcap_{n=1}^\infty nV_0 \subset tV
\]

which shows \(K\) is bounded.

Lemma 41.3. Suppose that \(A \subset X\), then

\[
\bar{A} = \bigcap_{N \in \tau_0(X)} (A + N).
\]

If \(U \in \tau_0\) there exists a balance \(V \in \tau_0\) such that \(\bar{V} \subset U\).

Proof. Since \(x - N\) with \(N \in \tau_0(X)\) is the generic neighborhood of \(x\), \(x \in A\) iff \((x - N) \cap A \neq \emptyset\) for all \(N \in \tau_0(X)\). This completes the proof of the first assertion since that latter condition is equivalent to the statement: \(x \in A + N\) for all \(N \in \tau_0(X)\). To prove the second assertion, use the continuity of addition to find \(\bar{W} \in \tau_0\) such that \(\bar{W} + W \subset U\) and then choose \(V \in \tau_0\) such that \(V + V \subset \bar{W}\) by Theorem 41.2 we may assume that \(V\) is balanced. Moreover by the first part of the lemma with \(A = V = N\) we find,

\[
\bar{V} + \bar{V} \subset (V + V) + (V + V) \subset W + W \subset U.
\]
Remark 41.4. Notice that if $E$ is bounded then so is $\bar{E}$. Indeed, if $V \in \tau_0(X)$ we may choose $W \in \tau_0(X)$ such that $\bar{W} \subseteq V$. Since $E$ is bounded we then have $E \subseteq tW$ for all sufficiently large $t$. For these large $t$, it follows that $E \subseteq tW \subseteq tv$.

**Theorem 41.5.** Suppose that $(X, \tau)$ is a topological vector space and $\lambda$ is a non-zero linear functional on $X$. Then the following are equivalent:

1. $\lambda$ is continuous.
2. $\text{Nul} (\lambda) = \{ 0 \}$.
3. $\text{Nul}(\lambda)$ is not dense in $X$.
4. $\lambda (V) \subseteq F$ is a bounded set for some $V \in \tau_0$.

**Proof.** 1. $\implies$ 2. because $\text{Nul} (\lambda) = \lambda^{-1} (0)$ and $\{ 0 \}$ is a closed subset of $F$. 2. $\implies$ 3. Since $\lambda \neq 0$, $\text{Nul} (\lambda)$ is a closed proper subspace of $X$ and hence $\text{Nul} (\lambda)$ is not dense in $X$. 3. $\implies$ 4. If $\text{Nul}(\lambda)$ is not dense there exists $x \in X$ and a balanced $V \in \tau_0$ such that $(x + V) \cap \text{Nul}(\lambda) = \emptyset$. Since $V$ is balanced it follows that $\lambda (V)$ is a balanced subset of $F$ and from this it follows that either $\lambda (V)$ is bounded or $\lambda (V) = F$. If $\lambda (V)$ is bounded we are done and if $\lambda (V) = F$ there exists $y \in \bar{V}$ such that $\lambda (y) = \lambda (x)$ from which it follows that $x - y \in (x + V) \cap \text{Nul}(\lambda) = \emptyset$ which is a contradiction. 4. $\implies$ 1. By assumption there exists $M < \infty$ such that $| \lambda (x) | < M$ for all $x \in X$. Therefore if $\epsilon > 0$ is given we have $\lambda (V) \subseteq B(0, \epsilon \in F)$ where $W = \frac{1}{M} V \in \tau_0$. This shows $\lambda$ is continuous at zero. As usual this implies $\lambda$ is continuous everywhere. Indeed, if $x \in X$ and $\epsilon > 0$ then

$$
\lambda (x + W) = \lambda (x) + \lambda (W) \subseteq B(\lambda (x), \epsilon) \subseteq F.
$$

\[\blacksquare\]

### 41.2 The Structure of Finite Dimensional Topological Vector Spaces

**Lemma 41.6.** Suppose $Y$ is a subspace of $X$ which is locally compact in the topology inherited from $X$. Then $Y$ is closed in $X$.

**Proof.** By definition of the inherited topology on $Y$ being locally compact, there exists $U \in \tau_0(X)$ such that the closure $K$ of $U \cap Y$ in the $Y$-topology is compact. Let $V \in \tau_0(X)$ be balanced and be chosen so that $\bar{V} \subseteq U$. We will now show that, given $x \in X$ and $y_0 \in Y \cap (x + \bar{V})$ that

$$
Y \cap (x + \bar{V}) \subseteq y_0 + Y \cap U \subseteq y_0 + K.
$$

(41.1)

Indeed for $y \in Y \cap (x + \bar{V})$,

$$
y - y_0 = (y - x) + (x - y_0) \in \bar{V} + \bar{V} \subseteq U.
$$

Since $Y \cap (x + \bar{V})$ is a $Y$-closed subset of the compact set $y_0 + K$, it now follows that $Y \cap (x + \bar{V})$ is compact for every $x \in X$. (Recall that $K$ is compact in $Y$ if $K$ is compact in $X$ – a statement that does not in general hold with the word compact replaced by closed.) We are now ready to show $\bar{Y} = Y$. Let $x \in \bar{Y}$ and let

$$
B := \{ W \in \tau_0(X) : 0 \in W \subseteq \bar{V} \}
$$

and for each $W \in B$ let

$$
E_W := Y \cap (x + W) \subseteq Y \cap (x + \bar{V}) = E_V.
$$

Since $x \in \bar{Y}$, $E_W$ is a non-empty compact set for every $W \in B$. Moreover the set $E := \bigcap_{W \in B} E_W$ is not empty. Indeed if $E$ were empty, we could write $E_V = \bigcup_{W \in B} (E_V \setminus E_W)$ and since $E_V$ is compact there would exist $B_0 \subseteq B$ such that $E_V = \bigcup_{W \in B_0} (E_V \setminus E_W)$ or equivalently that $\bigcap_{W \in B_0} E_W = \emptyset$. This is a contradiction since $\bigcap_{W \in B_0} E_W = E \cap W_{\in B_0}$ and $\bigcap_{W \in B_0} E_W \in B$. Letting $z \in E := \bigcap_{W \in B} E_W \subseteq Y$, we have $z \in (x + \bar{V})$ or equivalently that $z - x \in W$ for every $W \in B$. Using Lemma 41.3, it now follows that $z - x \in W$ for every open neighborhood $W \in \tau_0(X)$. If $z \neq x$, it would follow that $W := X \setminus \{ z - x \}$ is such an open neighborhood of zero and therefore $z - x \in W$ which is a contradiction. Thus $x = z \in Y$ and since $x \in \bar{Y}$ was arbitrary we have shown $\bar{Y} = Y$.

**Theorem 41.7.** Suppose that $Y$ is a finite dimensional subspace of $X$, $\text{dim} (Y) = n$ and $\Lambda : F^n \to Y$ is an algebraic isomorphism of vector spaces. Then $Y$ is a closed subspace of $X$ and $\Lambda$ is a homeomorphism. In particular, if $\text{dim} (Y) < \infty$ there is exactly one topology on $X$ which makes it into a topological vector space.

**Proof.** Let $\{ e_i \}_{i=1}^n$ be the standard basis for $F^n$ and $u_i := \Lambda (e_i)$ for all $i$. Then $\Lambda (a) = \sum_{i=1}^n a_i u_i$ and hence is continuous since $\Lambda (a)$ is a composition of the vector space operations all of which are continuous. To finish the proof it only remains to show $\gamma (y) := \Lambda^{-1} (y)$ is continuous and $Y$ is closed. This will be done by induction on $n$. If $n = 1$, $e_1 = (1)$ and let $u = u_1 = \Lambda (1)$. Then $\gamma (au) = a$ for all $a \in F$. From this it follows that $\text{Nul}(\gamma) = \{ 0 \}$ which is a closed subset of $X$ and hence also closed in the relative topology on $Y$. By Theorem 41.5 this implies that $\gamma = \Lambda^{-1}$ is continuous. This shows that $Y$ with the inherited topology from $X$ is homeomorphic to $F$ which is locally compact. Therefore by Lemma 41.6 $Y$ is closed in $X$. For $n > 1 = 2$. We have $y = \sum \gamma_i (y) u_i$ and so

$$
\text{Nul}(\gamma) = \text{span}(u_1, \ldots, u_{i-1}, u_{i+1}, \ldots, u_n)
$$
is a \( n - 1 \) - dimensional subspace of \( Y \). So by the induction hypothesis \( \text{Nul}(\gamma_i) \) is a closed subset of \( X \) and by Theorem [41.5] each \( \gamma_i \) is continuous on \( Y \). This again shows that \( A^{-1} = \gamma \) is continuous so that \( Y \) is homeomorphic to the locally compact space \( \mathbb{F}^n \). Another application of Lemma [41.6] shows \( Y \) is closed in \( X \) and this completes the induction argument.

Theorem 41.8. Suppose that \( X \) is a locally compact topological vector space. Then \( \dim X < \infty \).

Proof. By assumption there exists a precompact open neighborhood \( V \) of 0 in \( X \). Using the compactness of \( V \), we may choose \( A \subset X \) such that

\[
\bar{V} \subset \bigcup_{x \in A} \left( x + \frac{1}{2} V \right).
\]

Let \( Y := \text{span}(A) \), then the previous equation implies that

\[
V \subset \bar{V} \subset Y + \frac{1}{2} V.
\]

Multiplying this equation by \( \frac{1}{2} \) then shows

\[
\frac{1}{2} V \subset \frac{1}{2} Y + \frac{1}{4} V = Y + \frac{1}{4} V
\]

and hence

\[
V \subset Y + \frac{1}{2} V \subset Y + Y + \frac{1}{4} V = Y + \frac{1}{4} V.
\]

Continuing this way inductively then shows that

\[
V \subset Y + \frac{1}{2^n} V \text{ for all } n \in \mathbb{N}.
\]

Since \( V \) is bounded, \( \left\{ \frac{1}{2^n} V : n \in \mathbb{N} \right\} \) forms a local base at 0, and hence we learn, using Lemma [41.3]

\[
V \cap \cap_{n=1}^{\infty} \left( Y + \frac{1}{2^n} V \right) = \bar{V} = Y.
\]

It now follows that \( X = \cup_{n=1}^{\infty} n V \subset Y \) which completes the proof since \( \dim Y \leq \#(A) < \infty \). 

41.3 Metrizable Topological Vector Spaces

Suppose now that the topology \( \tau \) on \( X \) is determined by a translation invariant metric \( d(x,y) = f(x-y) \). Since \( d(x,y) = d(y,x) \) and \( d \) satisfies the triangle inequality, the function \( f : X \to [0, \infty) \) must satisfy \( f(x) = 0 \) iff \( x = 0 \) and

\[
f(-x) = f(x) \text{ and } f(x+y) \leq f(x) + f(y) \text{ for all } x, y \in X.
\]

For any such metric it is automatic that vector addition is continuous since

\[
d(x+y,x'+y') = f(x-x'+y-y') \leq f(x-x') + f(y-y') = d(x,x') + d(y,y')
\]

However, the condition that \( m : \mathbb{F} \times X \to X \) defined by \( m(\alpha, x) = \alpha x \) be continuous puts more restrictions on \( d \). (As we have seen above when \( \dim X < \infty \) these extra restrictions are very strong. Also see Example [41.10] below.) Let

\[
V_i := B(0,t) = \{ x \in X : d(x,0) = f(x) < t \}
\]

denote the ball of radius \( t \) centered at 0. It is easily seen that \( B(x,t) = x + V_i \) and that \( -V_i = V_i \) and

\[
V_{i+} \subset V_i + V_s \text{ for all } s, t > 0.
\]

Let \( D_\varepsilon := \{ \alpha \in \mathbb{F} : |\alpha| < \varepsilon \} \). The condition that \( m \) be continuous at \( (\alpha, x) \in \mathbb{F} \times X \) is: for every \( t > 0 \) there should exist \( \varepsilon, s > 0 \) such that

\[
(\alpha + D_\varepsilon)(x + V_s) = m(\alpha + D_\varepsilon, x + V_s) \subset \alpha x + V_t. \tag{41.2}
\]

That Eq. [41.2] should hold hold for all \( (\alpha, x) \in \mathbb{F} \times X \) and \( t > 0 \) is equivalent to the following conditions:

1. for every \( \alpha \in \mathbb{F} \) and \( t > 0 \) there exists \( s > 0 \) such that \( \alpha V_s \subset V_t \)
2. for every \( x \in X \) and \( t > 0 \) there exists \( \varepsilon > 0 \) such that \( D_\varepsilon x \subset V_t \)
3. for every \( t > 0 \) there exists \( \varepsilon > 0 \) and \( s > 0 \) such that \( D_\varepsilon V_s \subset V_t \).

For example if 1. - 3. hold and \( (\alpha, x) \in \mathbb{F} \times X \) and \( t > 0 \), we may choose \( s \) and \( \varepsilon \) so that 1. - 3. hold with \( t \) replaced by some \( \tau = t/3 \). It then follows that

\[
(\alpha + D_\varepsilon)(x + V_s) \subset \alpha \alpha + D_\varepsilon + x + \alpha V_s + D_\varepsilon \alpha x + V_t + V_s + V_t \subset \alpha x + V_t.
\]

Conversely if Eq. [41.2] holds for all \( (\alpha, x) \in \mathbb{F} \times X \) and \( t > 0 \), choosing \( \alpha = 0 \) shows that \( D_\varepsilon x + D_\varepsilon V_s \subset V_t \) which implies 2. and 3. and by taking \( x = 0 \), we learn \( \alpha V_s + D_\varepsilon V_s \subset V_t \) which implies 1. It is also worth noting that items 1. and 3. would be implied by assuming for every \( \tau > 0 \) and \( t > 0 \) there exists \( s > 0 \) such that \( D_\varepsilon V_s \subset V_t \).

Theorem 41.9. Suppose that \( X \) is a vector space and \( \{ N_t : t > 0 \} \) is a collection of subsets of \( X \) with the following properties:

1. \( \cap_{t>0} N_t = \{0\} \), \( \cup_{t>0} N_t = X \)
2. Each \( N_t \) is symmetric (-\( N_t = N_t \)) and absorbing, i.e. for every \( x \in X \) there exists for all \( t > 0 \),
3. \( N_t + N_s \subset N_{t+s} \) for all \( s, t > 0 \).

4. Given \( t, \tau > 0 \) there exists \( s > 0 \) such that \( D_x N_s \subset N_t \).

5. To every \( x \in X \) and \( t > 0 \) there exists \( \varepsilon > 0 \) such that \( D_\varepsilon x \subset N_t \).

Let \( \tau \) denote the collection of sets consisting of those \( V \subset X \) such that for each \( x \in V \) there exists \( t > 0 \) such that \( x + N_t \subset V \). Then \( \tau \) is topology on \( X \) which makes \( X \) into a topological vector space. Moreover there exists a translation invariant metric \( d \) on \( X \) such that \( \tau_d = \tau \).

The following example should illustrate what is going on in the theorem. The proof of Theorem 41.9 will follow the example.

**Example 41.10.** Let \( X = \mathbb{R} \) and \( N_t := [−t, t] \) for all \( t > 0 \). Then \( N_t \) satisfies the hypothesis of Theorem 41.9 and induced metric in this case is simply \( d(x, y) = |y − x| \). It is worth observing that in this case all of the sets \( N_t \) are closed on not open. One would also get the same metric \( d \) using the set \( N_t = (−t, t] \) or \( N_t = (−t, t) \). Let us also observe that if \( N_t = [−t, t] \) and we were to define \( \tau \) to be the topology generated by \( N_t \) and its translates (i.e. \( \tau \) is the topology generated by the closed intervals of positive length), then \( (X, \tau) \) is not a topological vector space. To see this let \( m(\lambda, x) = \lambda x \) for \( \lambda \in \mathbb{F} := \mathbb{R} \) (with its usual topology) and \( x \in X \) with the \( \tau \) topology. Then \( m^{-1}([-1, 1]) \) is the region between enclosed by the four curves shown in Figure 41.1 below. Note well the

![Image](85x141 to 301x285)

**Fig. 41.1.** The four curves above bound the set \( m^{-1}([-1, 1]) \).

that boundary of the curves are contained in \( m^{-1}([-1, 1]) \) and in particular \( (1, 1) \in m^{-1}([-1, 1]) \). A typical open neighborhood of this point is of the form \( (−\epsilon, \epsilon) \times J \) where \( J \) is any closed interval containing 1. Since for any \( \epsilon > 0 \), \( (−\epsilon, \epsilon) \times \{1\} \notin m^{-1}([-1, 1]) \) we learn that scalar multiplication is not continuous in this topology!

**Proof. (Theorem 41.9.)** Let us begin by showing \( \tau \) is a topology. Since \( 0 \in N_t \) for all \( t > 0 \),

\[ N_t = N_t + 0 \subset N_t + N_s \subset N_{t+s} \]

so that \( N_t \uparrow X \) as \( t \uparrow \infty \). Clearly \( \tau \) contains both the empty set and \( X \). If \( V, W \in \tau \) and \( x \in V \cap W \), then there exists \( s, t > 0 \) such that \( x + N_s \subset V \) and \( x + N_t \subset W \). Letting \( \tau := \min(s, t) > 0 \), we then have \( x + N_{\tau} \subset V \cap W \) which shows that \( V \cap W \in \tau \). It is trivial to check that \( \tau \) is closed under arbitrary unions and therefore \( \tau \) is a topology. Although as seen in an Example 41.10 it need not be the case that each \( N_t \) is an open set. However it is true that \( V_t := \cup_{s<\frac{1}{t}} N_s \) is open for all \( t > 0 \). This is because if \( x \in V_t \), then \( x \in N_s \) for some \( s < t \) and so

\[ x + N_{\delta} \subset N_{\delta} + N_{\delta} \subset N_{t+\delta} \subset V_t \quad \text{for} \quad \delta < t - s. \]

In particular this shows that \( 0 \in N_t^\circ \) for all \( t > 0 \). We now define a metric \( d \) on \( X \) which is consistent with \( \tau \). For this let

\[ f(x) := \inf \{ t > 0 : x \in N_t \} \]

Since \( \cap N_t = \{0\} \) it follows that \( f(x) = 0 \) iff \( x = 0 \). If \( x \in N_t \) and \( y \in N_s \), then \( x + y \in N_t + N_s \subset N_{t+s} \) and hence \( f(x + y) \leq s + t \). Since this is true for all \( t \) and \( s \) such that \( x \in N_t \) and \( y \in N_s \) it follows that \( f(x + y) \leq f(x) + f(y) \). Moreover since \( N_t = -N_t \), we also have \( f(-x) = f(x) \). From this observations it is now easily checked that \( d(x, y) := f(y - x) \) is a translation invariant metric on \( X \). The ball of radius \( t > 0 \) about \( x \in X \) is given by

\[ B(x, t) = \{ y \in X : f(x - y) < t \} \]

\[ = \{ y \in X : x - y \in N_s \text{ for some } s \leq t \} = x + V_t \]

which is a \( \tau \) open set by the previous paragraph. This shows that \( \tau_d \subset \tau \). Conversely if \( W \in \tau \), then for every \( x \in W \) we know there exists a \( t > 0 \) such that

\[ B(x, t) = x + V_t \subset x + N_t \subset W \]

which shows that \( W \in \tau_d \) as well. Thus \( \tau = \tau_d \). In particular it now follows that \( \tau = \tau_d \) is Hausdorff. The fact the vector space operations are continuous follows from the discussion preceding the statement of the theorem upon noting that \( \{V_t : t > 0\} \) satisfy the same properties 1. - 5. that \( \{N_t : t > 0\} \) satisfied.

**Theorem 41.11 (Metrization Theorem).** Suppose \( X \) is a topological vector space with a countable neighborhood base at 0, then there exists a translation invariant metric \( d \) on \( X \) which is consistent with the topology on \( X \) and whose balls about 0 are balanced neighborhood of 0.
Proof. For motivation purposes, suppose such a metric exists so that
\(d(x,y) = f(y - x)\) for some function \(f : X \to [0, \infty)\) with \(f(x+y) \leq f(x) + f(y)\). By replacing \(f\) by \(f(1+f)^{-1}\) if necessary we may assume further that \(0 \leq f < 1\). For \(r \in [0, 1]\) let

\[ U_r := \{f < r\} = \{x \in X : f(x) < r\} \]

and notice that we may recover \(f\) from \(\{U_r\}\) by the formula

\[ f(x) = \inf \{r \in [0, 1] : x \in U_r\} \]

since

\[ \inf \{r \in [0, 1] : x \in U_r\} = \inf \{r \in [0, 1] : f(x) < r\} = f(x) \]

Then if \(x \in U_r\) and \(y \in U_s\) we have \(f(x+y) < r+s\) which shows that

\[ U_r + U_s \subset U_{r+s} \]  

(41.3)

In particular if we let \(V_n := U_{2^{-n}}\), then \(V_{n+1} + V_{n+1} \subset V_n\) and moreover if \(r = \sum_{j \geq 1} r_j 2^{-j}\) with \(r_j \in [0, 1]\) and \(r_j = 0\) a.a., then

\[ \sum_j r_j V_j = \sum_j r_j U_{2^{-j}} \subset \bigcup_{j \geq 1} U_{2^{-j}} = U_r. \]  

(41.4)

We now turn the above logic around. Let \(W_n\) be a balanced local base for \(X\) at \(0\) and by replacing \(W_n\) by \(r_j W_j\) if necessary we may assume that \(W_n \downarrow \{0\}\). (The fact that \(W_n \downarrow \{0\}\) is a consequence of the assumption that points are closed in a topological vector space.) Let \(V_1 = W_1\) and use the continuity of addition to choose \(V_2 \in \tau_0(X)\) such that \(V_2 + V_2 \subset V_1\). Using Theorem [41.3] we may also still assume that \(V_2\) is balanced and by replacing \(V_2\) by \(V_2 \cap W_2\) if necessary we may assume \(V_2 \subset W_2\). Working this way inductively choose balanced \(V_n \in \tau_0(X)\) such that \(V_{n+1} + V_{n+1} \subset V_n\) and \(V_n \subset W_n\) for all \(n\). Thus \(\{V_n\}_{n=1}^{\infty}\) is now a balance neighborhood base for \(X\) such that

\[ V_{n+1} + V_{n+1} \subset V_n. \]

Let \(r = \sum_{j \geq 1} r_j 2^{-j}\) with \(r_j \in \{0, 1\}\) and \(r_j = 0\) a.a. and \(D\) denote the collection of all such dyadic rational numbers in \([0, 1)\). Motivated by Eq. [41.4] let \(U_1 = X\) and

\[ U_r := \sum_j r_j V_j. \]

We then have

\[ U_r + U_s = \sum (r_j V_j + s_j V_j) \subset U_{r+s}. \]  

(41.5)

For example if \(r = .01101\) and \(s = .0101101\) then

\[ U_r + U_s = V_2 + V_3 + V_5 + V_2 + V_3 + V_4 + V_5 + V_7 \]

\[ = V_2 + V_3 + V_5 + V_2 + V_3 + V_4 + V_7 \]

\[ \subset V_2 + V_3 + V_5 + V_7 \]

\[ \subset V_2 + V_3 + V_5 + V_7 \]

\[ \subset V_2 + V_3 + V_5 + V_7 \]

\[ \subset V_1 + V_2 + V_5 + V_7 = U_{1110001} = U_{r+s} \]

as desired. This example points out that the arithmetic of the \(U_r\) models that of binary arithmetic. To give a formal proof of Eq. [41.5] it suffices to assume \(r + s < 1\) since \(U_1 = X\). Suppose that \(n = \max \{j : s_j + r_j \neq 0\}\) and write

\[ s = s' + s_n 2^{-n} \]

and \(r = r' + r_n 2^{-n}\) and moreover if \(s_n, r_n = 0\) we have

\[ U_r + U_s = U_{r'} + U_{s'} + V_{2^{-n}} \subset U_{r'+s'} + V_{2^{-n}} = U_{r+s} \]

while if \(s_n = 1 = r_n\) then

\[ U_r + U_s = U_{r'} + U_{s'} + V_n \]

\[ \subset U_{r'+s'} + V_{n+1} = U_{r'+s'} + V_{2^{-n-1}} \subset U_{r'+s'+2^{-n-1}} = U_{r+s} \]

as desired. Notice that for \(r > s\) we have \(U_s \subset U_s + U_{r-s} \subset U_r\) which shows \(U_r \uparrow\) and \(r \uparrow\). We now define

\[ f(x) = \inf \{r \in [0, 1] : x \in U_r\} \]

and suppose that \(x, y \in X\). If \(x \in U_r\) and \(y \in U_s\) then \(x + y \in U_{r+s}\) and so \(f(x+y) \leq r+s\) and taking the infimum over all such \(r\) and \(s\) so that \(x \in U_r\) and \(y \in U_s\) we learn that \(f(x+y) \leq f(x) + f(y)\). Moreover since \(f(x) = f(-x)\) since \(x \in U_r\) if \(-x \in U_r\) because \(U_r\) is balanced. For \(s \in [0, 1]\) we have \(f(x) < s\) iff there exists \(r \in [0, 1] \cap D\) such that \(r < s\) and \(x \in U_r\) which shows

\[ \{f < s\} = \bigcup_{r \in D, r < s} U_r \]

is a balance neighborhood of \(0\). Finally if \(x \neq 0\) then \(x \notin V_n = U_{2^{-n}}\) for some \(n\) and since \(U_r \downarrow\) as \(r \downarrow\) it follows that \(x \notin U_r\) for all \(r \leq 2^{-n}\) and therefore \(f(x) \geq 2^{-n}\). From these properties of \(f\) all the desired properties of \(d(x,y) = f(y-x)\) easily follow. \(\blacksquare\)
Measure and Integration (Old Version)
The purpose of this part of the book is to develop a general integration theory. The motivations are two fold. The first is that the Riemann integrals continuity properties are limited and the second is that it is desirable to have integrals which are defined on functions over a wide variety of different sets.
From Riemann to Lebesgue

42.1 A Better Integral and an Introduction to Measure Theory

Let $a, b \in \mathbb{R}$ with $a < b$ and let

$$I^0(f) := \int_a^b f(t) \, dt \text{ for all } f \in C([a, b])$$

denote the Riemann integral. Also let $\mathcal{H}$ denote the smallest linear subspace of bounded functions on $[a, b]$ which is closed under bounded convergence and contains $C([a, b])$. Such a space exists since we can take the intersection over all such spaces of functions. It also true, but not obvious at this point, that $\mathcal{H}$ is a proper subspace of $L^\infty([a, b], \mathbb{R})$, see Corollary 42.6 below.

**Theorem 42.1.** There is an extension $I$ of $I^0$ to $\mathcal{H}$ such that $I$ is still linear and $\lim_{n \to \infty} I(f_n) = I(f)$ for all $f_n \in \mathcal{H}$ with $f_n \to f$ boundedly. Moreover there is only one such extension and this extension, $I$, is positive in the sense that $I(f) \geq 0$ if $f \in \mathcal{H}$ and $f \geq 0$.

**Proof.** We will only prove the uniqueness here. Suppose that $J$ and $I$ are two such extensions and let

$$K := \{ f \in \mathcal{H} : J(f) = I(f) \}.$$

Then $K$ is a linear subspace closed under bounded convergence which contains $C([a, b])$ and hence $K = \mathcal{H}$. The existence of $I$ is the hard part and will be dealt with later. The positivity of $I$ can be seen from the existence construction. ■

**Notation 42.2** Let $\mathcal{M} := \{ A \subset [a, b] : 1_A \in \mathcal{H} \}$ and for $A \in \mathcal{M}$ let $m(A) := I(1_A)$.

The next theorem gather’s a number of basic properties of $\mathcal{H}$, $\mathcal{M}$, $I$, and $m$.

**Theorem 42.3.** Continuing the notation established the following results hold.

1. The space $\mathcal{H}$ is an algebra, i.e. if $f, g \in \mathcal{H}$ then $fg \in \mathcal{H}$. To prove this, first assume that $f \in C([a, b])$ and let

$$\mathcal{H}_f := \{ g \in \mathcal{H} : fg \in \mathcal{H} \}.$$

Then $\mathcal{H}_f$ is closed under bounded convergence and contains $C([a, b])$ and hence $\mathcal{H}_f = \mathcal{H}$, i.e. the product of a continuous function and an element in $\mathcal{H}$ is back in $\mathcal{H}$.

Now suppose that $f \in \mathcal{H}$ and again let $\mathcal{H}_f$ be as above. By the same reasoning we may show again that $\mathcal{H}_f = \mathcal{H}$ and this proves the assertion.

2. The pair $(\mathcal{M}, m)$ have the following properties:

a) $\emptyset, [a, b] \in \mathcal{M}$ and $m(\emptyset) = 0$ and $m([a, b]) = b - a$. Moreover $m(A) \geq 0$ for all $A \in \mathcal{M}$.

b) If $A \in \mathcal{M}$ then $A^c \in \mathcal{M}$ and $m(A^c) = b - a - m(A)$. This follows from the fact that $1_{A^c} = 1 - 1_A$.

c) If $A, B \in \mathcal{M}$, then $A \cap B \in \mathcal{M}$ since $1_{A \cap B} = 1_A \cdot 1_B$ and $\mathcal{H}$ is an algebra.

Definition: a collection of sets $\mathcal{M}$ satisfying a) – c) is called an algebra of subsets of $[a, b]$.

d) More generally if $A_n \in \mathcal{M}$ then $\cap A_n \in \mathcal{M}$ since $1_{\cap A_n} = \lim_{N \to \infty} 1_{A_1} \cdots 1_{A_N}$ and the convergence is bounded.

Definition: a collection of sets $\mathcal{M}$ satisfying a) – d) is called an $\sigma$-algebra.

e) If $A_n \in \mathcal{M}$, then $\cup A_n \in \mathcal{M}$. Indeed, we know $\cup A_n \in \mathcal{M}$ iff $(\cup A_n)^c \in \mathcal{M}$. But

$$(\cup A_n)^c = \cap A_n^c \in \mathcal{M}$$

by item d. above.

f) If $A_n \in \mathcal{M}$ are pairwise disjoint, then

$$m(\cup A_n) = \sum_{n=1}^\infty m(A_n).$$

To prove this it suffices to observe $\sum_{n=1}^N 1_{A_n} \to 1_{\cup A_n}$ a $N \to \infty$.

g) $\mathcal{M}$ is not $2^{[a, b]}$, i.e. $\mathcal{M}$ is not all subset of $[a, b]$. This is not obvious and it is not possible to really write down an “explicit” subset $[a, b]$ which is not in $\mathcal{M}$. We will prove the existence of such sets later. Suppose $[\alpha, \beta] \subset [a, b]$, then $1_{[\alpha, \beta]} \in \mathcal{H}$ and $I(1_{[\alpha, \beta]}) = \beta - \alpha$. (Draw a picture.)

3. **Fact:** $\mathcal{M}$ is the smallest $\sigma$-algebra on $[a, b]$ which contains all sub-intervals of $[a, b]$. 

4. \( m \{ \{ \alpha \} \} = I \{ 1_\{\alpha\} \} = 0 \).
5. If \( f_n \in \mathcal{H}, f_n \geq 0 \) and \( f = \sum_{n=1}^{\infty} f_n \) is a bounded function, then \( f \in \mathcal{H} \) and
   \[
   I(f) = \sum_{n=1}^{\infty} I(f_n). \tag{42.1}
   \]

To prove Eq. \((42.1)\) we have
   \[
   \sum_{n=1}^{\infty} I(f_n) = \lim_{N \to \infty} I \left( \sum_{n=1}^{N} f_n \right) = I(f).
   \]

6. As an example of item 4., \( 1_{[0,\infty)} = \sum_{n=1}^{\infty} 1_{\{\alpha_n\}} \in \mathcal{H} \) and \( I(1_{[0,\infty)}) = 0 \).
   Here \( \{\alpha_n\}_{n=1}^{\infty} \) is an enumeration of the rational numbers in the interval \([a,b]\).

7. If \( f \in \mathcal{H} \) and \( \phi \in C(\mathbb{R}) \), then \( \phi \circ f \in \mathcal{H} \). This is a consequence of the Weierstrass approximation Theorem \( 50.35 \).

To prove Eq. \((42.1)\) we have
   \[
   I(f) = \sum_{n=1}^{\infty} I(f_n). \tag{42.1}
   \]

10. For \( f \in C([a,b], \mathbb{R}) \) and a partition \( \pi := \{ a = x_0 < x_1 < \cdots < x_n = b \} \) of \([a,b]\), let
   \[
   f_\pi = f(x_0)1_{[x_0,x_1]} + \sum_{k=1}^{n-1} f(x_k)1_{(x_k,x_{k+1})}.
   \]

Then by the uniform continuity of \( f \) it follows that \( f_\pi \to f \) uniformly as \( |\pi| \to 0 \) and therefore it follows that
   \[
   I(f) = \lim_{|\pi| \to 0} I(f_\pi) = \sum_{k=0}^{n-1} f(x_k) m((x_k,x_{k+1})].
   \]

In this way we see that the value of \( I \) on \( C([a,b], \mathbb{R}) \) is determined by the value of \( m \) on sub-intervals of \([a,b]\).

**Proposition 42.4.** For \( \lambda \in (0,1) \), let \( \psi_\lambda : [0,1] \to [0,1] \) be given by
   \[
   \psi_\lambda(x) := \begin{cases} 
   x + \lambda & \text{if } x \leq 1 - \lambda \\
   x + \lambda - 1 & \text{if } 1 - \lambda < x < 1 \\
   0 & \text{if } x = 1
   \end{cases}
   \]

and let \( \mathcal{H} \circ \psi_\lambda := \{ f \circ \psi_\lambda : f \in \mathcal{H} \} \) and \( \mathcal{H} \circ \psi^{-1}_\lambda := \{ f \circ \psi^{-1}_\lambda : f \in \mathcal{H} \} \). Then \( \mathcal{H} \circ \psi_\lambda = \mathcal{H} \circ \psi^{-1}_\lambda \) and \( I(f \circ \psi_\lambda) = I(f) \) for all \( f \in \mathcal{H} \) and in particular, \( m \left( \psi^{-1}_\lambda(A) \right) = m \left( A \right) \) for all \( A \in \mathcal{M} \).

![Graph of \( \psi_{0.3}(x) \)](image)

**Proof.** Now it is easily seen that \( \mathcal{H} \circ \psi_\lambda \) and \( \mathcal{H} \circ \psi^{-1}_\lambda \) are subspaces of \( \ell^\infty([0,1], \mathbb{R}) \) which contains the constant and are closed under bounded convergence. Moreover, it is relatively easy to construct functions \( \varphi_n \) and \( \eta_n \) in
Since the map $f$ from this it follows that $f \circ \psi_\lambda \in H$ as well. This then implies that $f = f \circ \psi_\lambda \circ \psi_\lambda^{-1} \in H \circ \psi_\lambda^{-1}$ and hence we have shown $C'(0, 1) \subset H \circ \psi^{-1}$. Hence by the definition of $H$ we have $H \subset H \circ \psi_\lambda^{-1}$. The same argument also shows $H \subset H \circ \psi_\lambda$ and therefore we have

$$H \subset H \circ \psi_\lambda \subset H \circ \psi_\lambda \circ \psi_\lambda = H$$

and we have shown $H = H \circ \psi_\lambda$ and $H \circ \psi_\lambda \circ \psi_\lambda^{-1} = H$.

Now suppose $(a, b) \subset [0, 1]$, then $\psi_\lambda^{-1}((a, b])$ is another interval of the same length or is the disjoint union of two intervals with the same combined length. From this it follows that

$$I(1_{(a, b]} \circ \psi_\lambda) = m(\psi_\lambda^{-1}((a, b])) = b - a = m((a, b])$$

and then by approximating $f \in C([0, 1], \mathbb{R})$ uniformly by step functions that

$$I(f \circ \psi_\lambda) = I(f) \text{ for all } f \in C([0, 1], \mathbb{R}).$$

Since the map $f \rightarrow I(f \circ \psi_\lambda)$ satisfies all the same properties as the map $f \rightarrow I(f)$ with agreement on $C([0, 1], \mathbb{R})$, it follows that $I(f \circ \psi_\lambda) = I(f)$ for all $f \in H$. This then implies, for $A \in \mathcal{M}$, that

$$m(\psi_\lambda^{-1}(A)) = I(1_A \circ \psi_\lambda) = I(1_A) = m(A).$$

\[ \tag*{\blacksquare} \]

**Theorem 42.5.** There does not exist a measure $m : 2^{[0, 1]} \rightarrow [0, \infty]$ such that $m((0, 1]) = 1$ and $m(A + \lambda) = m(A)$ for all $A \in 2^{[0, 1]}$ where

$$A + \lambda = \{(x + \lambda) \mod 1 : x \in A\}.$$

\[ \tag*{\blacksquare} \]

**Proof.** Let $R := \mathbb{Q} \cap [0, 1)$ be the rationale numbers in $[0, 1)$ and for $a, b \in [0, 1]$ let $a + b$ denote addition mod 1. Construct (using the axiom of choice) a subset $N \subset [0, 1]$ such that each $n \in N$ is a element from precisely one of the $R$ orbits in $[0, 1)$. Having done this, for each $a \in [0, 1)$, then $(a + R) \cap N$ consists of precisely one point, say $n$ and there is a unique $r \in R$ such that $a + r = n$. In this we have $a = n - r$ for some unique $n \in N$ and $r \in R$ and therefore,

$$[0, 1) = \bigcap_{r \in R} (N - r).$$

Since this is a countable disjoint union, if such an $m$ exists as in the theorem, we must have

$$1 = m((0, 1)) = \sum_{r \in R} m(N - r) = \sum_{r \in R} m(N) = \infty \cdot m(N).$$

This last identity is impossible and this proves no such measure $m$ exists. \[ \tag*{\blacksquare} \]
Algebras, Measures, and Simple Integrals

43.1 Algebras and \( \sigma \)– Algebras

Definition 43.1. A collection of subsets \( A \) of a set \( X \) is an algebra if

1. \( \emptyset, X \in A \)
2. \( A \in A \) implies that \( A^c \in A \)
3. \( A \) is closed under finite unions, i.e. if \( A_1, \ldots, A_n \in A \) then \( A_1 \cup \cdots \cup A_n \in A \).

In view of conditions 1. and 2., 3. is equivalent to

\[ f \cdot A \in A \text{ is closed under finite unions, i.e. if } \{A_i\}_{i=1}^n \subset M, \text{ then } \bigcup_{i=1}^n A_i \in M. \]

(Notice that since \( M \) is also closed under taking complements, \( M \) is also closed under taking countable intersections.)

The reader should compare these definitions with that of a topology in Definition [17.1]. Recall that the elements of a topology are called open sets. Analogously, elements of and algebra \( A \) or a \( \sigma \)– algebra \( M \) will be called measurable sets.

Definition 43.2. A collection of subsets \( M \) of \( X \) is a \( \sigma \)– algebra (or sometimes called a \( \sigma \)– field) if \( M \) is an algebra which also closed under countable unions, i.e. if \( \{A_i\}_{i=1}^\infty \subset M \), then \( \bigcup_{i=1}^\infty A_i \in M \).

Moreover, we see that \( g = 0 \) on \( \bigcup_{i=1}^n \{f = \lambda_i\} \) while \( g = 1 \) on \( \{f = \alpha\} \). So we have shown \( g = 1_{\{f = \alpha\}} \in S \) and therefore that \( \{f = \alpha\} \in A \).

Exercise 43.1. Continuing the notation introduced above:

1. Show \( A(S) \) is an algebra of sets.
2. Show \( S(A) \) is a simple function algebra.
3. Show that the map

\[ \mathcal{A} \in \{\text{Algebras } \subset 2^X\} \rightarrow \mathcal{S}(\mathcal{A}) \in \{\text{simple function algebras on } X\} \]

is bijective and the map, \( S \rightarrow A(S) \), is the inverse map.

Example 43.5. Here are some examples of algebras.

1. \( M = 2^X \), then \( M \) is a topology, an algebra and a \( \sigma \)– algebra.
2. Let \( X = \{1, 2, 3\} \), then \( \tau = \{\emptyset, X, \{2, 3\}\} \) is a topology on \( X \) which is not an algebra.
3. \( \tau = A = \{\{1\}, \{2, 3\}, \emptyset, X\} \) is a topology, an algebra, and a \( \sigma \)– algebra on \( X \). The sets \( X, \{1\}, \{2, 3\}, \emptyset \) are open and closed. The sets \( \{1, 2\} \) and \( \{1, 3\} \) are neither open nor closed and are not measurable.

The reader should compare this example with Example [17.3].

Proposition 43.6. Let \( \mathcal{E} \) be any collection of subsets of \( X \). Then there exists a unique smallest algebra \( A(\mathcal{E}) \) and \( \sigma \)– algebra \( \sigma(\mathcal{E}) \) which contains \( \mathcal{E} \).

Proof. The proof is the same as the analogous Proposition [17.6] for topologies, i.e.

\[ A(\mathcal{E}) := \bigcap \{\mathcal{A} : \mathcal{A} \text{ is an algebra such that } \mathcal{E} \subset \mathcal{A}\} \]

and

\[ \sigma(\mathcal{E}) := \bigcap \{\mathcal{M} : \mathcal{M} \text{ is a } \sigma \text{– algebra such that } \mathcal{E} \subset \mathcal{M}\}. \]
Example 43.7. Suppose $X = \{1, 2, 3\}$ and $E = \{\emptyset, X, \{1\}, \{2\}, \{1, 3\}\}$, see Figure 43.1. Then

$$\tau(E) = \{\emptyset, X, \{1\}, \{2\}, \{1, 3\}\}$$

$$A(E) = \sigma(E) = 2^X.$$  

The next proposition is the analogue to Proposition 17.7 for topologies and enables us to give elementary families. The next proposition is the analogue to Proposition 17.7 for topologies and enables us to give and explicit descriptions of $A(E)$. On the other hand, it should be noted that $\sigma(E)$ typically does not admit a simple concrete description.

Proposition 43.8. Let $X$ be a set and $E \subset 2^X$. Let $E^c := \{A^c : A \in E\}$ and $E_c := E \cup \{X, \emptyset\} \cup E^c$. Then

$$A(E) := \{\text{finite unions of finite intersections of elements from $E_c$}\}. \quad (43.1)$$

**Proof.** Let $A$ denote the right member of Eq. (43.1). From the definition of an algebra, it is clear that $E \subset A \subset A(E)$. Hence to show $A$ is an algebra, the proof of these assertions are routine except for possibly showing that $A$ is closed under complementation. To check $A$ is closed under complementation, let $Z \in A$ be expressed as

$$Z = \bigcup_{i=1}^{N} \bigcap_{j=1}^{K} A_{ij}$$

where $A_{ij} \in E_c$. Therefore, writing $B_{ij} = A_{ij}^c \in E_c$, we find that

$$Z^c = \bigcap_{i=1}^{N} \bigcup_{j=1}^{K} B_{ij} = \bigcup_{j=1}^{K} \left(\bigcap_{j=1}^{K} B_{1j1} \cap B_{2j2} \cap \cdots \cap B_{NjN}\right) \in A$$

wherein we have used the fact that $B_{1j1} \cap B_{2j2} \cap \cdots \cap B_{NjN}$ is a finite intersection of sets from $E_c$. $\blacksquare$

Remark 43.9. One might think that in general $\sigma(E)$ may be described as the countable unions of countable intersections of sets in $E^c$. However this is in general false, since if

$$Z = \bigcup_{i=1}^{\infty} \bigcap_{j=1}^{\infty} A_{ij}$$

with $A_{ij} \in E_c$, then

$$Z^c = \bigcap_{j_1=1}^{\infty} \bigcup_{j_2=1}^{\infty} \cdots \bigcup_{j_N=1}^{\infty} \left(\bigcap_{i=1}^{\infty} A_{i,j_1}^c \cdots A_{i,j_N}^c\right)$$

which is now an uncountable union. Thus the above description is not correct. In general it is complicated to explicitly describe $\sigma(E)$, see Proposition 1.23 on page 39 of Folland for details. Also see Proposition 43.15 below.

Exercise 43.2. Let $E$ be a topology on a set $X$ and $A = A(E)$ be the algebra generated by $E$. Show $A$ is the collection of subsets of $X$ which may be written as finite union of sets of the form $F \cap V$ where $F$ is closed and $V$ is open.

The following notion will be useful in the sequel and plays an analogous role for algebras as a base (Definition 17.8) does for a topology.

Definition 43.10. A set $E \subset 2^X$ is said to be an elementary family or elementary class provided that

- $\emptyset \in E$
- $E$ is closed under finite intersections
- if $E \in E$, then $E^c$ is a finite disjoint union of sets from $E$. (In particular $X = \emptyset^c$ is a finite disjoint union of elements from $E$.)

Example 43.11. Let $X = \mathbb{R}$, then

$$E := \{(a, b] \cap \mathbb{R} : a, b \in \mathbb{R}\}$$

$$= \{(a, b] : a \in [-\infty, \infty) \text{ and } a < b < \infty\} \cup \{\emptyset, \mathbb{R}\}$$

is an elementary family.

Exercise 43.3. Let $A \subset 2^X$ and $B \subset 2^Y$ be elementary families. Show the collection

$$E = A \times B = \{A \times B : A \in A \text{ and } B \in B\}$$

is also an elementary family.

Proposition 43.12. Suppose $E \subset 2^X$ is an elementary family, then $A = A(E)$ consists of sets which may be written as finite disjoint unions of sets from $E$. 

![Fig. 43.1. A collection of subsets.](image)
In particular, \( M \) is a countable set. Then there exists a unique \( \sigma \) - algebra which contains \( x \), and so it is the smallest set in \( \mathcal{M} \) containing \( x \), we must have that \( C = \emptyset \). Similarly if \( y \notin C \) then \( C = \emptyset \). Therefore if \( C \neq \emptyset \), then \( x, y \in A_x \cap A_y \in \mathcal{M} \) and \( A_x \cap A_y \subset A_x \) and \( A_x \cap A_y \in A_y \) and from which it follows that \( A_x = A_x \cap A_y = A_y \). This shows that \( \mathcal{F} = \{ A_x : x \in X \} \subset \mathcal{M} \) is a (necessarily countable) partition of \( X \) for which Eq. (43.2) holds for all \( B \in \mathcal{M} \). Enumerate the elements of \( \mathcal{F} \) as \( \mathcal{F} = \{ P_n \}_{n=1}^N \) where \( N \in \mathbb{N} \) or \( N = \infty \). If \( N = \infty \), then the correspondence
\[
a \in \{0,1\}^N \to A_n = \bigcup \{ P_n : a_n = 1 \} \in \mathcal{M}
\]
is bijective and therefore, by Lemma 2.6, \( \mathcal{M} \) is uncountable. Thus any countable \( \sigma \) - algebra is necessarily finite. This finishes the proof modulo the uniqueness assertion which is left as an exercise to the reader.

**Example 43.16.** Let \( X = \mathbb{R} \) and
\[
\mathcal{E} = \{ (a, \infty) : a \in \mathbb{R} \} \cup \{ \mathbb{R}, \emptyset \} = \{ (a, \infty) \cap \mathbb{R} : a \in \mathbb{R} \} \subset 2^\mathbb{R}.
\]
Notice that \( \mathcal{E}_f = \mathcal{E} \) and that \( \mathcal{E} \) is closed under unions, which shows that \( \tau(\mathcal{E}) = \mathcal{E} \), i.e. \( \mathcal{E} \) is already a topology. Since \( (a, \infty)^c = (-\infty, a] \) we find that \( \mathcal{E}_c = \{ (a, \infty), (-\infty, a], -\infty \leq a < \infty \} \cup \{ \mathbb{R}, \emptyset \} \). Noting that
\[
(a, \infty) \cap (-\infty, b] = (a, b]
\]
it follows that \( \mathcal{A}(\mathcal{E}) = \mathcal{A}(\mathcal{E}) \) where
\[
\tilde{\mathcal{E}} := \{ (a, b] \cap \mathbb{R} : a, b \in \mathbb{R} \}.
\]
Since \( \tilde{\mathcal{E}} \) is an elementary family of subsets of \( \mathbb{R} \), Proposition 43.12 implies \( \mathcal{A}(\mathcal{E}) \) may be described as being those sets which are finite disjoint unions of sets from \( \mathcal{E} \).

### 43.2 Finitely Additive Measures

**Definition 43.17.** Suppose that \( \mathcal{E} \subset 2^X \) is a collection of subsets of \( X \) and \( \mu : \mathcal{E} \to [0, \infty] \) is a function. Then

1. \( \mu \) is **monotonic** if \( \mu(A) \leq \mu(B) \) for all \( A, B \in \mathcal{E} \) with \( A \subseteq B \).
2. \( \mu \) is **sub-additive (finitely sub-additive)** on \( \mathcal{E} \) if
\[
\mu(E) \leq \sum_{i=1}^n \mu(E_i)
\]
whenever \( E = \bigcup_{i=1}^n E_i \in \mathcal{E} \) with \( n \in \mathbb{N} \cup \{ \infty \} \) \((n \in \mathbb{N})\).
3. \( \mu \) is super-additive (finitely super-additive) on \( E \) if
\[
\mu(E) \geq \sum_{i=1}^{n} \mu(E_i) \quad (43.3)
\]
whenever \( E = \bigcup_{i=1}^{n} E_i \in E \) with \( n \in \mathbb{N} \cup \{ \infty \} \) (\( n \in \mathbb{N} \)).

4. \( \mu \) is additive or finitely additive on \( E \) if
\[
\mu(E) = \sum_{i=1}^{n} \mu(E_i) \quad (43.4)
\]
whenever \( E = \bigcup_{i=1}^{n} E_i \in E \) with \( E_i \in E \) for \( i = 1, 2, \ldots, n < \infty \).

5. If \( E = A \) is an algebra, \( \mu(\emptyset) = 0 \), and \( \mu \) is finitely additive on \( A \), then \( \mu \) is said to be a finitely additive measure.

6. \( \mu \) is \( \sigma \)− additive (or countable additive) on \( E \) if item 4. holds even when \( n = \infty \).

7. If \( E = A \) is an algebra, \( \mu(\emptyset) = 0 \), and \( \mu \) is \( \sigma \)− additive on \( A \) then \( \mu \) is called a premeasure on \( A \).

8. A measure is a premeasure, \( \mu : M \rightarrow [0, \infty] \), where \( M \) is a \( \sigma \)− algebra.

Proposition 43.18 (Basic properties of finitely additive measures). Suppose \( \mu \) is a finitely additive measure on an algebra, \( A \subset 2^X, E, F \in A \) with \( E \subset F \) and \( \{ E_j \}_{j=1}^{n} \subset A \), then:

1. (\( \mu \) is monotone) \( \mu(E) \leq \mu(F) \) if \( E \subset F \).
2. (\( \mu \) is finitely subadditive) \( \mu(\bigcup_{j=1}^{n} E_j) \leq \sum_{j=1}^{n} \mu(E_j) \).
3. \( \mu \) is sub-additive on \( A \) iff
\[
\mu(A) \leq \sum_{i=1}^{\infty} \mu(A_i) \quad (43.5)
\]
where \( A \in A \) and \( \{ A_i \}_{i=1}^{\infty} \subset A \) are pairwise disjoint sets.
4. (\( \mu \) is countably superadditive) If \( A = \bigcup_{i=1}^{\infty} A_i \) with \( A_i, A \in A \), then
\[
\mu\left( \bigcup_{i=1}^{\infty} A_i \right) \geq \sum_{i=1}^{\infty} \mu(A_i).
\]
5. A finitely additive measure, \( \mu \), is a premeasure iff \( \mu \) is sub-additive.

Proof.
1. Since \( F \) is the disjoint union of \( E \) and \( (F \setminus E) \) and \( F \setminus E = F \cap E^c \in A \) it follows that
\[
\mu(F) = \mu(E) + \mu(F \setminus E) \geq \mu(E).
\]
2. Let \( \tilde{E}_j = E_j \setminus (E_1 \cup \cdots \cup E_{j-1}) \) so that the \( \tilde{E}_j \)'s are pair-wise disjoint and \( E = \bigcup_{j=1}^{\infty} \tilde{E}_j \). Since \( \tilde{E}_j \subset E_j \) it follows from Remark 43.20 and the monotonicity of \( \mu \) that
\[
\mu(E) = \sum_{j=1}^{\infty} \mu(\tilde{E}_j) \leq \sum_{j=1}^{\infty} \mu(E_j).
\]
3. If \( A = \bigcup_{i=1}^{\infty} A_i \) with \( A_i \in A \) and \( B_i \in A \), then \( A = \bigcup_{i=1}^{\infty} A_i \) where \( A_i := B_i \setminus (B_1 \cup \cdots B_{i-1}) \in A \) and \( B_0 = \emptyset \). Therefore using the monotonicity of \( \mu \) and Eq. (43.5)
\[
\mu(A) \leq \sum_{i=1}^{\infty} \mu(A_i) \leq \sum_{i=1}^{\infty} \mu(B_i).
\]
4. Suppose that \( A = \prod_{i=1}^{\infty} A_i \) with \( A_i \in A \), then \( \prod_{i=1}^{n} A_i \subset A \) for all \( n \) and so by the monotonicity and finite additivity of \( \mu \), \( \sum_{i=1}^{n} \mu(A_i) \leq \mu(A) \).

Letting \( n \to \infty \) in this equation shows \( \mu \) is superadditive.

5. This is a combination of items 3. and 4.

Exercise 43.4. Suppose that \( \mu \) is a finitely additive measure on an algebra \( A \).
Show \( \mu \) is a premeasure (see Definition 43.17) iff for every sequence \( \{ B_n \}_{n=1}^{\infty} \subset A \) such that \( B_n \uparrow B \in A \) we have \( \mu(B_n) \uparrow \mu(B) \) as \( n \to \infty \). Hint: Let \( A_n := B_n \setminus B_{n-1} \) where by convention \( B_0 := \emptyset \).

Recall from Definition 43.2 that \( M \subset 2^X \) is a \( \sigma \)− algebra on \( X \) if \( M \) is an algebra which is closed under countable unions and intersections.

Definition 43.19. A measure \( \mu \) on a measurable space \((X, M)\) is a finitely additive measure on \( M \) satisfying the following additional continuity condition. If \( A_n \in M \) and \( A_n \uparrow A \), then \( \mu(A_n) \uparrow \mu(A) \). A measure space is a triple, \((X, M, \mu)\), where \((X, M)\) is a measurable space and \( \mu : M \rightarrow [0, \infty] \) is a measure.

Remark 43.20. The continuity property of a finitely additive measure, \( \mu \), in Definition 43.19 is equivalent to the following condition. If \( \{ A_i \}_{i=1}^{\infty} \subset M \) are pairwise disjoint then
\[
\mu\left( \bigcup_{i=1}^{\infty} A_i \right) = \sum_{i=1}^{\infty} \mu(A_i). \quad (43.6)
\]

Indeed, if \( \{ A_i \}_{i=1}^{\infty} \subset M \) are pairwise disjoint, then \( B_n := \bigcup_{i=1}^{n} A_i \uparrow \bigcup_{i=1}^{\infty} A_i \) and hence if \( \mu \) is a finitely additive measure with the continuity property in Definition 43.19 then
Proposition 43.21 (Basic properties of measures). Suppose that 

\[ (X, \mathcal{M}, \mu) \text{ is a measure space and } E,F \in \mathcal{M} \text{ and } \{E_j\}_{j=1}^\infty \subset \mathcal{M}, \text{ then:} \]

1. \( \mu(E) \leq \mu(F) \) if \( E \subset F \).
2. \( \mu(E_1 \cup \cdots \cup E_j) \leq \sum \mu(E_j) \).
3. If \( \mu(E_1) < \infty \) and \( E_j \downarrow \emptyset \), i.e. \( E_1 \supset E_2 \supset E_3 \supset \ldots \) and \( E = \cap_j E_j \), then \( \mu(E) = \mu(E_j) \downarrow \mu(E) \) as \( j \to \infty \).

Proof. 1. Since \( F = E \cup (F \setminus E) \),

\[
\mu(F) = \mu(E) + \mu(F \setminus E) \geq \mu(E).
\]

2. Let \( \tilde{E}_j = E_j \setminus (E_1 \cup \cdots \cup E_{j-1}) \) so that the \( \tilde{E}_j \)'s are pair-wise disjoint and \( E = \bigcup \tilde{E}_j \). Since \( \tilde{E}_j \subset E_j \) it follows from Remark 43.20 and part (1), that

\[
\mu(E) = \sum \mu(\tilde{E}_j) \leq \sum \mu(E_j).
\]

3. Define \( D_i = E_1 \setminus E_i \) then \( D_i \uparrow E_1 \setminus E \) which implies that

\[
\mu(E_1) - \mu(E) = \lim_{i \to \infty} \mu(D_i) = \mu(E_1) - \lim_{i \to \infty} \mu(E_i)
\]

which shows that \( \lim_{i \to \infty} \mu(E_i) = \mu(E) \).

Proposition 43.22 (Construction of Finitely Additive Measures). Suppose \( \mathcal{E} \subset 2^X \) is an elementary family (see Definition 43.10) and \( \mathcal{A} = \mathcal{A}(\mathcal{E}) \) is the algebra generated by \( \mathcal{E} \). Then every additive function \( \mu : \mathcal{E} \to [0, \infty] \) which is finite on bounded sets there is a unique increasing function \( F : \mathbb{R} \to \mathbb{R} \) such that \( F(0) = 0, F^{-1}(\{ -\infty \}) \subset \{ -\infty \}, F^{-1}(\{ \infty \}) \subset \{ \infty \} \) and

\[
\mu((a,b] \cap \mathbb{R}) = F(b) - F(a) \quad \forall a \leq b \in \mathbb{R}.
\]

Conversely, given an increasing function \( F : \mathbb{R} \to \mathbb{R} \) such that \( F^{-1}(\{ -\infty \}) \subset \{ -\infty \} \) and \( F^{-1}(\{ \infty \}) \subset \{ \infty \} \), there is a unique finitely additive measure \( \mu = \mu_F \) on \( \mathcal{A} \) such that the relation in Eq. (43.10) holds.

Proof. If \( F \) is going to exist, then

\[
\mu((0,b] \cap \mathbb{R}) = F(b) - F(0) = F(b) \quad \text{if } b \in [0, \infty), \quad \mu((a,0]) = F(0) - F(a) = -F(a) \quad \text{if } a \in [\infty, 0]
\]

Proof. Since (by Proposition 43.12) every element \( A \in \mathcal{A} \) is of the form \( A = \bigcup_i E_i \) for a finite collection of \( E_i \in \mathcal{E} \), it is clear that if \( \mu \) extends to a measure then the extension is unique and must be given by

\[
\mu(A) = \sum_i \mu(E_i).
\]

To prove existence, the main point is to show that \( \mu(A) \) in Eq. (43.7) is well defined; i.e. if we also have \( A = \bigcup_j F_j \) with \( F_j \in \mathcal{E} \), then we must show

\[
\sum_i \mu(E_i) = \sum_j \mu(F_j).
\]

But \( E_i = \bigcup_j (E_i \cap F_j) \) and the additivity of \( \mu \) on \( \mathcal{E} \) implies \( \mu(E_i) = \sum_j \mu(E_i \cap F_j) \) and hence

\[
\sum_i \mu(E_i) = \sum_i \sum_j \mu(E_i \cap F_j) = \sum_{i,j} \mu(E_i \cap F_j).
\]

Similarly,

\[
\sum_j \mu(F_j) = \sum_{i,j} \mu(E_i \cap F_j)
\]

which combined with the previous equation shows that Eq. (43.8) holds. It is now easy to verify that \( \mu \) extended to \( \mathcal{A} \) as in Eq. (43.7) is an additive measure on \( \mathcal{A} \).

Proposition 43.23. Let \( X = \mathbb{R}, \mathcal{E} \) be the elementary class

\[
\mathcal{E} = \{(a,b] \cap \mathbb{R} : -\infty < a \leq b \leq \infty \}, \quad \text{and} \quad \mathcal{A} = \mathcal{A}(\mathcal{E}) \text{ be the algebra formed by taking finite disjoint unions of elements from } \mathcal{E}, \text{ see Proposition 43.12. To each finitely additive measures } \mu : \mathcal{A} \to [0, \infty] \text{ which is finite on bounded sets there is a unique increasing function } F : \mathbb{R} \to \mathbb{R} \text{ such that } F(0) = 0, F^{-1}(\{ -\infty \}) \subset \{ -\infty \}, F^{-1}(\{ \infty \}) \subset \{ \infty \} \text{ and}
\]

\[
\mu((a,b] \cap \mathbb{R}) = F(b) - F(a) \quad \forall a \leq b \in \mathbb{R}.
\]

Conversely, given an increasing function \( F : \mathbb{R} \to \mathbb{R} \) such that \( F^{-1}(\{ -\infty \}) \subset \{ -\infty \} \) and \( F^{-1}(\{ \infty \}) \subset \{ \infty \} \), there is a unique finitely additive measure \( \mu = \mu_F \) on \( \mathcal{A} \) such that the relation in Eq. (43.10) holds.

Proof. If \( F \) is going to exist, then

\[
\mu((0,b] \cap \mathbb{R}) = F(b) - F(0) = F(b) \quad \text{if } b \in [0, \infty), \quad \mu((a,0]) = F(0) - F(a) = -F(a) \quad \text{if } a \in [\infty, 0]
\]
from which we learn

\[ F(x) = \begin{cases} -\mu((x,0]) & \text{if } x \leq 0 \\ \mu((0, x] \cap \mathbb{R}) & \text{if } x > 0. \end{cases} \]

Moreover, one easily checks using the additivity of \( \mu \) that Eq. (43.10) holds for this \( F \). Conversely, suppose \( F : \mathbb{R} \to \mathbb{R} \) is an increasing function such that \( F^{-1}\{(-\infty)\} \subset \{-\infty\}, F^{-1}\{(\infty)\} \subset \{\infty\} \). Define \( \mu \) on \( \mathcal{E} \) using the formula in Eq. (43.10). The argument will be completed by showing \( \mu \) is additive on \( \mathcal{E} \) and hence, by Proposition 43.22 has a unique extension to a finitely additive measure on \( A \). Suppose that

\[ (a, b] = \prod_{i=1}^{n} (a_i, b_i]. \]

By reordering \( (a_i, b_i] \) if necessary, we may assume that

\[ a = a_1 < b_1 = a_2 < b_2 = a_3 < \cdots < b_{n-1} = a_n < b_n = b. \]

Therefore, by the telescoping series argument,

\[ \mu((a, b]) = F(b) - F(a) = \sum_{i=1}^{n} [F(b_i) - F(a_i)] = \sum_{i=1}^{n} \mu((a_i, b_i]]. \]

3. If \( \varphi, \psi \in \mathbb{S}_+(A) \) and \( \varphi \leq \psi \) then

\[ I_\mu(\varphi + \psi) = I_\mu(\psi) + I_\mu(\varphi). \]

In particular, \( I_\mu \) is positive, i.e. i.e. \( I(f) \geq 0 \) if \( f \geq 0 \).

Proof.

1. If \( \lambda \notin \{0, \infty\} \), then

\[ I_\mu(\lambda \varphi) = \sum_{y \in \mathcal{C}(\lambda \varepsilon)} y \mu(\lambda \varphi = y) = \sum_{y \in \mathcal{C}(\lambda \varepsilon)} y \mu(\varphi = y/\lambda \lambda) = \sum_{z \in \mathcal{C}(\lambda \varepsilon)} \lambda z \mu(\varphi = z) = \lambda I_\mu(\varphi). \]

The case \( \lambda = 0 \) and \( \lambda = \infty \) are easy to verify as well.

2. Writing \( \{\varphi = a, \psi = b\} \) for \( \varphi^{-1}\{\{a\}\} \cap \psi^{-1}\{\{b\}\} \), then

\[ I_\mu(\varphi + \psi) = \sum_{z \in \mathcal{F}} z \mu(\varphi + \psi = z) \]

\[ = \sum_{z \in \mathcal{F}} z \mu(\bigcup_{w \in \mathcal{F}} \{\varphi = w, \psi = z - w\}) \]

\[ = \sum_{z \in \mathcal{F}} \sum_{w \in \mathcal{F}} \mu(\varphi = w, \psi = z - w) \]

\[ = \sum_{z, w \in \mathcal{F}} (z + w) \mu(\varphi = w, \psi = z) \]

\[ = \sum_{z \in \mathcal{F}} z \mu(\psi = z) + \sum_{w \in \mathcal{F}} w \mu(\varphi = w) = I_\mu(\psi) + I_\mu(\varphi). \]

which proves 2.

3. If \( \varphi \) and \( \psi \) are non-negative simple functions such that \( \varphi \leq \psi \)

\[ I_\mu(\varphi) = \sum_{a \geq 0} a \mu(\varphi = a) = \sum_{a, b \geq 0} a \mu(\varphi = a, \psi = b) \]

\[ \leq \sum_{a, b \geq 0} b \mu(\varphi = a, \psi = b) = \sum_{b \geq 0} b \mu(\psi = b) = I_\mu(\psi), \]

wherein the third inequality we have used \( \{\varphi = a, \psi = b\} = \emptyset \) if \( a > b \).
Taking absolute values of Eq. (43.11) gives

$$|I(f)| \leq \sum_{y \in \mathbb{R}} |y| \mu(f = y) \leq \|f\|_{\infty} \mu(f \neq 0)$$

(43.13)

where \(\|f\|_{\infty} = \sup_{x \in X} |f(x)|\). For \(A \subseteq A\), let \(S_{A} := \{f \in S(A) : \{f \neq 0\} \subseteq A\}\).

The estimate in Eq. (43.13) implies

$$|I(f)| \leq \mu(A) \|f\|_{\infty} \text{ for all } f \in S_{A}.$$  

(43.14)

Let \(\hat{S}_{A}\) denote the closure of \(S_{A}\) inside \(\ell^{\infty}(X, \mathbb{R})\).

**Proposition 43.27.** Let \((A, \mu, I = I_{\mu})\) be as in Definition 43.25, then we may extend \(I\) to

$$\hat{S} := \bigcup \{\hat{S}_{A} : A \subseteq A \text{ with } \mu(A) < \infty\}$$

by defining \(I(f) = I_{A}(f)\) when \(f \in \hat{S}_{A}\) with \(\mu(A) < \infty\). Moreover this extension is still positive and satisfies the estimate in Eq. (43.13).

**Proof.** By Eq. (43.14) and the B.L.T. Theorem 50.4 \(I\) has a unique extension \(I_{A}\) to \(\hat{S}_{A} \subseteq C_{c}(\mathbb{R}, \mathbb{R})\) for any \(A \subseteq A\) such that \(\mu(A) < \infty\). The extension \(I_{A}\) is still positive. Indeed, let \(f \in \hat{S}_{A}\) with \(f \geq 0\) and let \(f_{n} \in S_{A}\) be a sequence such that \(\|f - f_{n}\|_{\infty} \to 0\) as \(n \to \infty\). Then \(f_{n} \to 0 \in S_{A}\) and

$$\|f - f_{n} \vee 0\|_{\infty} \leq \|f - f_{n}\|_{\infty} \to 0 \text{ as } n \to \infty.$$

Therefore, \(I_{A}(f) = \lim_{n \to \infty} I_{A}(f_{n} \vee 0) \geq 0\).

Now suppose that \(A, B \subseteq A\) are sets such that \(\mu(A) + \mu(B) < \infty\). Then \(S_{A} \cup S_{B} \subseteq S_{A \cup B}\) and so \(\hat{S}_{A} \cup \hat{S}_{B} \subseteq \hat{S}_{A \cup B}\). Therefore \(I_{A}(f) = I_{A \cup B}(f) = I_{B}(f)\) for all \(f \in \hat{S}_{A} \cap \hat{S}_{B}\). Therefore \(I(f) := I_{A}(f)\) for \(f \in \hat{S}_{A}\) is well defined.

As an example, suppose \(X = \mathbb{R}, A = A(\mathcal{E})\) with \(\mathcal{E}\) as in Eq. (27.21), and \(F\) and \(\mu\) as in Proposition 43.25. In this setting, for \(f \in \hat{S}\), we will write \(I_{\mu}(f)\) as \(\int_{-\infty}^{\infty} f(x)dF(x)\) and refer to this integral as the Riemann Stieljes integral of \(f\) relative to \(F\).

**Lemma 43.28.** Using the notation above, the map \(f \in \hat{S} \to \int_{-\infty}^{\infty} f(x)dF(x)\) is linear, positive and satisfies the estimate

$$\left|\int_{-\infty}^{\infty} f(x)dF(x)\right| \leq (F(b) - F(a)) \|f\|_{\infty} \quad \text{if } \text{supp}(f) \subseteq (a, b). \quad \text{Moreover } C_{c}(\mathbb{R}, \mathbb{R}) \subseteq \hat{S}.$$  

(43.15)

**Proof.** The only new point of the lemma is to prove \(C_{c}(\mathbb{R}, \mathbb{R}) \subseteq \hat{S}\), the remaining assertions follow directly from Proposition 43.27. The fact that \(C_{c}(\mathbb{R}, \mathbb{R}) \subseteq \hat{S}\) has essentially already been done in Example 45.11. In more detail, let \(f \in C_{c}(\mathbb{R}, \mathbb{R})\) and choose \(a < b\) such that \(\text{supp}(f) \subseteq (a, b)\). Then define \(f_{k} \in \hat{S}\) as in Example 45.11 i.e.

$$f_{k}(x) = \sum_{l=0}^{n_{k}-1} \min \{f(x) : a_{l}^{k} \leq x \leq a_{l+1}^{k}\} \chi(a_{l}^{k}, a_{l+1}^{k})$$

where \(\pi_{k} = \{a = a_{0}^{k} < a_{1}^{k} < \cdots < a_{n_{k}}^{k} = b\}\), for \(k = 1, 2, 3, \ldots\), is a sequence of refining partitions such that \(\text{mesh}(\pi_{k}) \to 0\) as \(k \to \infty\). Since \(\text{supp}(f)\) is compact and \(f\) is continuous, \(f - f_{k}\) is uniformly continuous on \(\mathbb{R}\). Therefore \(\|f - f_{k}\|_{\infty} \to 0\) as \(k \to \infty\), showing \(f \in \hat{S}\). Incidentally, for \(f \in C_{c}(\mathbb{R}, \mathbb{R})\), it follows that

$$\int_{-\infty}^{\infty} f(x)dF = \lim_{k \to \infty} \sum_{l=0}^{n_{k}-1} \min \{f(x) : a_{l}^{k} \leq x \leq a_{l+1}^{k}\} \left[F(a_{l+1}^{k}) - F(a_{l}^{k})\right].$$

(43.16)

The following Exercise is an abstraction of Lemma 43.28.

**Exercise 43.5.** Continue the notation of Definition 43.25 and Proposition 43.27 Further assume that \(X\) is a metric space, there exists open sets \(X_{n} \subseteq_{\sigma} X\) such that \(X_{n} \uparrow X\) and for each \(n \in \mathbb{N}\) and \(\delta > 0\) there exists a finite collection of \(A_{i}\) such that \(\pi_{n} < \delta\), \(\mu(A_{i}) < \infty\) and \(X_{n} \subseteq \bigcup_{i=1}^{k} A_{i}\). Then \(C_{c}(X, \mathbb{R}) \subseteq \hat{S}\) and so \(I\) is well defined on \(C_{c}(X, \mathbb{R})\).

**Exercise 43.6 (Banach Space Version of Proposition 43.27).** Let \((X, A, \mu)\) be as in Definition 43.25 and Proposition 43.27 \(Y\) be a Banach space and \(S(Y) := S_{c}(X, A, \mu ; Y)\) be the collection of functions \(f : X \to Y\) such that \(\#(f(X)) < \infty, f^{-1}(\{y\}) \in A\) for all \(y \in Y\) and \(\mu(f \neq 0) < \infty\). We may define a linear functional \(I : S(Y) \to Y\) by

$$I(f) = \sum_{y \in Y} y \mu(f = y).$$

Verify the following statements.

1. Let \(\|f\|_{\infty} = \sup_{x \in X} |f(x)|_{Y}\) be the sup norm on \(\ell^{\infty}(X, Y)\), then for \(f \in S(Y), \quad \|I(f)\|_{Y} \leq \|f\|_{\infty} \mu(f \neq 0).\)

Hence if \(\mu(X) < \infty\), \(I\) extends to a bounded linear transformation from \(S(Y) \subseteq \ell^{\infty}(X, Y)\) to \(Y\).
2. Assuming \((X, A, \mu)\) satisfies the hypothesis in Exercise 43.3 then \(C(X, Y) \subset \mathfrak{S}(Y)\).

3. Now assume the notation in Section 27.3.3 i.e. \(X = [-M, M]\) for some \(M \in \mathbb{R}\) and \(\mu\) is determined by an increasing function \(F\). Let \(\pi := \{-M = t_0 < t_1 < \cdots < t_n = M\}\) denote a partition of \(J := [-M, M]\) along with a choice \(c_i \in [t_i, t_{i+1}]\) for \(i = 0, 1, 2, \ldots, n - 1\). For \(f \in C([-M, M], Y)\), set

\[
\mu(\pi) := f(c_0)1_{[t_0, t_1]} + \sum_{i=1}^{n-1} f(c_i)1_{(t_i, t_{i+1})}.
\]

Show that \(f_\pi \in \mathcal{S}\) and

\[
\|f - f_\pi\|_\pi \to 0 \quad \text{as} \quad |\pi| := \max\{(t_{i+1} - t_i) : i = 0, 1, 2, \ldots, n - 1\} \to 0.
\]

Conclude from this that

\[
I(f) = \lim_{|\pi| \to 0} \sum_{i=0}^{n-1} f(c_i)(F(t_{i+1}) - F(t_i)).
\]

As usual we will write this integral as \(\int_M f dF\) and as \(\int_M f(t) dt\) if \(F(t) = t\).

### 43.4 Deeper Properties and Construction of Measures

**Example 43.29.** Suppose that \(X\) is any set and \(x \in X\) is a point. For \(A \subset X\), let

\[
\delta_x(A) = \begin{cases} 1 & \text{if } x \in A \\ 0 & \text{if } x \notin A \end{cases}
\]

Then \(\mu = \delta_x\) is a measure on \(X\) called the Dirac delta measure at \(x\).

**Example 43.30.** Suppose that \(\mu\) is a measure on \(X\) and \(\lambda > 0\), then \(\lambda \cdot \mu\) is also a measure on \(X\). Moreover, if \(\{\mu_\alpha\}_{\alpha \in J}\) are all measures on \(X\), then \(\mu = \sum_{\alpha \in J} \mu_\alpha\), i.e.

\[
\mu(A) = \sum_{\alpha \in J} \mu_\alpha(A) \quad \text{for all } A \subset X
\]

is a measure on \(X\). (See Section 2 for the meaning of this sum.) To prove this we must show that \(\mu\) is countably additive. Suppose that \(\{A_i\}_{i=1}^\infty\) is a collection of pair-wise disjoint subsets of \(X\), then

\[
\mu(\bigcup_{i=1}^\infty A_i) = \sum_{i=1}^\infty \mu(A_i) = \sum_{\alpha \in J} \sum_{i=1}^\infty \mu_\alpha(A_i)
\]

wherein the third equality we used Theorem 4.22 and in the fourth we used that fact that \(\mu_\alpha\) is a measure.

**Example 43.31.** Suppose that \(X\) is a set \(\lambda : X \to [0, \infty]\) is a function. Then

\[
\mu := \sum_{x \in X} \lambda(x)\delta_x
\]

is a measure, explicitly

\[
\mu(A) = \sum_{x \in A} \lambda(x)
\]

for all \(A \subset X\).

**Exercise 43.7.** Show there exists a non-zero translation invariant measures, \(\mu\), on \(\mathbb{R}\). Also show if \(\mu : \mathbb{R} \to [0, \infty]\) is a translation invariant measure such that \(\mu((0, 1]) = 1\), then \(\mu \equiv 0\).

#### 43.4.1 Example of Measures

Most \(\sigma\) – algebras and \(\sigma\) - additive measures are somewhat difficult to describe and define. However, one special case is fairly easy to understand. Namely suppose that \(\mathcal{F} \subset 2^X\) is a countable or finite partition of \(X\) and \(\mathcal{M} \subset 2^X\) is the \(\sigma\) – algebra which consists of the collection of sets \(A \subset X\) such that

\[
A = \bigcup \{\alpha \in \mathcal{F} : \alpha \subset A\}.
\]

(43.17)

It is easily seen that \(\mathcal{M}\) is a \(\sigma\) – algebra.

Any measure \(\mu : \mathcal{M} \to [0, \infty]\) is determined uniquely by its values on \(\mathcal{F}\). Conversely, if we are given any function \(\lambda : \mathcal{F} \to [0, \infty]\) we may define, for \(A \in \mathcal{M}\),

\[
\mu(A) = \sum_{\alpha \in \mathcal{F} : \alpha \subset A} \lambda(\alpha) = \sum_{\alpha \in \mathcal{F}} \lambda(\alpha)1_{\alpha \subset A}
\]

where \(1_{\alpha \subset A}\) is one if \(\alpha \subset A\) and zero otherwise. We may check that \(\mu\) is a measure on \(\mathcal{M}\). Indeed, if \(A = \bigcap_{i=1}^\infty A_i\) and \(\alpha \in \mathcal{F}\), then \(\alpha \subset A\) iff \(\alpha \subset A_i\) for one and hence exactly one \(A_i\). Therefore \(1_{\alpha \subset A} = \sum_{i=1}^\infty 1_{\alpha \subset A_i}\), and hence

\[
\mu(A) = \sum_{\alpha \in \mathcal{F}} \lambda(\alpha)1_{\alpha \subset A} = \sum_{\alpha \in \mathcal{F}} \lambda(\alpha)1_{\alpha \subset A} = \sum_{i=1}^\infty \sum_{\alpha \in \mathcal{F}} \lambda(\alpha)1_{\alpha \subset A_i} = \sum_{i=1}^\infty \mu(A_i)
\]

as desired. Thus we have shown that there is a one to one correspondence between measures \(\mu\) on \(\mathcal{M}\) and functions \(\lambda : \mathcal{F} \to [0, \infty]\).
43.5 Construction of Premeasures

Proposition 43.32. Suppose that $A \subset 2^X$ is an algebra and $\mu : A \to [0, \infty]$ is a finitely additive measure on $A$. Then $\mu$ is automatically super-additive on $A$.

Proof. Since

$$A = \left( \bigcap_{i=1}^{N} A_i \right) \cup \left( A \setminus \bigcup_{i=1}^{N} A_i \right),$$

$$\mu(A) = \sum_{i=1}^{N} \mu(A_i) + \mu \left( A \setminus \bigcup_{i=1}^{N} A_i \right) \geq \sum_{i=1}^{N} \mu(A_i),$$

Letting $N \to \infty$ in this last expression shows that $\mu(A) \geq \sum_{i=1}^{\infty} \mu(A_i)$. ■

Proposition 43.33. Suppose that $\mathcal{E} \subset 2^X$ is an elementary family, $A = \mathcal{A}(\mathcal{E})$ and $\mu : A \to [0, \infty]$ is a finitely additive measure. Then $\mu$ is a premeasure on $A$ iff $\mu$ is sub-additive on $\mathcal{E}$.

Proof. Clearly if $\mu$ is a premeasure on $A$ then $\mu$ is $\sigma$-additive and hence sub-additive on $\mathcal{E}$. Because of Proposition 43.32, to prove the converse it suffices to show that the sub-additivity of $\mu$ on $\mathcal{E}$ implies the sub-additivity of $\mu$ on $A$.

So suppose $A = \bigcup_{n=1}^{k} A_n$ with $A \in A$ and each $A_n \in A$ which we express as $A = \bigcup_{j=1}^{\infty} E_j$ with $E_j \in \mathcal{E}$ and $A_n = \bigcap_{i=1}^{N_n} E_{n,i}$ with $E_{n,i} \in \mathcal{E}$. Then

$$E_j = A \cap E_j = \bigcap_{n=1}^{\infty} A_n \cap E_j = \bigcap_{n=1}^{\infty} \bigcap_{i=1}^{N_n} E_{n,i} \cap E_j,$$

which is a countable union and hence by assumption,

$$\mu(E_j) \leq \sum_{n=1}^{\infty} \mu \left( E_{n,i} \cap E_j \right).$$

Summing this equation on $j$ and using the finite additivity of $\mu$ shows

$$\mu(A) = \sum_{j=1}^{k} \mu(E_j) \leq \sum_{j=1}^{k} \sum_{n=1}^{\infty} \sum_{i=1}^{N_n} \mu \left( E_{n,i} \cap E_j \right)$$

$$= \sum_{n=1}^{\infty} \sum_{i=1}^{N_n} \sum_{j=1}^{k} \mu \left( E_{n,i} \cap E_j \right) = \sum_{n=1}^{\infty} \sum_{i=1}^{N_n} \mu \left( E_{n,i} \right) = \sum_{n=1}^{\infty} \mu(A_n),$$

which proves (using Proposition 43.18) the sub-additivity of $\mu$ on $A$. ■

Now suppose that $F : \mathbb{R} \to \mathbb{R}$ be an increasing function, $F(\pm \infty) := \lim_{x \to \pm \infty} F(x)$ and $\mu = \mu_F$ be the finitely additive measure on $(\mathbb{R}, A)$ described in Proposition 43.23. If $\mu$ happens to be a premeasure on $A$, then, letting $A_n = (a, b_n]$ with $b_n \downarrow b$ as $n \to \infty$, implies

$$F(b_n) - F(a) = \mu((a, b_n]) = \mu(a, b_n] = F(b) - F(a).$$

Since $\{b_n\}_{n=1}^{\infty}$ was an arbitrary sequence such that $b_n \downarrow b$, we have shown $\lim_{n \to \infty} F(y) = F(b)$, i.e. $F$ is right continuous. The next proposition shows the converse is true as well. Hence premeasures on $A$ which are finite on bounded sets are in one to one correspondences with right continuous increasing functions which vanish at 0.

Proposition 43.34. To each right continuous increasing function $F : \mathbb{R} \to \mathbb{R}$ there exists a unique premeasure $\mu = \mu_F$ on $A$ such that

$$\mu_F((a, b]) = F(b) - F(a) \forall - \infty < a < b < \infty.$$

Proof. As above, let $F(\pm \infty) := \lim_{y \to \pm \infty} F(x)$ and $\mu = \mu_F$ be as in Proposition 43.23. Because of Proposition 43.33, to finish the proof it suffices to show $\mu$ is sub-additive on $\mathcal{E}$.

First suppose that $- \infty < a < b < \infty$, $J = (a, b]$, $J_n = (a_n, b_n]$ such that $J = \bigcap_{n=1}^{\infty} J_n$. We wish to show

$$\mu(J) \leq \sum_{n=1}^{\infty} \mu(J_n).$$

To do this choose numbers $\tilde{a} > a$, $\tilde{b}_n > b_n$ in which case $I := (\tilde{a}, b] \subset J$,

$$\tilde{J}_n := (a_n, \tilde{b}_n] \subset \tilde{J}_n := (a_n, b_n] \subset J_n.$$

Since $\tilde{I} = [a, b]$ is compact and $\tilde{I} \subset J \subset \bigcup_{n=1}^{\infty} \tilde{J}_n$ there exists $N < \infty$ such that

$$I \subset \tilde{I} \subset \bigcup_{n=1}^{N} \tilde{J}_n \subset \bigcup_{n=1}^{\infty} \tilde{J}_n.$$

Hence by finite sub-additivity of $\mu$,

$$F(b) - F(\tilde{a}) = \mu(I) \leq \sum_{n=1}^{N} \mu(\tilde{J}_n) \leq \sum_{n=1}^{\infty} \mu(\tilde{J}_n).$$

Using the right continuity of $F$ and letting $\tilde{a} \downarrow a$ in the above inequality,
The other cases where \( \varepsilon > 0 \), we may use the right continuity of \( F \) to choose \( b_n \) so that
\[
\mu(J) = \mu((a, b]) = F(b) - F(a) \leq \sum_{n=1}^{\infty} \mu(J_n).
\]

Using this in Eq. (43.19) shows
\[
\mu(J) = \mu((a, b]) \leq \sum_{n=1}^{\infty} \mu(J_n) + \varepsilon
\]
which verifies Eq. (43.18) since \( \varepsilon > 0 \) was arbitrary.

The hard work is now done but we still have to check the cases where \( a = -\infty \) or \( b = \infty \). For example, suppose that \( b = \infty \) so that \( J = (a, \infty) = \prod_{n=1}^{\infty} J_n \) with \( J_n = (a_n, b_n] \cap \mathbb{R} \). Then \( I_M := (a, M] = J \cap I_M = \prod_{n=1}^{\infty} J_n \cap I_M \) and so by what we have already proved,
\[
F(M) - F(a) = \mu(I_M) \leq \sum_{n=1}^{\infty} \mu(J_n \cap I_M) \leq \sum_{n=1}^{\infty} \mu(J_n).
\]
Now let \( M \to \infty \) in this last inequality to find that
\[
\mu((a, \infty)) = F(\infty) - F(a) \leq \sum_{n=1}^{\infty} \mu(J_n).
\]
The other cases where \( a = -\infty \) and \( b \in \mathbb{R} \) and \( a = -\infty \) and \( b = \infty \) are handled similarly. ■

43.5.1 Extending Premeasures to \( \mathcal{A}_\sigma \)

Definition 43.35. Given a collection of subsets, \( \mathcal{E} \), of \( X \), let \( \mathcal{E}_\sigma \) denote the collection of subsets of \( X \) which are finite or countable unions of sets from \( \mathcal{E} \). Similarly let \( \mathcal{E}_\delta \) denote the collection of subsets of \( X \) which are finite or countable intersections of sets from \( \mathcal{E} \). We also write \( \mathcal{E}_{\sigma\delta} = (\mathcal{E}_\sigma)_\delta \) and \( \mathcal{E}_{\delta\sigma} = (\mathcal{E}_\delta)_\sigma \), etc.

Lemma 43.36. Suppose that \( \mathcal{A} \subset 2^X \) is an algebra. Then:
1. \( \mathcal{A}_\sigma \) is closed under taking countable unions and finite intersections.
2. \( \mathcal{A}_\delta \) is closed under taking countable intersections and finite unions.
3. \( \{ A^c : A \in \mathcal{A}_\delta \} = \mathcal{A}_\delta \) and \( \{ A^c : A \in \mathcal{A}_\sigma \} = \mathcal{A}_\sigma \).

Proof. By construction \( \mathcal{A}_\sigma \) is closed under countable unions. Moreover if \( A = \bigcup_{n=1}^{\infty} A_i \) and \( B = \bigcup_{n=1}^{\infty} B_j \) with \( A_i, B_j \in \mathcal{A} \), then \( A \cap B = \bigcup_{i,j=1}^{\infty} A_i \cap B_j \in \mathcal{A}_\sigma \), which shows that \( \mathcal{A}_\sigma \) is also closed under finite intersections. Item 3. is straightforward and item 2. follows from items 1. and 3.

The next exercise is a minor variant of Remark 43.20 and Proposition 43.21

Exercise 43.8. Suppose \( \mu : \mathcal{A} \to [0, \infty] \) is a finitely additive measure. Show
1. \( \mu \) is a premeasure on \( \mathcal{A} \) iff \( \mu(A_n) \uparrow \mu(A) \) for all \( \{ A_n \}_{n=1}^{\infty} \subset \mathcal{A} \) such that \( \bigcup_{n=1}^{\infty} A_n \uparrow A \in \mathcal{A} \).
2. Further assume \( \mu \) is finite (i.e. \( \mu(X) < \infty \)). Then \( \mu \) is a premeasure on \( \mathcal{A} \) iff \( \mu(A_n) \downarrow 0 \) for all \( \{ A_n \}_{n=1}^{\infty} \subset \mathcal{A} \) such that \( \bigcap_{n=1}^{\infty} A_n = \emptyset \).

Proposition 43.37. Let \( \mu \) be a premeasure on an algebra \( \mathcal{A} \), then \( \mu \) has a unique extension (still called \( \mu \)) to a function on \( \mathcal{A}_\sigma \) satisfying the following properties.
1. (Continuity) If \( A_n \in \mathcal{A} \) and \( A_n \uparrow A \in \mathcal{A}_\sigma \), then \( \mu(A_n) \uparrow \mu(A) \) as \( n \to \infty \).
2. (Monotonicity) If \( A, B \in \mathcal{A}_\sigma \) with \( A \subset B \) then \( \mu(A) \leq \mu(B) \).
3. (Strong Additivity) If \( A, B \in \mathcal{A}_\sigma \), then
\[
\mu(A \cup B) + \mu(A \cap B) = \mu(A) + \mu(B).
\]
4. (Sub-Additivity on \( \mathcal{A}_\sigma \)) The function \( \mu \) is sub-additive on \( \mathcal{A}_\sigma \), i.e. if \( \{ A_n \}_{n=1}^{\infty} \subset \mathcal{A}_\sigma \), then
\[
\mu(\bigcup_{n=1}^{\infty} A_n) \leq \sum_{n=1}^{\infty} \mu(A_n).
\]
5. (\( \sigma \)-Additivity on \( \mathcal{A}_\sigma \)) The function \( \mu \) is countably additive on \( \mathcal{A}_\sigma \).

Proof. Let \( A, B \) be sets in \( \mathcal{A}_\sigma \) such that \( A \subset B \) and suppose \( \{ A_n \}_{n=1}^{\infty} \) and \( \{ B_n \}_{n=1}^{\infty} \) are sequences in \( \mathcal{A} \) such that \( A_n \uparrow A \) and \( B_n \uparrow B \) as \( n \to \infty \). Since \( B_m \cap A_n \uparrow A_n \) as \( m \to \infty \), the continuity of \( \mu \) on \( \mathcal{A} \) implies,
\[
\mu(A_n) = \lim_{m \to \infty} \mu(B_m \cap A_n) \leq \lim_{m \to \infty} \mu(B_m).
\]
We may let \( n \to \infty \) in this inequality to find,
\[
\lim_{n \to \infty} \mu(A_n) \leq \lim_{m \to \infty} \mu(B_m). \tag{43.22}
\]
Using this equation when \( B = A \), implies \( \lim_{n \to \infty} \mu(A_n) = \lim_{m \to \infty} \mu(B_m) \) whenever \( A_n \uparrow A \) and \( B_m \uparrow A \). Therefore it is unambiguous to define \( \mu(A) \) by;
\[
\mu(A) = \lim_{n \to \infty} \mu(A_n)
\]
for any sequence \( \{A_n\}_{n=1}^{\infty} \subset \mathcal{A} \) such that \( A_n \uparrow A \). With this definition, the continuity of \( \mu \) is clear and the monotonicity of \( \mu \) follows from Eq. \( \text{(43.22)} \).

Suppose that \( A, B \in \mathcal{A}_\sigma \) and \( \{A_n\}_{n=1}^{\infty} \) and \( \{B_n\}_{n=1}^{\infty} \) are sequences in \( \mathcal{A} \) such that \( A_n \uparrow A \) and \( B_n \uparrow B \) as \( n \to \infty \). Then passing to the limit as \( n \to \infty \) in the identity,
\[
\mu(A_n \cup B_n) + \mu(A_n \cap B_n) = \mu(A_n) + \mu(B_n)
\]
proves Eq. \( \text{(43.20)} \). In particular, it follows that \( \mu \) is finitely additive on \( \mathcal{A}_\sigma \).

Let \( \{A_n\}_{n=1}^{\infty} \) be any sequence in \( \mathcal{A}_\sigma \) and choose \( \{A_{n,i}\}_{i=1}^{\infty} \subset \mathcal{A} \) such that \( A_{n,i} \uparrow A_n \) as \( i \to \infty \). Then we have,
\[
\mu \left( \bigcup_{n=1}^{N} A_{n,N} \right) \leq \sum_{n=1}^{N} \mu(A_{n,N}) \leq \sum_{n=1}^{\infty} \mu(A_n) \leq \sum_{n=1}^{\infty} \mu(A_n) . \tag{43.23}
\]

Since \( \mathcal{A} \supset \bigcup_{n=1}^{\infty} A_{n,N} \uparrow \bigcup_{n=1}^{\infty} A_n \in \mathcal{A}_\sigma \), we may let \( N \to \infty \) in Eq. \( \text{(43.21)} \) to conclude Eq. \( \text{(43.22)} \) holds.

If we further assume that \( \{A_n\}_{n=1}^{\infty} \subset \mathcal{A}_\sigma \) is a disjoint sequence, by the finite additivity and monotonicity of \( \mu \) on \( \mathcal{A}_\sigma \), we have
\[
\sum_{n=1}^{\infty} \mu(A_n) = \lim_{N \to \infty} \sum_{n=1}^{N} \mu(A_n) = \lim_{N \to \infty} \mu \left( \bigcup_{n=1}^{N} A_n \right) \leq \mu \left( \bigcup_{n=1}^{\infty} A_n \right) . \tag{43.23}
\]

The previous two inequalities show \( \mu \) is \( \sigma \)-additive on \( \mathcal{A}_\sigma \). \( \square \)

Suppose \( \mu \) is a finite premeasure on an algebra, \( \mathcal{A} \subset 2^X \), and \( A \in \mathcal{A}_\delta \cap \mathcal{A}_\sigma \). Since \( A, A^c \in \mathcal{A}_\sigma \), and \( X = A \cup A^c \), it follows that \( \mu(X) = \mu(A) + \mu(A^c) \). From this observation we may extend \( \mu \) to a function on \( \mathcal{A}_\delta \cup \mathcal{A}_\sigma \) by defining
\[
\mu(A) := \mu(X) - \mu(A^c) \quad \text{for all } A \in \mathcal{A}_\delta . \tag{43.24}
\]

\textbf{Lemma 43.38.} Suppose \( \mu \) is a finite premeasure on an algebra, \( \mathcal{A} \subset 2^X \), and \( \mu \) has been extended to \( \mathcal{A}_\delta \cup \mathcal{A}_\sigma \) as described in Proposition \( \text{[43.37]} \) and Eq. \( \text{[43.24]} \) above.

1. If \( A \in \mathcal{A}_\delta \) and \( A_n \in \mathcal{A} \) such that \( A_n \downarrow A \), then \( \mu(A) = \lim_{n \to \infty} \mu(A_n) \).
2. \( \mu \) is additive when restricted to \( \mathcal{A}_\delta \).
3. If \( A \in \mathcal{A}_\delta \) and \( C \in \mathcal{A}_\sigma \) such that \( A \subset C \), then \( \mu(C \setminus A) = \mu(C) - \mu(A) \).

\textbf{Proof.} 1. Since \( A_n^c \uparrow A^c \in \mathcal{A}_\sigma \), by the definition of \( \mu(A) \) and Proposition \( \text{[43.37]} \), it follows that
\[
\mu(A) = \mu(X) - \mu(A^c) = \mu(X) - \lim_{n \to \infty} \mu(A_n^c) = \lim_{n \to \infty} [\mu(X) - \mu(A_n^c)] = \lim_{n \to \infty} \mu(A_n) .
\]

2. Suppose \( A, B \in \mathcal{A}_\delta \) are disjoint sets and \( A_n, B_n \in \mathcal{A} \) such that \( A_n \downarrow A \) and \( B_n \downarrow B \), then \( A_n \cup B_n \downarrow A \cup B \) and therefore,
\[
\mu(A \cup B) = \lim_{n \to \infty} \mu(A_n \cup B_n) = \lim_{n \to \infty} [\mu(A_n) + \mu(B_n) - \mu(A_n \cap B_n)] = \mu(A) + \mu(B)
\]
wherein the last equality we have used Exercise \( \text{[43.8]} \).

3. By assumption, \( X = A^c \cup C \). So applying the strong additivity of \( \mu \) on \( \mathcal{A}_\sigma \) in Eq. \( \text{(43.20)} \) with \( A \to A^c \in \mathcal{A}_\sigma \) and \( B \to C \in \mathcal{A}_\delta \) shows
\[
\mu(X) + \mu(C \setminus A) = \mu(A^c \cup C) + \mu(A^c \cap C) = \mu(A^c) + \mu(C) = \mu(X) - \mu(A) + \mu(C) .
\]

\textbf{Definition 43.39 (Measurable Sets).} Suppose \( \mu \) is a finite premeasure on an algebra \( \mathcal{A} \subset 2^X \). We say that \( B \subset X \) is \textit{measurable} if for all \( \varepsilon > 0 \) there exists \( A \in \mathcal{A}_\delta \) and \( C \in \mathcal{A}_\sigma \) such that \( A \subset B \subset C \) and \( \mu(C \setminus A) < \varepsilon \). We will denote the collection of measurable subsets of \( X \) by \( \mathcal{M} = \mathcal{M}(\mu) \). We also define \( \bar{\mu} : \mathcal{M} \to [0, \mu(X)] \) by
\[
\bar{\mu}(B) = \inf \{ \mu(C) : B \subset C \in \mathcal{A}_\sigma \} . \tag{43.25}
\]

\textbf{Remark 43.40.} If \( B \in \mathcal{M}, \varepsilon > 0, A \in \mathcal{A}_\delta \) and \( C \in \mathcal{A}_\sigma \) are such that \( A \subset B \subset C \) and \( \mu(C \setminus A) < \varepsilon \), then \( \mu(A) \leq \bar{\mu}(B) \leq \mu(C) \) and in particular,
\[
0 \leq \bar{\mu}(B) - \mu(A) < \varepsilon, \quad \text{and} \quad 0 \leq \mu(C) - \bar{\mu}(B) < \varepsilon . \tag{43.26}
\]
Indeed, if \( C' \in \mathcal{A}_\sigma \) with \( B \subset C' \), then \( A \subset C' \) and so by Lemma \( \text{[43.38]} \)
\[
\mu(A) \leq \mu(C' \setminus A) + \mu(A) = \mu(C')
\]
from which it follows that \( \mu(A) \leq \bar{\mu}(B) \). The fact that \( \bar{\mu}(B) \leq \mu(C) \) follows directly from Eq. \( \text{[43.25]} \).
Theorem 43.41 (Finite Premeasure Extension Theorem). Suppose \( \mu \) is a finite premeasure on an algebra \( \mathcal{A} \subset 2^X \). Then \( \mathcal{M} \) is a \( \sigma \) – algebra on \( X \) which contains \( \mathcal{A} \) and \( \bar{\mu} \) is a \( \sigma \) – additive measure on \( \mathcal{M} \). Moreover, \( \bar{\mu} \) is the unique measure on \( \mathcal{M} \) such that \( \bar{\mu}|_{\mathcal{A}} = \mu \).

Proof. It is clear that \( \mathcal{A} \subset \mathcal{M} \) and that \( \mathcal{M} \) is closed under complementation. Now suppose that \( B_i \in \mathcal{M} \) for \( i = 1, 2 \) and \( \varepsilon > 0 \) is given. We may then choose \( A_i \subset B_i \subset C_i \) such that \( A_i \in \mathcal{A}_\delta \), \( C_i \in \mathcal{A}_\sigma \), and \( \mu (C_i \setminus A_i) < \varepsilon \) for \( i = 1, 2 \). Then with \( A = A_1 \cup A_2 \), \( B = B_1 \cup B_2 \) and \( C = C_1 \cup C_2 \), we have \( \mathcal{A}_\delta \ni A \subset B \subset C \in \mathcal{A}_\sigma \). Since
\[
C \setminus A = (C_1 \setminus A) \cup (C_2 \setminus A) \subset (C_1 \setminus A_1) \cup (C_2 \setminus A_2),
\]

it follows from the sub-additivity of \( \mu \) that with
\[
\mu (C \setminus A) \leq \mu (C_1 \setminus A_1) + \mu (C_2 \setminus A_2) < 2\varepsilon.
\]

Since \( \varepsilon > 0 \) was arbitrary, we have shown that \( B \in \mathcal{M} \). Hence we now know that \( \mathcal{M} \) is an algebra.

Because \( \mathcal{M} \) is an algebra, to verify that \( \mathcal{M} \) is a \( \sigma \) – algebra it suffices to show that \( \mathcal{B} = \bigsqcup_{n=1}^{\infty} B_n \in \mathcal{M} \) whenever \( \{B_n\}_{n=1}^{\infty} \) is a disjoint sequence in \( \mathcal{M} \). To prove \( \mathcal{B} \in \mathcal{M} \), let \( \varepsilon > 0 \) be given and choose \( A_i \subset B_i \subset C_i \) such that \( A_i \in \mathcal{A}_\delta \), \( C_i \in \mathcal{A}_\sigma \), and \( \mu (C_i \setminus A_i) < \varepsilon 2^{-i} \) for all \( i \). Since the \( \{A_i\}_{i=1}^{\infty} \) are pairwise disjoint we may use Lemma 43.38 to show,
\[
\sum_{i=1}^{n} \mu (C_i) = \sum_{i=1}^{n} (\mu (A_i) + \mu (C_i \setminus A_i)) = \mu (\bigcup_{i=1}^{n} A_i) + \sum_{i=1}^{n} \mu (C_i \setminus A_i) \leq \mu (X) + \sum_{i=1}^{n} \varepsilon 2^{-i}.
\]

Passing to the limit, \( n \to \infty \), in this equation then shows
\[
\sum_{i=1}^{\infty} \mu (C_i) \leq \mu (X) + \varepsilon < \infty. \quad (43.27)
\]

Let \( B = \bigcup_{i=1}^{\infty} B_i \), \( C := \bigcup_{i=1}^{\infty} C_i \in \mathcal{A}_\sigma \) and for \( n \in \mathbb{N} \) let \( A^n := \bigsqcup_{i=1}^{n} A_i \in \mathcal{A}_\delta \). Then \( \mathcal{A}_\delta \ni A^n \subset B \subset C \in \mathcal{A}_\sigma \), \( \mathcal{A} \setminus A^n \) and \( C \setminus A^n = \bigcup_{i=1}^{\infty} (C_i \setminus A^n) \subset [\bigcup_{i=1}^{n} (C_i \setminus A_i)] \cup [\bigcup_{i=n+1}^{\infty} C_i] \in \mathcal{A}_\sigma \). Therefore, using the sub-additivity of \( \mu \) on \( \mathcal{A}_\sigma \) and the estimate (43.27),
\[
\mu (C \setminus A^n) \leq \sum_{i=1}^{n} \mu (C_i \setminus A_i) + \sum_{i=n+1}^{\infty} \mu (C_i) \leq \varepsilon + \sum_{i=n+1}^{\infty} \mu (C_i) \to \varepsilon \text{ as } n \to \infty.
\]

Since \( \varepsilon > 0 \) is arbitrary, it follows that \( B \in \mathcal{M} \). Moreover by repeated use of Remark 43.40 we find
\[
|\bar{\mu} (B) - \mu (A^n)| < \varepsilon + \sum_{i=n+1}^{\infty} \mu (C_i) \text{ and } \sum_{i=1}^{n} \bar{\mu} (B_i) - \mu (A^n) = \left| \sum_{i=1}^{n} [\bar{\mu} (B_i) - \mu (A_i)] \right| \leq \sum_{i=1}^{n} |\bar{\mu} (B_i) - \mu (A_i)| \leq \varepsilon \sum_{i=1}^{n} 2^{-i} < \varepsilon.
\]

Combining these estimates shows
\[
|\bar{\mu} (B) - \sum_{i=1}^{n} \bar{\mu} (B_i)| < 2\varepsilon + \sum_{i=n+1}^{\infty} \mu (C_i)
\]

which upon letting \( n \to \infty \) gives,
\[
|\bar{\mu} (B) - \sum_{i=1}^{\infty} \bar{\mu} (B_i)| \leq 2\varepsilon.
\]

Since \( \varepsilon > 0 \) is arbitrary, we have shown \( \bar{\mu} (B) = \sum_{i=1}^{\infty} \bar{\mu} (B_i) \). This completes the proof that \( \mathcal{M} \) is a \( \sigma \) – algebra and that \( \bar{\mu} \) is a measure on \( \mathcal{M} \).

Many theorems in the sequel will require some control on the size of a measure \( \mu \). The relevant notion for our purposes (and most purposes) is that of a \( \sigma \) – finite measure defined next.

Definition 43.42. Suppose \( X \) is a set, \( \mathcal{E} \subset \mathcal{M} \subset 2^X \) and \( \mu : \mathcal{M} \to [0, \infty] \) is a function. The function \( \mu \) is \( \sigma \) – finite on \( \mathcal{E} \) if there exists \( E_n \in \mathcal{E} \) such that \( \mu (E_n) < \infty \) and \( X = \bigsqcup_{n=1}^{\infty} E_n \). If \( \mathcal{M} \) is a \( \sigma \) – algebra and \( \mu \) is a measure on \( \mathcal{M} \) which is \( \sigma \) – finite on \( \mathcal{M} \) we will say \((X, \mathcal{M}, \mu)\) is a \( \sigma \) – finite measure space.

The reader should check that if \( \mu \) is a finitely additive measure on an algebra, \( \mathcal{A} \), then \( \mu \) is \( \sigma \) – finite on \( \mathcal{M} \) iff there exists \( X_n \in \mathcal{M} \) such that \( X_n \uparrow X \) and \( \mu (X_n) < \infty \).

Theorem 43.43. Suppose that \( \mu \) is a \( \sigma \) – finite premeasure on an algebra \( \mathcal{A} \). Then
\[
\bar{\mu} (B) := \inf \{ \mu (C) : B \subset C \in \mathcal{A} \} \quad \forall B \in \sigma (\mathcal{A}) \quad (43.28)
\]
defines a measure on \( \sigma (\mathcal{A}) \) and this measure is the unique extension of \( \mu \) on \( \mathcal{A} \) to a measure on \( \sigma (\mathcal{A}) \).

Proof. Let \( \{X_n\}_{n=1}^{\infty} \subset \mathcal{A} \) be chosen so that \( \mu (X_n) < \infty \) for all \( n \) and \( X_n \uparrow X \) as \( n \to \infty \) and let
\[
\mu_n (A) := \mu_n (A \cap X_n) \text{ for all } A \in \mathcal{A}.
\]
Each $\mu_n$ is a premeasure (as is easily verified) on $\mathcal{A}$ and hence by Theorem 43.41 each $\mu_n$ has an extension, $\tilde{\mu}_n$, to a measure on $\sigma(\mathcal{A})$. Since the measure $\tilde{\mu}_n$ is increasing, $\tilde{\mu} := \lim_{n \to \infty} \tilde{\mu}_n$ is a measure which extends $\mu$, see Exercise 45.4.

The proof will be completed by verifying that Eq. (43.28) holds. (See the argument in Theorem 48.3.) Let $B \in \sigma(\mathcal{A})$, $B_m = X_m \cap B$ and $\varepsilon > 0$ be given. By Theorem 43.41 there exists $C_m \in \mathcal{A}_\sigma$ such that $B_m \subset C_m \subset X_m$ and

$$\mu(C_m \setminus B_m) = \mu(C_m \setminus B_m) < 2^{-m}. $$

Thus

$$\tilde{\mu}(C \setminus B) \leq \tilde{\mu} \left( \bigcup_{m=1}^{\infty} (C_m \setminus B) \right) \leq \sum_{m=1}^{\infty} \tilde{\mu}(C_m \setminus B_m) \leq \sum_{m=1}^{\infty} \tilde{\mu}(C_m \setminus B_m) < \varepsilon.$$ 

Then $C := \cup_{m=1}^{\infty} C_m \in \mathcal{A}_\sigma$ and $\mu(C \setminus B) \leq \varepsilon$.

Thus

$$\tilde{\mu}(C \setminus B) \leq \tilde{\mu}(C) = \tilde{\mu}(B) + \tilde{\mu}(C \setminus B) \leq \tilde{\mu}(B) + \varepsilon$$

which, since $\varepsilon > 0$ is arbitrary, shows $\tilde{\mu}$ satisfies Eq. (43.28). The uniqueness of the extension $\tilde{\mu}$ is proved in Theorem 43.43.

43.6 Regularity Results

BRUCE: The following result is the same as Theorem 46.9 below.

Theorem 43.44 (Regularity Result). Suppose $\mathcal{A} \subset 2^X$ is an algebra, $\mathcal{M} = \sigma(\mathcal{A})$ and $\mu: \mathcal{M} \to [0, \infty]$ is a measure which is $\sigma$-finite on $\mathcal{A}$, i.e. there exists $X_n \in \mathcal{A}$ such that $\mu(X_n) < \infty$ for all $n$. Then for every $\varepsilon > 0$ and $B \in \mathcal{M}$ there exists $A \in \mathcal{A}_\delta$ and $C \in \mathcal{A}_\sigma$ such that $A \subset B \subset C$ and $\mu(C \setminus A) < \varepsilon$.

Proof. First assume that $\mu(X) < \infty$ and let $\mathcal{M}_0$ denote the collection of $B \in \mathcal{M}$ such that for every $\varepsilon > 0$ there here exists $A \in \mathcal{A}_\delta$ and $C \in \mathcal{A}_\sigma$ such that $A \subset B \subset C$ and $\mu(C \setminus A) < \varepsilon$. It is now clear that $A \subset \mathcal{M}_0$ and that $\mathcal{M}_0$ is closed under complementation. Moreover if $B_i \in \mathcal{M}_0$ for $i = 1, 2, \ldots$ and $\varepsilon > 0$, there exists $A_i \in \mathcal{A}_\delta$ and $C_i \in \mathcal{A}_\sigma$ such that $A_i \subset B_i \subset C_i$ and $\mu(C_i \setminus A_i) < 2^{-i}\varepsilon$. Letting $A := \cup_{i=1}^{\infty} A_i, A^N := \cup_{i=1}^{N} A_i \in \mathcal{A}_\delta$ and $C := \cup_{i=1}^{\infty} C_i \in \mathcal{A}_\sigma$, we have $A^N \subset A \subset \cup_{i=1}^{\infty} B_i \subset C$ and

$$\mu(C \setminus A) = \mu(C \setminus A) \leq \sum_{i=1}^{\infty} \mu(C_i \setminus A_i) \leq \mu(C_i \setminus A_i) < \varepsilon.$$ 

Since $C \setminus A^N \downarrow C \setminus A$, it also follows that $\mu(C \setminus A^N) < \varepsilon$ for sufficiently large $N$ and therefore we have shown $\cup_{i=1}^{\infty} B_i \in \mathcal{M}_0$ as well. Therefore $\mathcal{M}_0$ is a sub-$\sigma$-algebra of $\mathcal{M} = \sigma(\mathcal{A})$ which contains $\mathcal{A}$ and hence $\mathcal{M}_0 = \mathcal{M}$.

Now suppose $\mu$ is only $\sigma$-finite on $\mathcal{A}$ and let $B \in \mathcal{M}$. Since $\mathcal{M} \to \mu_i(A) := \mu(X_i \cap A)$ is a finite measure on $A \in \mathcal{M}$ for each $i$, by what we have just proved there exists $C_i \in \mathcal{A}_\sigma$ such that $B \subset C_i$ and $\mu((X_i \cap [C_i \setminus B])) < 2^{-i}\varepsilon$. Now let $C := \cup_{i=1}^{\infty} X_i \cap C_i \in \mathcal{A}_\sigma$ and observe that $B \subset C$ and

$$\mu(C \setminus B) \leq \sum_{i=1}^{\infty} \mu([X_i \cap C_i] \setminus B)) \leq \sum_{i=1}^{\infty} \mu(X_i \cap [C_i \setminus B]) < \varepsilon.$$ 

Applying this result to $B^c$ shows there exists $D \in \mathcal{A}_\sigma$ such that $B^c \subset D$ and

$$\mu(B \setminus D^c) = \mu(D \setminus B^c) < \varepsilon.$$ 

So if we let $A := D^c \in \mathcal{A}_\delta$, then $A \subset B \subset C$ and

$$\mu(C \setminus A) = \mu(B \setminus A) \leq \mu(B \setminus A) + \mu(C \setminus B) < 2\varepsilon$$

and the result is proved.

Corollary 43.45. Suppose $\mathcal{A} \subset 2^X$ is an algebra and $\mu : \mathcal{M} = \sigma(\mathcal{A}) \to [0, \infty]$ is a measure which is $\sigma$-finite on $A$. Then for all $B \in \mathcal{M}$, there exists $A \in \mathcal{A}_\delta$ and $C \in \mathcal{A}_\sigma$ such that $A \subset B \subset C$ and $\mu(C \setminus A) = 0$.

Proof. By Theorem 43.44, given $B \in \mathcal{M}$, we may choose $A_n \in \mathcal{A}_\delta$ and $C_n \in \mathcal{A}_\sigma$ such that $A_n \subset B \subset C_n$ and $\mu(C_n \setminus B) \leq 1/n$ and $\mu(B \setminus A_n) \leq 1/n$. By replacing $A_n$ by $\cup_{i=1}^{n} A_i$ and $C_n$ by $\cup_{i=1}^{n} C_i$, we may assume that $A_n \uparrow$ and $C_n \downarrow$ as $n$ increases. Let $A = \cup A_n \in \mathcal{A}_\sigma$ and $C = \cap C_n \in \mathcal{A}_\sigma$, then $A \subset B \subset C$ and

$$\mu(C \setminus A) = \mu(C \setminus B) + \mu(B \setminus A) \leq \mu(C_n \setminus B) + \mu(B \setminus A_n) \leq 2/n \to 0 \text{ as } n \to \infty.$$ 

Exercise 43.9. Suppose $\mathcal{A} \subset 2^X$ is an algebra and $\mu$ and $\nu$ are two measures on $\mathcal{M} = \sigma(\mathcal{A})$ which are $\sigma$-finite on $A$ such that $\mu = \nu$ on $A$. Then $\mu = \nu$.

43.7 Completions of Measure Spaces

Definition 43.46. A set $E \subset X$ is a null set if $E \in \mathcal{M}$ and $\mu(E) = 0$. If $P$ is some “property” which is either true or false for each $x \in X$, we will use the terminology $P$ a.e. (to be read $P$ almost everywhere) to mean

$$E := \{ x \in X : P \text{ is false for } x \}$$

is a null set. For example if $f$ and $g$ are two measurable functions on $(X, \mathcal{M}, \mu)$, $f = g$ a.e. means that $\mu(f \neq g) = 0$. 
Definition 43.47. A measure space $(X, \mathcal{M}, \mu)$ is complete if every subset of a null set is in $\mathcal{M}$, i.e. for all $F \subset X$ such that $F \subset E \in \mathcal{M}$ with $\mu(E) = 0$ implies that $F \in \mathcal{M}$.

Proposition 43.48 (Completion of a Measure). Let $(X, \mathcal{M}, \mu)$ be a measure space. Set

$$\mathcal{N} = \mathcal{N}^\mu := \{ N \subset X : \exists F \in \mathcal{M} \text{ such that } N \subset F \text{ and } \mu(F) = 0 \},$$
$$\bar{\mathcal{M}} = \bar{\mathcal{M}}^\mu := \{ A \cup N : A \in \mathcal{M} \text{ and } N \in \mathcal{N} \}$$

and

$$\bar{\mu}(A \cup N) := \mu(A) \text{ for } A \in \mathcal{M} \text{ and } N \in \mathcal{N},$$

see Fig. 43.2. Then $\bar{\mathcal{M}}$ is a $\sigma$–algebra, $\bar{\mu}$ is a well defined measure on $\bar{\mathcal{M}}$, $\bar{\mu}$ is the unique measure on $\bar{\mathcal{M}}$ which extends $\mu$ on $\mathcal{M}$, and $(X, \mathcal{M}, \bar{\mu})$ is complete measure space. The $\sigma$-algebra, $\mathcal{M}$, is called the completion of $\mathcal{M}$ relative to $\mu$ and $\bar{\mu}$ is called the completion of $\mu$.

**Proof.** Clearly $X, \emptyset \in \bar{\mathcal{M}}$. Let $A \in \mathcal{M}$ and $N \in \mathcal{N}$ and choose $F \in \mathcal{M}$ such that $N \subset F$ and $\mu(F) = 0$. Since $N^c = (F \setminus N) \cup F^c$,

$$\begin{align*}
(A \cup N)^c &= A^c \cap N^c = A^c \cap [(F \setminus N) \cup F^c] \\
&= [A^c \cap (F \setminus N)] \cup [A^c \cap F^c]
\end{align*}$$

where $[A^c \cap (F \setminus N)] \in \mathcal{N}$ and $[A^c \cap F^c] \in \mathcal{M}$. Thus $\bar{\mathcal{M}}$ is closed under complements.

If $A_i \in \mathcal{M}$ and $N_i \subset F_i \in \mathcal{M}$ such that $\mu(F_i) = 0$ then $\cup (A_i \cup N_i) = (\cup A_i) \cup (\cup N_i) \in \bar{\mathcal{M}}$ since $\cup A_i \in \mathcal{M}$ and $\cup N_i \subset \cup F_i$ and $\mu(\cup F_i) \leq \sum \mu(F_i) = 0$. Therefore, $\bar{\mathcal{M}}$ is a $\sigma$–algebra.

Suppose $A \cup N_1 = B \cup N_2$ with $A, B \in \mathcal{M}$ and $N_1, N_2 \in \mathcal{N}$. Then $A \subset A \cup N_1 \subset A \cup N_1 \cup F_2 = B \cup F_2$ which shows that $\mu(A) \leq \mu(B) + \mu(F_2) = \mu(B)$.

Similarly, we show that $\mu(B) \leq \mu(A)$ so that $\mu(A) = \mu(B)$ and hence $\bar{\mu}(A \cup N) := \mu(A)$ is well defined. It is left as an exercise to show $\bar{\mu}$ is a measure, i.e. that it is countably additive.

**43.8 Extending Premeasures to Measures**

Throughout this chapter, $X$ will be a given set.

**Theorem 43.49.** Suppose that $\mathcal{E} \subset 2^X$ is an elementary family (Definition 43.10), $\mathcal{A} = \mathcal{A}(\mathcal{E})$ is the algebra generated by $\mathcal{E}$ (see Proposition 43.12) and $\mu : \mathcal{E} \to [0, \infty]$ is a function such that $\mu(\emptyset) = 0$.

1. If $\mu$ is additive on $\mathcal{E}$, then $\mu$ has a unique extension to a finitely additive measure on $\mathcal{A}$ which will still be denoted by $\mu$.
2. If $\mu$ is also countably sub-additive on $\mathcal{E}$, then $\mu$ is a premeasure on $\mathcal{A}$.
3. If $\mu$ is a premeasure on $\mathcal{A}$ then

$$\bar{\mu}(A) = \inf \{ \sum_{n=1}^{\infty} \mu(E_n) : A \subset \bigcup_{n=1}^{\infty} E_n \text{ with } E_n \in \mathcal{E} \}$$

and

$$\bar{\mu}(A) = \inf \{ \sum_{n=1}^{\infty} \mu(E_n) : A \subset \bigcup_{n=1}^{\infty} E_n \text{ with } E_n \in \mathcal{E} \}$$

extends $\mu$ to a measure $\bar{\mu}$ on $\sigma(\mathcal{A}) = \sigma(\mathcal{E})$.

4. If we further assume $\mu$ is $\sigma$–finite on $\mathcal{E}$, then $\bar{\mu}$ is the unique measure on $\sigma(\mathcal{E})$ such that $\bar{\mu}|_E = \mu$.

**Proof.** Item 1. is Proposition 43.22 item 2. is Proposition 43.33 item 3. is contained in Theorem 48.16 (or see Theorems 48.13 or 49.49 for the $\sigma$–finite case) and item 4. is a consequence of Theorem 45.42. The equivalence of Eqs. (43.29) and (43.30) requires a little comment.

Suppose $\bar{\mu}$ is defined by Eq. (43.29) and $A \subset \bigcup_{n=1}^{\infty} E_n$ with $E_n \in \mathcal{E}$ and let $\tilde{E}_n := E_n \setminus (E_1 \cup \cdots \cup E_{n-1}) \in \mathcal{A}(\mathcal{E})$, where $E_0 := \emptyset$. Then $A \subset \bigcup_{n=1}^{\infty} \tilde{E}_n$ and by Proposition 43.12 $\tilde{E}_n = \bigcup_{j=1}^{N_n} E_{n,j}$ for some $E_{n,j} \in \mathcal{E}$. Therefore, $A \subset \bigcup_{n=1}^{\infty} \bigcup_{j=1}^{N_n} E_{n,j}$ and hence

$$\bar{\mu}(A) \leq \sum_{n=1}^{\infty} \sum_{j=1}^{N_n} \mu(E_{n,j}) = \sum_{n=1}^{\infty} \mu(E_n) \leq \sum_{n=1}^{\infty} \mu(E_n),$$

which easily implies the equality in Eq. (43.30).

Example 43.50. The uniqueness assertion in item 4. of Theorem 43.49 may fail if the \( \sigma \) – finiteness assumption is dropped. For example, let \( X = \mathbb{R} \) and \( \mathcal{A} \) denote the algebra generated by

\[
\mathcal{E} := \{(a,b] \cap \mathbb{R} : -\infty \leq a \leq b \leq \infty\}. 
\]

Then each of the following three distinct measures on \( \mathcal{B}_\mathbb{R} \) restrict to the same premeasure on \( \mathcal{A} \):
1. \( \mu_1 = \infty \) except on the empty set,
2. \( \mu_2 \) is counting measure, and
3. \( \mu_3(A) = \mu_2(A \cap D) \) where \( D \) is any dense subset of \( \mathbb{R} \).

43.9 Extending Premasures to Measures

The construction of measures will be covered in Chapters 48–49 below. However, let us record here the existence of an interesting class of measures. BRUCE: use the proofs of these results which are given in Chapters 4 and 5 of my probability lecture notes at:

[Link to Lecture Notes]

Theorem 43.51. To every right continuous non-decreasing function \( F : \mathbb{R} \to \mathbb{R} \) there exists a unique measure \( \mu_F \) on \( \mathcal{B}_\mathbb{R} \) such that

\[
\mu_F((a,b]) = F(b) - F(a) \quad \forall \quad -\infty < a \leq b < \infty \tag{43.31}
\]

Moreover, if \( A \in \mathcal{B}_\mathbb{R} \) then

\[
\mu_F(A) = \inf \left\{ \sum_{i=1}^{\infty} (F(b_i) - F(a_i)) : A \subset \bigcup_{i=1}^{\infty} (a_i, b_i] \right\} \tag{43.32}
\]

In fact the map \( F \to \mu_F \) is a one to one correspondence between right continuous functions \( F \) with \( F(0) = 0 \) on one hand and measures \( \mu \) on \( \mathcal{B}_\mathbb{R} \) such that \( \mu(J) < \infty \) on any bounded set \( J \in \mathcal{B}_\mathbb{R} \) on the other.

Proof. See Section 27.3 below or Theorem 27.29 below.

Example 43.52. The most important special case of Theorem 43.51 is when \( F(x) = x \), in which case we write \( m \) for \( \mu_F \). The measure \( m \) is called Lebesgue measure.

Theorem 43.53. Lebesgue measure \( m \) is invariant under translations, i.e. for \( B \in \mathcal{B}_\mathbb{R} \) and \( x \in \mathbb{R} \),

\[
m(x + B) = m(B). \tag{43.34}
\]

Moreover, \( m \) is the unique measure on \( \mathcal{B}_\mathbb{R} \) such that \( m((0,1]) = 1 \) and Eq. (43.33) holds for \( B \in \mathcal{B}_\mathbb{R} \) and \( x \in \mathbb{R} \). Moreover, \( m \) has the scaling property

\[
m(\lambda B) = |\lambda| m(B) \tag{43.35}
\]

where \( \lambda \in \mathbb{R} \), \( B \in \mathcal{B}_\mathbb{R} \) and \( \lambda B := \{\lambda x : x \in B\} \).

Proof. Let \( m_x(B) := m(x + B) \), then one easily shows that \( m_x \) is a measure on \( \mathcal{B}_\mathbb{R} \) such that \( m_x((a,b]) = b - a \) for all \( a < b \). Therefore, \( m_x = m \) by the uniqueness assertion in Theorem 43.51. For the converse, suppose that \( m \) is translation invariant and \( m((0,1]) = 1 \). Given \( n \in \mathbb{N} \), we have

\[
(0,1] = \bigcup_{k=1}^{n} \left( \frac{k-1}{n}, \frac{k}{n} \right] = \bigcup_{k=1}^{n} \left( \frac{k-1}{n} + (0, \frac{1}{n}) \right). 
\]

Therefore,

\[
m((0, \frac{1}{n})] = \sum_{k=1}^{n} m \left( \frac{k-1}{n} + (0, \frac{1}{n}) \right) = \sum_{k=1}^{n} m((0, \frac{1}{n})] = n \cdot m((0, \frac{1}{n})].
\]

That is to say

\[
m((0, \frac{1}{n})] = 1/n.
\]

Similarly, \( m((0, \frac{l}{n})] = l/n \) for all \( l, n \in \mathbb{N} \) and therefore by the translation invariance of \( m \),

\[
m((a,b)) = b - a \quad \text{for all} \quad a, b \in \mathbb{Q} \quad \text{with} \quad a < b.
\]

Finally for \( a, b \in \mathbb{R} \) such that \( a < b \), choose \( a_n, b_n \in \mathbb{Q} \) such that \( b_n \downarrow b \) and \( a_n \uparrow a \), then \( (a_n, b_n) \downarrow (a, b) \) and thus

\[
m((a,b)) = \lim_{n \to \infty} m((a_n, b_n)) = \lim_{n \to \infty} (b_n - a_n) = b - a,
\]

i.e. \( m \) is Lebesgue measure. To prove Eq. (43.35) we may assume that \( \lambda \neq 0 \) since this case is trivial to prove. Now let \( m_\lambda(B) := |\lambda|^{-1} m(\lambda B) \). It is easily checked that \( m_\lambda \) is again a measure on \( \mathcal{B}_\mathbb{R} \) which satisfies

\[
m_\lambda((a,b]) = \lambda^{-1} m((\lambda a, \lambda b]) = \lambda^{-1} (\lambda b - \lambda a) = b - a
\]
if \( \lambda > 0 \) and
\[
m_\lambda((a, b]) = |\lambda|^{-1} m([\lambda b, \lambda a]) = -|\lambda|^{-1} (\lambda b - \lambda a) = b - a
\]
if \( \lambda < 0 \). Hence \( m_\lambda = m \).

We are now going to develop integration theory relative to a measure. The integral defined in the case for Lebesgue measure, \( m \), will be an extension of the standard Riemann integral on \( \mathbb{R} \).

### 43.9.1 ADD: Examples of Measures

**BRUCE:** ADD details.

1. Product measure for the flipping of a coin.
2. Haar Measure
3. Measure on embedded submanifolds, i.e. Hausdorff measure.
4. Wiener measure.
5. Gibbs states.
6. Measure associated to self-adjoint operators and classifying them.

### 43.9.2 Old version of Proposition 43.37 to be deleted?

**BRUCE:** In the following result we do not need the strong sub-additivity.

**Proposition 43.54.** Let \( \mu \) be a premeasure on an algebra \( \mathcal{A} \), then \( \mu \) has a unique extension (still called \( \mu \)) to a countably additive function on \( \mathcal{A}_\sigma \), Moreover the extended function \( \mu \) satisfies the following properties\(^1\)

1. (Continuity) If \( A_n \in \mathcal{A} \) and \( A_n \uparrow A \in \mathcal{A}_\sigma \), then \( \mu(A_n) \uparrow \mu(A) \) as \( n \to \infty \).
2. (Monotonicity) If \( A, B \in \mathcal{A}_\sigma \) with \( A \subset B \) then \( \mu(A) \leq \mu(B) \).
3. (Strong Additivity) If \( A, B \in \mathcal{A}_\sigma \), then
\[
\mu(A \cup B) + \mu(A \cap B) = \mu(A) + \mu(B).
\]
4. (Sub-Additivity on \( \mathcal{A}_\sigma \)) The function \( \mu \) is sub-additive on \( \mathcal{A}_\sigma \).

**Proof.** Suppose \( \{A_n\}_{n=1}^\infty \subset \mathcal{A}, \ A_0 := \emptyset, \) and \( A = \bigcup_{n=1}^\infty A_n \in \mathcal{A}_\sigma \). By replacing each \( A_n \) by \( A_n \setminus (A_1 \cup \cdots \cup A_{n-1}) \) if necessary we may assume that collection of sets \( \{A_n\}_{n=1}^\infty \) are pairwise disjoint. Hence every element \( A \in \mathcal{A}_\sigma \) may be expressed as a disjoint union, \( A = \bigcup_{n=1}^\infty A_n \) with \( A_n \in \mathcal{A} \). With \( A \) expressed this way we must define

\[
\mu(A) := \sum_{n=1}^\infty \mu(A_n).
\]

The proof that \( \mu(A) \) is well defined follows the same argument used in the proof of Proposition 43.22. Explicitly, suppose also that \( A = \bigcap_{k=1}^\infty B_k \) with \( B_k \in \mathcal{A} \), then for each \( n \), \( A_n = \bigcap_{k=1}^n (A_n \cap B_k) \) and therefore because \( \mu \) is a premeasure,
\[
\mu(A_n) = \sum_{k=1}^n \mu(A_n \cap B_k).
\]

Summing this equation on \( n \) shows,
\[
\sum_{n=1}^\infty \mu(A_n) = \sum_{n=1}^\infty \sum_{k=1}^n \mu(A_n \cap B_k) = \sum_{k=1}^\infty \sum_{n=1}^\infty \mu(A_n \cap B_k)
\]
wherein the last equality we have used Tonelli’s theorem for sums. By symmetry we also have
\[
\sum_{k=1}^\infty \mu(B_k) = \sum_{k=1}^\infty \sum_{n=1}^\infty \mu(A_n \cap B_k)
\]
and comparing the last two equations gives \( \sum_{n=1}^\infty \mu(A_n) = \sum_{k=1}^\infty \mu(B_k) \) which shows the extension of \( \mu \) to \( \mathcal{A}_\sigma \) is well defined.

**Countable additivity of \( \mu \) on \( \mathcal{A}_\sigma \).** If \( \{A_n\}_{n=1}^\infty \) is a collection of pairwise disjoint subsets of \( \mathcal{A}_\sigma \), then there exists \( A_n \in \mathcal{A} \) such that \( A_n = \bigcup_{i=1}^\infty A_n \) for all \( n \), and therefore,
\[
\mu(\bigcup_{i=1}^\infty A_n) = \mu\left( \bigcap_{i,n=1}^\infty A_{ni} \right) := \sum_{i,n=1}^\infty \mu(A_{ni}) = \sum_{n=1}^\infty \sum_{i=1}^\infty \mu(A_{ni}) = \sum_{n=1}^\infty \mu(A_n).
\]

Again there are no problems in manipulating the above sums since all summands are non-negative.

**Continuity of \( \mu \).** Suppose \( A_n \in \mathcal{A} \) and \( A_n \uparrow A \in \mathcal{A}_\sigma \). Letting \( A_0 = \emptyset \) and \( B_n := A_n \setminus (A_1 \cup \cdots \cup A_{n-1}) \in \mathcal{A} \) for \( n = 1, 2, \ldots \), we have \( A_n = \bigcup_{i=1}^n B_i \) and \( A = \bigcap_{i=1}^\infty B_i \). So by definition of \( \mu(A) \),
\[
\mu(A) = \sum_{i=1}^\infty \mu(B_i) = \lim_{n \to \infty} \sum_{i=1}^n \mu(B_i) = \lim_{n \to \infty} \mu(A_n)
\]
which proves the continuity assertion.

**Monotonicity of \( \mu \) on \( \mathcal{A} \).** Let \( A_n, B_n \in \mathcal{A} \) such that \( A_n \uparrow A \) and \( B_n \uparrow B \). Then, \( A_n \cap B_n \uparrow A \) as well and therefore,

\[
\mu(A) = \lim_{n \to \infty} \mu(A_n \cap B_n) \leq \lim_{n \to \infty} \mu(B_n) = \mu(B).
\]

**Strong additivity of \( \mu \).** Let \( A \) and \( B \) be in \( \mathcal{A} \) and choose \( A_n, B_n \in \mathcal{A} \) such that \( A_n \uparrow A \) and \( B_n \uparrow B \) as \( n \to \infty \) then

\[
\mu(A_n \cup B_n) + \mu(A_n \cap B_n) = \mu(A_n) + \mu(B_n).
\]

(43.37)

Indeed if \( \mu(A_n) + \mu(B_n) = \infty \) the identity is true because \( \infty = \infty \) and if \( \mu(A_n) + \mu(B_n) < \infty \) the identity follows from the finite additivity of \( \mu \) on \( \mathcal{A} \) and the set identity,

\[
A_n \cup B_n = [A_n \cap B_n] \cup [A_n \setminus (A_n \cap B_n)] \cup [B_n \setminus (A_n \cap B_n)].
\]

Since \( A_n \cup B_n \uparrow A \cup B \) and \( A_n \cap B_n \uparrow A \cap B \), Eq. (43.36) follows by passing to the limit as \( n \to \infty \) in Eq. (43.37) while making use of the continuity property of \( \mu \).

**Sub-Additivity on \( \mathcal{A} \).** Suppose \( A_n \in \mathcal{A} \) and \( A = \bigcup_{n=1}^{\infty} A_n \). Choose \( A_{n,j} \in \mathcal{A} \) such that \( A_n := \bigsqcup_{j=1}^{\infty} A_{n,j} \), let \( \{B_k\}_{k=1}^{\infty} \) be an enumeration of the collection of sets, \( \{A_{n,j} : n, j \in \mathbb{N}\} \), and define \( C_k := B_k \setminus (B_1 \cup \cdots \cup B_{k-1}) \in \mathcal{A} \) with the usual convention that \( B_0 = \emptyset \). Then \( A = \bigsqcup_{k=1}^{\infty} C_k \) and therefore by the definition of \( \mu \) on \( \mathcal{A} \) and the monotonicity of \( \mu \) on \( \mathcal{A} \),

\[
\mu(A) = \sum_{k=1}^{\infty} \mu(C_k) \leq \sum_{k=1}^{\infty} \mu(B_k) = \sum_{n=1}^{\infty} \sum_{j=1}^{\infty} \mu(A_{n,j}) = \sum_{n=1}^{\infty} \mu(A_n).
\]
Measurability

Our goal in this chapter is to understand the class of functions that we will eventually be able to integrate. In the case $X = \mathbb{R}$, the class of functions to be integrated will be a significant enlargement of the Riemann integrable functions. Moreover, this class of functions is going to be stable under a number of limiting operations.

**Definition 44.1 (Bounded Convergence).** We say that a sequence of functions $f_n$ from $X$ to $\mathbb{R}$ or $\mathbb{C}$ converges boundedly to a function $f$ if $\lim_{n \to \infty} f_n(x) = f(x)$ for all $x \in X$ and

$$\sup\{|f_n(x)| : x \in X \text{ and } n = 1, 2, \ldots\} < \infty.$$  

**Definition 44.2.** A function algebra $H$ on $X$ is a linear subspace of $l^\infty(X, \mathbb{R})$ which contains 1 and is closed under pointwise multiplication, i.e. $H$ is a subalgebra of $l^\infty(X, \mathbb{R})$ which contains 1. If $H$ is further closed under bounded convergence then $H$ is said to be a $\sigma$ – function algebra.

Recall from Definition 43.2 that $M \subset 2^X$ is a $\sigma$ – algebra on $X$ if $M$ is an algebra which is closed under countable unions and intersections. We also define the characteristic function of a set $A \subset X$ to be the function, $1_A : X \to \mathbb{R}$, defined by

$$1_A(x) = \begin{cases} 1 & \text{if } x \in A \\ 0 & \text{if } x \notin A. \end{cases}$$

The following lemma is elementary to prove

**Lemma 44.3.** Given a subset $H \subset l^\infty(X, \mathbb{R})$, let

$$M(H) := \{ A \subset X : 1_A \in H \}.$$  

If $H$ is a function algebra then $M(H)$ is an algebra and if $H$ is a $\sigma$ – function algebra then $M(H)$ is a $\sigma$ – algebra.

**Example 44.4.** $H := C([0, 1])$ is a function algebra which is not a $\sigma$ – function algebra since the continuous functions are not closed under pointwise limits. In this example, $M(H) = \{ \emptyset, [0, 1] \}$. So even though $H$ is large, $M(H)$ is small.

The phenomenon in the previous example does not happen when $H$ is a $\sigma$ – function algebra. In fact, we are going to prove in Theorem 11.22 that the map,

$$H \in \{ \text{\sigma – function algebras on } X \} \to M(H) \in \{ \text{\sigma – algebras on } X \},$$

is a bijection. With this as motivation,

**Example 44.5.** Let $X = \mathbb{R}$ and

$$\mathcal{E} = \{(a, \infty) : a \in \mathbb{R}\} \cup \{\mathbb{R}, \emptyset\} = \{(a, \infty) \cap \mathbb{R} : a \in \mathbb{R}\} \subset 2^\mathbb{R}.$$  

be as in Example 43.16 where it was shown that $A(\mathcal{E})$ may be described as being those sets which are finite disjoint unions of sets from $\mathcal{E}^\circ := \{(a, b) \cap \mathbb{R} : a, b \in \mathbb{R}\}$. In contrast the $\sigma$ – algebra, $\sigma(\mathcal{E})$, generated by $\mathcal{E}$ is very complicated. Here are some sets in $\sigma(\mathcal{E})$ – most of which are not in $A(\mathcal{E})$.

(a) $(a, b) = \bigcup_{n=1}^{\infty} (a, b - \frac{1}{n}) \in \sigma(\mathcal{E})$.
(b) All of the standard open subsets of $\mathbb{R}$ are in $\sigma(\mathcal{E})$.
(c) $\{x \} = \bigcap_{n} (x - \frac{1}{n}, x) \in \sigma(\mathcal{E})$
(d) $[a, b] = \{a\} \cup (a, b) \in \sigma(\mathcal{E})$
(e) Any countable subset of $\mathbb{R}$ is in $\sigma(\mathcal{E})$.

**Remark 44.6.** In the above example, one may replace $\mathcal{E}$ by $\mathcal{E} = \{(a, \infty) : a \in \mathbb{Q}\} \cup \{\mathbb{R}, \emptyset\}$, in which case $A(\mathcal{E})$ may be described as being those sets which are finite disjoint unions of sets from the following list

$$\{(a, \infty), (-\infty, a], (a, b) : a, b \in \mathbb{Q}\} \cup \{\emptyset, \mathbb{R}\}.$$  

This shows that $A(\mathcal{E})$ is a countable set – a useful fact which will be needed later.

**Notation 44.7** For a general topological space $(X, \tau)$, the Borel $\sigma$ – algebra is the $\sigma$ – algebra $\mathcal{B}_X := \sigma(\tau)$ on $X$. In particular if $X = \mathbb{R}^n$, $\mathcal{B}_{\mathbb{R}^n}$ will be used to denote the Borel $\sigma$ – algebra on $\mathbb{R}^n$ when $\mathbb{R}^n$ is equipped with its standard Euclidean topology.
Exercise 44.1. Verify the σ–algebra, $B_\mathbb{R}$, is generated by any of the following collection of sets:

1. $\{(a, \infty) : a \in \mathbb{R}\}$, 2. $\{(a, \infty) : a \in \mathbb{Q}\}$ or 3. $\{(a, \infty) : a \in \mathbb{Q}\}$.

Proposition 44.8. If $\tau$ is a second countable topology on $X$ and $E$ is a countable collection of subsets of $X$ such that $\tau = \tau(E)$, then $B_X := \sigma(\tau) = \sigma(E)$, i.e. $\sigma(\tau(E)) = \sigma(E)$.

Proof. Let $E_f$ denote the collection of subsets of $X$ which are finite intersection of elements from $E$ along with $X$ and $\emptyset$. Notice that $E_f$ is still countable (you prove). A set $E \in \sigma(E)$ iff $E$ is an arbitrary union of sets from $E_f$. Therefore $Z = \bigcup_{A \in F} A$ for some subset $F \subset E_f$ which is necessarily countable. Since $E_f \subset \sigma(E)$ and $\sigma(E)$ is closed under countable unions it follows that $Z \in \sigma(E)$ and hence that $\tau(E) \subset \sigma(E)$. Lastly, since $E \subset \tau(E) \subset \sigma(E)$, $\sigma(E) \subset \sigma(\tau(E)) \subset \sigma(E)$.

44.1 Measurable Functions

Definition 44.9. A measurable space is a pair $(X, \mathcal{M})$, where $X$ is a set and $\mathcal{M}$ is a σ–algebra on $X$.

Our notion of a “measurable” function will be analogous to that for a continuous function. For motivational purposes, suppose $(X, \mathcal{M}, \mu)$ is a measure space and $f : X \to \mathbb{R}_+$. Roughly speaking, in the next chapter we are going to define $\int_X f \, d\mu$ as a certain limit of sums of the form,

$$\sum_{0 < a_1 < a_2 < a_3 < \ldots} a_i \mu(f^{-1}(a_i, a_{i+1}]).$$

For this to make sense we will need to require $f^{-1}((a, b]) \in \mathcal{M}$ for all $a < b$.

Because of Lemma 44.10 below, this last condition is equivalent to the condition $f^{-1}(B_\mathbb{R}) \subset \mathcal{M}$.

Definition 44.10. Let $(X, \mathcal{M})$ and $(Y, \mathcal{F})$ be measurable spaces. A function $f : X \to Y$ is measurable of more precisely, $\mathcal{M}/\mathcal{F}$ - measurable or $(\mathcal{M}, \mathcal{F})$ - measurable, if $f^{-1}(\mathcal{F}) \subset \mathcal{M}$, i.e if $f^{-1}(A) \in \mathcal{M}$ for all $A \in \mathcal{F}$.

Example 44.11 (Characteristic Functions). Let $(X, \mathcal{M})$ be a measurable space and $A \subset X$. If $A \in \mathcal{M}$, then $1_A$ is $(\mathcal{M}, \mathcal{B}_\mathbb{R})$ - measurable because $1_A^{-1}(W)$ is either $\emptyset$, $X$, $A$ or $A^c$ for any $W \subset \mathbb{R}$. Conversely, if $\mathcal{F}$ is any σ–algebra on $\mathbb{R}$ containing a set $W \subset \mathbb{R}$ such that $1 \in W$ and $0 \in W^c$, then $A \in \mathcal{M}$ if $1_A$ is $(\mathcal{M}, \mathcal{F})$ – measurable. This is because $A = 1_A^{-1}(W) \in \mathcal{M}$.

Exercise 44.2. Suppose $f : X \to Y$ is a function, $\mathcal{F} \subset 2^Y$ and $\mathcal{M} \subset 2^X$. Show $f^{-1}(\mathcal{F})$ and $f_*\mathcal{M}$ (see Notation 2.7) are algebras (σ – algebras) provided $\mathcal{F}$ and $\mathcal{M}$ are algebras (σ – algebras).

Remark 44.12. Let $f : X \to Y$ be a function. Given a σ–algebra $\mathcal{F} \subset 2^Y$, the σ–algebra $\mathcal{M} := f^{-1}(\mathcal{F})$ is the smallest σ–algebra on $X$ such that $f$ is $(\mathcal{M}, \mathcal{F})$ - measurable. Similarly, if $\mathcal{M}$ is a σ–algebra on $X$ then $\mathcal{F} = f_*\mathcal{M}$ is the largest σ–algebra on $Y$ such that $f$ is $(\mathcal{M}, \mathcal{F})$ - measurable.

Recall from Definition 2.8 that for $\mathcal{E} \subset 2^X$ and $A \subset X$ that

$$\mathcal{E}_A = i_A^{-1}(\mathcal{E}) = \{A \cap E : E \in \mathcal{E}\}$$

where $i_A : A \to X$ is the inclusion map. Because of Exercise 17.3 when $\mathcal{E} = \mathcal{M}$ is an algebra (σ – algebra), $\mathcal{M}_A$ is an algebra (σ – algebra) on $A$ and we call $\mathcal{M}_A$ the relative or induced algebra (σ – algebra) on $A$.

The next two Lemmas are direct analogues of their topological counter parts in Lemmas 17.13 and 17.14. For completeness, the proofs will be given even though they are same as those for Lemmas 17.13 and 17.14.

Lemma 44.13. Suppose that $(X, \mathcal{M}), (Y, \mathcal{F})$ and $(Z, \mathcal{G})$ are measurable spaces. If $f : (X, \mathcal{M}) \to (Y, \mathcal{F})$ and $g : (Y, \mathcal{F}) \to (Z, \mathcal{G})$ are measurable functions then $g \circ f : (X, \mathcal{M}) \to (Z, \mathcal{G})$ is measurable as well.

Proof. By assumption $g^{-1}(\mathcal{G}) \subset \mathcal{F}$ and $f^{-1}(\mathcal{F}) \subset \mathcal{M}$ so that

$$(g \circ f)^{-1}(\mathcal{G}) = f^{-1}(g^{-1}(\mathcal{G})) \subset f^{-1}(\mathcal{F}) \subset \mathcal{M}.$$
\[ f_\sigma(f^{-1}(\mathcal{E})) = \{ B \subset Y : f^{-1}(B) \in \sigma(f^{-1}(\mathcal{E})) \} \]
is a \( \sigma \) – algebra which contains \( \mathcal{E} \) and thus \( \sigma(\mathcal{E}) \subset f_\sigma(f^{-1}(\mathcal{E})) \). Hence if \( B \in \sigma(\mathcal{E}) \) we know that \( f^{-1}(B) \in \sigma(f^{-1}(\mathcal{E})) \), i.e.

\[
  f^{-1}(\sigma(\mathcal{E})) \subset \sigma(f^{-1}(\mathcal{E})).
\]

Equations (44.4) and (44.5) are equivalent to Eq. (44.2).

Applying Eq. (44.2) with \( X = A \) and \( f = i_A \) being the inclusion map implies

\[
  (\sigma(\mathcal{E}))_A = i_A^{-1}(\sigma(\mathcal{E})) = i_A(i_A^{-1}(\mathcal{E})) = \sigma(\mathcal{E}).
\]

Lastly if \( f^{-1}\mathcal{E} \subset \mathcal{M} \), then \( f^{-1}\sigma(\mathcal{E}) = \sigma(f^{-1}\mathcal{E}) \subset \mathcal{M} \) which shows \( f \) is \( (\mathcal{M}, \mathcal{F}) \) – measurable.

**Corollary 44.15.** Suppose that \( (X, \mathcal{M}) \) is a measurable space. Then the following conditions on a function \( f : X \to \mathbb{R} \) are equivalent:

1. \( f \) is \( (\mathcal{M}, \mathcal{B}_\mathbb{R}) \) – measurable,
2. \( f^{-1}((a, \infty)) \in \mathcal{M} \) for all \( a \in \mathbb{R} \),
3. \( f^{-1}((a, \infty)) \in \mathcal{M} \) for all \( a \in \mathbb{Q} \),
4. \( f^{-1}((\infty, a]) \in \mathcal{M} \) for all \( a \in \mathbb{R} \).

**Proof.** An exercise in using Lemma 44.14 and is the content of Exercise 11.38.

Here is yet another way to generate \( \sigma \) – algebras. (Compare with the analogous topological Definition 17.20)

**Definition 44.16 (\( \sigma \) – Algebras Generated by Functions).** Let \( X \) be a set and suppose there is a collection of measurable spaces \( \{ (Y_\alpha, \mathcal{F}_\alpha) : \alpha \in A \} \) and functions \( f_\alpha : X \to Y_\alpha \) for all \( \alpha \in A \). Let \( \sigma(f_\alpha : \alpha \in A) \) denote the smallest \( \sigma \) – algebra on \( X \) such that each \( f_\alpha \) is measurable, i.e.

\[ \sigma(f_\alpha : \alpha \in A) = \sigma(\cup_{\alpha \in A} f_\alpha^{-1}(\mathcal{F}_\alpha)). \]

**Proposition 44.17.** Assuming the notation in Definition 44.16 and additionally let \( (Z, \mathcal{M}) \) be a measurable space and \( g : Z \to X \) be a function. Then \( g \) is \( (\mathcal{M}, \sigma(f_\alpha : \alpha \in A)) \) – measurable iff \( f_\alpha \circ g \) is \( (\mathcal{M}, \mathcal{F}_\alpha) \) – measurable for all \( \alpha \in A \).

**Proof.** This proof is essentially the same as the proof of the topological analogue in Proposition 17.21 \((=)\). If \( g \) is \( (\mathcal{M}, \sigma(f_\alpha : \alpha \in A)) \) – measurable, then the composition \( f_\alpha \circ g \) is \( (\mathcal{M}, \mathcal{F}_\alpha) \) – measurable by Lemma 44.13 \((\Leftarrow)\). Let

\[ g = \sigma(f_\alpha : \alpha \in A) = \sigma(\cup_{\alpha \in A} f_\alpha^{-1}(\mathcal{F}_\alpha)). \]

If \( f_\alpha \circ g \) is \( (\mathcal{M}, \mathcal{F}_\alpha) \) – measurable for all \( \alpha \), then

\[
g^{-1}f_\alpha^{-1}(\mathcal{F}_\alpha) \subset \mathcal{M} \forall \alpha \in A
\]

and therefore

\[
g^{-1}(\cup_{\alpha \in A} f_\alpha^{-1}(\mathcal{F}_\alpha)) = \cup_{\alpha \in A} g^{-1}f_\alpha^{-1}(\mathcal{F}_\alpha) \subset \mathcal{M}.
\]

Hence

\[
g^{-1}(\mathcal{G}) = g^{-1}(\sigma(\cup_{\alpha \in A} f_\alpha^{-1}(\mathcal{F}_\alpha))) = \sigma(g^{-1}(\cup_{\alpha \in A} f_\alpha^{-1}(\mathcal{F}_\alpha))) \subset \mathcal{M}
\]

which shows that \( g \) is \( (\mathcal{M}, \mathcal{G}) \) – measurable.

**Definition 44.18.** A function \( f : X \to Y \) between two topological spaces is **Borel measurable** if \( f^{-1}(B_Y) \subset B_X \).

**Proposition 44.19.** Let \( X \) and \( Y \) be two topological spaces and \( f : X \to Y \) be a continuous function. Then \( f \) is Borel measurable.

**Proof.** Using Lemma 44.14 and \( B_Y = \sigma(\tau_Y) \),

\[ f^{-1}(B_Y) = f^{-1}(\sigma(\tau_Y)) = \sigma(f^{-1}(\tau_Y)) = \sigma(\tau_X) = B_X. \]

**Definition 44.20.** Given measurable spaces \( (X, \mathcal{M}) \) and \( (Y, \mathcal{F}) \) and a subset \( A \subset X \). We say a function \( f : A \to Y \) is measurable iff \( f \) is \( \mathcal{M}_A / \mathcal{F} \) – measurable.

**Proposition 44.21 (Localizing Measurability).** Let \( (X, \mathcal{M}) \) and \( (Y, \mathcal{F}) \) be measurable spaces and \( f : X \to Y \) be a function.

1. If \( f \) is measurable and \( A \subset X \) then \( f|_A : A \to Y \) is measurable,
2. Suppose there exist \( A_n \subset \mathcal{M} \) such that \( X = \cup_{n=1}^\infty A_n \) and \( f|A_n \subset \mathcal{M}_{A_n} \) measurable for all \( n \), then \( f \) is \( \mathcal{M} \) – measurable.

**Proof.** As the reader will notice, the proof given below is essentially identical to the proof of Proposition 17.19 which is the topological analogue of this proposition.

1. If \( f \) is measurable and \( A \subset X \) then \( f|_A : A \to Y \) is measurable,
2. Suppose there exist \( A_n \subset \mathcal{M} \) such that \( X = \cup_{n=1}^\infty A_n \) and \( f|A_n \subset \mathcal{M}_{A_n} \) measurable for all \( n \), then \( f \) is \( \mathcal{M} \) – measurable.
Proposition 44.22. If $(X, \mathcal{M})$ is a measurable space, then
\[ f = (f_1, f_2, \ldots, f_n) : X \to \mathbb{R}^n \]
is $(\mathcal{M}, \mathcal{B}_{\mathbb{R}^n})$ - measurable iff $f_i : X \to \mathbb{R}$ is $(\mathcal{M}, \mathcal{B}_{\mathbb{R}})$ - measurable for each $i$. In particular, a function $f : X \to \mathbb{C}$ is $(\mathcal{M}, \mathcal{B}_{\mathbb{C}})$ - measurable iff Re $f$ and Im $f$ are $(\mathcal{M}, \mathcal{B}_{\mathbb{R}})$ - measurable.

Proof. This is formally a consequence of Corollary 47.8 and Proposition 47.3 below. Nevertheless it is instructive to give a direct proof now. Let $\tau = \pi_{\mathbb{R}^n}$ denote the usual topology on $\mathbb{R}^n$ and $\pi_i : \mathbb{R}^n \to \mathbb{R}$ be projection onto the $i$th factor. Since $\pi_i$ is continuous, $\pi_i$ is $\mathcal{B}_{\mathbb{R}^n}/\mathcal{B}_{\mathbb{R}}$ - measurable and therefore if $f : X \to \mathbb{R}^n$ is measurable then so is $f_i = \pi_i \circ f$. Now suppose $f_i : X \to \mathbb{R}$ is measurable for all $i = 1, 2, \ldots, n$. Let
\[ \mathcal{E} := \{(a, b) : a, b \in \mathbb{Q}^n \ni a < b\}, \]
where, for $a, b \in \mathbb{R}^n$, we write $a < b$ iff $a_i < b_i$ for $i = 1, 2, \ldots, n$ and let
\[ (a, b) = (a_1, b_1) \times \cdots \times (a_n, b_n). \]
Since $\mathcal{E} \subset \tau$ and every element $V \in \tau$ may be written as a (necessarily) countable union of elements from $\mathcal{E}$, we have $\sigma(\mathcal{E}) \subset \mathcal{B}_{\mathbb{R}^n} = \sigma(\tau) \subset \sigma(\mathcal{E})$, i.e. $\sigma(\mathcal{E}) = \mathcal{B}_{\mathbb{R}^n}$. (This part of the proof is essentially a direct proof of Corollary 47.8 below.) Because
\[ f^{-1}((a, b)) = f_1^{-1}((a_1, b_1)) \cap f_2^{-1}((a_2, b_2)) \cap \cdots \cap f_n^{-1}((a_n, b_n)) \in \mathcal{M} \]
for all $a, b \in \mathbb{Q}$ with $a < b$, it follows that $f^{-1}\mathcal{E} \subset \mathcal{M}$ and therefore
\[ f^{-1}\mathcal{B}_{\mathbb{R}^n} = f^{-1}\sigma(\mathcal{E}) = \sigma(f^{-1}\mathcal{E}) \subset \mathcal{M}. \]

Corollary 44.23. Let $(X, \mathcal{M})$ be a measurable space and $f, g : X \to \mathbb{C}$ be $(\mathcal{M}, \mathcal{B}_{\mathbb{C}})$ - measurable functions. Then $f \pm g$ and $f \cdot g$ are also $(\mathcal{M}, \mathcal{B}_{\mathbb{C}})$ - measurable.

Proof. Define $F : X \to \mathbb{C} \times \mathbb{C}$, $A_\pm : \mathbb{C} \times \mathbb{C} \to \mathbb{C}$ and $M : \mathbb{C} \times \mathbb{C} \to \mathbb{C}$ by $F(x) = (f(x), g(x))$, $A_\pm(w, z) = w \pm z$ and $M(w, z) = wz$. Then $A_\pm$ and $M$ are continuous and hence $(\mathcal{B}_{\mathbb{C}^2}, \mathcal{B}_{\mathbb{C}})$ - measurable. Also $F$ is $(\mathcal{M}, \mathcal{B}_{\mathbb{C}^2} \otimes \mathcal{B}_{\mathbb{C}})$ - measurable since $\pi_1 \circ F = f$ and $\pi_2 \circ F = g$ are $(\mathcal{M}, \mathcal{B}_{\mathbb{C}})$ - measurable. Therefore $A_\pm \circ F = f \pm g$ and $M \circ F = f \cdot g$, being the composition of measurable functions, are also measurable.

Lemma 44.24. Let $\alpha \in \mathbb{C}$, $(X, \mathcal{M})$ be a measurable space and $f : X \to \mathbb{C}$ be a $(\mathcal{M}, \mathcal{B}_{\mathbb{C}})$ - measurable function. Then
\[ F(x) := \begin{cases} \frac{1}{\alpha} & \text{if } f(x) \neq 0 \\ 0 & \text{if } f(x) = 0 \end{cases} \]
is measurable.

Proof. Define $i : \mathbb{C} \to \mathbb{C}$ by
\[ i(z) = \begin{cases} \frac{1}{z} & \text{if } z \neq 0 \\ 0 & \text{if } z = 0. \end{cases} \]
For any open set $V \subset \mathbb{C}$ we have
\[ i^{-1}(V) = i^{-1}(V \setminus \{0\}) \cup i^{-1}(\{0\}). \]
Because $i$ is continuous except at $z = 0$, $i^{-1}(V \setminus \{0\})$ is an open set and hence in $\mathcal{B}_\mathbb{C}$. Moreover, $i^{-1}(V \setminus \{0\}) \subset \mathcal{B}_\mathbb{C}$ since $i^{-1}(V \setminus \{0\})$ is either the empty set or the one point set $\{0\}$. Therefore $i^{-1}(\{0\}) \subset \mathcal{B}_\mathbb{C}$ and hence $i^{-1}(\mathcal{B}_\mathbb{C}) = i^{-1}(\mathcal{B}_\mathbb{C}) = i^{-1}(\mathcal{B}_\mathbb{C}) \subset \mathcal{B}_\mathbb{C}$ which shows that $i$ is Borel measurable. Since $F = i \circ f$ is the composition of measurable functions, $F$ is also measurable.

We will often deal with functions $f : X \to \mathbb{R} = \mathbb{R} \cup \{\pm \infty\}$. When talking about measurability in this context we will refer to the $\sigma$ - algebra on $\mathbb{R}$ defined by
\[ \mathcal{B}_\mathbb{R} := \sigma(\{[a, \infty] : a \in \mathbb{R}\}). \]}

Proposition 44.25 (The Structure of $\mathcal{B}_\mathbb{R}$). Let $\mathcal{B}_\mathbb{R}$ and $\mathcal{B}_\mathbb{R}$ be as above, then
\[ \mathcal{B}_\mathbb{R} = \{A \subset \mathbb{R} : A \cap \mathbb{R} \in \mathcal{B}_\mathbb{R}\}. \]

In particular $\{\infty\}, \{-\infty\} \in \mathcal{B}_\mathbb{R}$ and $\mathcal{B}_\mathbb{R} \subset \mathcal{B}_\mathbb{R}$.

Proof. Let us first observe that
\[ \{\infty\} = \bigcap_{n=1}^{\infty} [\infty, n) = \bigcap_{n=1}^{\infty} [-n, \infty) \in \mathcal{B}_\mathbb{R}, \]
\[ \{-\infty\} = \bigcap_{n=1}^{\infty} [n, \infty) \in \mathcal{B}_\mathbb{R} \text{ and } \mathbb{R} = \mathbb{R} \setminus \{\pm \infty\} \in \mathcal{B}_\mathbb{R}. \]

Letting $i : \mathbb{R} \to \mathbb{R}$ be the inclusion map,
\[ i^{-1}(\mathcal{B}_\mathbb{R}) = \sigma(i^{-1}(\{[a, \infty] : a \in \mathbb{R}\})) = \sigma(\{i^{-1}(\{a, \infty\} : a \in \mathbb{R}\})) = \sigma(\{[a, \infty] : a \in \mathbb{R}\}) = \mathcal{B}_\mathbb{R}. \]

Thus we have shown
\[ \mathcal{B}_\mathbb{R} = i^{-1}(\mathcal{B}_\mathbb{R}) = \{A \cap \mathbb{R} : A \in \mathcal{B}_\mathbb{R}\}. \]

This implies:
1. \( A \in B_{\mathbb{R}} \implies A \cap \mathbb{R} \in B_{\mathbb{R}} \) and
2. If \( A \subset \mathbb{R} \) is such that \( A \cap \mathbb{R} \in B_{\mathbb{R}} \) there exists \( B \in B_{\mathbb{R}} \) such that \( A \cap \mathbb{R} = B \cap \mathbb{R} \).

Because \( A \Delta B \subset \{ \pm \infty \} \) and \( \{ \infty \}, \{-\infty \} \in B_{\mathbb{R}} \), we may conclude that \( A \in B_{\mathbb{R}} \) as well.

This proves Eq. [44.7]. \( \square \)

The proofs of the next two corollaries are left to the reader, see Exercises 44.3 and 44.4.

**Corollary 44.26.** Let \((X, \mathcal{M})\) be a measurable space and \(f : X \to \mathbb{R}\) be a function. Then the following are equivalent

1. \(f\) is \((\mathcal{M}, B_{\mathbb{R}})\) - measurable,
2. \(f^{-1}((a, \infty]) \in \mathcal{M}\) for all \(a \in \mathbb{R}\),
3. \(f^{-1}((-\infty, a]) \in \mathcal{M}\) for all \(a \in \mathbb{R}\),
4. \(f^{-1}((-\infty)) \in \mathcal{M}\), \(f^{-1}(\{\infty\}) \in \mathcal{M}\) and \(f^0 : X \to \mathbb{R}\) defined by

\[
f^0(x) := 1_{\mathbb{R}}(f(x)) = \begin{cases} f(x) & \text{if } f(x) \in \mathbb{R} \\ 0 & \text{if } f(x) \in \{\pm \infty\} \end{cases}
\]

is measurable.

**Proof.** Define \(g_+(x) := \sup_j f_j(x)\), then

\[
\{x : g_+(x) \leq a\} = \{x : f_j(x) \leq a \forall j\} = \bigcap_j \{x : f_j(x) \leq a\} \in \mathcal{M}
\]

so that \(g_+\) is measurable. Similarly if \(g_-(x) = \inf_j f_j(x)\) then

\[
\{x : g_-(x) \geq a\} = \bigcap_j \{x : f_j(x) \geq a\} \in \mathcal{M}
\]

Since

\[
\limsup_{j \to \infty} f_j = \inf \sup \{f_j : j \geq n\} \quad \text{and} \quad \liminf_{j \to \infty} f_j = \sup \inf \{f_j : j \geq n\}
\]

we are done by what we have already proved. \( \square \)

**Definition 44.29.** Given a function \(f : X \to \mathbb{R}\) let \(f_+ := \max\{f(x), 0\}\) and \(f_- := \max(-f(x), 0) = -\min(f(x), 0)\). Notice that \(f = f_+ - f_-\).

**Corollary 44.30.** Suppose \((X, \mathcal{M})\) is a measurable space and \(f : X \to \mathbb{R}\) is a function. Then \(f\) is measurable iff \(f \pm\) are measurable.

**Proof.** If \(f\) is measurable, then Proposition 44.28 implies \(f \pm\) are measurable. Conversely if \(f \pm\) are measurable then so is \(f = f_+ - f_-\). \( \square \)

44.1.1 More general pointwise limits

**Lemma 44.31.** Suppose that \((X, \mathcal{M})\) is a measurable space, \((Y, d)\) is a metric space and \(f_j : X \to Y\) is \((\mathcal{M}, B_Y)\) - measurable for all \(j\). Also assume that for each \(x \in X\), \(f(x) = \lim_{n \to \infty} f_n(x)\) exists. Then \(f : X \to Y\) is also \((\mathcal{M}, B_Y)\) - measurable.

**Proof.** Let \(V \in \tau_d\) and \(W_m := \{y \in Y : d_Y(y) > 1/m\}\) for \(m = 1, 2, \ldots\).

Then \(W_m \in \tau_d\),

\[
W_m \subset \bar{W}_m \subset \{y \in Y : d_Y(y) \geq 1/m\} \subset V
\]

for all \(m\) and \(W_m \uparrow V\) as \(m \to \infty\). The proof will be completed by verifying the identity,

\[
f^{-1}(V) = \bigcup_{m=1}^\infty \bigcap_{n=1}^\infty \cap_{j \geq n} f_j^{-1}(W_m) \in \mathcal{M}.
\]

If \(x \in f^{-1}(V)\) then \(f(x) \in V\) and hence \(f(x) \in W_m\) for some \(m\). Since \(f_n(x) \to f(x)\), \(f_n(x) \in W_m\) for almost all \(n\). That is \(x \in \bigcup_{m=1}^\infty \bigcap_{n=1}^\infty \cap_{j \geq n} f_j^{-1}(W_m)\). Conversely when \(x \in \bigcup_{m=1}^\infty \bigcap_{n=1}^\infty \cap_{j \geq n} f_j^{-1}(W_m)\) there exists an \(m\) such that \(f_n(x) \in W_m\) for almost all \(n\). Since \(f_n(x) \to f(x)\), it follows that \(x \in f^{-1}(V)\). \( \square \)
Remark 44.32. In the previous Lemma 44.31 it is possible to let \((Y, \tau)\) be any topological space which has the “regularity” property that if \(V \in \tau\) there exists \(W_m \in \tau\) such that \(W_m \subset W_n \subset V\) and \(V = \bigcup_{m=1}^{\infty} W_m\). Moreover, some extra condition is necessary on the topology \(\tau\) in order for Lemma 44.31 to be correct. For example if \(Y = \{1, 2, 3\}\) and \(\tau = \{Y, \emptyset, \{1, 2\}, \{2, 3\}, \{2\}\}\) as in Example 44.36 and \(X = \{a, b\}\) with the trivial \(\sigma\)-algebra. Let \(f_1(a) = f_2(b) = 2\) for all \(j\), then \(f_j\) is constant and hence measurable. Let \(f(a) = 1\) and \(f(b) = 2\), then \(f_j \to f\) as \(j \to \infty\) with \(f\) being non-measurable. Notice that the Borel \(\sigma\)-algebra on \(Y\) is \(2^Y\).

Definition 44.33. Let \((X, M)\) be a measurable space. A function \(\varphi : X \to \mathbb{F}\) (\(\mathbb{F}\) denotes either \(\mathbb{R}, \mathbb{C}\) or \([0, \infty] \subset \mathbb{R}\)) is a simple function if \(\varphi\) is \(M - \mathcal{B}\) measurable and \(\varphi(X)\) contains only finitely many elements.

Any such simple functions can be written as

\[
\varphi = \sum_{i=1}^{n} \lambda_i 1_{A_i} \text{ with } A_i \in M \text{ and } \lambda_i \in \mathbb{F}.
\]  

Indeed, take \(\lambda_1, \lambda_2, \ldots, \lambda_n\) to be an enumeration of the range of \(\varphi\) and \(A_i = \varphi^{-1}(\{\lambda_i\})\). Note that this argument shows that any simple function may be written intrinsically as

\[
\varphi = \sum_{y \in \mathbb{F}} y \mathbb{1}_{\varphi^{-1}(\{y\})}.
\]  

The next theorem shows that simple functions are “pointwise dense” in the space of measurable functions.

Theorem 44.34 (Approximation Theorem). Let \(f : X \to [0, \infty]\) be measurable and define, see Figure 44.1

\[
\varphi_n(x) := \sum_{k=0}^{2^n-1} \frac{k}{2^n} f^{-1} \left( \left( \frac{k}{2^n}, \frac{k+1}{2^n} \right) \right) + 2^n \mathbb{1}_{f^{-1}(\{0\})}(x)
\]

then \(\varphi_n \leq f\) for all \(n\), \(\varphi_n(x) \uparrow f(x)\) for all \(x \in X\) and \(\varphi_n \uparrow f\) uniformly on the sets \(X_M := \{x \in X : f(x) \leq M\}\) with \(M < \infty\). Moreover, if \(f : X \to \mathbb{C}\) is a measurable function, then there exists simple functions \(\varphi_n\) such that \(\lim_{n \to \infty} \varphi_n(x) = f(x)\) for all \(x\) and \(|\varphi_n| \uparrow |f|\) as \(n \to \infty\).

Proof. Since

\[
\left( \frac{k}{2^n}, \frac{k+1}{2^n} \right) = \left( \frac{2k}{2n+1}, \frac{2k+1}{2n+1} \right) \cup \left( \frac{2k+1}{2n+1}, \frac{2k+2}{2n+1} \right),
\]

if \(x \in f^{-1} \left( \left( \frac{2k}{2n+1}, \frac{2k+1}{2n+1} \right) \right)\) then \(\varphi_n(x) = \varphi_{n+1}(x) = \frac{2k}{2n+1}\) and if \(x \in f^{-1} \left( \left( \frac{2k+1}{2n+1}, \frac{2k+2}{2n+1} \right) \right)\) then \(\varphi_n(x) = \frac{2k}{2n+1} < \frac{2k+1}{2n+1} = \varphi_{n+1}(x)\).

and so for \(x \in f^{-1} \left( \left( 2^{n+1}, \infty \right) \right)\), \(\varphi_n(x) = 2^n < 2^{n+1} = \varphi_{n+1}(x)\) and for \(x \in f^{-1} \left( \left( 2^n, 2^{n+1} \right) \right)\), \(\varphi_n(x) \geq 2^n = \varphi_n(x)\). Therefore \(\varphi_n \leq \varphi_{n+1}\) for all \(n\). It is clear by construction that \(\varphi_n(x) \leq f(x)\) for all \(x\) and that \(0 \leq f(x) - \varphi_n(x) \leq 2^{-n}\) if \(x \in X_2^n\). Hence we have shown that \(\varphi_n(x) \uparrow f(x)\) for all \(x \in X\) and \(\varphi_n \uparrow f\) uniformly on bounded sets. For the second assertion, first assume that \(f : X \to \mathbb{R}\) is a measurable function and choose \(\varphi_n^\pm\) to be simple functions such that \(\varphi_n^\pm \uparrow f\pm\) as \(n \to \infty\) and define \(\varphi_n = \varphi_n^+ - \varphi_n^-\). Then

\[
|\varphi_n| = \varphi_n^+ + \varphi_n^- \leq \varphi_n^+ + \varphi_n^- = |\varphi_{n+1}|
\]

and clearly \(\varphi_n = \varphi_n^+ + \varphi_n^- \uparrow f_+ + f_- = |f|\) and \(\varphi_n = \varphi_n^- - \varphi_n^+ \to f_+ - f_- = f\) as \(n \to \infty\). Now suppose that \(f : X \to \mathbb{C}\) is measurable. We may now choose simple function \(u_n\) and \(v_n\) such that \(|u_n| \uparrow |\text{Re } f|\), \(|v_n| \uparrow |\text{Im } f|\), \(u_n \to \text{Re } f\) and \(v_n \to \text{Im } f\) as \(n \to \infty\). Let \(\varphi_n = u_n + iv_n\), then

\[
|\varphi_n|^2 = u_n^2 + v_n^2 \uparrow |\text{Re } f|^2 + |\text{Im } f|^2 = |f|^2
\]

and \(\varphi_n = u_n + iv_n \to \text{Re } f + i \text{Im } f = f\) as \(n \to \infty\).
45.1 Integrals of positive functions

Definition 45.1. Let \( L^+ = L^+(\mathcal{M}) = \{ f : X \to [0, \infty] : f \text{ is measurable} \} \). Define

\[
\int_X f(x) \, d\mu(x) = \int_X f \, d\mu := \sup \{ I_\mu(\varphi) : \varphi \text{ is simple and } \varphi \leq f \}.
\]

We say the \( f \in L^+ \) is integrable if \( \int X f \, d\mu < \infty \). If \( A \in \mathcal{M} \), let

\[
\int_A f(x) \, d\mu(x) = \int_A f \, d\mu := \int_X 1_A f \, d\mu.
\]

Remark 45.2. Because of item 3. of Proposition 43.26, if \( \varphi \) is a non-negative simple function, \( \int_X \varphi \, d\mu = I_\mu(\varphi) \) so that \( \int_X \) is an extension of \( I_\mu \). This extension still has the monotonicity property of \( I_\mu \); namely if \( 0 \leq f \leq g \) then

\[
\int_X f \, d\mu = \sup \{ I_\mu(\varphi) : \varphi \text{ is simple and } \varphi \leq f \}
\]

\[
\leq \sup \{ I_\mu(\varphi) : \varphi \text{ is simple and } \varphi \leq g \} \leq \int_X g \, d\mu.
\]

Similarly if \( c > 0 \),

\[
\int_X cf \, d\mu = c \int_X f \, d\mu.
\]

Also notice that if \( f \) is integrable, then \( \mu(\{f = \infty\}) = 0 \).

Lemma 45.3 (Sums as Integrals). Let \( X \) be a set and \( \rho : X \to [0, \infty] \) be a function, let \( \mu = \sum_{x \in X} \rho(x) \delta_x \) on \( \mathcal{M} = 2^X \), i.e.

\[
\mu(A) = \sum_{x \in A} \rho(x).
\]

If \( f : X \to [0, \infty] \) is a function (which is necessarily measurable), then

\[
\int_X f \, d\mu = \sum_X f(\rho).
\]

Proof. Suppose that \( \varphi : X \to [0, \infty) \) is a simple function, then

\[
\sum_{\varphi = 0} \sum_{\rho(x) \in [0, \infty]} \sum_{\{\varphi = z\}} z \, \rho(x) = \sum_{\varphi = 0} z \, \rho(x) \, \{\varphi = z\} = \int_X \varphi \, d\mu.
\]

Similarly if \( \rho : X \to [0, \infty) \) is also a function (which is necessarily measurable), then

\[
\sum_{\rho(x) \in [0, \infty)} \sum_{\varphi = 0} \sum_{\{\varphi = z\}} z \, \rho(x) = \sum_{\varphi = 0} z \, \rho(x) \, \{\varphi = z\} = \int_X \varphi \, d\mu.
\]

So if \( \varphi : X \to [0, \infty) \) is a simple function such that \( \varphi \leq f \), then

\[
\int_X \varphi \, d\mu = \sum_X \varphi \rho \leq \sum_X f \rho.
\]

Taking the sup over \( \varphi \) in this last equation then shows that

\[
\int_X f \, d\mu \leq \sum_X f \rho.
\]

For the reverse inequality, let \( A \subset X \) be a finite set and \( N \in (0, \infty) \). Set \( f^N(x) = \min\{N, f(x)\} \) and let \( \varphi_{N,A} \) be the simple function given by \( \varphi_{N,A}(x) := 1_A(x) f^N(x) \). Because

\[
\varphi_{N,A}(x) \leq f(x),
\]

\[
\sum_A f^N \rho = \sum_A \varphi_{N,A} \rho = \int_X \varphi_{N,A} \, d\mu \leq \int_X f \, d\mu.
\]

Since \( f^N \uparrow f \) as \( N \to \infty \), we may let \( N \to \infty \) in this last equation to conclude

\[
\sum_A f \rho \leq \int_X f \, d\mu.
\]

Since \( A \) is arbitrary, this implies

\[
\sum_X f \rho \leq \int_X f \, d\mu.
\]
Theorem 45.4 (Monotone Convergence Theorem). Suppose $f_n \in L^+$ is a sequence of functions such that $f_n \uparrow f$ ($f$ is necessarily in $L^+$) then

$$\int f_n \uparrow \int f \quad \text{as } n \to \infty.$$  

Proof. Since $f_n \leq f_m \leq f$, for all $n \leq m < \infty$,

$$\int f_n \leq \int f_m \leq \int f$$

from which it follows $\int f_n$ is increasing in $n$ and

$$\lim_{n \to \infty} \int f_n \leq \int f. \quad (45.1)$$

For the opposite inequality, let $\varphi : X \to [0, \infty)$ be a simple function such that $0 \leq \varphi \leq f$, $\alpha \in (0,1)$ and $X_n := \{f_n \geq \alpha \varphi\}$. Notice that $X_n \uparrow X$ and $f_n \geq \alpha 1_{X_n} \varphi$ and so by definition of $\int f_n$,

$$\int f_n \geq \int \alpha 1_{X_n} \varphi = \alpha \int 1_{X_n} \varphi. \quad (45.2)$$

Then using the continuity property of $\mu$,

$$\lim_{n \to \infty} \int 1_{X_n} \varphi = \lim_{n \to \infty} \int 1_{X_n} \sum_{y>0} y 1_{\{\varphi=y\}} = \lim_{n \to \infty} \sum_{y>0} y \mu(X_n \cap \{\varphi=y\}) = \sum_{y>0} \lim_{n \to \infty} \mu(X_n \cap \{\varphi=y\}) = \sum_{y>0} y \mu(\{\varphi=y\}) = \int \varphi.$$

This identity allows us to let $n \to \infty$ in Eq. (45.2) to conclude

$$\int \varphi \leq \frac{1}{\alpha} \lim_{n \to \infty} \int f_n.$$

Since this is true for all non-negative simple functions $\varphi$ with $\varphi \leq f$;

$$\int f = \sup \left\{ \int_X \varphi : \varphi \text{ is simple and } \varphi \leq f \right\} \leq \frac{1}{\alpha} \lim_{n \to \infty} \int f_n.$$  

Because $\alpha \in (0,1)$ was arbitrary, it follows that $\int f \leq \lim_{n \to \infty} \int f_n$ which combined with Eq. (45.1) proves the theorem. \hfill $\blacksquare$

The following simple lemma will be used often in the sequel.

Lemma 45.5 (Chebyshev's Inequality). Suppose that $f \geq 0$ is a measurable function, then for any $\varepsilon > 0$,

$$\mu(f \geq \varepsilon) \leq \frac{1}{\varepsilon} \int_X fd\mu. \quad (45.3)$$

In particular if $\int_X fd\mu < \infty$ then $\mu(f = \infty) = 0$ (i.e. $f < \infty$ a.e.) and the set \{ $f > 0$ \} is $\sigma$-finite.

Proof. Since $1_{\{f \geq \varepsilon\}} \leq 1_{\{f \geq \varepsilon\}} \frac{1}{\varepsilon} f \leq \frac{1}{\varepsilon} f$,

$$\mu(f \geq \varepsilon) = \int_X 1_{\{f \geq \varepsilon\}}d\mu \leq \int_X 1_{\{f \geq \varepsilon\}} \frac{1}{\varepsilon} f d\mu \leq \frac{1}{\varepsilon} \int_X fd\mu.$$  

If $M := \int_X fd\mu < \infty$, then

$$\mu(f = \infty) \leq \mu(f \geq n) \leq \frac{M}{n} \to 0 \text{ as } n \to \infty$$

and \{ $f \geq 1/n$ \} $\uparrow$ \{ $f > 0$ \} with $\mu(f \geq 1/n) \leq nM < \infty$ for all $n$. \hfill $\blacksquare$

Corollary 45.6. If $f_n \in L^+$ is a sequence of functions then

$$\int \sum_{n=1}^{\infty} f_n = \sum_{n=1}^{\infty} \int f_n.$$  

In particular, if $\sum_{n=1}^{\infty} \int f_n < \infty$ then $\sum_{n=1}^{\infty} f_n < \infty$ a.e.

Proof. First off we show that

$$\int (f_1 + f_2) = \int f_1 + \int f_2$$

by choosing non-negative simple function $\varphi_n$ and $\psi_n$ such that $\varphi_n \uparrow f_1$ and $\psi_n \uparrow f_2$. Then $(\varphi_n + \psi_n)$ is simple as well and $(\varphi_n + \psi_n) \uparrow (f_1 + f_2)$ so by the monotone convergence theorem,

$$\int (f_1 + f_2) = \lim_{n \to \infty} \int (\varphi_n + \psi_n) = \lim_{n \to \infty} \left( \int \varphi_n + \int \psi_n \right) = \lim_{n \to \infty} \int \varphi_n + \lim_{n \to \infty} \int \psi_n = \int f_1 + \int f_2.$$  

Now to the general case. Let $g_N := \sum_{n=1}^{N} f_n$ and $g = \sum_{n=1}^{\infty} f_n$, then $g_N \uparrow g$ and so again by monotone convergence theorem and the additivity just proved,
\[
\sum_{n=1}^{\infty} \int f_n := \lim_{N \to \infty} \sum_{n=1}^{N} \int f_n = \lim_{N \to \infty} \int \sum_{n=1}^{N} f_n
\]

Remark 45.7. It is in the proof of this corollary (i.e. the linearity of the integral) that we really make use of the assumption that all of our functions are measurable. In fact the definition \( \int f \, d\mu \) makes sense for all functions \( f : X \to [0, \infty] \) not just measurable functions. Moreover the monotone convergence theorem holds in this generality with no change in the proof. However, in the proof of Corollary 45.6 we use the approximation Theorem 44.3 which relies heavily on the measurability of the functions to be approximated.

The following Lemma and the next Corollary are simple applications of Corollary 45.6.

**Lemma 45.8 (The First Borel – Carntelli Lemma).** Let \((X, \mathcal{M}, \mu)\) be a measure space, \(A_n \in \mathcal{M}\), and set

\[
\{ A_n \text{ i.o.} \} = \{ x \in X : x \in A_n \text{ for infinitely many } n\}'s = \bigcap_{N=1}^{\infty} \bigcup_{n \geq N} A_n.
\]

If \( \sum_{n=1}^{\infty} \mu(A_n) < \infty \) then \( \mu(\{ A_n \text{ i.o.} \}) = 0 \).

**Proof.** (First Proof.) Let us first observe that

\[
\{ A_n \text{ i.o.} \} = \left\{ x \in X : \sum_{n=1}^{\infty} 1_{A_n}(x) = \infty \right\}.
\]

Hence if \( \sum_{n=1}^{\infty} \mu(A_n) < \infty \) then

\[
\infty > \sum_{n=1}^{\infty} \mu(A_n) = \sum_{n=1}^{\infty} \int X 1_{A_n} \, d\mu = \int X \sum_{n=1}^{\infty} 1_{A_n} \, d\mu
\]

implies that \( \sum_{n=1}^{\infty} 1_{A_n}(x) < \infty \) for \( \mu \) - a.e. \( x \). That is to say \( \mu(\{ A_n \text{ i.o.} \}) = 0 \).

(Second Proof.) Of course we may give a strictly measure theoretic proof of this fact:

\[
\mu(\{ A_n \text{ i.o.} \}) = \lim_{N \to \infty} \mu \left( \bigcup_{n \geq N} A_n \right)
\]

\[
\leq \lim_{N \to \infty} \sum_{n \geq N} \mu(A_n)
\]

and the last limit is zero since \( \sum_{n=1}^{\infty} \mu(A_n) < \infty \).

**Corollary 45.9.** Suppose that \((X, \mathcal{M}, \mu)\) is a measure space and \(\{ A_n \}_{n=1}^{\infty} \subset \mathcal{M}\) is a collection of sets such that \( \mu(A_i \cap A_j) = 0 \) for all \( i \neq j \), then

\[
\mu \left( \bigcup_{n=1}^{\infty} A_n \right) = \sum_{n=1}^{\infty} \mu(A_n).
\]

**Proof.** Since

\[
\mu \left( \bigcup_{n=1}^{\infty} A_n \right) = \int_X 1_{\bigcup_{n=1}^{\infty} A_n} \, d\mu
\]

and

\[
\sum_{n=1}^{\infty} \mu(A_n) = \int_X \sum_{n=1}^{\infty} 1_{A_n} \, d\mu
\]

it suffices to show

\[
\sum_{n=1}^{\infty} 1_{A_n} = 1_{\bigcup_{n=1}^{\infty} A_n} \mu \text{ - a.e. (45.4)}
\]

Now \( \sum_{n=1}^{\infty} 1_{A_n} \geq 1_{\bigcup_{n=1}^{\infty} A_n} \) and \( \sum_{n=1}^{\infty} 1_{A_n}(x) \neq 1_{\bigcup_{n=1}^{\infty} A_n}(x) \iff x \in A_i \cap A_j \) for some \( i \neq j \), that is

\[
\left\{ x : \sum_{n=1}^{\infty} 1_{A_n}(x) \neq 1_{\bigcup_{n=1}^{\infty} A_n}(x) \right\} = \bigcup_{i<j} A_i \cap A_j
\]

and the latter set has measure 0 being the countable union of sets of measure zero. This proves Eq. (45.4) and hence the corollary.

**Notation 45.10** If \( m \) is Lebesgue measure on \( \mathbb{B}_\mathbb{R} \), \( f \) is a non-negative Borel measurable function and \( a < b \) with \( a, b \in \mathbb{R} \), we will often write \( \int_a^b f(x) \, dx \) or \( \int_a^b f \, d\mu \) for \( \int_{[a,b] \cap \mathbb{R}} f \, dm \).

**Example 45.11.** Suppose \( -\infty < a < b < \infty \), \( f \in C([a,b], [0, \infty]) \) and \( m \) be Lebesgue measure on \( \mathbb{R} \). Also let \( \pi_k = \{ a = a_k^0 < a_k^1 < \cdots < a_k^{n_k} = b \} \) be a sequence of refining partitions (i.e. \( \pi_k \subset \pi_{k+1} \) for all \( k \)) such that

\[
\text{mesh}(\pi_k) := \max\{ a_j^k - a_{j+1}^k : j = 1, \ldots, n_k \} \to 0 \text{ as } k \to \infty.
\]

For each \( k \), let

\[
\int f_k(x) = \int f(x) 1_{(a_1^k, a_2^k)} + \sum_{l=0}^{n_k-1} \min \{ f(x) : a_l^k \leq x \leq a_{l+1}^k \} 1_{(a_l^k, a_{l+1}^k]}(x)
\]

then \( f_k \uparrow f \) as \( k \to \infty \) and so by the monotone convergence theorem,
Let us also consider the functions $x^p$ if $p \neq 1$.

\[ \int_a^b f \, dm := \int_{[a,b]} f \, dm = \lim_{k \to \infty} \int_a^b f_k \, dm \]

\[ = \lim_{k \to \infty} \sum_{i=0}^{n_k-1} \min \{ f(x) : a_i^k \leq x \leq a_{i+1}^k \} m((a_i^k, a_{i+1}^k)) \]

\[ = \int_a^b f(x) \, dx. \]

The latter integral being the Riemann integral.

We can use the above result to integrate some non-Riemann integrable functions:

**Example 45.12.** For all $\lambda > 0$,

\[ \int_0^\infty e^{-\lambda x} \, dm(x) = \lambda^{-1} \text{ and } \int_0^\infty \frac{1}{1 + x^2} dm(x) = \pi. \]

The proof of these identities are similar. By the monotone convergence theorem, Example [45.11] and the fundamental theorem of calculus for Riemann integrals (or see Theorem [50.14] above or Theorem [45.28] below),

\[ \int_0^\infty e^{-\lambda x} \, dm(x) = \lim_{N \to \infty} \int_0^N e^{-\lambda x} \, dm(x) = \lim_{N \to \infty} \int_0^N e^{-\lambda x} \, dx \]

\[ = \lim_{N \to \infty} \frac{1}{\lambda} e^{-\lambda x} \Big|_0^N = \lambda^{-1} \]

and

\[ \int_0^\infty \frac{1}{1 + x^2} \, dm(x) = \lim_{N \to \infty} \int_0^N \frac{1}{1 + x^2} \, dm(x) = \lim_{N \to \infty} \int_0^N \frac{1}{1 + x^2} \, dx \]

\[ = \lim_{N \to \infty} \left[ \tan^{-1}(N) - \tan^{-1}(-N) \right] = \pi. \]

Let us also consider the functions $x^{-p}$,

\[ \int_{[0,1]} \frac{1}{x^p} \, dm(x) = \lim_{n \to \infty} \int_0^1 \frac{1}{x^p} \, dm(x) \]

\[ = \lim_{n \to \infty} \frac{1}{n} \int_0^1 \frac{1}{x} \, dx = \lim_{n \to \infty} \frac{x^{-p+1}}{1-p} \Big|_1^n \]

\[ = \begin{cases} \frac{1}{1-p} & \text{if } p < 1 \\ \infty & \text{if } p > 1 \end{cases} \]

If $p = 1$ we find

\[ \int_{[0,1]} \frac{1}{x} \, dm(x) = \lim_{n \to \infty} \int_0^1 \frac{1}{x} \, dx = \lim_{n \to \infty} \ln(x) \Big|_1^n = \infty. \]

**Example 45.13.** Let $\{r_n\}_{n=1}^\infty$ be an enumeration of the points in $\mathbb{Q} \cap [0,1]$ and define

\[ f(x) = \sum_{n=1}^\infty \frac{2^{-n}}{\sqrt{|x - r_n|}} \]

with the convention that

\[ \frac{1}{\sqrt{|x - r_n|}} = 5 \text{ if } x = r_n. \]

Since, By Theorem [45.28],

\[ \int_0^1 \frac{1}{\sqrt{|x - r_n|}} \, dx = \int_{r_n}^1 \frac{1}{\sqrt{x - r_n}} \, dx + \int_0^{r_n} \frac{1}{\sqrt{r_n - x}} \, dx \]

\[ = 2\sqrt{x-r_n} - 2\sqrt{r_n-x} \]

\[ = 2(\sqrt{1-r_n} - \sqrt{r_n}) \leq 4, \]

we find

\[ \int_{[0,1]} f(x) \, dm(x) = \sum_{n=1}^\infty 2^{-n} \int_{[0,1]} \frac{1}{\sqrt{|x - r_n|}} \, dx \leq \sum_{n=1}^\infty 2^{-n} 4 = 4 < \infty. \]

In particular, $m(f = \infty) = 0$, i.e. that $f < \infty$ for almost every $x \in [0,1]$ and this implies that

\[ \sum_{n=1}^\infty 2^{-n} \frac{1}{\sqrt{|x - r_n|}} < \infty \text{ for a.e. } x \in [0,1]. \]

This result is somewhat surprising since the singularities of the summands form a dense subset of $[0,1]$.

**Proposition 45.14.** Suppose that $f \geq 0$ is a measurable function. Then $\int_X f \, d\mu = 0$ iff $f = 0$ a.e. Also if $f, g \geq 0$ are measurable functions such that $f \leq g$ a.e. then $\int f \, d\mu \leq \int g \, d\mu$. In particular if $f = g$ a.e. then $\int f \, d\mu = \int g \, d\mu$.

**Proof.** If $f = 0$ a.e. and $\varphi \leq f$ is a simple function then $\varphi = 0$ a.e. This implies that $\mu(\varphi^{-1}(\{y\})) = 0$ for all $y > 0$ and hence $\int_X \varphi \, d\mu = 0$ and therefore $\int_X f \, d\mu = 0$. Conversely, if $\int f \, d\mu = 0$, then by [Lemma 45.5],

\[ \mu(f \geq 1/n) \leq n \int f \, d\mu = 0 \text{ for all } n. \]

Therefore, $\mu(f > 0) \leq \sum_{n=1}^\infty \mu(f \geq 1/n) = 0$, i.e. $f = 0$ a.e. For the second assertion let $E$ be the exceptional set where $f > g$, i.e. $E := \{ x \in X : f(x) > g(x) \}$.
\( g(x) \). By assumption \( E \) is a null set and \( 1_{E^c} f \leq 1_{E^c} g \) everywhere. Because 
\[ g = 1_{E^c} g + 1_E g \text{ and } 1_E g = 0 \text{ a.e.,} \]
\[ \int g \, d\mu = \int 1_{E^c} g \, d\mu + \int 1_E g \, d\mu = \int 1_{E^c} g \, d\mu \]
and similarly \( \int f \, d\mu = \int 1_{E^c} f \, d\mu \). Since \( 1_{E^c} f \leq 1_{E^c} g \) everywhere,
\[ \int f \, d\mu = \int 1_{E^c} f \, d\mu \leq \int 1_{E^c} g \, d\mu = \int g \, d\mu. \]

**Corollary 45.15.** Suppose that \( \{ f_n \} \) is a sequence of non-negative measurable functions and \( f \) is a measurable function such that \( f_n \uparrow f \) off a null set, then
\[ \int f_n \uparrow \int f \text{ as } n \to \infty. \]

**Proof.** Let \( E \subseteq X \) be a null set such that \( f_n 1_{E^c} \uparrow f 1_{E^c} \) as \( n \to \infty \). Then by the monotone convergence theorem and Proposition 45.14,
\[ \int f_n = \int f_n 1_{E^c} \uparrow \int f 1_{E^c} = \int f \text{ as } n \to \infty. \]

**Lemma 45.16 (Fatou’s Lemma).** If \( f_n : X \to [0, \infty] \) is a sequence of measurable functions then
\[ \liminf_{n \to \infty} f_n \leq \liminf_{n \to \infty} \int f_n \]

**Proof.** Define \( g_k := \inf_{n \geq k} f_n \) so that \( g_k \uparrow \liminf_{n \to \infty} f_n \) as \( k \to \infty \). Since \( g_k \leq f_n \) for all \( k \leq n \),
\[ \int g_k \leq \int f_n \text{ for all } n \geq k \]
and therefore
\[ \int g_k \leq \liminf_{n \to \infty} \int f_n \text{ for all } k. \]
We may now use the monotone convergence theorem to let \( k \to \infty \) to find
\[ \liminf_{n \to \infty} f_n = \lim_{k \to \infty} \liminf_{n \to \infty} g_k \leq \liminf_{n \to \infty} \int f_n. \]

**45.2 Integrals of Complex Valued Functions**

**Definition 45.17.** A measurable function \( f : X \to \mathbb{R} \) is **integrable** if \( f_+ := f 1_{\{ f \geq 0 \}} \) and \( f_- = -f 1_{\{ f \leq 0 \}} \) are integrable. We write \( L^1(\mu; \mathbb{R}) \) for the space of real valued integrable functions. For \( f \in L^1(\mu; \mathbb{R}) \), let
\[ \int f \, d\mu = \int f_+ \, d\mu - \int f_- \, d\mu. \]

**Convention:** If \( f, g : X \to \mathbb{R} \) are two measurable functions, let \( f + g \) denote the collection of measurable functions \( h : X \to \mathbb{R} \) such that \( h(x) = f(x) + g(x) \) whenever \( f(x) + g(x) \) is well defined, i.e. is not of the form \( -\infty - \infty \) or \( \infty - \infty \). We use a similar convention for \( f - g \). Notice that if \( f, g \in L^1(\mu; \mathbb{R}) \) and \( h_1, h_2 \in f + g \), then \( h_1 = h_2 \) a.e. because \( |f| < \infty \) and \( |g| < \infty \) a.e.

**Notation 45.18 (Abuse of notation).** We will sometimes denote the integral \( \int_X f \, d\mu \) by \( \mu(f) \). With this notation we have \( \mu(A) = \mu(1_A) \) for all \( A \in \mathcal{M} \).

**Remark 45.19.** Since
\[ f_\pm \leq |f| \leq f_+ + f_- \]
a measurable function \( f \) is integrable iff \( \int |f| \, d\mu < \infty \). Hence
\[ L^1(\mu; \mathbb{R}) := \left\{ f : X \to \mathbb{R} : f \text{ is measurable and } \int_X |f| \, d\mu < \infty \right\}. \]
If \( f, g \in L^1(\mu; \mathbb{R}) \) and \( f = g \) a.e. then \( f_\pm = g_\pm \) a.e. and so it follows from Proposition 45.14 that \( \int f \, d\mu = \int g \, d\mu \). In particular if \( f, g \in L^1(\mu; \mathbb{R}) \) we may define
\[ \int_X (f + g) \, d\mu = \int_X h \, d\mu \]
where \( h \) is any element of \( f + g \).

**Proposition 45.20.** The map
\[ f \in L^1(\mu; \mathbb{R}) \to \int_X f \, d\mu \in \mathbb{R} \]
is linear and has the monotonicity property: \( \int f \, d\mu \leq \int g \, d\mu \) for all \( f, g \in L^1(\mu; \mathbb{R}) \) such that \( f \leq g \) a.e.

**Proof.** Let \( f, g \in L^1(\mu; \mathbb{R}) \) and \( a, b \in \mathbb{R} \). By modifying \( f \) and \( g \) on a null set, we may assume that \( f, g \) are real valued functions. We have \( af + bg \in L^1(\mu; \mathbb{R}) \) because
\[ |af + bg| \leq |a| |f| + |b| |g| \in L^1(\mu; \mathbb{R}) \]
The monotonicity property is also a consequence of the linearity of the integral, so that
\[ f = a \int f \quad \text{and hence} \quad h = a \int h. \]

A similar calculation works for \( a > 0 \) and the case \( a = 0 \) is trivial so we have shown that
\[ \int a f = a \int f. \]

Now set \( h = f + g. \) Since \( h = h_+ - h_- \),
\[ h_+ - h_- = f_+ - f_- + g_+ - g_- \]
or
\[ h_+ + f_- + g_- = h_- + f_+ + g_+. \]

Therefore,
\[ \int h_+ + \int f_- + \int g_- = \int h_- + \int f_+ + \int g_+ \]
and hence
\[ \int h = \int h_+ - \int h_- = \int f_+ + \int g_+ - \int f_- - \int g_- = \int f + \int g. \]

Finally if \( f_+ - f_- = f \leq g = g_+ - g_- \) then \( f_+ + g_- \leq g_+ + f_- \) which implies that
\[ \int f_+ + \int g_- \leq \int g_+ + \int f_- \]
or equivalently that
\[ \int f = \int f_+ - \int f_- \leq \int g_+ - \int g_- = \int g. \]

The monotonicity property is also a consequence of the linearity of the integral, the fact that \( f \leq g \) a.e. implies \( 0 \leq g - f \) a.e. and Proposition 45.14.

**Definition 45.21.** A measurable function \( f : X \rightarrow \mathbb{C} \) is **integrable** if \( \int_X |f| \ d\mu < \infty \). Analogously to the real case, let
\[ L^1(\mu; \mathbb{C}) := \left\{ f : X \rightarrow \mathbb{C} : f \text{ is measurable and } \int_X |f| \ d\mu < \infty \right\} \]
denote the complex valued integrable functions. Because, max \( |\text{Re } f|, |\text{Im } f| \) \leq |f| \leq \sqrt{2} \max (|\text{Re } f|, |\text{Im } f|), \int |f| \ d\mu < \infty \iff

\[ \int |\text{Re } f| d\mu + \int |\text{Im } f| d\mu < \infty. \]

For \( f \in L^1(\mu; \mathbb{C}) \) define
\[ \int_X f d\mu = \int \text{Re } f d\mu + i \int \text{Im } f d\mu. \]

It is routine to show the integral is still linear on \( L^1(\mu; \mathbb{C}) \) (prove!). In the remainder of this section, let \( L^1(\mu) \) be either \( L^1(\mu; \mathbb{C}) \) or \( L^1(\mu; \mathbb{R}) \). If \( A \in \mathcal{M} \) and \( f \in L^1(\mu; \mathbb{C}) \) or \( f : X \rightarrow [0, \infty] \) is a measurable function, let
\[ \int_A f d\mu := \int_X 1_A f d\mu. \]

**Proposition 45.22.** Suppose that \( f \in L^1(\mu; \mathbb{C}) \), then
\[ \int_X |f| d\mu \leq \int_X |f| d\mu. \quad (45.5) \]

**Proof.** Start by writing \( \int_X f d\mu = e^{i\theta} \) with \( R \geq 0 \). We may assume that \( R = |\int_X f d\mu| > 0 \) since otherwise there is nothing to prove. Since
\[ R = e^{-i\theta} \int_X f d\mu = \int_X e^{-i\theta} f d\mu = \int_X \text{Re } (e^{-i\theta} f) d\mu + i \int_X \text{Im } (e^{-i\theta} f) d\mu, \]
it must be that \( \int_X \text{Im } [e^{-i\theta} f] d\mu = 0. \) Using the monotonicity in Proposition 45.14
\[ \left| \int_X f d\mu \right| = \int_X \text{Re } (e^{-i\theta} f) d\mu \leq \int_X \left| \text{Re } (e^{-i\theta} f) \right| d\mu \leq \int_X |f| d\mu. \]

**Proposition 45.23.** Let \( f, g \in L^1(\mu) \), then

1. The set \( \{ f \neq 0 \} \) is \( \sigma \)-finite, in fact \( \{ |f| \geq \frac{1}{n} \} \uparrow \{ f \neq 0 \} \) and \( \mu(\{ |f| \geq \frac{1}{n} \}) < \infty \) for all \( n \).
2. The following are equivalent
   a) \( \int_E f = \int_E g \) for all \( E \in \mathcal{M} \)
   b) \( \int_X |f - g| = 0 \)
   c) \( f = g \) a.e.
Proof. 1. By Chebyshev’s inequality, Lemma 45.5
\[ \mu(|f| \geq \frac{1}{n}) \leq n \int_X |f| \, d\mu < \infty \]
for all \( n \). 2. (a) \( \Rightarrow \) (c) Notice that
\[ \int_E f = \int_E g \Leftrightarrow \int_E (f - g) = 0 \]
for all \( E \in \mathcal{M} \). Taking \( E = \{ \text{Re}(f - g) > 0 \} \) and using \( 1_E \text{Re}(f - g) \geq 0 \), we learn that
\[ 0 = \text{Re} \int_E (f - g) \, d\mu = \int 1_E \text{Re}(f - g) \Rightarrow 1_E \text{Re}(f - g) = 0 \text{ a.e.} \]
This implies that \( 1_E = 0 \text{ a.e.} \) which happens iff
\[ \mu(\{ \text{Re}(f - g) > 0 \}) = \mu(E) = 0. \]
Similar \( \mu(\text{Re}(f - g) < 0) = 0 \) so that \( \text{Re}(f - g) = 0 \text{ a.e.} \). Similarly, \( \text{Im}(f - g) = 0 \text{ a.e.} \) and hence \( f - g = 0 \) a.e., i.e. \( f = g \) a.e. (c) \( \Rightarrow \) (b) is clear and so is (b) \( \Rightarrow \) (a) since
\[ \left| \int_E f - \int_E g \right| \leq \int |f - g| = 0. \]

Definition 45.24. Let \((X, \mathcal{M}, \mu)\) be a measure space and \( L^1(\mu) = L^1(X, \mathcal{M}, \mu) \)
denote the set of \( L^1(\mu) \) functions modulo the equivalence relation; \( f \sim g \) iff \( f = g \) a.e. We make this into a normed space using the norm
\[ \|f - g\|_{L^1} = \int |f - g| \, d\mu \]
and into a metric space using \( \rho_1(f, g) = \|f - g\|_{L^1} \).

Warning: in the future we will often not make much of a distinction between \( L^1(\mu) \) and \( L^1(\mu) \). On occasion this can be dangerous and this danger will be pointed out when necessary.

Remark 45.25. More generally we may define \( L^p(\mu) = L^p(X, \mathcal{M}, \mu) \) for \( p \in [1, \infty) \) as the set of measurable functions \( f \) such that
\[ \int_X |f|^p \, d\mu < \infty \]
modulo the equivalence relation; \( f \sim g \) iff \( f = g \) a.e. We will see in Chapter 18 that
\[ \|f\|_{L^p} = \left( \int |f|^p \, d\mu \right)^{1/p} \]
is a norm and \( (L^p(\mu), \|\cdot\|_{L^p}) \) is a Banach space in this norm.

Theorem 45.26 (Dominated Convergence Theorem). Suppose \( f_n, g_n, g \in L^1(\mu) \), \( f_n \rightarrow f \) a.e., \( |f_n| \leq g_n \in L^1(\mu) \), \( g_n \rightarrow g \) a.e. and \( \int_X g_n d\mu \rightarrow \int_X g d\mu \). Then \( f \in L^1(\mu) \) and
\[ \int_X f d\mu = \lim_{n \rightarrow \infty} \int_X f_n d\mu. \]
(In most typical applications of this theorem \( g_n = g \in L^1(\mu) \) for all \( n \).)

Proof. Notice that \( |f| = \lim_{n \rightarrow \infty} |f_n| \leq \lim_{n \rightarrow \infty} |g_n| \leq g \) a.e. so that \( f \in L^1(\mu) \). By considering the real and imaginary parts of \( f \) separately, it suffices to prove the theorem in the case where \( f \) is real. By Fatou’s Lemma,
\[ \int_X (g \pm f) d\mu = \int_X \liminf_{n \rightarrow \infty} (g_n \pm f_n) d\mu \leq \liminf_{n \rightarrow \infty} \int_X (g_n \pm f_n) d\mu = \lim_{n \rightarrow \infty} \int_X g_n d\mu + \liminf_{n \rightarrow \infty} \left( \pm \int_X f_n d\mu \right) = \int_X g d\mu + \liminf_{n \rightarrow \infty} \left( \pm \int_X f_n d\mu \right) \]
Since \( \liminf_{n \rightarrow \infty} (-a_n) = -\limsup_{n \rightarrow \infty} a_n \), we have shown,
\[ \int_X g d\mu \pm \int_X f d\mu \leq \int_X g d\mu + \left\{ \liminf_{n \rightarrow \infty} \int_X f_n d\mu \right\} - \limsup_{n \rightarrow \infty} \int_X f_n d\mu \]
and therefore
\[ \limsup_{n \rightarrow \infty} \int_X f_n d\mu \leq \int_X f d\mu \leq \liminf_{n \rightarrow \infty} \int_X f_n d\mu. \]
This shows that \( \lim_{n \rightarrow \infty} \int_X f_n d\mu \) exists and is equal to \( \int_X f d\mu \).

Exercise 45.1. Give another proof of Proposition 45.22 by first proving Eq. 45.5 with \( f \) being a cylinder function in which case the triangle inequality for complex numbers will do the trick. Then use the approximation Theorem 44.34 along with the dominated convergence Theorem 45.26 to handle the general case.
Corollary 45.27. Let \( \{f_n\}_{n=1}^{\infty} \subset L^1(\mu) \) be a sequence such that \( \sum_{n=1}^{\infty} \|f_n\|_{L^1(\mu)} < \infty \), then \( \sum_{n=1}^{\infty} f_n \) is convergent a.e. and

\[
\int_X \left( \sum_{n=1}^{\infty} f_n \right) \, d\mu = \sum_{n=1}^{\infty} \int_X f_n \, d\mu.
\]

**Proof.** The condition \( \sum_{n=1}^{\infty} \|f_n\|_{L^1(\mu)} < \infty \) is equivalent to \( \sum_{n=1}^{\infty} |f_n| \in L^1(\mu) \). Hence \( \sum_{n=1}^{\infty} f_n \) is almost everywhere convergent and if \( S_N := \sum_{n=1}^{N} f_n \), then

\[
|S_N| \leq \sum_{n=1}^{N} |f_n| \leq \sum_{n=1}^{\infty} |f_n| \in L^1(\mu).
\]

So by the dominated convergence theorem,

\[
\int_X \left( \sum_{n=1}^{\infty} f_n \right) \, d\mu = \int_X \lim_{N \to \infty} S_N \, d\mu = \lim_{N \to \infty} \int_X S_N \, d\mu
\]

\[
= \lim_{N \to \infty} \sum_{n=1}^{N} \int_X f_n \, d\mu = \sum_{n=1}^{\infty} \int_X f_n \, d\mu.
\]

Theorem 45.28 (The Fundamental Theorem of Calculus). Suppose \( -\infty < a < b < \infty \), \( f \in C([a, b], \mathbb{R}) \cap L^1((a, b), m) \) and \( F(x) := \int_a^x f(y) \, dm(y) \). Then

1. \( F \in C([a, b], \mathbb{R}) \cap C^1((a, b), \mathbb{R}) \).
2. \( F'(x) = f(x) \) for all \( x \in (a, b) \).
3. If \( G \in C([a, b], \mathbb{R}) \cap C^1((a, b), \mathbb{R}) \) is an anti-derivative of \( f \) on \( (a, b) \) (i.e. \( f = G'|_{(a,b)} \) then

\[
\int_a^b f(x) \, dm(x) = F(b) - F(a).
\]

**Proof.** Since \( F(x) := \int_0^x h(y) f(y) \, dm(y) \), \( \lim_{x \to -\infty} F(x) = 1 \) for \( m \)-a.e. \( y \) and \( \int_{(a, b)} f(y) \, dm(y) \) is an \( L^1 \) function, it follows from the dominated convergence theorem that \( F \) is continuous on \( [a, b] \). Simple manipulations show,

\[
\frac{F(x+h) - F(x) - f(x)h}{h} = \frac{1}{|h|} \begin{cases} \int_x^{x+h} [f(y) - f(x)] \, dm(y) & \text{if } h > 0 \\ \int_x^{x+h} [f(y) - f(x)] \, dm(y) & \text{if } h < 0 \end{cases}
\]

\[
\leq \frac{1}{|h|} \begin{cases} \int_x^{x+h} |f(y) - f(x)| \, dm(y) & \text{if } h > 0 \\ \int_x^{x+h} |f(y) - f(x)| \, dm(y) & \text{if } h < 0 \end{cases}
\]

\[\leq \sup \{ |f(y) - f(x)| : y \in [x-h, x+h] \}
\]

and the latter expression, by the continuity of \( f \), goes to zero as \( h \to 0 \). This shows \( F' = f \) on \( (a, b) \). For the converse direction, we have by assumption that \( G'(x) = F'(x) \) for \( x \in (a, b) \). Therefore by the mean value theorem, \( F - G = C \) for some constant \( C \). Hence

\[
\int_a^b f(x) \, dm(x) = F(b) - F(a) = (G(b) + C) - (G(a) + C) = G(b) - G(a).
\]

Example 45.29. The following limit holds,

\[
\lim_{n \to \infty} \int_0^n (1 - \frac{x}{n})^n \, dm(x) = 1.
\]

Let \( f_n(x) = (1 - \frac{x}{n})^n 1_{[0,n]}(x) \) and notice that \( \lim_{n \to \infty} f_n(x) = e^{-x} \). We will now show

\[
0 \leq f_n(x) \leq e^{-x}
\]

for all \( x \geq 0 \). It suffices to consider \( x \in [0, n] \). Let \( g(x) = e^x f_n(x) \), then for \( x \in (0, n) \),

\[
\frac{d}{dx} \ln g(x) = 1 + n \frac{1}{(1 - \frac{x}{n})(-\frac{1}{n})} = 1 - \frac{1}{1 - \frac{x}{n}} \leq 0
\]

which shows that \( \ln g(x) \) and hence \( g(x) \) is decreasing on \([0, n]\). Therefore \( g(x) \leq g(0) = 1 \), i.e.

\[
0 \leq f_n(x) \leq e^{-x}.
\]

From Example 45.12 we know

\[
\int_0^\infty e^{-x} \, dm(x) = 1 < \infty,
\]

so that \( e^{-x} \) is an integrable function on \([0, \infty)\). Hence by the dominated convergence theorem,

\[
\lim_{n \to \infty} \int_0^n (1 - \frac{x}{n})^n \, dm(x) = \lim_{n \to \infty} \int_0^\infty f_n(x) \, dm(x)
\]

\[
= \int_0^\infty \lim_{n \to \infty} f_n(x) \, dm(x) = \int_0^\infty e^{-x} \, dm(x) = 1.
\]

Example 45.30 (Integration of Power Series). Suppose \( R > 0 \) and \( \{a_n\}_{n=0}^{\infty} \) is a sequence of complex numbers such that \( \sum_{n=0}^{\infty} |a_n| r^n < \infty \) for all \( r \in (0, R) \). Then
Suppose that
\[ \int_{\alpha}^{\beta} \left( \sum_{n=0}^{\infty} a_n x^n \right) \, dm(x) = \sum_{n=0}^{\infty} a_n \int_{\alpha}^{\beta} x^n \, dm(x) = \sum_{n=0}^{\infty} a_n \frac{\beta^{n+1} - \alpha^{n+1}}{n+1} \]

for all \(-R < \alpha < \beta < R\). Indeed this follows from Corollary 45.27 since
\[
\sum_{n=0}^{\infty} \int_{\alpha}^{\beta} |a_n| |x|^n \, dm(x) \leq \sum_{n=0}^{\infty} \left( \int_{\alpha}^{\beta} |a_n| |x|^n \, dm(x) + \int_{0}^{|\beta|} |a_n| |x|^n \, dm(x) \right) \\
\leq \sum_{n=0}^{\infty} |a_n| \frac{|\beta|^{n+1} + |\alpha|^{n+1}}{n+1} \leq 2r \sum_{n=0}^{\infty} |a_n| r^n < \infty
\]

where \(r = \max(|\beta|, |\alpha|)\).

**Corollary 45.31 (Differentiation Under the Integral).** Suppose that \(J \subset \mathbb{R}\) is an open interval and \(f : J \times X \to \mathbb{C}\) is a function such that

1. \(x \to f(t, x)\) is measurable for each \(t \in J\).
2. \(f(t_0, \cdot) \in L^1(\mu)\) for some \(t_0 \in J\).
3. \(\frac{\partial f}{\partial t}(t, x)\) exists for all \((t, x)\).
4. There is a function \(g \in L^1(\mu)\) such that \(|\frac{\partial f}{\partial t}(t, \cdot)| \leq g(t)\) for each \(t \in J\).

Then \(f(t, \cdot) \in L^1(\mu)\) for all \(t \in J\) (i.e. \(\int_X |f(t, x)| \, d\mu(x) < \infty\)), \(t \to \int_X f(t, x) \, d\mu(x)\) is a differentiable function on \(J\) and
\[
\frac{d}{dt} \int_X f(t, x) \, d\mu(x) = \int_X \frac{\partial f}{\partial t}(t, x) \, d\mu(x).
\]

**Proof.** (The proof is essentially the same as for sums.) By considering the real and imaginary parts of \(f\) separately, we may assume that \(f\) is real. Also notice that
\[
\frac{\partial f}{\partial t}(t, x) = \lim_{n \to \infty} n(f(t+n^{-1}, x) - f(t, x))
\]
and therefore, for \(x \to \frac{\partial f}{\partial t}(t, x)\) is a sequential limit of measurable functions and hence is measurable for all \(t \in J\). By the mean value theorem,
\[
|f(t, x) - f(t_0, x)| \leq g(x) |t - t_0| \quad \text{for all } t \in J
\]
and hence
\[
|f(t, x)| \leq |f(t, x) - f(t_0, x)| + |f(t_0, x)| \leq g(x) |t - t_0| + |f(t_0, x)|.
\]
This shows \(f(t, \cdot) \in L^1(\mu)\) for all \(t \in J\). Let \(G(t) := \int_X f(t, x) \, d\mu(x)\), then
\[
\frac{G(t) - G(t_0)}{t - t_0} = \int_X \frac{f(t, x) - f(t_0, x)}{t - t_0} \, d\mu(x).
\]
By assumption,
\[
\lim_{t \to t_0} \frac{f(t, x) - f(t_0, x)}{t - t_0} = \frac{\partial f}{\partial t}(t, x) \quad \text{for all } x \in X
\]
and by Eq. (45.9),
\[
\left| \frac{f(t, x) - f(t_0, x)}{t - t_0} \right| \leq g(x) \quad \text{for all } t \in J \text{ and } x \in X.
\]
Therefore, we may apply the dominated convergence theorem to conclude
\[
\lim_{n \to \infty} \frac{G(t_n) - G(t_0)}{t_n - t_0} = \lim_{n \to \infty} \int_X \frac{f(t_n, x) - f(t_0, x)}{t_n - t_0} \, d\mu(x)
\]
\[
= \int_X \lim_{n \to \infty} \frac{f(t_n, x) - f(t_0, x)}{t_n - t_0} \, d\mu(x)
\]
\[
= \int_X \frac{\partial f}{\partial t}(t_0, x) \, d\mu(x)
\]
for all sequences \(t_n \in J \setminus \{t_0\}\) such that \(t_n \to t_0\). Therefore, \(G(t) = \lim_{t \to t_0} \frac{G(t) - G(t_0)}{t - t_0}\) exists and
\[
\frac{d}{dt} G(t) = \int_X \frac{\partial f}{\partial t}(t_0, x) \, d\mu(x).
\]

**Example 45.32.** Recall from Example 45.12 that
\[
\lambda^{-1} = \int_{[0, \infty)} e^{-\lambda x} \, dm(x) \quad \text{for all } \lambda > 0.
\]
Let \(\varepsilon > 0\). For \(\lambda \geq 2\varepsilon > 0\) and \(n \in \mathbb{N}\) there exists \(C_n(\varepsilon) < \infty\) such that
\[
0 \leq \left( -\frac{d}{d\lambda} \right)^n e^{-\lambda x} = x^n e^{-\lambda x} \leq C(\varepsilon) e^{-\varepsilon x}.
\]
Using this fact, Corollary 45.31 and induction gives
\[
n! \lambda^{-n-1} = \left( -\frac{d}{d\lambda} \right)^n \lambda^{-1} = \int_{[0, \infty)} \left( -\frac{d}{d\lambda} \right)^n e^{-\lambda x} \, dm(x)
\]
\[
= \int_{[0, \infty)} x^n e^{-\lambda x} \, dm(x).
\]
That is \(n! = \lambda^n \int_{[0, \infty)} x^n e^{-\lambda x} \, dm(x)\). Recall that
\[ \Gamma(t) := \int_{[0,\infty)} x^{t-1} e^{-x} \, dx \text{ for } t > 0. \]

(The reader should check that \( \Gamma(t) < \infty \) for all \( t > 0 \).) We have just shown that \( \Gamma(n+1) = n! \) for all \( n \in \mathbb{N} \).

**Remark 45.33.** Corollary \ref{corollary:measurability} may be generalized by allowing the hypothesis to hold for \( x \in X \setminus E \) where \( E \in \mathcal{M} \) is a fixed null set, i.e. \( E \) must be independent of \( t \). Consider what happens if we formally apply Corollary \ref{corollary:measurability} to \( g(t) := \int_0^\infty 1_{x \leq t} \, d\mu(x) \),

\[ \dot{g}(t) = \frac{d}{dt} \int_0^\infty 1_{x \leq t} \, d\mu(x) = \int_0^\infty \frac{\partial}{\partial t} 1_{x \leq t} \, d\mu(x). \]

The last integral is zero since \( \frac{d}{dt} 1_{x \leq t} = 0 \) unless \( t = x \) in which case it is not defined. On the other hand \( g(t) = t \) so that \( \dot{g}(t) = 1 \). (The reader should decide which hypothesis of Corollary \ref{corollary:measurability} has been violated in this example.)

### 45.3 Measurability on Complete Measure Spaces

In this subsection we will discuss a couple of measurability results concerning completions of measure spaces.

**Proposition 45.34.** Suppose that \((X, \mathcal{M}, \mu)\) is a complete measure space and \( f : X \to \mathbb{R} \) is measurable.

1. If \( g : X \to \mathbb{R} \) is a function such that \( f(x) = g(x) \) for \( \mu \)-a.e. \( x \), then \( g \) is measurable.

2. If \( f_n : X \to \mathbb{R} \) are measurable and \( f : X \to \mathbb{R} \) is a function such that

\[ \lim_{n \to \infty} f_n(x) = f(x) \text{ for } \mu \text{-a.e., then } f \text{ is measurable as well.} \]

**Proof.** Let \( E = \{ x : f(x) \neq g(x) \} \) which is assumed to be in \( \mathcal{M} \) and \( \mu(E) = 0 \). Then \( g = 1_{E^c} f + 1_E g \) since \( f = g \) on \( E^{c} \). Now \( 1_E \) is measurable so \( g \) will be measurable if we show \( 1_E g\,d\mu \) is measurable. For this consider,

\[ (1_E g)^{-1}(A) = \begin{cases} E^{c} \cup (1_E g)^{-1}(A \setminus \{0\}) & \text{if } 0 \in A \\ (1_E g)^{-1}(A) & \text{if } 0 \not\in A \end{cases} \quad (45.7) \]

Since \((1_E g)^{-1}(B) \subset E \) if \( 0 \not\in B \) and \( \mu(E) = 0 \), it follow by completeness of \( \mathcal{M} \) that \((1_E g)^{-1}(B) \in \mathcal{M} \) if \( 0 \not\in B \). Therefore Eq. \eqref{eq:measurability} shows that \( 1_E g \) is measurable. 2. Let \( E = \{ x : \lim_{n \to \infty} f_n(x) \neq f(x) \} \) by assumption \( E \in \mathcal{M} \) and

\[ \mu(E) = 0. \]

Since \( g : X \to [0,\infty] \) is measurable. Because \( \dot{g} = g \) on \( E^{c} \) and \( \mu(E) = 0 \), \( \dot{g} = (\mu - a.e.) \) so by part 1, \( \dot{g} \) is also measurable.

The above results are in general false if \((X, \mathcal{M}, \mu)\) is not complete. For example, let \( X = \{0,1,2\} \), \( \mathcal{M} = \{\{0\}, \{1,2\}, X, \varnothing\} \) and \( \mu = \delta_0 \). Take \( g(0) = 0 \), \( g(1) = 1 \), \( g(2) = 2 \), then \( g \) is \( \mu \)-a.e. yet \( g \) is not measurable.

**Lemma 45.35.** Suppose that \((X, \mathcal{M}, \mu)\) is a measure space and \( \bar{\mathcal{M}} \) is the completion of \( \mathcal{M} \) relative to \( \mu \) and \( \bar{\mu} \) is the extension of \( \mu \) to \( \bar{\mathcal{M}} \). Then a function \( f : X \to \mathbb{R} \) is \((\bar{\mathcal{M}}, \bar{\mathcal{B}} = B_\mathbb{R})\) measurable iff there exists a function \( g : X \to R \) such that \((\mathcal{M}, \mathcal{B}) - \text{measurable}\) is \( \mathcal{M} \) and \( \bar{\mu}(E) = 0 \), i.e. \( f(x) = g(x) \) for \( \bar{\mu} - \text{a.e.} \). Moreover for such a pair \( f \) and \( g \), \( f \in L^1(\bar{\mu}) \) iff \( g \in L^1(\mu) \) and in which case

\[ \int_X f \, d\bar{\mu} = \int_X g \, d\mu. \]

**Proof.** Suppose first that such a function \( g \) exists so that \( \bar{\mu}(E) = 0 \). Since \( g \) is also \((\mathcal{M}, \mathcal{B})\) measurable, we see from Proposition \ref{proposition:measurability} that \( f \) is \((\mathcal{M}, \mathcal{B})\) measurable. Conversely if \( f \) is \((\mathcal{M}, \mathcal{B})\) measurable, by considering \( f \) we may assume that \( f \geq 0 \). Choose \((\mathcal{M}, \mathcal{B})\) measurable simple function \( \varphi_n \geq 0 \) such that \( \varphi_n \uparrow f \) as \( n \to \infty \). Writing

\[ \varphi_n = \sum a_k 1_{A_k} \]

with \( A_k \in \mathcal{M} \), we may choose \( B_k \in \mathcal{M} \) such that \( B_k \subset A_k \) and \( \bar{\mu}(A_k \setminus B_k) = 0 \). Letting

\[ \varphi_n := \sum a_k 1_{B_k} \]

we have produced a \((\mathcal{M}, \mathcal{B})\) measurable simple function \( \varphi_n \geq 0 \) such that \( E_n := \{ \varphi_n \neq \varphi_n \} \) has zero \( \bar{\mu} \) measure. Since \( \bar{\mu}(\cup_n E_n) \leq \sum_n \bar{\mu}(E_n) = 0 \), there exists \( F \in \mathcal{M} \) such that \( \cup_n E_n \subset F \) and \( \mu(F) = 0 \). It now follows that

\[ 1_F \cdot \varphi_n = 1_F \cdot \varphi_n \uparrow g := 1_F \cdot f \text{ as } n \to \infty. \]

This shows that \( g = 1_F \cdot f \) is \((\mathcal{M}, \mathcal{B})\) measurable and that \( \{ f \neq g \} \subset F \) has \( \bar{\mu} \) measure zero. Since \( f = g, \bar{\mu} - \text{a.e.}, \int_X f \, d\bar{\mu} = \int_X g \, d\mu \) so to prove Eq. \eqref{eq:measurability} it suffices to prove

\[ \int_X g \, d\mu = \int_X g \, d\mu. \quad (45.8) \]

Because \( \bar{\mu} = \mu \) on \( \mathcal{M} \), Eq. \eqref{eq:measurability} is easily verified for non-negative \( \mathcal{M} \) measurable simple functions. Then by the monotone convergence theorem and the approximation Theorem \ref{theorem:approximation} it holds for all \( \mathcal{M} \) measurable functions \( g : X \to [0,\infty] \). The rest of the assertions follow in the standard way by considering \( \Re g \) and \( \Im g \).

---

\[ \text{Page:} \quad 542 \quad \text{job:} \quad \text{newanal} \quad \text{macro:} \quad \text{svmonob.cls} \quad \text{date/time:} \quad 6-Jan-2012/17:01 \]
45.4 Comparison of the Lebesgue and the Riemann Integral

For the rest of this chapter, let $-\infty < a < b < \infty$ and $f : [a, b] \to \mathbb{R}$ be a bounded function. A partition of $[a, b]$ is a finite subset $\pi \subset [a, b]$ containing $(a, b)$. To each partition
\[ \pi = \{a = t_0 < t_1 < \cdots < t_n = b\} \] (45.9)
of $[a, b]$ let
\[ \text{mesh}(\pi) := \max\{|t_j - t_{j-1}| : j = 1, \ldots, n\}, \]
\[ M_j = \sup\{f(x) : t_j \leq x \leq t_{j-1}\}, \quad m_j = \inf\{f(x) : t_j \leq x \leq t_{j-1}\} \]
\[ G_\pi = f(a)1_{\{a\}} + \sum_{j=1}^{n} M_j1_{(t_{j-1}, t_j]}, \quad g_\pi = f(a)1_{\{a\}} + \sum_{j=1}^{n} m_j1_{(t_{j-1}, t_j]} \]
\[ S_\pi = \sum M_j(t_j - t_{j-1}) \quad \text{and} \quad s_\pi = \sum m_j(t_j - t_{j-1}). \]

Notice that
\[ S_\pi f = \int_a^b G_\pi dm \quad \text{and} \quad s_\pi f = \int_a^b g_\pi dm. \]

The upper and lower Riemann integrals are defined respectively by
\[ \int_a^b f(x)dx = \inf_\pi S_\pi f \quad \text{and} \quad \int_a^b f(x)dx = \sup_\pi s_\pi f. \]

Definition 45.36. The function $f$ is Riemann integrable if $\int_a^b f = \int_a^b f \in \mathbb{R}$ and which case the Riemann integral $\int_a^b f$ is defined to be the common value:
\[ \int_a^b f(x)dx = \int_a^b f(x)dx = \int_a^b f(x)dx. \]

The proof of the following Lemma is left to the reader as Exercise [45.20]

Lemma 45.37. If $\pi'$ and $\pi$ are two partitions of $[a, b]$ and $\pi \subset \pi'$ then
\[ G_\pi \geq G_{\pi'} \geq f \geq g_{\pi'} \geq g_\pi \quad \text{and} \quad S_\pi f \geq S_{\pi'} f \geq s_{\pi'} f \geq s_\pi f. \]

There exists an increasing sequence of partitions $\{\pi_k\}_{k=1}^{\infty}$ such that $\text{mesh}(\pi_k) \downarrow 0$ and
\[ S_{\pi_k} f \downarrow \int_a^b f \quad \text{and} \quad s_{\pi_k} f \uparrow \int_a^b f \quad \text{as} \quad k \to \infty. \]

If we let
\[ G := \lim_{k \to \infty} G_{\pi_k} \quad \text{and} \quad g := \lim_{k \to \infty} g_{\pi_k} \]
then by the dominated convergence theorem,
\[ \int_{[a,b]} gdm = \lim_{k \to \infty} \int_{[a,b]} g_{\pi_k} = \lim_{k \to \infty} s_{\pi_k} f = \int_a^b f(x)dx \]
and
\[ \int_{[a,b]} Gdm = \lim_{k \to \infty} \int_{[a,b]} G_{\pi_k} = \lim_{k \to \infty} S_{\pi_k} f = \int_a^b f(x)dx. \]

Notation 45.38. For $x \in [a, b]$, let
\[ H(x) = \limsup_{y \to x} f(y) := \lim \sup_{\varepsilon \downarrow 0} \{f(y) : |y - x| \leq \varepsilon, \; y \in [a, b]\} \quad \text{and} \quad h(x) = \liminf_{y \to x} f(y) := \lim \inf_{\varepsilon \downarrow 0} \{f(y) : |y - x| \leq \varepsilon, \; y \in [a, b]\}. \]

Lemma 45.39. The functions $H, h : [a, b] \to \mathbb{R}$ satisfy:
1. $h(x) \leq f(x) \leq H(x)$ for all $x \in [a, b]$ and $h(x) = H(x)$ iff $f$ is continuous at $x$.
2. If $\{\pi_k\}_{k=1}^{\infty}$ is any increasing sequence of partitions such that $\text{mesh}(\pi_k) \downarrow 0$ and $G$ and $g$ are defined as in Eq. (45.10), then
\[ G(x) = H(x) \geq f(x) \geq h(x) = g(x) \quad \forall \; x \notin \pi := \cup_{k=1}^{\infty} \pi_k. \]

(Note $\pi$ is a countable set.)
3. $H$ and $h$ are Borel measurable.

Proof. Let $G_k := G_{\pi_k} \downarrow G$ and $g_k := g_{\pi_k} \uparrow g$.
1. It is clear that $h(x) \leq f(x) \leq H(x)$ for all $x$ and $H(x) = h(x)$ iff $\lim_{y \to x} f(y)$ exists and is equal to $f(x)$. That is $H(x) = h(x)$ iff $f$ is continuous at $x$.
2. For $x \notin \pi$,
\[ G_k(x) \geq H(x) \geq f(x) \geq h(x) = g_k(x) \forall \; k \]
and letting $k \to \infty$ in this equation implies
\[ G(x) \geq H(x) \geq f(x) \geq h(x) = g(x) \forall \; x \notin \pi. \] (45.14)
Moreover, given $\varepsilon > 0$ and $x \notin \pi$,
\[ \sup\{f(y) : |y - x| \leq \varepsilon, \; y \in [a, b]\} \geq G_k(x) \]
for all $k$ large enough, since eventually $G_k(x) \leq \sup_{|y-x| \leq \varepsilon} f(y)$ for some interval contained in $[x - \varepsilon, x + \varepsilon]$. Again letting $k \to \infty$ implies

$$H(x) = \lim_{y \to x} \sup_{|y-x| \leq \varepsilon} f(y) \geq G(x)$$

for all $x \notin \bar{\pi}$. Combining this equation with Eq. (45.14) then implies $H(x) = G(x)$ if $x \notin \bar{\pi}$. A similar argument shows that $h(x) = g(x)$ if $x \notin \bar{\pi}$ and hence Eq. (45.13) is proved.

3. The functions $G$ and $g$ are limits of measurable functions and hence measurable. Since $H = G$ and $h = g$ except possibly on the countable set $\bar{\pi}$, both $H$ and $h$ are also Borel measurable. (You justify this statement.)

\[\text{Theorem 45.40.} \quad \text{Let } f : [a,b] \to \mathbb{R} \text{ be a bounded function. Then}
\]

$$\int_a^b f = \int_{[a,b]} H \, dm \quad \text{and} \quad \int_a^b f = \int_{[a,b]} h \, dm \quad (45.15)$$

and the following statements are equivalent:

1. $H(x) = h(x)$ for $m$ - a.e. $x$.
2. the set

$$E := \{ x \in [a,b] : f \text{ is discontinuous at } x \}$$

is an $\bar{\pi}$ -null set.
3. $f$ is Riemann integrable.

If $f$ is Riemann integrable then $f$ is Lebesgue measurable, i.e. $f$ is $\mathcal{L}/\mathcal{B}$ - measurable where $\mathcal{L}$ is the Lebesgue $\sigma$ - algebra and $\mathcal{B}$ is the Borel $\sigma$ - algebra on $[a,b]$. Moreover if we let $\bar{\pi}$ denote the completion of $\pi$, then

$$\int_{[a,b]} H \, dm = \int_a^b f(x) \, dx = \int_{[a,b]} f \, d\bar{\pi} = \int_{[a,b]} h \, dm. \quad (45.16)$$

\[\text{Proof.} \quad \text{Let } \{ \pi_k \}_{k=1}^\infty \text{ be an increasing sequence of partitions of } [a,b] \text{ as described in Lemma 45.37} \text{ and let } G \text{ and } g \text{ be defined as in Lemma 45.38. Since}
\]

$m(\pi) = 0, H = G$ a.e., Eq. (45.15) is a consequence of Eqs. (45.11) and (45.12). From Eq. (45.15), $f$ is Riemann integrable iff

$$\int_{[a,b]} H \, dm = \int_{[a,b]} h \, dm$$

and because $h \leq f \leq H$ this happens iff $h(x) = H(x)$ for $m$ - a.e. $x$. Since $E = \{ x : H(x) \neq h(x) \}$, this last condition is equivalent to $E$ being a $m$ - null set. In light of these results and Eq. (45.13), the remaining assertions including Eq. (45.16) are now consequences of Lemma 45.35.\]

\[\text{Notation 45.41} \quad \text{In view of this theorem we will often write } \int_a^b f(x) \, dx \text{ for } \int_a^b f \, dm.\]

\subsection*{45.5 Determining Classes of Measures}

\[\text{Definition 45.42} \quad (\sigma - \text{finite}). \quad \text{Let } X \text{ be a set and } C \subset \mathcal{F} \subset 2^X. \text{ We say that a function } \mu : \mathcal{F} \to [0, \infty] \text{ is } \sigma - \text{finite on } \mathcal{E} \text{ if there exist } X_n \in \mathcal{E} \text{ such that}
\]

$$X \cap X_n \in \mathcal{E} \text{ and } \mu(X_n) \leq \infty \text{ for all } n.$$ 

\[\text{Theorem 45.43 (Uniqueness).} \quad \text{Suppose that } C \subset 2^X \text{ is a } \sigma - \text{class (see Definition 11.29), } \mathcal{M} = \sigma(C) \text{ and } \mu \text{ and } \nu \text{ are two measure on } \mathcal{M}. \text{ If } \mu \text{ and } \nu \text{ are } \sigma - \text{ finite on } C \text{ and } \mu = \nu \text{ on } C, \text{ then } \mu = \nu \text{ on } \mathcal{M}.
\]

\[\text{Proof.} \quad \text{We begin first with the special case where } \mu(X) < \infty \text{ and therefore also } \nu(X) = \lim_{n \to \infty} \nu(X_n) = \lim_{n \to \infty} \mu(X_n) = \mu(X) < \infty.
\]

Let

$$\mathcal{H} := \{ f \in \ell^\infty(\mathcal{M}, \mathbb{R}) : \mu(f) = \nu(f) \}.$$ 

Then $\mathcal{H}$ is a linear subspace which is closed under bounded convergence (by the dominated convergence theorem), contains $1$ and contains the multiplicative system, $M := \{ 1_C : C \in \mathcal{C} \}$. Therefore, by Theorem 11.26 or Corollary 11.29 $\mathcal{H} = \ell^\infty(\mathcal{M}, \mathbb{R})$ and hence $\mu = \nu$. For the general case, let $X_n^1, X_n^2 \in C$ be chosen so that $X_n^1 \uparrow X$ and $X_n^2 \uparrow X$ as $n \to \infty$ and $\mu(X_n^1) + \nu(X_n^2) < \infty$ for all $n$. Then $X_n := X_n^1 \cap X_n^2 \in \mathcal{C}$ increases to $X$ and $\nu(X_n) = \mu(X_n) < \infty$ for all $n$. For each $n \in \mathbb{N}$, define two measures $\mu_n$ and $\nu_n$ on $\mathcal{M}$ by

$$\mu_n(A) := \mu(A \cap X_n) \quad \text{and} \quad \nu_n(A) := \nu(A \cap X_n).$$

Then, as the reader should verify, $\mu_n$ and $\nu_n$ are finite measure on $\mathcal{M}$ such that $\mu_n = \nu_n$ on $C$. Therefore, by the special case just proved, $\mu_n = \nu_n$ on $\mathcal{M}$. Finally, using the continuity properties of measures,

$$\mu(A) = \lim_{n \to \infty} \mu(A \cap X_n) = \lim_{n \to \infty} \nu(A \cap X_n) = \nu(A)$$

for all $A \in \mathcal{M}$. As an immediate consequence we have the following corollaries.
Corollary 45.44. Suppose that \((X, \tau)\) is a topological space, \(B_X = \sigma(\tau)\) is the Borel \(\sigma\)-algebra on \(X\) and \(\mu\) and \(\nu\) are two measures on \(B_X\) which are \(\sigma\)-finite on \(\tau\). If \(\mu = \nu\) on \(\tau\) then \(\mu = \nu\) on \(B_X\), i.e. \(\mu \equiv \nu\).

Corollary 45.45. Suppose that \(\mu\) and \(\nu\) are two measures on \(B_{\mathbb{R}^n}\) which are finite on bounded sets and such that \(\mu(X) = \nu(X)\) for all sets \(X\) of the form 
\[
A = [a, b] = [a_1, b_1] \times \cdots \times [a_n, b_n]
\]
with \(a, b \in \mathbb{R}^n\) and \(a < b\), i.e. \(a_i < b_i\) for all \(i\). Then \(\mu \equiv \nu\) on \(B_{\mathbb{R}^n}\).

Proposition 45.46. Suppose that \((X, d)\) is a metric space, \(\mu\) and \(\nu\) are two measures on \(B_X := \sigma(\tau_d)\) which are finite on bounded measurable subsets of \(X\) and 
\[
\int_X f d\mu = \int_X f d\nu
\]
for all \(f \in BC_b(X, \mathbb{R})\) where 
\[
BC_b(X, \mathbb{R}) = \{f \in BC(X, \mathbb{R}) : \text{supp}(f) \text{ is bounded}\}.
\]
Then \(\mu \equiv \nu\).

Proof. To prove this fix \(a \in X\) and let 
\[
\psi_R(x) = \max(0, R - d(x, a))
\]
so that \(\psi_R \in BC_b([0,1])\), \(\text{supp}(\psi_R) \subset B(a, R + 1)\) and \(\psi_R \uparrow 1\) as \(R \to \infty\). Let \(H_R\) denote the space of bounded real valued \(B_X\)-measurable functions \(f\) such that 
\[
\int_X \psi_R f d\mu = \int_X \psi_R f d\nu.
\]
Then \(H_R\) is closed under bounded convergence and because of Eq. (45.17) contains \(BC(X, \mathbb{R})\). Therefore by Corollary 45.30 \(H_R\) contains all bounded measurable functions on \(X\). Take \(f = 1_A\) in Eq. (45.20) with \(A \in B_X\), and then use the monotone convergence theorem to let \(R \to \infty\). The result is \(\mu(A) = \nu(A)\) for all \(A \in B_X\).

Here is another version of Proposition 45.46.

Proposition 45.47. Suppose that \((X, d)\) is a metric space, \(\mu\) and \(\nu\) are two measures on \(B_X = \sigma(\tau_d)\) which are both finite on compact sets. Further assume there exist compact sets \(K_k \subset X\) such that \(K_k \uparrow X\). If 
\[
\int_X f d\mu = \int_X f d\nu
\]
for all \(f \in C_c(X, \mathbb{R})\) then \(\mu \equiv \nu\).

Proof. Let \(\psi_{n,k}\) be defined as in the proof of Proposition 11.31 and let \(H_{n,k}\) denote those bounded \(B_X\)-measurable functions, \(f : X \to \mathbb{R}\) such that 
\[
\int_X f \psi_{n,k} d\mu = \int_X f \psi_{n,k} d\nu.
\]
By assumption \(BC(X, \mathbb{R}) \subset H_{n,k}\) and one easily checks that \(H_{n,k}\) is closed under bounded convergence. Therefore, by Corollary 11.30 \(H_{n,k}\) contains all bounded measurable function. In particular for \(A \in B_X\), 
\[
\int_X 1_A \psi_{n,k} d\mu = \int_X 1_A \psi_{n,k} d\nu.
\]
Letting \(n \to \infty\) in this equation, using the dominated convergence theorem, one shows 
\[
\int_X 1_A 1_{K_n} d\mu = \int_X 1_A 1_{K_n} d\nu
\]
holds for \(k\). Finally using the monotone convergence theorem we may let \(k \to \infty\) to conclude 
\[
\mu(A) = \int_X 1_A d\mu = \int_X 1_A d\nu = \nu(A)
\]
for all \(A \in B_X\).
Exercise 45.4. Suppose that $\mu_n : \mathcal{M} \to [0, \infty]$ are measures on $\mathcal{M}$ for $n \in \mathbb{N}$. Also suppose that $\mu_n(A)$ is increasing in $n$ for all $A \in \mathcal{M}$. Prove that $\mu : \mathcal{M} \to [0, \infty]$ defined by $\mu(A) := \lim_{n \to \infty} \mu_n(A)$ is also a measure.

Exercise 45.5. Now suppose that $A$ is some index set and for each $\lambda \in A$, $\mu_\lambda : \mathcal{M} \to [0, \infty]$ is a measure on $\mathcal{M}$. Define $\mu : \mathcal{M} \to [0, \infty]$ by $\mu(A) = \sum_{\lambda \in A} \mu_\lambda(A)$ for each $A \in \mathcal{M}$. Show that $\mu$ is also a measure.

Exercise 45.6. Let $(X, \mathcal{M}, \mu)$ be a measure space and $\rho : X \to [0, \infty]$ be a measurable function. For $A \in \mathcal{M}$, set $\nu(A) := \int_A \rho d\mu$.

1. Show $\nu : \mathcal{M} \to [0, \infty]$ is a measure.
2. Let $f : X \to [0, \infty]$ be a measurable function, show
\[
\int_X f d\nu = \int_X f \rho d\mu. \tag{45.22}
\]
\textbf{Hint:} first prove the relationship for characteristic functions, then for simple functions, and then for general positive measurable functions.
3. Show that a measurable function $f : X \to \mathbb{C}$ is in $L^1(\nu)$ iff $|f| \rho \in L^1(\mu)$ and if $f \in L^1(\nu)$ then Eq. (45.22) still holds.

\textbf{Notation 45.48} It is customary to informally describe $\nu$ defined in Exercise 45.6 by writing $d\nu = \rho d\mu$.

Exercise 45.7. Let $(X, \mathcal{M}, \mu)$ be a measure space, $(Y, \mathcal{F})$ be a measurable space and $f : X \to Y$ be a measurable map. Define a function $\nu : \mathcal{F} \to [0, \infty]$ by $\nu(A) := \mu(f^{-1}(A))$ for all $A \in \mathcal{F}$.

1. Show $\nu$ is a measure. (We will write $\nu = f_\ast \mu$ or $\nu = \mu \circ f^{-1}$.)
2. Show
\[
\int_Y g d\nu = \int_X (g \circ f) d\mu \tag{45.23}
\]
for all measurable functions $g : Y \to [0, \infty]$. \textbf{Hint:} see the hint from Exercise 45.6.
3. Show a measurable function $g : Y \to \mathbb{C}$ is in $L^1(\nu)$ iff $g \circ f \in L^1(\mu)$ and that Eq. (45.23) holds for all $g \in L^1(\nu)$.

Exercise 45.8. Let $F : \mathbb{R} \to \mathbb{R}$ be a $C^1$-function such that $F'(x) > 0$ for all $x \in \mathbb{R}$ and $\lim_{x \to \pm \infty} F(x) = \pm \infty$. (Notice that $F$ is strictly increasing so that $F^{-1} : \mathbb{R} \to \mathbb{R}$ exists and moreover, by the inverse function theorem that $F^{-1}$ is a $C^1$ – function.) Let $m$ be Lebesgue measure on $\mathcal{B}_\mathbb{R}$ and

\[
\nu(A) = m(F(A)) = m((F^{-1})^{-1}(A)) = (F_\ast m)(A)
\]
for all $A \in \mathcal{B}_\mathbb{R}$. Show $d\nu = F' dm$. Use this result to prove the change of variable formula,
\[
\int_R h \circ F \cdot F' dm = \int_R h dm \tag{45.24}
\]
which is valid for all Borel measurable functions $h : \mathbb{R} \to [0, \infty]$.

\textbf{HINT:} Start by showing $d\nu = F' dm$ on sets of the form $A = (a,b]$ with $a, b \in \mathbb{R}$ and $a < b$. Then use the uniqueness assertions in Theorem 43.51 (or see Corollary 45.45) to conclude $d\nu = F' dm$ on all of $\mathcal{B}_\mathbb{R}$. To prove Eq. (45.24) apply Exercise 45.7 with $g = h \circ F$ and $f = F^{-1}$.

Exercise 45.9. Let $(X, \mathcal{M}, \mu)$ be a measure space and $\{A_n\}_{n=1}^\infty \subset \mathcal{M}$, show

\[
\mu(\{A_n \text{ a.a.}\}) \leq \liminf_{n \to \infty} \mu(A_n)
\]
and if $\mu(\cup_{m \geq n} A_m) < \infty$ for some $n$, then
\[
\mu(\{A_n \text{ i.o.}\}) \geq \limsup_{n \to \infty} \mu(A_n).
\]

Exercise 45.10. BRUCE: Delete this exercise which is contained in Lemma 45.5. Suppose $(X, \mathcal{M}, \mu)$ be a measure space and $f : X \to [0, \infty]$ be a measurable function such that $\int_X f d\mu < \infty$. Show $\mu(\{f = \infty\}) = 0$ and the set $\{f > 0\}$ is $\sigma$ – finite.

Exercise 45.11 (Folland 2.13 on p. 52.). Suppose that $\{f_n\}_{n=1}^\infty$ is a sequence of non-negative measurable functions such that $f_n \to f$ pointwise and
\[
\lim_{n \to \infty} \int f_n = \int f < \infty.
\]
Then
\[
\int_E f = \lim_{n \to \infty} \int_E f_n
\]
for all measurable sets $E \in \mathcal{M}$. The conclusion need not hold if $\lim_{n \to \infty} \int f_n = \int f$. \textbf{HINT:} “Fatou times two.”

Exercise 45.12. Folland 2.14 on p. 52. BRUCE: delete this exercise

Exercise 45.13. Give examples of measurable functions $\{f_n\}$ on $\mathbb{R}$ such that $f_n$ decreases to 0 uniformly yet $\int f_n dm = \infty$ for all $n$. Also give an example of a sequence of measurable functions $\{g_n\}$ on $[0,1]$ such that $g_n \to 0$ while $\int g_n dm = 1$ for all $n$.

Exercise 45.14. Folland 2.19 on p. 59. (This problem is essentially covered in the previous exercise.)
Exercise 45.15. Suppose \( \{a_n\}_{n=-\infty}^{\infty} \subset \mathbb{C} \) is a summable sequence (i.e. \( \sum_{n=-\infty}^{\infty} |a_n| < \infty \)), then \( f(\theta) := \sum_{n=-\infty}^{\infty} a_n e^{i\theta n} \) is a continuous function for \( \theta \in \mathbb{R} \) and \( a_n = \frac{1}{2\pi} \int_{-\pi}^{\pi} f(\theta) e^{-i\theta n} d\theta \).

Exercise 45.16. For any function \( f \in L^1(m) \), show \( f \in \mathbb{R} \Rightarrow \int_{(-\infty,x]} f(t) \, dt \) is continuous in \( x \). Also find a finite measure, \( \mu \), on \( \mathcal{B}_\mathbb{R} \) such that \( x \rightarrow \int_{(-\infty,x]} f(t) \, d\mu(t) \) is not continuous.

Exercise 45.17 (Folland 2.28 on p. 60.). Compute the following limits and justify your calculations:

1. \( \lim_{n \to \infty} \int_0^\infty \frac{\sin(z)}{(1+z^2)^2} \, dx \).
2. \( \lim_{n \to \infty} \int \frac{1}{(1+x^2)^2} \, dx \).
3. \( \lim_{n \to \infty} \int_0^\infty \frac{\sin(x/n)}{x(1+x^2)} \, dx \).

Exercise 45.18. Folland 2.31b and 2.31e on p. 60. (The answer in 2.13b is wrong by a factor of \(-1\) and the sum is on \( k = 1 \) to \( \infty \). In part e, \( s \) should be taken to be \( a \). You may also freely use the Taylor series expansion\( (1-z)^{-1/2} = \sum_{n=0}^{\infty} \frac{(2n-1)!!}{2^n n!} z^n \) for \( |z| < 1 \).

Remark 45.49 (Generalized Cantor Sets). In the next problem you are asked to make use of the generalized Cantor sets discussed on p. 39 of Folland. The construction is as follows. Let \( \alpha := \{a_j\}_{j=1}^{\infty} \subset (0,1) \) be any sequence. Associated to this sequence we construct closed subsets, \( K_n \subset [0,1] \) inductively as follows. Let \( K_0 = [0,1] \) and then define \( K_n \) to be \( K_{n-1} \) minus the open “middle \( \alpha_n \)'s\footnote{Given \( \alpha \in (0,1) \) and a closed interval, \( I = [a,b] \) with \( a < b \), we call \( V = \frac{1}{2} (a+b) + \frac{\alpha}{2} (-a,b-a) \). This is the open middle \( \alpha \) of \( I \).} of each of the closed intervals making up \( K_{n-1} \).\footnote{Notice that the centers of the middle \( \alpha_n \)'s are located at \( \{ \frac{k}{2^n} : 1 \leq k < 2^n \} \).} It then follows that

\[ m(K_n) = m(K_{n-1}) - \alpha_n m(K_{n-1}) = (1-\alpha_n) m(K_{n-1}) \]

and so by induction,

\[ m(K_n) = \prod_{k=1}^{n} (1 - \alpha_k) \cdot \]

The generalize Cantor set, \( C(\alpha) \), associated to \( \alpha \) is then taken to be \( \cap_n K_n \).

Since \( K_n \subset C(\alpha) \) it follows that

\[ m(C(\alpha)) = \prod_{k=1}^{\infty} (1 - \alpha_k) \]

which can take on any value between \([0,1]\) as you should verify. This cantor set enjoys the following properties;

1. \( C(\alpha) \) is closed being the intersection of closed sets.
2. \( C(\alpha) \) is nowhere dense, i.e. \( C(\alpha)^c = \emptyset \) (see Definition \ref{def:nowhere-dense} since

\[ C(\alpha) \subset [0,1] \setminus \left( \cup_{n=1}^{\infty} \left\{ \frac{k}{2^n} : 1 \leq k < 2^n \right\} \right) \] .

(45.25)

3. \( C(\alpha) \) is totally disconnected, i.e. the only connected subsets are single point sets. Indeed suppose that \( A \subset C(\alpha) \) is a non-empty connected set. If \( \#(A) \geq 2 \), we may choose \( x,y \in A \) with \( x \neq y \). It is then possible because of Eq. \ref{eq:45.25} to find \( z \in I \setminus C(\alpha) \) such that \( x < z < y \). Letting \( B = A \cap (z,\infty) \) and \( C = A \cap (-\infty,z) \) we will have \( A = B \cup C \) with \( B \) and \( C \) being non-empty disjoint relatively open subsets of \( A \) which shows \( A \) is not connected.

4. \( C(\alpha) \) has no isolated points. Indeed, if \( x \in C(\alpha) \) we may find \( \xi_n \in \left\{ \frac{k}{2^n} : 1 \leq k < 2^n \right\} \) for each \( n \) such that \( \xi_n \rightarrow x \). Let \( x_n \in C(\alpha) \) be on the endpoints of the middle \( \alpha_n \) which is centered at \( \xi_n \). Then \( x_n \rightarrow x \) as \( n \rightarrow \infty \) which shows that \( x \) is not an isolated point.

Exercise 45.19. There exists a meager (see Definition \ref{def:meager} and Theorem \ref{thm:meager}) subsets of \( \mathbb{R} \) which have full Lebesgue measure, i.e. whose complement is a Lebesgue null set. (This is Folland 5.27. Hint: Consider the generalized Cantor sets discussed in Remark \ref{rem:generalized-cantor} above.)

Exercise 45.20. Prove Lemma \ref{lem:45.37}
46.1 Monotone Class and $\pi - \lambda$ Theorems

**Definition 46.1.** Let $\mathcal{C} \subset 2^X$ be a collection of sets.

1. $\mathcal{C}$ is a **monotone class** if it is closed under countable increasing unions and countable decreasing intersections.
2. $\mathcal{C}$ is a $\pi - \lambda$ class if it is closed under finite intersections and
3. $\mathcal{C}$ is a $\lambda - \lambda$ class if $\mathcal{C}$ satisfies the following properties:
   a) $X \in \mathcal{C}$
   b) If $A, B \in \mathcal{C}$ and $A \cap B = \emptyset$, then $A \cup B \in \mathcal{C}$. (Closed under disjoint unions.)
   c) If $A, B \in \mathcal{C}$ and $A \supset B$, then $A \setminus B \in \mathcal{C}$. (Closed under proper differences.)
   d) If $A_n \in \mathcal{C}$ and $A_n \uparrow A$, then $A \in \mathcal{C}$. (Closed under countable increasing unions.)
4. $\mathcal{C}$ is a $\lambda_0 - \lambda$ class if $\mathcal{C}$ satisfies conditions a) - c) but not necessarily d).

**Remark 46.2.** Notice that every $\lambda - \lambda$ class is also a monotone class.

(The reader wishing to shortcut this section may jump to Theorem 46.5 where he/she should then only read the second proof.)

**Lemma 46.3 (Monotone Class Theorem).** Suppose $\mathcal{A} \subset 2^X$ is an algebra and $\mathcal{C}$ is the smallest monotone class containing $\mathcal{A}$. Then $\mathcal{C} = \sigma(\mathcal{A})$.

**Proof.** For $C \in \mathcal{C}$ let

$$C(C) = \{ B \in \mathcal{C} : C \cap B, C \cap B^c, B \cap C^c \in \mathcal{C} \},$$

then $C(C)$ is a monotone class. Indeed, if $B_n \in C(C)$ and $B_n \uparrow B$, then $B_n^\uparrow \uparrow B^c$ and so

$$\mathcal{C} \ni C \cap B_n \uparrow C \cap B$$

$$\mathcal{C} \ni C \cap B_n^\uparrow \downarrow C \cap B^c$$

$$\mathcal{C} \ni B_n \cap C^c \uparrow B \cap C^c.$$  

Since $\mathcal{C}$ is a monotone class, it follows that $C \cap B, C \cap B^c, B \cap C^c \in \mathcal{C}$, i.e. $B \in C(C)$. This shows that $C(C)$ is closed under increasing limits and a similar argument shows that $C(C)$ is closed under decreasing limits. Thus we have shown that $C(C)$ is a monotone class for all $C \in \mathcal{C}$. If $A \in \mathcal{A} \subset \mathcal{C}$, then $A \cap B, A \cap B^c, B \cap A^c \in \mathcal{C}$ for all $B \in \mathcal{A}$ and hence it follows that $\mathcal{A} \subset C(\mathcal{A}) \subset \mathcal{C}$. Since $\mathcal{C}$ is the smallest monotone class containing $\mathcal{A}$ and $C(\mathcal{A})$ is a monotone class containing $\mathcal{A}$, we conclude that $C(\mathcal{A}) = C$ for any $A \in \mathcal{A}$. Let $B \in \mathcal{C}$ and notice that $A \in C(\mathcal{B})$ happens iff $B \in C(\mathcal{A})$. This observation and the fact that $C(\mathcal{A}) = C$ for all $A \in \mathcal{A}$ implies $A \subset C(B) \subset C$ for all $B \in \mathcal{B}$. Again since $\mathcal{C}$ is the smallest monotone class containing $\mathcal{A}$ and $C(B)$ is a monotone class we conclude that $C(B) = C$ for all $B \in \mathcal{B}$. That is to say, if $A, B \in \mathcal{B}$ then $A \in C(\mathcal{B})$ and hence $A \cap B, A \cap B^c, A^c \cap B \in \mathcal{C}$. So $\mathcal{C}$ is closed under complements (since $X \in \mathcal{A} \subset \mathcal{C}$) and finite intersections and increasing unions from which it easily follows that $\mathcal{C}$ is a $\sigma - \lambda$ algebra.

Let $\mathcal{E} \subset 2^X \times Y$ be given by

$$\mathcal{E} = \mathcal{M} \times \mathcal{N} = \{ A \times B : A \in \mathcal{M}, B \in \mathcal{N} \}$$

and recall from Exercise 43.3 that $\mathcal{E}$ is an elementary family. Hence the algebra $\mathcal{A} = \mathcal{A}(\mathcal{E})$ generated by $\mathcal{E}$ consists of sets which may be written as disjoint unions of sets from $\mathcal{E}$.

**Lemma 46.4.** If $\mathcal{D}$ is a $\lambda_0 - \lambda$ class which contains a $\pi - \lambda$ class, $\mathcal{C}$, then $\mathcal{D}$ contains $\mathcal{A}(\mathcal{C})$ – the algebra generated by $\mathcal{C}$.

**Proof.** We will give two proofs of this lemma. The first proof is “constructive” and makes use of Proposition 43.8 which tells how to construct $\mathcal{A}(\mathcal{C})$ from $\mathcal{C}$. The key to the first proof is the following claim which will be proved by induction.

**Claim.** Let $\tilde{C}_0 = \mathcal{C}$ and $\tilde{C}_n$ denote the collection of subsets of $X$ of the form

$$A_1 \cap \cdots \cap A_n \cap B = B \setminus A_1 \setminus \cdots \setminus A_n.$$  

with $A_i \in \mathcal{C}$ and $B \in \mathcal{C} \cup \{ X \}$. Then $\tilde{C}_n \subset \mathcal{D}$ for all $n$, i.e. $\tilde{C} := \bigcup_{n=0}^\infty \tilde{C}_n \subset \mathcal{D}$. By assumption $\tilde{C}_0 \subset \mathcal{D}$ and when $n = 1$,

$$B \setminus A_1 = B \setminus (A_1 \cap B) \in \mathcal{D}$$

when $A_1, B \in \mathcal{C} \subset \mathcal{D}$ since $A_1 \cap B \in \mathcal{C} \subset \mathcal{D}$. Therefore, $\tilde{C}_1 \subset \mathcal{D}$. For the induction step, let $B \in \mathcal{C} \cup \{ X \}$ and $A_i \in \mathcal{C} \cup \{ X \}$ and let $E_n$ denote the set in Eq. (46.1). We now assume $\tilde{C}_n \subset \mathcal{D}$ and wish to show $E_{n+1} \in \mathcal{D}$, where
Then $C \subset D_1$ and $D_1$ is also a $\lambda$–class because as we now check. a) $X \in D_1$. b) If $A, B \in D_1$ with $A \cap B = \emptyset$, then $(A \cup B) \cap C = (A \cap C) \bigcup (B \cap C) \in D$ for all $C \in C$. c) If $A, B \in D_1$ with $B \subset A$, then $(A \setminus B) \cap C = A \cap C \setminus (B \cap C) \in D$ for all $C \in C$. d) If $A_n \in D_1$ and $A_n \uparrow A$ as $n \to \infty$, then $A_n \cap C \in D$ for all $C \in D$ and hence $A_n \cap C \uparrow A \cap C \in D$. Since $C \subset D_1 \subset D$ and $D$ is the smallest $\lambda$–class containing $C$ it follows that $D_1 = D$. From this we conclude that if $A \in D$ and $B \in C$ then $A \cap B \in D$. Let

$$D_2 := \{ A \in D : A \cap D \in D \forall \ D \in D \}.$$  

Then $D_2$ is a $\lambda$–class (as you should check) which, by the above paragraph, contains $C$. As above this implies that $D = D_2$, i.e. we have shown that $D$ is closed under finite intersections. Since $\lambda$–classes are closed under complementation, $D$ is an algebra which is closed under increasing unions and hence is closed under arbitrary countable unions, i.e. $D$ is a $\sigma$–algebra. Since $C \subset D$ we must have $\sigma(C) \subset D$ and in fact $\sigma(C) = D$.  

### 46.1.1 Some other proofs of previously proved theorems

**Proof.** Other Proof of Corollary 11.29 Let $D := \{ A \subset X : 1_A \in \mathcal{H} \}$. Then by assumption $C \subset D$ and since $1 \in \mathcal{H}$ we know $X \in D$. If $A, B \in D$ are disjoint then $1_{A \cup B} = 1_A + 1_B \in \mathcal{H}$ so that $A \cup B \in D$ and if $A, B \in D$ and $A \subset B$, then $1_{B \setminus A} = 1_B - 1_A \in \mathcal{H}$. Finally if $A_n \in D$ and $A_n \uparrow A$ as $n \to \infty$ then $A_n \to A$ boundedly so $1_{A_n} \in \mathcal{H}$ and hence $A \in D$. So $D$ is $\lambda$–class containing $C$ and hence $D \subset \sigma(C)$. From this it follows that $\mathcal{H}$ contains $1_A$ for all $A \in \sigma(C)$ and hence all $\sigma(C)$–measurable simple functions by linearity. The proof is now complete with an application of the approximation Theorem 44.34 along with the assumption that $\mathcal{H}$ is closed under bounded convergence.  

**Proof.** Other Proof of Theorems 11.26 and 11.27 Let $\mathbb{F}$ be $\mathbb{R}$ or $\mathbb{C}$. Let $C$ be the family of all sets of the form:

$$B := \{ x \in X : f_1(x) \in R_1, \ldots, f_m(x) \in R_m \}$$  

where $m = 1, 2, \ldots, m$ and for $k = 1, 2, \ldots, m$, $f_k \in M$ and $R_k$ is an open interval if $\mathbb{F} = \mathbb{R}$ or $R_k$ is an open rectangle in $\mathbb{C}$ if $\mathbb{F} = \mathbb{C}$. The family $C$ is easily seen to be a $\pi$–system such that $\sigma(M) = \sigma(C)$. So by Corollary 11.29 to finish the proof it suffices to show $1_B \in \mathcal{H}$ for all $B$. It is easy to construct, for each $k$, a uniformly bounded sequence of continuous functions $(\varphi_n)_{n=1}^\infty$ on $\mathbb{F}$ converging to the characteristic function $1_{R_k}$. By Weierstrass’ theorem, there exists polynomials $p_m(x)$ such that $|p_m(x) - \varphi_m(x)| \leq 1/n$ for $|x| \leq ||\varphi_k||_\infty$ in the real case and polynomials $p_m(z, \bar{z})$ in $z$ and $\bar{z}$ such that $|p_n(z, \bar{z}) - \varphi_n(z)| \leq 1/n$ for $|z| \leq ||\varphi_k||_\infty$ in the complex case. The functions

$$E_{n+1} = E_n \setminus A_{n+1} = E_n \setminus (A_{n+1} \cap E_n).$$  

Because

$$A_{n+1} \cap E_n = A_1 \cap \cdots \cap A_n \cap (B \cap A_{n+1}) \in \check{C}_n \subset D$$  

and $(A_{n+1} \cap E_n) \subset E_n \in \check{C}_n \subset D$, we have $E_{n+1} \subset D$ as well. This finishes the proof of the claim.

Notice that $C$ is still a multiplicative class and from Proposition 43.8 (using the fact that $C$ is a multiplicative class), $A(C)$ consists of finite unions of elements from $\check{C}$. By applying the claim to $\check{C}$, $A_1 \cap \cdots \cap A_n \cap D \in D$ for all $A_i \in \check{C}$ and hence

$$A_1 \cup \cdots \cup A_n = (A_1 \cap \cdots \cap A_n)^c \in D.$$  

Thus we have shown $A(C) \subset D$ which completes the proof.

**Second Proof.** With out loss of generality, we may assume that $D$ is the smallest $\lambda_0$–class containing $C$ for if not just replace $D$ by the intersection of all $\lambda_0$–classes containing $C$. Let

$$D_1 := \{ A \in D : A \cap C \in D \forall C \in C \}.$$  

Then $C \subset D_1$ and $D_1$ is also a $\lambda_0$–class as we now check. a) $X \in D_1$. b) If $A, B \in D_1$ with $A \cap B = \emptyset$, then $(A \cup B) \cap C = (A \cap C) \bigcup (B \cap C) \in D$ for all $C \in C$. c) If $A, B \in D_1$ with $B \subset A$, then $(A \setminus B) \cap C = A \cap C \setminus (B \cap C) \in D$ for all $C \in C$. Since $C \subset D_1 \subset D$ and $D$ is the smallest $\lambda_0$–class containing $C$ it follows that $D_1 = D$. From this we conclude that if $A \in D$ and $B \in C$ then $A \cap B \in D$. Let

$$D_2 := \{ A \in D : A \cap D \in D \forall D \in D \}.$$  

Then $D_2$ is a $\lambda_0$–class (as you should check) which, by the above paragraph, contains $C$. As above this implies that $D = D_2$, i.e. we have shown that $D$ is closed under finite intersections. Since $\lambda_0$–classes are closed under complementation, $D$ is an algebra which is closed under increasing unions and hence is closed under arbitrary countable unions, i.e. $D$ is a $\sigma$–algebra. Since $C \subset D$ we must have $\sigma(C) \subset D$ and in fact $\sigma(C) = D$.
\[ F_n := p_n^1(f_1)p_n^2(f_2) \ldots p_n^m(f_m) \quad \text{(real case)} \]
\[ F_n := p_n^1(\bar{f}_1)p_n^2(\bar{f}_2) \ldots p_n^m(\bar{f}_m, \bar{f}_m) \quad \text{(complex case)} \]
on \( X \) are uniformly bounded, belong to \( \mathcal{H} \) and converge pointwise to \( 1_B \) as \( n \to \infty \), where \( B \) is the set in Eq. \ref{eq:46.2}. Thus \( 1_B \in \mathcal{H} \) and the proof is complete.

**Theorem 46.6 (Uniqueness).** Suppose that \( \mathcal{E} \subset 2^X \) is an elementary class and \( M = \sigma(\mathcal{E}) \) (the \( \sigma \)-algebra generated by \( \mathcal{E} \)). If \( \mu \) and \( \nu \) are two measures on \( M \) which are \( \sigma \)-finite on \( \mathcal{E} \) and such that \( \mu = \nu \) on \( \mathcal{E} \) then \( \mu = \nu \) on \( M \).

**Proof.** Let \( \mathcal{A} := \mathcal{A}(\mathcal{E}) \) be the algebra generated by \( \mathcal{E} \). Since every element of \( \mathcal{A} \) is a disjoint union of elements from \( \mathcal{E} \), it is clear that \( \mu = \nu \) on \( \mathcal{A} \). Henceforth we may assume that \( \mathcal{E} = \mathcal{A} \). We begin first with the special case where \( \mu(X) < \infty \) and hence \( \nu(X) = \mu(X) < \infty \). Let
\[ \mathcal{C} = \{ A \in M : \mu(A) = \nu(A) \} \]
The reader may easily check that \( \mathcal{C} \) is a monotone class. Since \( \mathcal{A} \subset \mathcal{C} \), the monotone class lemma asserts that \( M = \sigma(\mathcal{A}) \subset \mathcal{C} \subset M \) showing that \( \mathcal{C} = M \) and hence that \( \mu = \nu \) on \( M \). For the \( \sigma \)-finite case, let \( X_n \in \mathcal{A} \) be sets such that \( \mu(X_n) = \nu(X_n) < \infty \) and \( X_n \uparrow X \) as \( n \to \infty \). For \( n \in \mathbb{N} \), let
\[ \mu_n(A) := \mu(A \cap X_n) \text{ and } \nu_n(A) = \nu(A \cap X_n) \]
for all \( A \in M \). Then one easily checks that \( \mu_n \) and \( \nu_n \) are finite measure on \( M \) such that \( \mu_n = \nu_n \) on \( \mathcal{A} \). Therefore, by what we have just proved, \( \mu_n = \nu_n \) on \( M \). Hence or all \( A \in M \), using the continuity of measures,
\[ \mu(A) = \lim_{n \to \infty} \mu(A \cap X_n) = \lim_{n \to \infty} \nu(A \cap X_n) = \nu(A). \]

Using Dynkin’s \( \pi - \lambda \) Theorem \ref{thm:45.43} we may strengthen Theorem \ref{thm:46.6} to the following.

**Proof. Second Proof of Theorem 45.43.** As in the proof of Theorem \ref{thm:46.6}, it suffices to consider the case where \( \mu \) and \( \nu \) are finite measure such that \( \mu(X) = \nu(X) < \infty \). In this case the reader may easily verify from the basic properties of measures that
\[ \mathcal{D} = \{ A \in M : \mu(A) = \nu(A) \} \]
is a \( \lambda \)-class. By assumption \( \mathcal{C} \subset \mathcal{D} \) and hence by the \( \pi - \lambda \) theorem, \( \mathcal{D} \) contains \( M = \sigma(\mathcal{C}) \).

**46.2 Regularity of Measures**

**Definition 46.7.** Suppose that \( \mathcal{E} \) is a collection of subsets of \( X \), let \( \mathcal{E}_\sigma \) denote the collection of subsets of \( X \) which are finite or countable unions of sets from \( \mathcal{E} \). Similarly let \( \mathcal{E}_\delta \) denote the collection of subsets of \( X \) which are finite or countable intersections of sets from \( \mathcal{E} \). We also write \( \mathcal{E}_{\sigma\delta} \) for \( (\mathcal{E}_\sigma)_\delta \) and \( \mathcal{E}_{\sigma\delta} \) for \( (\mathcal{E}_\delta)_\sigma \), etc.

**Remark 46.8.** Notice that if \( \mathcal{A} \) is an algebra and \( C = \cup C_i \) and \( D = \cup D_j \) with \( C_i, D_j \in \mathcal{A} \), then
\[ C \cap D = \cup_{i,j} (C_i \cap D_j) \in \mathcal{A} \]
so that \( \mathcal{A} \) is closed under finite intersections.

The following theorem shows how recover a measure \( \mu \) on \( \sigma(\mathcal{A}) \) from its values on an algebra \( \mathcal{A} \).

**Theorem 46.9 (Regularity Theorem).** Let \( \mathcal{A} \subset 2^X \) be an algebra of sets, \( M = \sigma(\mathcal{A}) \) and \( \mu : M \to [0, \infty] \) be a measure on \( M \) which is \( \sigma \)-finite on \( \mathcal{A} \). Then for all \( A \in M \),
\[ \mu(A) = \inf \{ \mu(B) : A \subset B \in \mathcal{A} \}. \]
Moreover, if \( A \in M \) and \( \varepsilon > 0 \) are given, then there exists \( B \in \mathcal{A} \) such that \( A \subset B \) and \( \mu(B \setminus A) \leq \varepsilon \).

**Proof.** For \( A \subset X \), define
\[ \mu^*(A) = \inf \{ \mu(B) : A \subset B \in \mathcal{A} \}. \]
We are trying to show \( \mu^* = \mu \) on \( M \). We will begin by first assuming that \( \mu \) is a finite measure, i.e. \( \mu(X) < \infty \). Let
\[ \mathcal{F} = \{ B \in M : \mu^*(B) = \mu(B) \} = \{ B \in M : \mu^*(B) \leq \mu(B) \}. \]
It is clear that \( \mathcal{A} \subset \mathcal{F} \), so the finite case will be finished by showing \( \mathcal{F} \) is a monotone class. Suppose \( B_n \in \mathcal{F} \), \( B_n \uparrow B \) as \( n \to \infty \) and let \( \varepsilon > 0 \) be given. Since \( \mu^*(B_n) = \mu(B_n) \) there exists \( A_n \in \mathcal{A} \) such that \( B_n \subset A_n \) and \( \mu(A_n) \leq \mu(B_n) + \varepsilon 2^{-n} \) i.e.
\[ \mu(A_n \setminus B_n) \leq \varepsilon 2^{-n}. \]
Let \( A = \cup_n A_n \in \mathcal{A} \), then \( B \subset A \) and
\[ \mu(A \setminus B) = \mu(\cup_n (A_n \setminus B)) \leq \sum_{n=1}^{\infty} \mu((A_n \setminus B)) \]
\[ \leq \sum_{n=1}^{\infty} \mu((A_n \setminus B_n)) \leq \sum_{n=1}^{\infty} \varepsilon 2^{-n} = \varepsilon. \]
Therefore,
\[ \mu^*(B) \leq \mu(A) \leq \mu(B) + \varepsilon \]
and since \( \varepsilon > 0 \) was arbitrary it follows that \( B \in \mathcal{F} \). Now suppose that \( B_n \in \mathcal{F} \) and \( B \downarrow B \) as \( n \to \infty \) so that
\[ \mu(B_n) \downarrow \mu(B) \text{ as } n \to \infty. \]
As above choose \( A_n \in \mathcal{A}_\sigma \) such that \( B_n \subset A_n \) and
\[ 0 \leq \mu(A_n) - \mu(B_n) = \mu(A_n \setminus B_n) \leq 2^{-n}. \]
Combining the previous two equations shows that \( \lim_{n \to \infty} \mu(A_n) = \mu(B) \). Since \( \mu^*(B) \leq \mu(A_n) \) for all \( n \), we conclude that \( \mu^*(B) \leq \mu(B) \), i.e. that \( B \in \mathcal{F} \). Since \( \mathcal{F} \) is a monotone class containing the algebra \( \mathcal{A} \), the monotone class theorem asserts that
\[ \mathcal{M} = \sigma(\mathcal{A}) \subset \mathcal{F} \subset \mathcal{M} \]
showing the \( \mathcal{F} = \mathcal{M} \) and hence that \( \mu^* = \mu \) on \( \mathcal{M} \).

For the \( \sigma \) – finite case, let \( X_n \in \mathcal{A} \) be sets such that \( \mu(X_n) < \infty \) and \( X_n \uparrow X \) as \( n \to \infty \). Let \( \mu_n \) be the finite measure on \( \mathcal{M} \) defined by \( \mu_n(A) := \mu(A \cap X_n) \) for all \( A \in \mathcal{M} \). Suppose that \( \varepsilon > 0 \) and \( A \in \mathcal{M} \) are given. By what we have just proved, for all \( A \in \mathcal{M} \), there exists \( B_n \in \mathcal{A}_\sigma \) such that \( A \subset B_n \) and
\[ \mu((B_n \cap X_n) \setminus (A \cap X_n)) = \mu(B_n \setminus A) \leq \varepsilon 2^{-n}. \]
Notice that since \( X_n \in \mathcal{A}_\sigma \), \( B_n \cap X_n \in \mathcal{A}_\sigma \) and
\[ B := \bigcup_{n=1}^{\infty} (B_n \cap X_n) \in \mathcal{A}_\sigma. \]
Moreover, \( A \subset B \) and
\begin{align*}
\mu(B \setminus A) &\leq \sum_{n=1}^{\infty} \mu((B_n \cap X_n) \setminus A) \leq \sum_{n=1}^{\infty} \mu((B_n \cap X_n) \setminus (A \cap X_n)) \\
&\leq \sum_{n=1}^{\infty} \varepsilon 2^{-n} = \varepsilon.
\end{align*}
Since this implies that
\[ \mu(A) \leq \mu(B) \leq \mu(A) + \varepsilon \]
and \( \varepsilon > 0 \) is arbitrary, this equation shows that Eq. (46.4) holds. \( \square \)

**Corollary 46.10.** Let \( A \subset 2^X \) be an algebra of sets, \( \mathcal{M} = \sigma(\mathcal{A}) \) and \( \mu : \mathcal{M} \to [0, \infty] \) be a measure on \( \mathcal{M} \) which is \( \sigma \) – finite on \( \mathcal{A} \). Then for all \( A \in \mathcal{M} \) and \( \varepsilon > 0 \) there exists \( B \in \mathcal{A}_\delta \) such that \( B \subset A \) and
\[ \mu(A \setminus B) < \varepsilon. \]
Furthermore, for any \( B \in \mathcal{M} \) there exists \( A \in \mathcal{A}_{\delta\sigma} \) and \( C \in \mathcal{A}_{\sigma\delta} \) such that \( A \subset B \subset C \) and \( \mu(C \setminus A) = 0 \).

**Proof.** By Theorem 46.9 there exist \( C \in \mathcal{A}_\sigma \) such that \( A^c \subset C \) and \( \mu(C \setminus A^c) \leq \varepsilon \). Let \( B = C^c \subset A \) and notice that \( B \in \mathcal{A}_\delta \) and that \( C \setminus A^c = B^c \cap A = A \setminus B \), so that
\[ \mu(A \setminus B) = \mu(C \setminus A^c) \leq \varepsilon. \]
Finally, given \( B \in \mathcal{M} \), we may choose \( A_n \in \mathcal{A}_\delta \) and \( C_n \in \mathcal{A}_\sigma \) such that \( A_n \subset B \subset C_n \) and \( \mu(C_n \setminus B) \leq 1/n \) and \( \mu(B \setminus A_n) \leq 1/n \). By replacing \( A_N \) by \( \bigcup_{n=1}^{N} A_n \) and \( C_N \) by \( \bigcap_{n=1}^{N} C_n \), we may assume that \( A_n \uparrow \) and \( C_n \downarrow \) as \( n \) increases. Let \( A = \bigcup_{n=1}^{\infty} A_n \in \mathcal{A}_{\delta\sigma} \) and \( C = \bigcap_{n=1}^{\infty} C_n \in \mathcal{A}_{\sigma\delta} \), then \( A \subset B \subset C \) and
\[ \mu(C \setminus A) = \mu(C \setminus B) + \mu(B \setminus A) \leq \mu(C_n \setminus B) + \mu(B \setminus A_n) \leq 2/n \to 0 \text{ as } n \to \infty. \]
Exercise 46.4 (Generalization to the $\sigma$–finite case). Let $\tau \subset 2^X$ be a topology with the property that to every closed set $F \subset X$, there exists $V_n \in \tau$ such that $V_n \downarrow F$ as $n \to \infty$. Also let $\mathcal{M} = \sigma(\tau)$ and $\mu : \mathcal{M} \to [0, \infty]$ be a measure which is $\sigma$–finite on $\tau$.

1. Show that for all $\varepsilon > 0$ and $A \in \mathcal{M}$ there exists an open set $V \in \tau$ and a closed set $F$ such that $F \subset A \subset V$ and $\mu(V \setminus F) \leq \varepsilon$.
2. Let $F_\sigma$ denote the collection of subsets of $X$ which may be written as a countable union of closed sets. Use item 1. to show for all $B \in \mathcal{M}$, there exists $C \in \tau_\delta$ ($\tau_\delta$ is customarily written as $G_\delta$) and $A \in F_\sigma$ such that $A \subset B \subset C$ and $\mu(C \setminus A) = 0$.

46.2.1 Another proof of Theorem 27.16

Proof. The main part of this proof is an application of Exercise 46.4. So we begin by checking the hypothesis of this exercise. Suppose that $C \subset X$ is a closed set, then by assumption there exists $K_n \varsubsetneq X$ such that $C^c = \bigcup_{n=1}^{\infty} K_n$. Letting $V_n := \cap_{n=1}^{\infty} K_n \subset X$, by taking complements of the last equality we find that $V_n \downarrow X$ as $n \to \infty$. Also by assumption there exists $K_n \varsubsetneq X$ such that $K_n \uparrow X$ as $n \to \infty$. For each $x \in K_n$, let $V_x \varsubsetneq X$ be a precompact neighborhood of $x$. By compactness of $K_n$, there exists a finite set $A \subset K_n$ such that $\mu(V_x) \leq \mu(V_n)$. Since $X = \cup_{n=1}^{\infty} V_n$, we learn that $\mu$ is $\sigma$ finite on open sets of $X$. By Exercise 46.4, we conclude that for all $\varepsilon > 0$ and $A \in B_\mathcal{X}$ there exists $V \varsubsetneq X$ and $F \varsubsetneq X$ such that $F \subset A \subset V$ and $\mu(V \setminus F) < \varepsilon$. For this $F$ and $V$ we have

$$\mu(A) \leq \mu(V) = \mu(A) + \mu(V \setminus A) \leq \mu(A) + \mu(V \setminus F) < \mu(A) + \varepsilon \quad (46.6)$$

and

$$\mu(F) \leq \mu(A) = \mu(F) + \mu(A \setminus F) < \mu(F) + \varepsilon. \quad (46.7)$$

From Eq. (46.6) we see that $\mu$ is outer regular on $B_\mathcal{X}$. To finish the proof of inner regularity, let $K_n \varsubsetneq X$ such that $K_n \uparrow X$. If $\mu(A) = \infty$, it follows from Eq. (46.7) that $\mu(F) = \infty$. Since $F \cap K_n \uparrow F$, $\mu(F \cap K_n) \uparrow = \mu(A)$ which shows that $\mu$ is inner regular on $A$ because $F \cap K_n$ is a compact subset of $A$ for each $n$. If $\mu(A) < \infty$, we again have $F \cap K_n \uparrow F$ and hence by Eq. (46.7) for $n$ sufficiently large we still have

$$\mu(F \cap K_n) \leq \mu(A) < \mu(F \cap K_n) + \varepsilon$$

from which it follows that $\mu$ is inner regular on $A$.

Exercise 46.5 (Metric Space Examples). Suppose that $(X, d)$ is a metric space and $\tau_d$ is the topology of $d$–open subsets of $X$. To each set $F \subset X$ and $\varepsilon > 0$ let

$$F_\varepsilon = \{x \in X : d_F(x) < \varepsilon\} = \cup_{x \in F} B_\varepsilon(x) \in \tau_d.$$
Moreover, to prove this it suffices to show for $A \in \mathcal{M}$ with $\mu(A) < \infty$ that $1_A$ may be well approximated by an $f \in BC_f(X)$. By Exercises 46.4 and 46.5 for any $\varepsilon > 0$ there exists a closed set $F$ and an open set $V$ such that $F \subset A \subset V$ and $\mu(V \setminus F) < \varepsilon$. (Notice that $\mu(V) < \mu(A) < \varepsilon < \infty$.) Let $f$ be as in Eq. [13.4], then $f \in BC_f(X)$ and since $|1_A - f| \leq 1_{V \setminus F}$,

$$\int |1_A - f|^p d\mu \leq \int 1_{V \setminus F} d\mu = \mu(V \setminus F) \leq \varepsilon \quad (46.11)$$

or equivalently

$$\|1_A - f\| \leq \varepsilon^{1/p}.$$

Since $\varepsilon > 0$ is arbitrary, we have shown that $1_A$ can be approximated in $L^p(\mu)$ arbitrarily well by functions from $BC_f(X)$.)
Multiple Integrals

In this chapter we will introduce iterated integrals and product measures. We are particularly interested in when it is permissible to interchange the order of integration in multiple integrals.

Example 47.1. As an example let \( X = [1, \infty) \) and \( Y = [0, 1] \) equipped with their Borel \( \sigma \)-algebras and let \( \mu = \nu = m, \) where \( m \) is Lebesgue measure. The iterated integrals of the function \( f(x, y) := e^{-xy} - 2e^{-2xy} \) satisfy,
\[
\int_0^1 \left[ \int_1^\infty (e^{-xy} - 2e^{-2xy}) \, dy \right] \, dx = \int_0^1 e^{-y} \left( \frac{1-e^{-y}}{y} \right) \, dy \in (0, \infty)
\]
and
\[
\int_1^\infty \left[ \int_0^1 (e^{-xy} - 2e^{-2xy}) \, dy \right] \, dx = -\int_1^\infty e^{-x} \left[ \frac{1-e^{-x}}{x} \right] \, dx \in (-\infty, 0)
\]
and therefore are not equal. Hence it is not always true that order of integration is irrelevant.

47.1 Product \( \sigma \)-Algebras

Let \( \{ (X_\alpha, M_\alpha) \}_{\alpha \in A} \) be a collection of measurable spaces \( X = X_A = \prod_{\alpha \in A} X_\alpha \) and \( \pi_\alpha : X_A \to X_\alpha \) be the canonical projection map as in Notation 2.2.

Definition 47.2 (Product \( \sigma \)-Algebra). The product \( \sigma \)-algebra, \( \otimes_{\alpha \in A} M_\alpha \), is the smallest \( \sigma \)-algebra on \( X \) such that each \( \pi_\alpha \) for \( \alpha \in A \) is measurable, i.e.
\[
\otimes_{\alpha \in A} M_\alpha := \sigma(\pi_\alpha : \alpha \in A) = \sigma \left( \bigcup_{\alpha \in A} \pi_\alpha^{-1}(M_\alpha) \right).
\]

Applying Proposition 44.17 in this setting implies the following proposition.

Proposition 47.3. Suppose \( Y \) is a measurable space and \( f : Y \to X = X_A \) is a map. Then \( f \) is measurable iff \( \pi_\alpha \circ f : Y \to X_\alpha \) is measurable for all \( \alpha \in A \). In particular if \( A = \{1, 2, \ldots, n\} \) so that \( X = X_1 \times X_2 \times \cdots \times X_n \) and \( f(y) = (f_1(y), f_2(y), \ldots, f_n(y)) \in X_1 \times X_2 \times \cdots \times X_n \), then \( f : Y \to X_A \) is measurable iff \( f_i : Y \to X_i \) is measurable for all \( i \).

Proposition 47.4. Suppose that \( (X_\alpha, M_\alpha)_{\alpha \in A} \) is a collection of measurable spaces and \( E_\alpha \subset M_\alpha \) generates \( M_\alpha \) for each \( \alpha \in A \), then
\[
\otimes_{\alpha \in A} M_\alpha = \sigma \left( \bigcup_{\alpha \in A} \pi_\alpha^{-1}(E_\alpha) \right) \quad (47.1)
\]
Moreover, suppose that \( A \) is either finite or countably infinite, \( X_\alpha \in \mathcal{E}_\alpha \) for each \( \alpha \in A \), and \( M_\alpha = \sigma(\mathcal{E}_\alpha) \) for each \( \alpha \in A \). Then the product \( \sigma \)-algebra satisfies
\[
\otimes_{\alpha \in A} M_\alpha = \sigma \left( \left\{ \prod_{\alpha \in A} E_\alpha : E_\alpha \in \mathcal{E}_\alpha \text{ for all } \alpha \in A \right\} \right) \quad (47.2)
\]
In particular if \( A = \{1, 2, \ldots, n\} \), then \( X = X_1 \times X_2 \times \cdots \times X_n \) and
\[
M_1 \otimes M_2 \otimes \cdots \otimes M_n = \sigma(M_1 \times M_2 \times \cdots \times M_n),
\]
where \( M_1 \times M_2 \times \cdots \times M_n \) is as defined in Notation 17.26.

Proof. Since \( \cup_{\alpha \in A} \pi_\alpha^{-1}(E_\alpha) \subset \cup_{\alpha \in A} \pi_\alpha^{-1}(M_\alpha) \), it follows that
\[
\mathcal{F} := \sigma \left( \cup_{\alpha \in A} \pi_\alpha^{-1}(E_\alpha) \right) \subset \sigma \left( \cup_{\alpha \in A} \pi_\alpha^{-1}(M_\alpha) \right) = \otimes_{\alpha \in A} M_\alpha.
\]
Conversely,
\[
\mathcal{F} \supset \sigma(\pi_\alpha^{-1}(E_\alpha)) = \pi_\alpha^{-1}(\sigma(E_\alpha)) = \pi_\alpha^{-1}(M_\alpha)
\]
holds for all \( \alpha \) implies that
\[
\cup_{\alpha \in A} \pi_\alpha^{-1}(M_\alpha) \subset \mathcal{F}
\]
and hence that \( \otimes_{\alpha \in A} M_\alpha \subset \mathcal{F} \). We now prove Eq. (47.2). Since we are assuming that \( X_\alpha \in \mathcal{E}_\alpha \) for each \( \alpha \in A \), we see that
\[
\cup_{\alpha \in A} \pi_\alpha^{-1}(E_\alpha) \subset \left\{ \prod_{\alpha \in A} E_\alpha : E_\alpha \in \mathcal{E}_\alpha \text{ for all } \alpha \in A \right\}
\]
and therefore by Eq. (47.1)
\[
\otimes_{\alpha \in A} M_\alpha = \sigma \left( \cup_{\alpha \in A} \pi_\alpha^{-1}(E_\alpha) \right) \subset \sigma \left( \left\{ \prod_{\alpha \in A} E_\alpha : E_\alpha \in \mathcal{E}_\alpha \text{ for all } \alpha \in A \right\} \right).
\]
This last statement is true independent as to whether $A$ is countable or not. For the reverse inclusion it suffices to notice that since $A$ is countable,
\[
\prod_{\alpha \in A} E_\alpha = \cap_{\alpha \in A} \pi_\alpha^{-1}(E_\alpha) \in \otimes_{\alpha \in A} \mathcal{M}_\alpha
\]
and hence
\[
\sigma \left( \left\{ \prod_{\alpha \in A} E_\alpha : E_\alpha \in \mathcal{E}_\alpha \text{ for all } \alpha \in A \right\} \right) \subset \otimes_{\alpha \in A} \mathcal{M}_\alpha.
\]

Remark 47.5. One can not relax the assumption that $X_\alpha \in \mathcal{E}_\alpha$ in the second part of Proposition 47.4. For example, if $X_1 = X_2 = \{1,2\}$ and $\mathcal{E}_1 = \mathcal{E}_2 = \{\{1\}\}$, then $\mathcal{E}(X_1 \times X_2) = \emptyset, X_1 \times X_2, \{(1,1)\}$ while $\sigma(\mathcal{E}(X_1) \times \mathcal{E}(X_2)) = 2^{X_1 \times X_2}$.

Theorem 47.6. Let $\{X_\alpha \}_{\alpha \in A}$ be a sequence of sets where $A$ is at most countable. Suppose for each $\alpha \in A$ we are given a countable set $\mathcal{E}_\alpha \subset 2^{X_\alpha}$. Let $\tau_\alpha = \tau(\mathcal{E}_\alpha)$ be the topology on $X_\alpha$ generated by $\mathcal{E}_\alpha$ and $X$ be the product space $\prod_{\alpha \in A} X_\alpha$ equipped with the product topology $\tau := \otimes_{\alpha \in A} \tau(\mathcal{E}_\alpha)$. Then the Borel $\sigma$–algebra $\mathcal{B}_X = \sigma(\tau)$ is the same as the product $\sigma$–algebra:
\[
\mathcal{B}_X = \otimes_{\alpha \in A} \mathcal{B}_X_\alpha,
\]
where $\mathcal{B}_X_\alpha = \sigma(\tau_\alpha) = \sigma(\mathcal{E}_\alpha)$ for all $\alpha \in A$.

In particular if $A = \{1,2,\ldots,n\}$ and each $(X_i, \tau_i)$ is a second countable topological space, then
\[
\mathcal{B}_X := \sigma(\tau_1 \otimes \tau_2 \otimes \cdots \otimes \tau_n) = \sigma(\mathcal{B}_1 \times \cdots \times \mathcal{B}_n) =: \mathcal{B}_X_1 \otimes \cdots \otimes \mathcal{B}_X_n.
\]

Proof. By Proposition 17.25, the topology $\tau$ may be described as the smallest topology containing $\mathcal{E} = \cup_{\alpha \in A} \tau_\alpha^{-1}(\mathcal{E}_\alpha)$. Now $\mathcal{E}$ is the countable union of countable sets so is still countable. Therefore by Proposition 44.8 and Proposition 47.4
\[
\mathcal{B}_X = \sigma(\tau) = \sigma(\tau(\mathcal{E})) = \sigma(\mathcal{E}) = \otimes_{\alpha \in A} \mathcal{B}_X_\alpha = \mathcal{B}(X_1 \times \cdots \times X_n).
\]

Corollary 47.7. If $(X_i, d_i)$ are separable metric spaces for $i = 1, \ldots, n$, then
\[
\mathcal{B}(X_1) \otimes \cdots \otimes \mathcal{B}(X_n) = \mathcal{B}(X_1 \times \cdots \times X_n)
\]
where $\mathcal{B}(X_i)$ is the Borel $\sigma$–algebra on $X_i$ and $\mathcal{B}(X_1 \times \cdots \times X_n)$ is the Borel $\sigma$–algebra on $X_1 \times \cdots \times X_n$ equipped with the metric topology associated to the metric $d(x,y) = \sum_{i=1}^n d_i(x_i, y_i)$ where $x = (x_1, x_2, \ldots, x_n)$ and $y = (y_1, y_2, \ldots, y_n)$.

Proof. This is a combination of the results in Lemma 17.28 Exercise 17.12 and Theorem 17.6. Because all norms on finite dimensional spaces are equivalent, the usual Euclidean norm on $\mathbb{R}^m \times \mathbb{R}^n$ is equivalent to the “product” norm defined by
\[
\|(x,y)\|_{\mathbb{R}^m \times \mathbb{R}^n} = \|x\|_{\mathbb{R}^m} + \|y\|_{\mathbb{R}^n}.
\]
Hence by Lemma 17.28 the Euclidean topology on $\mathbb{R}^{m+n}$ is the same as the product topology on $\mathbb{R}^m \times \mathbb{R}^n$. Here we are identifying $\mathbb{R}^m \times \mathbb{R}^n$ with $\mathbb{R}^{m+n}$ by the map
\[
(x,y) \in \mathbb{R}^m \times \mathbb{R}^n \to (x_1, \ldots, x_m, y_1, \ldots, y_n) \in \mathbb{R}^{m+n}.
\]
These comments along with Corollary 47.7 proves the following result.

Corollary 47.8. After identifying $\mathbb{R}^m \times \mathbb{R}^n$ with $\mathbb{R}^{m+n}$ as above and letting $\mathcal{B}_{\mathbb{R}^n}$ denote the Borel $\sigma$–algebra on $\mathbb{R}^n$, we have
\[
\mathcal{B}_{\mathbb{R}^{m+n}} = \mathcal{B}_{\mathbb{R}^m} \otimes \mathcal{B}_{\mathbb{R}^n} \text{ and } \mathcal{B}_{\mathbb{R}^n} = \mathcal{B}_{\mathbb{R}} \otimes \cdots \otimes \mathcal{B}_{\mathbb{R}}.
\]

147.1.1 Factoring of Measurable Maps

Lemma 47.9. Suppose that $(Y, \mathcal{Y})$ is a measurable space and $F : X \to Y$ is a map. Then to every $(\sigma(\mathcal{F}), \mathcal{B})$–measurable function, $H : X \to \mathbb{R}$, there is a $(\mathcal{F}, \mathcal{B}_{\mathbb{R}})$–measurable function $h : Y \to \mathbb{R}$ such that $H = h \circ F$.

Proof. First suppose that $H = 1_A$ where $A \in \sigma(\mathcal{F}) = F^{-1}(\mathcal{Y})$. Let $B \in \mathcal{F}$ such that $A = F^{-1}(B)$ then $1_A = 1_{F^{-1}(B)} = 1_B \circ F$ and hence the Lemma is valid in this case with $h = 1_B$. More generally if $H = \sum a_i 1_{A_i}$ is a simple function, then there exists $B_i \in \mathcal{F}$ such that $A_i = 1_{B_i} \circ F$ and hence $H = h \circ F$ with $h := \sum a_i 1_{B_i}$ a simple function on $\mathbb{R}$. For general $(\sigma(\mathcal{F}), \mathcal{F})$–measurable function, $H$, from $X \to \mathbb{R}$, choose simple functions $H_n$ converging to $H$. Let $h_n$ be simple functions on $\mathbb{R}$ such that $H_n = h_n \circ F$. Then it follows that
\[
H = \lim_{n \to \infty} H_n = \limsup_{n \to \infty} h_n \circ F = h \circ F
\]
where $h := \limsup_{n \to \infty} h_n$ a measurable function from $Y$ to $\mathbb{R}$.

The following is an immediate corollary of Proposition 44.17 and Lemma 17.28.

Corollary 47.10. Let $X$ and $A$ be sets, and suppose for $\alpha \in A$ we are given a measurable space $(Y_\alpha, \mathcal{F}_\alpha)$ and a function $f_\alpha : X \to Y_\alpha$. Let $Y := \prod_{\alpha \in A} Y_\alpha, \mathcal{F} := \otimes_{\alpha \in A} \mathcal{F}_\alpha$ be the product $\sigma$–algebra on $Y$ and $\mathcal{M} := \sigma(\mathcal{F}_\alpha : \alpha \in A)$ be the
smallest $\sigma$-algebra on $X$ such that each $f_\alpha$ is measurable. Then the function $F : X \to Y$ defined by $[F(x)]_\alpha := f_\alpha(x)$ for each $\alpha \in A$ is $(\mathcal{M}, \mathcal{F})$ - measurable and a function $H : X \to \mathbb{R}$ is $(\mathcal{M}, \mathcal{B}_\mathbb{R})$ - measurable iff there exists an $(\mathcal{F}, \mathcal{B}_\mathbb{R})$ - measurable function $h$ from $Y$ to $\mathbb{R}$ such that $H = h \circ F$.

**Lemma 47.11.** Let $\mathbb{F}$ be either $[0, \infty)$, $\mathbb{R}$ or $\mathbb{C}$. Suppose $(X, \mathcal{M})$ and $(Y, \mathcal{N})$ are two measurable spaces and $f : X \times Y \to \mathbb{F}$ is a $(\mathcal{M} \otimes \mathcal{N}, \mathcal{B}_\mathbb{F})$ - measurable function, then for each $y \in Y$,

$$x \to f(x, y) \text{ is } (\mathcal{M}, \mathcal{B}_\mathbb{F}) \text{ measurable,} \quad (47.3)$$

for each $x \in X$,

$$y \to f(x, y) \text{ is } (\mathcal{N}, \mathcal{B}_\mathbb{F}) \text{ measurable.} \quad (47.4)$$

**Proof.** Suppose that $E = A \times B \in \mathcal{E} := \mathcal{M} \otimes \mathcal{N}$ and $f = 1_E$. Then

$$f(x, y) = 1_{A \times B}(x, y) = 1_A(x)1_B(y)$$

from which it follows that Eqs. (47.3) and (47.4) hold for this function. Let $\mathcal{H}$ be the collection of all bounded $(\mathcal{M} \otimes \mathcal{N}, \mathcal{B}_\mathbb{F})$ - measurable functions on $X \times Y$ such that Eqs. (47.3) and (47.4) hold, here we assume $\mathbb{F} = \mathbb{R}$ or $\mathbb{C}$. Because measurable functions are closed under taking linear combinations and pointwise limits, $\mathcal{H}$ is linear subspace of $\mathcal{F}^\infty (\mathcal{M} \otimes \mathcal{N}, \mathbb{F})$ which is closed under bounded convergence and contains $1_E \in \mathcal{H}$ for all $E$ in the $\pi$ - class, $\mathcal{E}$. Therefore by Corollary 11.29 $\mathcal{H} = \mathcal{F}^\infty (\mathcal{M} \otimes \mathcal{N}, \mathbb{F})$.

For the general $(\mathcal{M} \otimes \mathcal{N}, \mathcal{B}_\mathbb{F})$ - measurable functions $f : X \times Y \to \mathbb{F}$ and $M \in \mathbb{N}$, let $f_M := 1_{[f] \leq M} f \in \mathcal{F}^\infty (\mathcal{M} \otimes \mathcal{N}, \mathbb{F})$. Then Eqs. (47.3) and (47.4) hold with $f$ replaced by $f_M$ and hence for $f$ as well by letting $M \to \infty$. \hfill \blacksquare

**47.2 Iterated Integrals**

**Notation 47.12 (Iterated Integrals)** If $(X, \mathcal{M}, \mu)$ and $(Y, \mathcal{N}, \nu)$ are two measurable spaces and $f : X \times Y \to \mathbb{C}$ is a $\mathcal{M} \otimes \mathcal{N}$ - measurable function, the **iterated integrals** of $f$ (when they make sense) are:

$$\int_X \, d\mu(x) \int_Y \, d\nu(y) f(x, y) := \int_X \left[ \int_Y f(x, y) \, d\nu(y) \right] \, d\mu(x)$$

and

$$\int_Y \, d\nu(y) \int_X \, d\mu(x) f(x, y) := \int_Y \left[ \int_X f(x, y) \, d\mu(x) \right] \, d\nu(y).$$

**Notation 47.13** Suppose that $f : X \to \mathbb{C}$ and $g : Y \to \mathbb{C}$ are functions, let $f \otimes g$ denote the function on $X \times Y$ given by

$$f \otimes g(x, y) = f(x) g(y).$$

Notice that if $f, g$ are measurable, then $f \otimes g$ is $(\mathcal{M} \otimes \mathcal{N}, \mathcal{B}_\mathbb{C})$ - measurable.

**Theorem 47.14.** Suppose $(X, \mathcal{M}, \mu)$ and $(Y, \mathcal{N}, \nu)$ are $\sigma$-finite measure spaces and $f$ is a nonnegative $(\mathcal{M} \otimes \mathcal{N}, \mathcal{B}_\mathbb{R})$ - measurable function, then for each $y \in Y$,

$$x \to f(x, y) \text{ is } \mathcal{M} - \mathcal{B}_{[0, \infty]} \text{ measurable,} \quad (47.5)$$

for each $x \in X$,

$$y \to f(x, y) \text{ is } \mathcal{N} - \mathcal{B}_{[0, \infty]} \text{ measurable,} \quad (47.6)$$

$$x \to \int_Y f(x, y) \, d\nu(y) \text{ is } \mathcal{M} - \mathcal{B}_{[0, \infty]} \text{ measurable,} \quad (47.7)$$

$$y \to \int_X f(x, y) \, d\mu(x) \text{ is } \mathcal{N} - \mathcal{B}_{[0, \infty]} \text{ measurable,} \quad (47.8)$$

and

$$\int_X \, d\mu(x) \int_Y \, d\nu(y) f(x, y) = \int_Y \, d\nu(y) \int_X \, d\mu(x) f(x, y). \quad (47.9)$$

**Proof.** Suppose that $E = A \times B \in \mathcal{E} := \mathcal{M} \otimes \mathcal{N}$ and $f = 1_E$. Then

$$f(x, y) = 1_{A \times B}(x, y) = 1_A(x)1_B(y)$$

and one sees that Eqs. (47.5) and (47.6) hold. Moreover

$$\int_Y f(x, y) \, d\nu(y) = \int_Y 1_A(x)1_B(y) \, d\nu(y) = 1_A(x) \nu(B),$$

so that Eq. (47.7) holds and we have

$$\int_X \, d\mu(x) \int_Y \, d\nu(y) f(x, y) = \nu(B) \mu(A). \quad (47.10)$$

Similarly,

$$\int_X f(x, y) \, d\mu(x) = \mu(A)1_B(y)$$

and

$$\int_Y \, d\nu(y) \int_X \, d\mu(x) f(x, y) = \nu(B) \mu(A).$$
from which it follows that Eqs. (47.8) and (47.9) hold in this case as well. For the moment let us further assume that \( \mu(X) < \infty \) and \( \nu(Y) < \infty \) and let \( \mathcal{H} \) be the collection of all bounded \((\mathcal{M} \otimes \mathcal{N}, \mathcal{B}_2)\) measurable functions on \( X \times Y \) such that Eqs. (47.5) – (47.9) hold. Using the fact that measurable functions are closed under pointwise limits and the dominated convergence theorem (the dominating function always being a constant), one easily shows that \( \mathcal{H} \) closed under bounded convergence. Since we have just verified that \( 1_E \in \mathcal{H} \) for all \( E \) in the \( \pi \)-class, \( \mathcal{E} \), it follows by Corollary 11.29 that \( \mathcal{H} \) is the space of all bounded \((\mathcal{M} \otimes \mathcal{N}, \mathcal{B}_2)\) measurable functions on \( X \times Y \). Finally if \( f : X \times Y \to [0, \infty) \) is a \((\mathcal{M} \otimes \mathcal{N}, \mathcal{B}_2)\) measurable function, let \( f_M = M \wedge f \) so that \( f_M \uparrow f \) as \( M \to \infty \) and Eqs. (47.5) – (47.9) hold with \( f \) replaced by \( f_M \) for all \( M \in \mathbb{N} \). Repeated use of the monotone convergence theorem allows us to pass to the limit \( M \to \infty \) in these equations to deduce the theorem in the case \( \mu \) and \( \nu \) are finite measures. For the \( \pi \)-finite case, choose \( X_n \in \mathcal{M}, Y_n \in \mathcal{N} \) such that \( X_n \uparrow X, Y_n \uparrow Y, \mu(X_n) < \infty \) and \( \nu(Y_n) < \infty \) for all \( n, m \in \mathbb{N} \). Then define \( \mu_m(A) = \mu(X_m \cap A) \) and \( \nu_n(B) = \nu(Y_n \cap B) \) for all \( A \in \mathcal{M} \) and \( B \in \mathcal{N} \) or equivalently \( d\mu_m = 1_{X_m} \, d\mu \) and \( d\nu_n = 1_{Y_n} \, d\nu \). By what we have just proved Eqs. (47.5) – (47.9) with \( \mu \) replaced by \( \mu_m \) and \( \nu \) by \( \nu_n \) for all \((\mathcal{M} \otimes \mathcal{N}, \mathcal{B}_2)\) measurable functions, \( f : X \times Y \to [0, \infty) \). The validity of Eqs. (47.5) – (47.9) then follows by passing to the limits \( m \to \infty \) and then \( n \to \infty \) making use of the monotone convergence theorem in the form,

\[
\int_X u \, d\mu_m = \int_X u \, 1_{X_m} \, d\mu \uparrow \int_X u \, d\mu \quad \text{as} \quad m \to \infty
\]

and

\[
\int_Y v \, d\mu_n = \int_Y v \, 1_{Y_n} \, d\nu \uparrow \int_Y v \, d\nu \quad \text{as} \quad n \to \infty
\]

for all \( u \in L^+(X, \mathcal{M}) \) and \( v \in L^+(Y, \mathcal{N}) \).

**Corollary 14.17.** Suppose \((X, \mathcal{M}, \mu)\) and \((Y, \mathcal{N}, \nu)\) are \( \sigma \)-finite measure spaces. Then there exists a unique measure \( \pi \) on \( \mathcal{M} \otimes \mathcal{N} \) such that \( \pi(A \times B) = \mu(A) \nu(B) \) for all \( A \in \mathcal{M} \) and \( B \in \mathcal{N} \). Moreover \( \pi \) is given by

\[
\pi(E) = \int_X d\mu(x) \int_Y d\nu(y) 1_E(x,y) = \int_Y d\nu(y) \int_X d\mu(x) 1_E(x,y)
\]

(47.11)

for all \( E \in \mathcal{M} \otimes \mathcal{N} \) and \( \pi \) is \( \sigma \)-finite.

**Proof.** Notice that any measure \( \pi \) such that \( \pi(A \times B) = \mu(A) \nu(B) \) for all \( A \in \mathcal{M} \) and \( B \in \mathcal{N} \) is necessarily \( \sigma \)-finite. Indeed, let \( X_n \in \mathcal{M} \) and \( Y_n \in \mathcal{N} \) be chosen so that \( \mu(X_n) < \infty \), \( \nu(Y_n) < \infty \), \( X_n \uparrow X \) and \( Y_n \uparrow Y \), then \( X_n \times Y_n \in \mathcal{M} \otimes \mathcal{N} \), \( X_n \times Y_n \uparrow X \times Y \) and \( \pi(X_n \times Y_n) < \infty \) for all \( n \). The uniqueness assertion is a consequence of Theorem 45.43 or see Theorem 46.6 below with \( \mathcal{E} = \mathcal{M} \times \mathcal{N} \). For the existence, it suffices to observe, using the monotone convergence theorem, that \( \pi \) defined in Eq. (47.11) is a measure on \( \mathcal{M} \otimes \mathcal{N} \). Moreover this measure satisfies \( \pi(A \times B) = \mu(A) \nu(B) \) for all \( A \in \mathcal{M} \) and \( B \in \mathcal{N} \) from Eq. (47.10).

**Notation 47.16** The measure \( \pi \) is called the product measure of \( \mu \) and \( \nu \) and will be denoted by \( \mu \times \nu \).

**Theorem 47.17 (Tonelli’s Theorem).** Suppose \((X, \mathcal{M}, \mu)\) and \((Y, \mathcal{N}, \nu)\) are \( \sigma \)-finite measure spaces and \( \pi = \mu \times \nu \) is the product measure on \( \mathcal{M} \otimes \mathcal{N} \). If \( f \in L^+(X \times Y, \mathcal{M} \otimes \mathcal{N}) \), then \( f(\cdot, y) \in L^+(X, \mathcal{M}) \) for all \( y \in Y \), \( f(x, \cdot) \in L^+(Y, \mathcal{N}) \) for all \( x \in X \),

\[
\int_Y f(\cdot, y) \, d\nu(y) \in L^+(X, \mathcal{M}), \quad \int_X f(x, \cdot) \, d\mu(x) \in L^+(Y, \mathcal{N})
\]

and

\[
\int_X f(x, \cdot) \, d\mu(x) \int_Y d\nu(y) f(x, y) = \int_Y d\nu(y) \int_X d\mu(x) f(x, y).
\]

(47.12)

(47.13)

**Proof.** By Theorem 47.14 and Corollary 47.15 the theorem holds when \( f = 1_E \) with \( E \in \mathcal{M} \otimes \mathcal{N} \). Using the linearity of all of the statements, the theorem is also true for non-negative simple functions. Then using the monotone convergence theorem repeatedly along with the approximation Theorem 44.34 one deduces the theorem for general \( f \in L^+(X \times Y, \mathcal{M} \otimes \mathcal{N}) \).

The following convention will be in force for the rest of this chapter.

**Convention:** If \((X, \mathcal{M}, \mu)\) is a measure space and \( f : X \to \mathbb{C} \) is a measurable but non-integrable function, i.e. \( \int_X |f| \, d\mu = \infty \), by convention we will define \( \int_X f \, d\mu := 0 \). However if \( f \) is a non-negative function (i.e. \( f : X \to [0, \infty] \)) is a non-integrable function we will still write \( \int_X f \, d\mu = \infty \).

**Theorem 47.18 (Fubini’s Theorem).** Suppose \((X, \mathcal{M}, \mu)\) and \((Y, \mathcal{N}, \nu)\) are \( \sigma \)-finite measure spaces, \( \pi = \mu \times \nu \) is the product measure on \( \mathcal{M} \otimes \mathcal{N} \) and \( f : X \times Y \to \mathbb{C} \) is a \( \mathcal{M} \otimes \mathcal{N} \) measurable function. Then the following three conditions are equivalent:

\[
\int_{X \times Y} |f| \, d\pi < \infty, \quad \text{i.e.} \quad f \in L^1(\pi),
\]

(47.14)

\[
\int_X \left( \int_Y |f(x, y)| \, d\nu(y) \right) \, d\mu(x) < \infty \quad \text{and}
\]

(47.15)

\[
\int_Y \left( \int_X |f(x, y)| \, d\mu(x) \right) \, d\nu(y) < \infty.
\]

(47.16)
If any one (and hence all) of these condition hold, then \( f(x, \cdot) \in L^1(\nu) \) for \( \mu \)-a.e. \( x, f(\cdot, y) \in L^1(\mu) \) for \( \nu \)-a.e. \( y \), \( \int_Y f(\cdot, y) d\nu(y) \in L^1(\mu), \int_X f(x, \cdot) d\mu(x) \in L^1(\nu) \) and Eqs. (47.12) and (47.13) are still valid.

**Proof.** The equivalence of Eqs. (47.14) - (47.16) is a direct consequence of Tonelli’s Theorem 47.17. Now suppose \( f \in L^1(\pi) \) is a real valued function and let

\[
E := \left\{ x \in X : \int_Y |f(x, y)| d\nu(y) = \infty \right\}. \tag{47.17}
\]

Then by Tonelli’s theorem, \( x \to \int_Y |f(x, y)| d\nu(y) \) is measurable and hence \( E \in \mathcal{M} \). Moreover Tonelli’s theorem implies

\[
\int_X \left[ \int_Y |f(x, y)| d\nu(y) \right] d\mu(x) = \int_{X \times Y} |f| d\pi < \infty
\]

which implies that \( \mu(E) = 0 \). Let \( f_\pm \) be the positive and negative parts of \( f \), then using the above convention we have

\[
\int_Y f(x, y) d\nu(y) = \int_Y 1_{E^c}(x) f(x, y) d\nu(y) = \int_Y 1_{E^c}(x) [f_+(x, y) - f_-(x, y)] d\nu(y) = \int_Y 1_{E^c}(x) f_+(x, y) d\nu(y) - \int_Y 1_{E^c}(x) f_-(x, y) d\nu(y). \tag{47.18}
\]

Noting that \( 1_{E^c}(x) f_\pm(x, y) = (1_{E^c} \otimes 1_Y \cdot f_\pm)(x, y) \) is a positive \( \mathcal{M} \otimes \mathcal{N} \) – measurable function, it follows from another application of Tonelli’s theorem that \( x \to \int_Y f(x, y) d\nu(y) \) is \( \mathcal{M} \) – measurable, being the difference of two measurable functions. Moreover

\[
\int_X \left[ \int_Y f(x, y) d\nu(y) \right] d\mu(x) \leq \int_X \left[ \int_Y |f(x, y)| d\nu(y) \right] d\mu(x) < \infty,
\]

which shows \( \int_Y f(\cdot, y) d\nu(y) \in L^1(\mu) \). Integrating Eq. (47.18) on \( x \) and using Tonelli’s theorem repeatedly implies,

\[
\int_X \left[ \int_Y f(x, y) d\nu(y) \right] d\mu(x) = \int_X d\mu(x) \int_Y d\nu(y) 1_{E^c}(x) f_+(x, y) - \int_Y d\mu(x) \int_Y d\nu(y) 1_{E^c}(x) f_-(x, y) = \int_X d\nu(y) \int_X d\mu(x) 1_{E^c}(x) f_+(x, y) - \int_Y d\nu(y) \int_X d\mu(x) 1_{E^c}(x) f_-(x, y) = \int_X d\nu(y) \int_X d\mu(x) f_+(x, y) - \int_Y d\nu(y) \int_X d\mu(x) f_-(x, y) = \int_{X \times Y} f_+ d\pi - \int_{X \times Y} f_- d\pi = \int_{X \times Y} (f_+ - f_-) d\pi = \int_{X \times Y} f d\pi \tag{47.19}
\]

which proves Eq. (47.12) holds.

Now suppose that \( f = u + iv \) is complex valued and again let \( E \) be as in Eq. (47.17). Just as above we still have \( E \in \mathcal{M} \) and \( \mu(E) = 0 \). By our convention,

\[
\int_Y f(x, y) d\nu(y) = \int_Y 1_{E^c}(x) f(x, y) d\nu(y) = \int_Y 1_{E^c}(x) [u(x, y) + iv(x, y)] d\nu(y) = \int_Y 1_{E^c}(x) u(x, y) d\nu(y) + i \int_Y 1_{E^c}(x) v(x, y) d\nu(y)
\]

which is measurable in \( x \) by what we have just proved. Similarly one shows \( \int_Y f(\cdot, y) d\nu(y) \in L^1(\mu) \) and Eq. (47.12) still holds by a computation similar to that done in Eq. (47.19). The assertions pertaining to Eq. (47.13) may be proved in the same way.

**Notation 47.19** Given \( E \subset X \times Y \) and \( x \in X \), let

\[
\mathcal{E}_x := \{ y \in Y : (x, y) \in E \}.
\]

Similarly if \( y \in Y \) is given let

\[
\mathcal{E}_y := \{ x \in X : (x, y) \in E \}.
\]

If \( f : X \times Y \to \mathbb{C} \) is a function let \( f_x = f(x, \cdot) \) and \( f_y := f(\cdot, y) \) so that \( f_x : Y \to \mathbb{C} \) and \( f_y : X \to \mathbb{C} \).

**Theorem 47.20.** Suppose \((X, \mathcal{M}, \mu)\) and \((Y, \mathcal{N}, \nu)\) are complete \( \sigma \) – finite measure spaces. Let \((X \times Y, \mathcal{L})\) be the completion of \((X \times Y, \mathcal{M} \otimes \mathcal{N}, \mu \otimes \nu)\). If \( f \) is \( \mathcal{L} \) – measurable and (a) \( f \geq 0 \) or (b) \( f \in L^1(\lambda) \) then \( f_x \) is \( \mathcal{N} \) – measurable for \( \mu \) a.e. \( x \) and \( f_y \) is \( \mathcal{M} \) – measurable for \( \nu \) a.e. \( y \) and in case (b) \( f_x \in L^1(\mu) \) and \( f_y \in L^1(\nu) \) for \( \mu \) a.e. \( x \) and \( \nu \) a.e. \( y \) respectively. Moreover,

\[
(x \to \int_Y f_x d\nu) \in L^1(\mu) \text{ and } (y \to \int_X f_y d\mu) \in L^1(\nu)
\]
and
\[ \int_{X \times Y} f d\lambda = \int_Y d\nu \int_X d\mu f = \int_X d\mu \int_Y d\nu f. \]

**Proof.** If \( E \in \mathcal{M} \otimes \mathcal{N} \) is a \( \mu \otimes \nu \) null set (i.e. \( (\mu \otimes \nu)(E) = 0 \)), then
\[ 0 = (\mu \otimes \nu)(E) = \int_E (\nu \circ E)d\mu(x) = \int_X \mu(E_y)d\nu(y). \]
This shows that
\[ \mu(\{ x : \nu(\{ x \}) \neq 0 \}) = 0 \quad \text{and} \quad \nu(\{ y : \mu(E_y) \neq 0 \}) = 0, \]
i.e. \( \nu(x) = 0 \) for \( \mu \) a.e. \( x \) and \( \mu(E_y) = 0 \) for \( \nu \) a.e. \( y \). If \( h \) is \( \mathcal{L} \) measurable and \( h = 0 \) for \( \lambda \) a.e., then there exists \( E \in \mathcal{M} \otimes \mathcal{N} \) such that \( \{ (x, y) : h(x, y) \neq 0 \} \subset E \) and \( (\mu \otimes \nu)(E) = 0 \). Therefore \( |h(x, y)| \leq 1_E(x, y) \) and \( (\mu \otimes \nu)(E) = 0 \).

Since
\[ \{ h_x \neq 0 \} = \{ y \in Y : h(x, y) \neq 0 \} \subset E \quad \text{and} \quad \{ h_y \neq 0 \} = \{ x \in X : h(x, y) \neq 0 \} \subset E_y, \]
we learn that for \( \mu \) a.e. \( x \) and \( \nu \) a.e. \( y \) that \( \{ h_x \neq 0 \} \in \mathcal{M}, \{ h_y \neq 0 \} \in \mathcal{N}, \)
\( \nu(\{ h_x \neq 0 \}) = 0 \) and a.e. and \( \mu(\{ h_y \neq 0 \}) = 0 \). This implies \( \int_Y h(x, y)d\nu(y) \) exists and equals 0 for \( \mu \) a.e. \( x \) and similarly that \( \int_X h(x, y)d\mu(x) \) exists and equals 0 for \( \nu \) a.e. \( y \). Therefore
\[ 0 = \int_{X \times Y} h d\lambda = \int_Y \left( \int_X h d\mu \right) d\nu = \int_X \left( \int_Y h d\nu \right) d\mu. \]

For general \( f \in L^1(\lambda) \), we may choose \( g \in L^1(\mathcal{M} \otimes \mathcal{N}, \mu \otimes \nu) \) such that \( f(x, y) = g(x, y) \) for \( \lambda \) a.e. \( (x, y) \). Define \( h := f - g \). Then \( h = 0 \), \( \lambda \) a.e. Hence by what we have just proved and Theorem 47.17, \( f = g + h \) has the following properties:

1. For \( \mu \) a.e. \( x, y \to f(x, y) = g(x, y) + h(x, y) \) is in \( L^1(\nu) \) and
\[ \int_Y f(x, y)d\nu(y) = \int_Y g(x, y)d\nu(y). \]
2. For \( \nu \) a.e. \( x \to f(x, y) = g(x, y) + h(x, y) \) is in \( L^1(\mu) \) and
\[ \int_X f(x, y)d\mu(x) = \int_X g(x, y)d\mu(x). \]

From these assertions and Theorem 47.17 it follows that
\[ \int_X d\mu(x) \int_Y d\nu(y)f(x, y) = \int_X d\mu(x) \int_Y d\nu(y)g(x, y) = \int_Y d\nu(y) \int_X d\mu(x) g(x, y) = \int_{X \times Y} g(x, y)d(\mu \otimes \nu)(x, y) = \int_{X \times Y} f(x, y)d\lambda(x, y). \]
Similarly it is shown that
\[ \int_Y d\nu(y) \int_X d\mu(x)f(x, y) = \int_{X \times Y} f(x, y)d\lambda(x, y). \]

The previous theorems have obvious generalizations to products of any finite number of \( \sigma \) finite measure spaces. For example the following theorem holds.

**Theorem 47.21.** Suppose \( \{(X_i, \mathcal{M}_i, \mu_i)\}_{i=1}^n \) are \( \sigma \) finite measure spaces and \( X := X_1 \times \cdots \times X_n \). Then there exists a unique measure, \( \pi \), on \( (X, \mathcal{M}_1 \otimes \cdots \otimes \mathcal{M}_n) \) such that
\[ \pi(A_1 \times \cdots \times A_n) = \mu_1(A_1) \cdots \mu_n(A_n) \quad \text{for all } A_i \in \mathcal{M}_i. \]
(This measure and its completion will be denoted by \( \mu_1 \otimes \cdots \otimes \mu_n \).) If \( f : X \to [0, \infty] \) is a \( \mathcal{M}_1 \otimes \cdots \otimes \mathcal{M}_n \) measurable function then
\[ \int_X f d\pi = \int_{X_{\sigma(1)}} d\mu(\sigma(1)) \cdots \int_{X_{\sigma(n)}} d\mu(\sigma(n)) f(x_1, \ldots, x_n) \quad (47.20) \]
where \( \sigma \) is any permutation of \( \{1, 2, \ldots, n\} \). This equation also holds for any \( f \in L^1(\pi) \) and moreover, \( f \in L^1(\pi) \) iff
\[ \int_{X_{\sigma(1)}} d\mu(\sigma(1)) \cdots \int_{X_{\sigma(n)}} d\mu(\sigma(n)) |f(x_1, \ldots, x_n)| < \infty \]
for some (and hence all) permutations, \( \sigma \).

This theorem can be proved by the same methods as in the two factor case, see Exercise 12.1. Alternatively, one can use the theorems already proved and induction on \( n \), see Exercise 12.2 in this regard.

**Example 47.22.** In this example we will show
\[ \lim_{M \to \infty} \int_0^M \frac{\sin x}{x} \, dx = \frac{\pi}{2}. \quad (47.21) \]
To see this write \( \frac{1}{x} = \int_0^\infty e^{-tx} dt \) and use Fubini-Tonelli to conclude that

\[
\int_0^M \frac{\sin x}{x} \, dx = \int_0^M \left[ \int_0^\infty e^{-tx} \sin x \, dt \right] \, dx \\
= \int_0^\infty \left[ \int_0^M e^{-tx} \sin x \, dx \right] \, dt \\
= \int_0^\infty \frac{1}{1 + t^2} \left( 1 - te^{-Mt} \sin M - e^{-Mt} \cos M \right) \, dt \\
\to \int_0^\infty \frac{1}{1 + t^2} \, dt = \frac{\pi}{2} \text{ as } M \to \infty,
\]

wherein we have used the dominated convergence theorem to pass to the limit.

The next example is a refinement of this result.

**Example 47.23.** We have

\[
\int_0^\infty \frac{\sin x}{x} e^{-Ax} \, dx = \frac{1}{2} \pi - \arctan A \text{ for all } A > 0 \tag{47.22}
\]

and for \( A, M \in [0, \infty) \),

\[
\left| \int_0^M \frac{\sin x}{x} e^{-Ax} \, dx - \frac{1}{2} \pi + \arctan A \right| \leq C e^{-MA/M} \tag{47.23}
\]

where \( C = \max_{x \geq 0} \frac{1 + x}{4 + x^2} = \frac{1}{2 \sqrt{2} - 2} \approx 1.2 \). In particular Eq. (47.21) is valid.

To verify these assertions, first notice that by the fundamental theorem of calculus,

\[
|\sin x| = \left| \int_0^x \cos y \, dy \right| \leq \int_0^x |\cos y| \, dy \leq \int_0^x 1 \, dy = |x|
\]

so \( |\sin x| \leq 1 \) for all \( x \neq 0 \). Making use of the identity

\[
\int_0^\infty e^{-tx} \, dt = 1/x
\]

and Fubini’s theorem,

\[
\int_0^M \frac{\sin x}{x} e^{-Ax} \, dx = \int_0^M \frac{\sin x}{x} \, dx - \int_0^M \frac{\sin x}{x} \, dx \\
= \int_0^M \frac{\sin x}{x} \, dx - \int_0^\infty \frac{\sin x}{x} \, dx \\
= \frac{\pi}{2} - \arctan A - \varepsilon(M, A) \tag{47.24}
\]

where

\[
\varepsilon(M, A) = \int_0^{\infty} \frac{\cos M + (A + t) \sin M}{(A + t)^2 + 1} e^{-M(A+t)} dt.
\]

Since

\[
\left| \frac{\cos M + (A + t) \sin M}{(A + t)^2 + 1} \right| \leq \frac{1 + (A + t)}{(A + t)^2 + 1} \leq C,
\]

\[
|\varepsilon(M, A)| \leq \int_0^{\infty} e^{-M(A+t)} dt = C e^{-MA/M}.
\]

This estimate along with Eq. (47.24) proves Eq. (47.23) from which Eq. (47.21) follows by taking \( A \to \infty \) and Eq. (47.22) follows (using the dominated convergence theorem again) by letting \( M \to \infty \).

**47.4 Lebesgue Measure on \( \mathbb{R}^d \) and the Change of Variables Theorem**

**Notation 47.24** Let

\[
m^d := m \otimes \cdots \otimes m \text{ on } B_{\mathbb{R}^d} = B_{\mathbb{R}} \otimes \cdots \otimes B_{\mathbb{R}}
\]

be the \( d \)-fold product of Lebesgue measure \( m \) on \( B_{\mathbb{R}} \). We will also use \( m^d \) to denote its completion and let \( \mathcal{L}_d \) be the completion of \( B_{\mathbb{R}^d} \) relative to \( m^d \). A subset \( A \in \mathcal{L}_d \) is called a Lebesgue measurable set and \( m^d \) is called \( d \)-dimensional Lebesgue measure, or just Lebesgue measure for short.

**Definition 47.25.** A function \( f : \mathbb{R}^d \to \mathbb{R} \) is Lebesgue measurable if \( f^{-1}(B_{\mathbb{R}}) \subseteq \mathcal{L}_d \).
**Notation 47.26** I will often be sloppy in the sequel and write \( m \) for \( m^d \) and \( dx \) for \( dm(x) = dm^d(x) \), i.e.

\[
\int_{\mathbb{R}^d} f(x) \, dx = \int_{\mathbb{R}^d} f \, dm = \int_{\mathbb{R}^d} f \, dm^d.
\]

Hopefully the reader will understand the meaning from the context.

**Theorem 47.27.** Lebesgue measure \( m^d \) is translation invariant. Moreover \( m^d \) is the unique translation invariant measure on \( \mathcal{B}_{\mathbb{R}^d} \) such that \( m^d((0,1]^d) = 1 \).

**Proof.** Let \( A = J_1 \times \cdots \times J_d \) with \( J_i \in \mathcal{B}_\mathbb{R} \) and \( x \in \mathbb{R}^d \). Then

\[
 x + A = (x_1 + J_1) \times (x_2 + J_2) \times \cdots \times (x_d + J_d)
\]

and therefore by translation invariance of \( m \) on \( \mathcal{B}_\mathbb{R} \) we find that

\[
m^d(x + A) = m(x_1 + J_1) \ldots m(x_d + J_d) = m(J_1) \ldots m(J_d) = m^d(A)
\]

and hence \( m^d(x + A) = m^d(A) \) for all \( A \in \mathcal{B}_{\mathbb{R}^d} \) by Corollary 45.45. From this fact we see that the measure \( m^d(x+) \) and \( m^d(\cdot) \) have the same null sets. Using this it is easily seen that \( m(x + A) = m(A) \) for all \( A \in \mathcal{L}_d \). The proof of the second assertion is Exercise 12.3.

**Exercise 47.1.** In this problem you are asked to show there is no reasonable notion of Lebesgue measure on an infinite dimensional Hilbert space. To be more precise, suppose \( H \) is an infinite dimensional Hilbert space and \( m \) is a countably additive measure on \( \mathcal{B}_H \) which is invariant under translations and satisfies, \( m(B_0(\varepsilon)) > 0 \) for all \( \varepsilon > 0 \). Show \( m(V) = \infty \) for all non-empty open subsets \( V \subset H \).

BRUCE: perhaps a better proof of the change of variables formula is that of Peter Lax, see [14] and [15]. (See this directory for these papers. I am not sure the second paper is as easy as it should be though.) Also see [30].

**Theorem 47.28 (Change of Variables Theorem).** Let \( \Omega \subset_a \mathbb{R}^d \) be an open set and \( T : \Omega \to T(\Omega) \subset_a \mathbb{R}^d \) be a \( C^1 \)–diffeomorphism. Then for any Borel measurable function, \( f : T(\Omega) \to [0, \infty] \),

\[
\int_{T(\Omega)} f(T(x)) \, \text{det} T'(x) \, |dx| = \int_\Omega f(y) \, dy,
\]

(47.25)

where \( T'(x) \) is the linear transformation on \( \mathbb{R}^d \) defined by \( T'(x)v := \frac{d}{dt}|_0 T(x + tv) \). More explicitly, viewing vectors in \( \mathbb{R}^d \) as columns, \( T'(x) \) may be represented by the matrix

\[
T'(x) = \begin{bmatrix} 
\partial_1 T_1(x) & \ldots & \partial_d T_1(x) \\
\vdots & \ddots & \vdots \\
\partial_1 T_d(x) & \ldots & \partial_d T_d(x) 
\end{bmatrix},
\]

(47.26)

i.e. the \( i - j \) matrix entry of \( T'(x) \) is given by \( T'(x)_{ij} = \partial_i T_j(x) \) where \( T(x) = (T_1(x), \ldots, T_d(x))^\top \) and \( \partial_i = \partial/\partial x_i \).

Remark 47.29. Theorem 47.28 is best remembered as the statement: if we make the change of variables \( y = T(x) \), then \( dy = |\text{det} T'(x)| \, dx \). As usual, you must also change the limits of integration appropriately, i.e. if \( x \) ranges through \( \Omega \) then \( y \) must range through \( T(\Omega) \).

**Proof.** The proof will be by induction on \( d \). The case \( d = 1 \) was essentially done in Exercise 45.8. Nevertheless, for the sake of completeness let us give a proof here. Suppose \( d = 1 \), \( a < \alpha < \beta < b \) such that \( [a, b] \) is a compact subinterval of \( \Omega \). Then \( |\text{det} T'| = |T'| \) and

\[
\int_{[a, b]} 1_{T([\alpha, \beta])} (T(x)) \, T'(x) \, |dx| = \int_{[a, b]} 1_{[\alpha, \beta]} (x) \, |T'(x)| \, dx = \int_{[a, b]} |T'(x)| \, dx.
\]
If \( T'(x) > 0 \) on \([a, b]\), then
\[
\int_{a}^{b} |T'(x)| \, dx = \int_{a}^{b} T'(x) \, dx = T(\beta) - T(\alpha) = m(T((\alpha, \beta])) = \int_{T([a,b])} 1_{T((\alpha, \beta])} (y) \, dy
\]
while if \( T'(x) < 0 \) on \([a, b]\), then
\[
\int_{a}^{b} |T'(x)| \, dx = -\int_{a}^{b} T'(x) \, dx = T(\alpha) - T(\beta) = m(T((\alpha, \beta])) = \int_{T([a,b])} 1_{T((\alpha, \beta])} (y) \, dy.
\]
Combining the previous three equations shows
\[
\int_{[a,b]} f(T'(x)) \cdot |T'(x)| \, dx = \int_{T([a,b])} f(y) \, dy \quad (47.27)
\]
whenever \( f \) is of the form \( f = 1_{T((\alpha, \beta])} \) with \( a < \alpha < \beta < b \). An application of Dynkin’s multiplicative system Theorem [11.26] then implies that Eq. (47.27) holds for every bounded measurable function \( f : T([a,b]) \to \mathbb{R} \). (Observe that \(|T'(x)|\) is continuous and hence bounded for \( x \) in the compact interval \([a, b]\).)

From Exercise [17.21] \( \Omega = \bigcup_{n=1}^{N} (a_n, b_n) \) where \( a_n, b_n \in \mathbb{R} \cup \{\pm \infty\} \) for \( n = 1, 2, \cdots , N \) with \( N = \infty \) possible. Hence if \( f : T(\Omega) \to \mathbb{R}_+ \) is a Borel measurable function and \( a_n < \alpha_k < \beta_k < b_n \) with \( \alpha_k \downarrow a_n \) and \( \beta_k \uparrow b_n \), then by what we have already proved and the monotone convergence theorem
\[
\int_{\Omega} 1_{(a_n, b_n)} \cdot (f \circ T) \cdot |T'| \, dm = \int_{\Omega} (1_{T((\alpha_k, \beta_k])} \cdot f) \circ T \cdot |T'| \, dm
\]
\[
= \lim_{k \to \infty} \int_{\Omega} (1_{T((\alpha_k, \beta_k])} \cdot f) \circ T \cdot |T'| \, dm
\]
\[
= \lim_{k \to \infty} \int_{T(\Omega)} 1_{T((\alpha, \beta])} \cdot f \, dm
\]
\[
= \int_{T(\Omega)} 1_{T((\alpha, \beta])} \cdot f \, dm.
\]
Summing this equality on \( n \), then shows Eq. (47.25) holds.

To carry out the induction step, we now suppose \( d > 1 \) and suppose the theorem is valid with \( d-1 \) and replace \( d-1 \) by \( d-1 \). For notational compactness, let us write vectors in \( \mathbb{R}^d \) as row vectors rather than column vectors. Nevertheless, the matrix associated to the differential, \( T'(x) \), will always be taken to be given as in Eq. (47.26).

Case 1. Suppose \( T(x) \) has the form
\[
T(x) = (x_i, T_2(x), \ldots, T_d(x)) \quad (47.28)
\]
or
\[
T(x) = (T_1(x), \ldots, T_{d-1}(x), x_i) \quad (47.29)
\]
for some \( i \in \{1, \ldots, d\} \). For definiteness we will assume \( T \) is as in Eq. (47.28), the case of \( T \) in Eq. (47.29) may be handled similarly. For \( t \in \mathbb{R} \), let \( t_i : \mathbb{R}^{d-1} \to \mathbb{R}^d \) be the inclusion map defined by
\[
i_t(w) := (w_1, \ldots, w_{i-1}, t, w_{i+1}, \ldots, w_{d-1}),
\]
\( \Omega_t \) be the (possibly empty) open subset of \( \mathbb{R}^{d-1} \) defined by
\[
\Omega_t := \{ w \in \mathbb{R}^{d-1} : (w_1, \ldots, w_{i-1}, t, w_{i+1}, \ldots, w_{d-1}) \in \Omega \}
\]
and \( T_1 : \Omega_t \to \mathbb{R}^{d-1} \) be defined by
\[
T_1(w) = (T_2(w_i), \ldots, T_d(w_i)),
\]
see Figure 47.2. Expanding \( \det T'(w_i) \) along the first row of the matrix \( T'(w_i) \)

\[
\text{Fig. 47.2. In this picture } d = i = 3 \text{ and } \Omega \text{ is an egg-shaped region with an egg-shaped hole. The picture indicates the geometry associated with the map } T \text{ and slicing the set } \Omega \text{ along planes where } x_3 = t.
\]
Now by the Fubini-Tonelli Theorem and the induction hypothesis,

\[
\int_{\mathbb{R}^d} f \circ T |\det T'| dm = \int_{\mathbb{R}^d} 1_{\Omega} \cdot f \circ T |\det T'| dm
\]

\[
= \int_{\mathbb{R}^d} 1_{\Omega} (w_i) |f \circ T (w_i)| |\det T' (w_i)| dw dt \\
= \int_{\mathbb{R}} \int_{T_i(\Omega)} |f (t, T_i (w))| |\det T_i' (w)| dw dt \\
= \int_{\mathbb{R}} \left[ \int_{T_i(\Omega)} f (t, z) dz \right] dt = \int_{\mathbb{R}} \left[ \int_{\mathbb{R}^d} 1_{T_i(\Omega)} (t, z) f (t, z) dz \right] dt \\
= \int_{T_i(\Omega)} f (y) dy \\
\]

wherein the last two equalities we have used Fubini-Tonelli along with the identity;

\[
T (\Omega) = \bigcap_{i \in \mathbb{R}} T (i_\Omega) = \bigcap_{i \in \mathbb{R}} \{ (t, z) : z \in T_i (i_\Omega) \}. \\
\]

Case 2. (Eq. [47.25] is true locally.) Suppose that \( T : \Omega \to \mathbb{R}^d \) is a general map as in the statement of the theorem and \( x_0 \in \Omega \) is an arbitrary point. We will now show there exists an open neighborhood \( W \subset \Omega \) of \( x_0 \) such that

\[
\int_{W} f \circ T |\det T'| dm = \int_{T(W)} f dm \\
\]

holds for all Borel measurable function, \( f : T(W) \to [0, \infty] \). Let \( M_i \) be the 1-i minor of \( T'(x_0) \), i.e. the determinant of \( T'(x_0) \) with the first row and \( i^{th} \) column removed. Since

\[
0 \neq \det T'(x_0) = \sum_{i=1}^{d} (-1)^{i+1} \partial_i T_j (x_0) \cdot M_i, \\
\]

there must be some \( i \) such that \( M_i \neq 0 \). Fix an \( i \) such that \( M_i \neq 0 \) and let,

\[
S (x) := (x_1, T_2 (x), \ldots, T_d (x)). \\
\]

Observe that \( |\det S' (x_0)| = |M_i| \neq 0 \). Hence by the inverse function Theorem there exist an open neighborhood \( W \) of \( x_0 \) such that \( W \subset \Omega \) and \( S (W) \subset \mathbb{R}^d \) and \( S : W \to S (W) \) is a \( C^1 \) – diffeomorphism. Let \( R : S (W) \to T (W) \subset \mathbb{R}^d \) to be the \( C^1 \) – diffeomorphism defined by

\[
R (z) := T \circ S^{-1} (z) \text{ for all } z \in S (W). \\
\]

Because

\[
(T_1 (x), \ldots, T_d (x)) = T (x) = R (S (x)) = R ((x_1, T_2 (x), \ldots, T_d (x))) \\
\]

for all \( x \in W \), if

\[
(z_1, z_2, \ldots, z_d) = S (x) = (x_1, T_2 (x), \ldots, T_d (x)) \\
\]

then

\[
R (z) = (T_1 (S^{-1} (z)), z_2, \ldots, z_d). \\
\]

Observe that \( S \) is a map of the form in Eq. [47.28], \( R \) is a map of the form in Eq. [47.29], \( T' (x) = R' (S (x)) S' (x) \) (by the chain rule) and (by the multiplicative property of the determinant)

\[
|\det T' (x)| = |\det R' (S (x))| |\det S' (x)| \forall x \in W. \\
\]

So if \( f : T(W) \to [0, \infty] \) is a Borel measurable function, two applications of the results in Case 1. shows,

\[
\int_{W} f \circ T |\det T'| dm = \int_{W} (f \circ R \cdot |\det R'|) \circ S \cdot |\det S'| \ dm \\
\]

\[
= \int_{S(W)} f \circ R \cdot |\det R'| dm = \int_{R(S(W))} f dm \\
= \int_{T(W)} f dm \\
\]

and Case 2. is proved.

Case 3. Let \( f : T (\Omega) \to [0, \infty] \) be a general non-negative Borel measurable function and let

\[
K_n := \{ x \in \Omega : \text{ dist}(x, \Omega^c) \geq 1/n \text{ and } |x| \leq n \}. \\
\]

Then each \( K_n \) is a compact subset of \( \Omega \) and \( K_n \uparrow \Omega \) as \( n \to \infty \). Using the compactness of \( K_n \) and case 2, for each \( n \in \mathbb{N} \), there is a finite open cover
Then by the chain rule and the fundamental theorem of calculus, Eq. (47.25) holds with \( W_n \) replaced by \( W \). Let \( \{W_i\}_{i=1}^{\infty} \) be an enumeration of \( \bigcup_{n=1}^{\infty} W_n \) and set \( \hat{W}_i = W_i \) and \( \tilde{W}_i = W_i \backslash (W_1 \cup \cdots \cup W_{i-1}) \) for all \( i \geq 2 \). Then \( \Omega = \bigcap_{i=1}^{\infty} W_i \) and by repeated use of case 2.,

\[
\int_{\Omega} f \circ T \, |\det T'| \, dm = \sum_{i=1}^{\infty} \int_{\tilde{W}_i} f \circ T \, |\det T'| \, dm
\]

\[
= \sum_{i=1}^{\infty} \int_{\tilde{W}_i} [ (1_{T(\hat{W}_i)} f) \circ T ] \, |\det T'| \, dm
\]

\[
= \sum_{i=1}^{\infty} \int_{T(\tilde{W}_i)} f \, dm = \sum_{i=1}^{\infty} \int_{T(\hat{W}_i)} f \, dm
\]

\[
= \int_{T(\Omega)} f \, dm,
\]

wherein we have used \( T(\Omega) = \bigcap_{i=1}^{\infty} T(\hat{W}_i) \) for the last equality.

**Remark 47.30.** When \( d = 1 \), one often learns the change of variables formula as

\[
\int_{a}^{b} f(T(x)) \, T'(x) \, dx = \int_{T(a)}^{T(b)} f(y) \, dy
\]

(47.32)

where \( f : [a, b] \to \mathbb{R} \) is a continuous function and \( T \) is \( C^1 \) – function defined in a neighborhood of \([a, b]\). If \( T' > 0 \) on \((a, b)\) then \( T((a, b)) = (T(a), T(b)) \) and Eq. (47.32) implies Eq. (47.25) with \( \Omega = (a, b) \). On the other hand if \( T' < 0 \) on \((a, b)\) then \( T((a, b)) = (T(b), T(a)) \) and Eq. (47.32) is equivalent to

\[
\int_{(a, b)} f(T(x)) \, (-|T'(x)|) \, dx = -\int_{T(a)}^{T(b)} f(y) \, dy = -\int_{T((a, b))} f(y) \, dy
\]

which is again implies Eq. (47.25). On the other hand Eq. (47.32) is more general than Eq. (47.25) since it does not require \( T \) to be injective. The standard proof of Eq. (47.32) is as follows. For \( z \in T([a, b]) \), let

\[
F(z) := \int_{T(a)}^{z} f(y) \, dy.
\]

Then by the chain rule and the fundamental theorem of calculus,

\[
\int_{a}^{b} f(T(x)) \, T'(x) \, dx = \int_{a}^{b} F'(T(x)) \, T'(x) \, dx = \int_{a}^{b} \frac{d}{dx} [F(T(x))] \, dx
\]

\[
= F(T(x)) \bigg|_{a}^{b} = \int_{T(a)}^{T(b)} f(y) \, dy.
\]

An application of Dynkin’s multiplicative systems theorem (in the form of Corollary [11.30]) now shows that Eq. (47.32) holds for all bounded measurable functions \( f \) on \((a, b)\). Then by the usual truncation argument, it also holds for all positive measurable functions on \((a, b)\).

**Example 47.31.** Continuing the setup in Theorem 47.28, if \( A \in \mathcal{B}_\Omega \), then

\[
m(T(A)) = \int_{\mathbb{R}^d} 1_{T(A)}(y) \, dy = \int_{\mathbb{R}^d} 1_{T(A)}(T(x)) \, |\det T'(x)| \, dx
\]

\[
= \int_{\mathbb{R}^d} 1_A(x) \, |\det T'(x)| \, dx
\]

wherein the second equality we have made the change of variables, \( y = T(x) \). Hence we have shown

\[
d(m \circ T) = |\det T'| \, dm.
\]

In particular if \( T \in GL(d, \mathbb{R}) = GL(\mathbb{R}^d) \) – the space of \( d \times d \) invertible matrices, then \( m \circ T = |\det T| \, m \), i.e.

\[
m(T(A)) = |\det T| \, m(A) \text{ for all } A \in \mathcal{B}_\mathbb{R}^d.
\]

(47.33)

This equation also shows that \( m \circ T \) and \( m \) have the same null sets and hence the equality in Eq. (47.33) is valid for any \( A \in \mathcal{L}_d \).

**Exercise 47.2.** Show that \( f \in L^1(T(\Omega), m^d) \) iff

\[
\int_{\Omega} |f \circ T| \, |\det T'| \, dm < \infty
\]

and if \( f \in L^1(T(\Omega), m^d) \), then Eq. (47.25) holds.

**Example 47.32 (Polar Coordinates).** Suppose \( T : (0, \infty) \times (0, 2\pi) \to \mathbb{R}^2 \) is defined by

\[
x = T(r, \theta) = (r \cos \theta, r \sin \theta),
\]

i.e. we are making the change of variable,

\[
x_1 = r \cos \theta \text{ and } x_2 = r \sin \theta \text{ for } 0 < r < \infty \text{ and } 0 < \theta < 2\pi.
\]

In this case

\[
T'(r, \theta) = \begin{pmatrix} \cos \theta & -r \sin \theta \\ \sin \theta & r \cos \theta \end{pmatrix}
\]

and therefore

\[
dx = |\det T'(r, \theta)| \, drd\theta = rdrd\theta.
\]
Observing that
\[ \mathbb{R}^2 \setminus T \left( (0, \infty) \times (0, 2\pi) \right) = \ell := \{(x, 0) : x \geq 0\} \]
has \( m^2 \) measure zero, it follows from the change of variables Theorem 47.28 that
\[ \int_{\mathbb{R}^2} f(x)dx = \int_0^{2\pi} d\theta \int_0^\infty dr \ r \cdot f(r \cos \theta, \sin \theta) \]  
(47.34)
for any Borel measurable function \( f : \mathbb{R}^2 \to [0, \infty] \).

**Example 47.33 (Holomorphic Change of Variables).** Suppose that \( f : \Omega \subset \mathbb{C} \cong \mathbb{R}^2 \to \mathbb{C} \) is an injective holomorphic function such that \( f'(z) \neq 0 \) for all \( z \in \Omega \). We may express \( f \) as
\[ f(x + iy) = U(x, y) + iV(x, y) \]
for all \( z = x + iy \in \Omega \). Hence if we make the change of variables, \( w = u + iv = f(x + iy) = U(x, y) + iV(x, y) \)
then
\[ dudv = \left| \det \begin{bmatrix} U_x & U_y \\ V_x & V_y \end{bmatrix} \right| dxdy = |U_x V_y - U_y V_x| dxdy. \]
Recalling that \( U \) and \( V \) satisfy the Cauchy Riemann equations, \( U_x = V_y \) and \( U_y = -V_x \) with \( f' = U_x + iV_x \), we learn
\[ U_x V_y - U_y V_x = U_x^2 + V_y^2 = |f'|^2. \]
Therefore
\[ dudv = |f'(x + iy)|^2 dxdy. \]

**Example 47.34.** In this example we will evaluate the integral
\[ I := \iint_{\Omega} (x^4 - y^4) \ dxdy \]
where
\[ \Omega = \{(x, y) : 1 < x^2 - y^2 < 2, 0 < xy < 1\}, \]
see Figure 47.3. We are going to do this by making the change of variables,
\[ (u, v) := T(x, y) = (x^2 - y^2, xy), \]
in which case
\[ dudv = \left| \det \begin{bmatrix} 2x & -2y \\ y & x \end{bmatrix} \right| dxdy = 2 \left( x^2 + y^2 \right) dxdy \]
and therefore \[ I = I_+ + I_- = 2 \cdot \frac{3}{4} = 3/2. \]

**Exercise 47.3 (Spherical Coordinates).** Let \( T : (0, \infty) \times (0, \pi) \times (0, 2\pi) \to \mathbb{R}^3 \) be defined by
\[ T(r, \varphi, \theta) = (r \sin \varphi \cos \theta, r \sin \varphi \sin \theta, r \cos \varphi) \]
= \( r (\sin \varphi \cos \theta, \sin \varphi \sin \theta, \cos \varphi) \),
see Figure 47.4. By making the change of variables \( x = T(r, \varphi, \theta) \), show
\[ \int_{\mathbb{R}^3} f(x)dx = \int_0^\pi d\varphi \int_0^{2\pi} d\theta \int_0^\infty dr \ r^2 \sin \varphi \cdot f(T(r, \varphi, \theta)) \]
for any Borel measurable function, \( f : \mathbb{R}^3 \to [0, \infty] \).

**Lemma 47.35.** Let \( a > 0 \) and
I This shows that

\[ \int e^{-\alpha |x|^2} dm(x). \]

Then \( I_d(a) = (\pi/\alpha)^{d/2} \).

**Proof.** By Tonelli’s theorem and induction,

\[
I_d(a) = \int_{\mathbb{R}^{d-1} \times \mathbb{R}} e^{-\alpha |y|^2} e^{-\alpha t^2} m_{d-1}(dy) \, dt \\
= I_{d-1}(a) I_1(a) = I_1^d(a).
\]

So it suffices to compute:

\[
I_2(a) = \int e^{-\alpha |x|^2} dm(x) = \int_{\mathbb{R}^2 \setminus \{0\}} e^{-\alpha (x_1^2 + x_2^2)} \, dx_1 dx_2.
\]

Using polar coordinates, see Eq. (47.34), we find,

\[
I_2(a) = \int_0^\infty dr \int_0^{2\pi} d\theta \, e^{-\alpha r^2} = 2\pi \int_0^\infty re^{-\alpha r^2} dr \\
= 2\pi \lim_{M \to \infty} \int_0^M re^{-\alpha r^2} dr = 2\pi \lim_{M \to \infty} \frac{e^{-\alpha M^2}}{-2\alpha} \int_0^M \frac{2\pi}{2\alpha} = \pi/\alpha.
\]

This shows that \( I_2(a) = \pi/\alpha \) and the result now follows from Eq. (47.35). ■

### 47.5 The Polar Decomposition of Lebesgue Measure

Let

\[ S^{d-1} = \{ x \in \mathbb{R}^d : |x|^2 := \sum_{i=1}^d x_i^2 = 1 \} \]

be the unit sphere in \( \mathbb{R}^d \) equipped with its Borel \( \sigma \) - algebra, \( \mathcal{B}_{S^{d-1}} \) and \( \Phi : \mathbb{R}^d \setminus \{0\} \to (0, \infty) \times S^{d-1} \) be defined by \( \Phi(x) := (|x|, |x|^{-1} x) \). The inverse map, \( \Phi^{-1} : (0, \infty) \times S^{d-1} \to \mathbb{R}^d \setminus \{0\} \), is given by \( \Phi^{-1}(r, \omega) = rw \). Since \( \Phi \) and \( \Phi^{-1} \) are continuous, they are both Borel measurable. For \( E \in \mathcal{B}_{S^{d-1}} \) and \( a > 0 \), let

\[ E_a := \{ rw : r \in (0, a] \text{ and } \omega \in E \} = \Phi^{-1}((0, a] \times E) \in \mathcal{B}_{\mathbb{R}^d}. \]

**Definition 47.36.** For \( E \in \mathcal{B}_{S^{d-1}} \), let \( \sigma(E) := d \cdot m(E_1) \). We call \( \sigma \) the surface measure on \( S^{d-1} \).

It is easy to check that \( \sigma \) is a measure. Indeed if \( E \in \mathcal{B}_{S^{d-1}} \), then \( E_1 = \Phi^{-1}((0, 1] \times E) \in \mathcal{B}_{\mathbb{R}^d} \) so that \( m(E_1) \) is well defined. Moreover if \( E = \bigsqcup_{i=1}^\infty E_i \), then

\[ \sigma(E) = d \cdot m(E_1) = \sum_{i=1}^\infty m((E_i)_1) = \sum_{i=1}^\infty \sigma(E_i). \]

The intuition behind this definition is as follows. If \( E \subset S^{d-1} \) is a set and \( \varepsilon > 0 \) is a small number, then the volume of

\[ (1, 1 + \varepsilon) \cdot E = \{ rw : r \in (1, 1 + \varepsilon] \text{ and } \omega \in E \} \]

should be approximately given by \( m((1, 1 + \varepsilon) \cdot E) \approx \sigma(E) \varepsilon \), see Figure 47.5 below. On the other hand

![Figure 47.5](image-url)
568  47 Multiple Integrals

\[ m((1, 1 + \varepsilon)E) = m(E_{1+\varepsilon} \setminus E_1) = \{(1 + \varepsilon)^d - 1\} m(E_1). \]

Therefore we expect the area of \( E \) should be given by

\[ \sigma(E) = \lim_{\varepsilon \to 0} \frac{\{(1 + \varepsilon)^d - 1\} m(E_1)}{\varepsilon} = d \cdot m(E_1). \]

The following theorem is motivated by Example 47.32 and Exercise 47.3

**Theorem 47.37 (Polar Coordinates).** If \( f : \mathbb{R}^d \to [0, \infty] \) is a \((\mathcal{B}_{\mathbb{R}^d}, \mathcal{B})\)-measurable function then

\[ \int_{\mathbb{R}^d} f(x) dm(x) = \int_{(0, \infty) \times S^{d-1}} f(r\omega) r^{d-1} ddrd\sigma(\omega). \]

(47.36)

In particular if \( f : \mathbb{R}_+ \to \mathbb{R}_+ \) is measurable then

\[ \int_{\mathbb{R}_+^d} f(|x|) dx = \int_0^\infty f(r) dV(r) \]

(47.37)

where \( V(r) = m(B(0, r)) = r^d m(B(0, 1)) = d^{-1} \sigma(S^{d-1}) r^d \).

**Proof.** By Exercise 45.7

\[ \int_{\mathbb{R}^d} f dm = \int_{\mathbb{R}_+^d} (f \circ \Phi^{-1}) \circ \Phi dm = \int_{(0, \infty) \times S^{d-1}} (f \circ \Phi^{-1}) d(\Phi_* m) \]

(47.38)

and therefore to prove Eq. (47.36) we must work out the measure \( \Phi_* m \) on \( \mathcal{B}_{(0, \infty)} \otimes \mathcal{B}_{S^{d-1}} \) defined by

\[ \Phi_* m(A) := m(\Phi^{-1}(A)) \forall A \in \mathcal{B}_{(0, \infty)} \otimes \mathcal{B}_{S^{d-1}}. \]

(47.39)

If \( A = (a, b) \times E \) with \( 0 < a < b \) and \( E \in \mathcal{B}_{S^{d-1}} \), then

\[ \Phi^{-1}(A) = \{r \omega : r \in (a, b) \text{ and } \omega \in E\} = bE_1 \setminus aE_1 \]

wherein we have used \( E_a = aE_1 \) in the last equality. Therefore by the basic scaling properties of \( m \) and the fundamental theorem of calculus,

\[ (\Phi_* m)((a, b] \times E) = m(bE_1 \setminus aE_1) = m(bE_1) - m(aE_1) = b^d m(E_1) - a^d m(E_1) = d \cdot m(E_1) \int_a^b r^{d-1} dr. \]

(47.40)

Letting \( d\rho(r) = r^{d-1} dr \), i.e.

\[ \rho(J) = \int_J r^{d-1} dr \forall J \in \mathcal{B}_{(0, \infty)}, \]

(47.41)

Eq. (47.40) may be written as

\[ (\Phi_* m)((a, b] \times E) = (\rho(a, b]) \cdot \sigma(E) = (\rho \otimes \sigma)((a, b] \times E). \]

(47.42)

Since

\[ E = \{(a, b] \times E : 0 < a < b \text{ and } E \in \mathcal{B}_{S^{d-1}}\}, \]

is a \( \pi \) class (in fact it is an elementary class) such that \( \sigma(E) = \mathcal{B}_{(0, \infty)} \otimes \mathcal{B}_{S^{d-1}} \), it follows from Theorem 47.43 and Eq. (47.42) that \( \Phi_* m = \rho \otimes \sigma \). Using this result in Eq. (47.38) gives

\[ \int_{\mathbb{R}^d} f dm = \int_{(0, \infty) \times S^{d-1}} (f \circ \Phi^{-1}) d(\rho \otimes \sigma) \]

which combined with Tonelli’s Theorem 47.17 proves Eq. (47.38). \( \Box \)

**Corollary 47.38.** The surface area \( \sigma(S^{d-1}) \) of the unit sphere \( S^{d-1} \subset \mathbb{R}^d \) is

\[ \sigma(S^{d-1}) = \frac{2\pi^{d/2}}{\Gamma(d/2)} \]

(47.43)

where \( \Gamma \) is the gamma function given by

\[ \Gamma(x) := \int_0^\infty u^{x-1} e^{-u} du \]

(47.44)

Moreover, \( \Gamma(1/2) = \sqrt{\pi} \), \( \Gamma(1) = 1 \) and \( \Gamma(x+1) = x\Gamma(x) \) for \( x > 0 \).

**Proof.** Using Theorem 47.37 we find

\[ I_d(1) = \int_0^\infty dr r^{d-1} e^{-r^2} \int_{S^{d-1}} d\sigma = \sigma(S^{d-1}) \int_0^\infty r^{d-1} e^{-r^2} dr. \]

We simplify this last integral by making the change of variables \( u = r^2 \) so that \( r = u^{1/2} \) and \( dr = \frac{1}{2} u^{-1/2} du \). The result is

\[ \int_0^\infty r^{d-1} e^{-r^2} dr = \frac{1}{2} \int_0^\infty u^{d/2} e^{-u/2} du \]

\[ = \frac{1}{2} \int_0^\infty u^{d/2} e^{-u} du = \frac{1}{2} \Gamma(d/2). \]

(47.45)

Combining the last two equations with Lemma 47.32 which states that \( I_d(1) = \pi^{d/2} \), we conclude that
\[ \pi^{d/2} = I_d(1) = \frac{1}{2} \sigma(S^{d-1}) \Gamma(d/2) \]

which proves Eq. (47.43). Example 45.12 implies \( \Gamma(1) = 1 \) and from Eq. (47.45),

\[ \Gamma(1/2) = 2 \int_0^\infty e^{-r^2} \, dr = \int_0^\infty e^{-r^2} \, dr \]

\[ = I_1(1) = \sqrt{\pi}. \]

The relation, \( \Gamma(x+1) = x \Gamma(x) \) is the consequence of the following integration by parts argument:

\[ \Gamma(x+1) = \int_0^\infty e^{-u} \, \frac{du}{u} = \int_0^\infty u^{x-1} e^{-u} \, du \]

\[ = x \int_0^\infty u^{x-1} e^{-u} \, du = x \Gamma(x). \]

\[ \blacksquare \]

BRUCE: add Morrey’s Inequality ?? here.

### 47.6 More proofs of the classical Weierstrass approximation Theorem 50.35

In each of these proofs we will use the reduction explained the previous proof of Theorem 50.35 to reduce to the case where \( f \in C([0, 1]^d) \). The first proof we will give here is based on the “weak law” of large numbers. The second will be another approximate \( \delta \) – function argument.

**Proof.** of Theorem 50.35 Let \( 0 = (0, 0, \ldots, 0), 1 = (1, 1, \ldots, 1) \) and \( [0, 1]^d \). By considering the real and imaginary parts of \( f \) separately, it suffices to assume \( f \in C([0, 1], \mathbb{R}) \). For \( x \in [0, 1] \), let \( \nu_x \) be the measure on \( [0, 1] \) such that \( \nu_x \{ \{ 0 \} \} = 1 - x \) and \( \nu_x \{ \{ 1 \} \} = x \). Then

\[ \int_{[0,1]} y d\nu_x(y) = 0 \cdot (1 - x) + 1 \cdot x = x \quad (47.46) \]

\[ \int_{[0,1]} (y - x)^2 d\nu_x(y) = x^2 (1 - x) + (1 - x)^2 \cdot x = x(1 - x). \quad (47.47) \]

For \( x \in [0, 1] \) let \( \mu_x = \nu_{x_1} \otimes \cdots \otimes \nu_{x_d} \) be the product of \( \nu_{x_1}, \ldots, \nu_{x_d} \) on \( \Omega := [0, 1]^d \). Alternatively the measure \( \mu_x \) may be described by

\[ \mu_x \{ \{ \varepsilon \} \} = \prod_{i=1}^d \frac{1}{1 - x_i} \, x_i^\varepsilon, \quad (47.48) \]

for \( \varepsilon \in \Omega \). Notice that \( \mu_x \{ \{ \varepsilon \} \} \) is a degree \( d \) polynomial in \( x \) for each \( \varepsilon \in \Omega \).

For \( n \in \mathbb{N} \) and \( x \in [0, 1] \), let \( \mu^n \) denote the \( n \) – fold product of \( \mu_x \) with itself on \( \Omega^n \), \( X_i(\omega) = \omega_i \in \Omega \subset \mathbb{R}^d \) for \( \omega \in \Omega^n \) and let

\[ S_n = (S_{n_1}^1, \ldots, S_{n_d}^d) := (X_1 + X_2 + \cdots + X_n)/n, \]

so \( S_n : \Omega^n \to \mathbb{R}^d \). The reader is asked to verify (Exercise 47.4) that

\[ \int_{\Omega^n} S_n d\mu^n_x := \left( \int_{\Omega^n} S_{n}^1 d\mu^n_x, \ldots, \int_{\Omega^n} S_{n}^d d\mu^n_x \right) = (x_1, \ldots, x_d) = x \quad (47.49) \]

and

\[ \int_{\Omega^n} |S_n - x|^2 d\mu^n_x = \frac{1}{n} \sum_{i=1}^d x_i(1 - x_i) \leq \frac{d}{n}. \quad (47.50) \]

From these equations it follows that \( S_n \) is concentrating near \( x \) as \( n \to \infty \), a manifestation of the law of large numbers. Therefore it is reasonable to expect

\[ p_n(x) := \int_{\Omega^n} f(S_n) d\mu^n_x \quad (47.51) \]

should approach \( f(x) \) as \( n \to \infty \). Let \( \varepsilon > 0 \) be given, \( M = \sup \{|f(x)| : x \in [0, 1]\} \) and

\[ \delta_\varepsilon = \sup \{|f(y) - f(x)| : x, y \in [0, 1] \text{ and } |y - x| \leq \varepsilon \}. \]

By uniform continuity of \( f \) on \([0, 1]\), \( \lim_{\varepsilon \to 0} \delta_\varepsilon = 0 \). Using these definitions and the fact that \( \mu^n_x(\Omega^n) = 1 \),

\[ |f(x) - p_n(x)| = \left| \int_{\Omega^n} (f(x) - f(S_n)) \, d\mu^n_x \right| \leq \int_{\Omega^n} |f(x) - f(S_n)| \, d\mu^n_x \]

\[ \leq \int_{\{|S_n - x| > \varepsilon\}} |f(x) - f(S_n)| \, d\mu^n_x + \int_{\{|S_n - x| \leq \varepsilon\}} |f(x) - f(S_n)| \, d\mu^n_x \]

\[ \leq 2M \mu^n_x (|S_n - x| > \varepsilon) + \delta_\varepsilon. \quad (47.52) \]

By Chebyshev’s inequality,

\[ \mu^n_x (|S_n - x| > \varepsilon) \leq \frac{1}{\varepsilon^2} \int_{\Omega^n} (S_n - x)^2 d\mu^n_x = \frac{d}{n \varepsilon^2}, \]

and therefore, Eq. (47.52) yields the estimate

\[ \|f - p_n\|_\infty \leq \frac{2dM}{n \varepsilon^2} + \delta_\varepsilon \]

and hence
This completes the proof since, using Eq. (47.48),

\[ p_n(x) = \sum_{\omega \in \Omega^n} f(S_n(\omega))p_x^n(\{\omega\}) = \sum_{\omega \in \Omega^n} f(S_n(\omega)) \prod_{i=1}^n \mu_x(\{\omega_i\}), \]

is an nd-degree polynomial in \( x \in \mathbb{R}^d \).

\[ \limsup_{n \to \infty} \|f - p_n\|_\infty \leq \delta \rightarrow 0 \text{ as } \varepsilon \downarrow 0. \]

**Exercise 47.4.** Verify Eqs. (47.49) and (47.50). This is most easily done using Eqs. (47.40) and (47.47) and Fubini’s theorem repeatedly. (Of course Fubini’s theorem here is over kill since these are only finite sums after all. Nevertheless it is convenient to use this formulation.)

The second proof requires the next two lemmas.

**Lemma 47.39 (Approximate \( \delta \)-sequences).** Suppose that \( \{Q_n\}_{n=1}^\infty \) is a sequence of positive functions on \( \mathbb{R}^d \) such that

\[ \int_{\mathbb{R}^d} Q_n(x) \, dx = 1 \quad \text{and} \quad \lim_{n \to \infty} \int_{|x| \geq \varepsilon} Q_n(x) \, dx = 0 \text{ for all } \varepsilon > 0. \]

(47.53)

(47.54)

For \( f \in BC(\mathbb{R}^d) \), \( Q_n * f \) converges to \( f \) uniformly on compact subsets of \( \mathbb{R}^d \).

**Proof.** The proof is exactly the same as the proof of Lemma 50.29 it is only necessary to replace \( \mathbb{R}^d \) by \( \mathbb{R}^d \) everywhere in the proof.

Define

\[ Q_n : \mathbb{R}^n \to [0, \infty) \text{ by } Q_n(x) = q_n(x_1) \ldots q_n(x_d). \]

(47.55)

where \( q_n \) is defined in Eq. (50.25).

**Lemma 47.40.** The sequence \( \{Q_n\}_{n=1}^\infty \) is an approximate \( \delta \)-sequence, i.e. they satisfy Eqs. (47.53) and (47.54).

**Proof.** The fact that \( Q_n \) integrates to one is an easy consequence of Tonelli’s theorem and the fact that \( q_n \) integrates to one. Since all norms on \( \mathbb{R}^d \) are equivalent, we may assume that \( |x| = \max \{ |x_i| : i = 1, 2, \ldots, d \} \) when proving Eq. (47.54). With this norm

\[ \{ x \in \mathbb{R}^d : |x| \geq \varepsilon \} = \cup_{i=1}^d \{ x \in \mathbb{R}^d : |x_i| \geq \varepsilon \} \]

and therefore by Tonelli’s theorem,

\[ \int_{\mathbb{R}^d} Q_n(x) \, dx \leq \sum_{i=1}^d \int_{\{|x_i| \geq \varepsilon\}} Q_n(x) \, dx = d \int_{\{x \in \mathbb{R}^d : |x| \geq \varepsilon\}} q_n(t) \, dt \]

which tends to zero as \( n \to \infty \) by Lemma 50.30.

**Proof.** Proof of Theorem 50.35. Again we assume \( f \in C(\mathbb{R}^d, \mathbb{C}) \) and \( f \equiv 0 \) on \( Q_\delta \) where \( Q_d := (0, 1)^d \). Let \( Q_n(x) \) be defined as in Eq. (47.55). Then by Lemma 47.40 and 47.39 \( p_n(x) := (Q_n * f)(x) \to F(x) \) uniformly for \( x \in [0, 1] \) as \( n \to \infty \). So to finish the proof it only remains to show \( p_n(x) \) is a polynomial when \( x \in [0, 1] \). For \( x \in [0, 1] \),

\[ p_n(x) = \int_{\mathbb{R}^d} Q_n(x - y)f(y) \, dy = \frac{1}{c_n} \int_{[0,1]} f(y) \prod_{i=1}^d \left[ c_n^{-1}(1 - (x_i - y_i)^2)^n \right]_{1|x_i - y_i|\leq 1} \, dy = \frac{1}{c_n} \int_{[0,1]} f(y) \prod_{i=1}^d \left[ c_n^{-1}(1 - (x_i - y_i)^2)^n \right] \, dy. \]

Since the product in the above integrand is a polynomial if \( (x, y) \in \mathbb{R}^d \times \mathbb{R}^d \), it follows easily that \( p_n(x) \) is polynomial in \( x \).

### 47.7 More Spherical Coordinates

In this section we will define spherical coordinates in all dimensions. Along the way we will develop an explicit method for computing surface integrals on spheres. As usual when \( n = 2 \) define spherical coordinates \((r, \theta, \phi) \in (0, \infty) \times [0, 2\pi) \) so that

\[ \begin{pmatrix} x_1 \\ x_2 \\ x_3 \end{pmatrix} = \begin{pmatrix} r \cos \theta \\ r \sin \theta \end{pmatrix} = T_1(\theta, r). \]

For \( n = 3 \) we let \( x_3 = r \cos \phi_1 \) and then

\[ \begin{pmatrix} x_1 \\ x_2 \\ x_3 \end{pmatrix} = T_2(\theta, r \sin \phi_1), \]

as can be seen from Figure 47.1 so that

\[ \begin{pmatrix} x_1 \\ x_2 \\ x_3 \end{pmatrix} = \begin{pmatrix} r \sin \phi_1 \cos \theta \\ r \sin \phi_1 \sin \theta \\ r \cos \phi_1 \end{pmatrix} = T_3(\theta, \varphi_1, r). \]

We continue to work inductively this way to define
Fig. 47.6. Setting up polar coordinates in two and three dimensions.

\[
\begin{pmatrix}
    x_1 \\
    \vdots \\
    x_n \\
    x_{n+1}
\end{pmatrix} = \begin{pmatrix}
    T_n(\theta, \varphi_1, \ldots, \varphi_{n-2}, \sin \varphi_{n-1}, r) \\
    \vdots \\
    T_n(\theta, \varphi_1, \ldots, \varphi_{n-2}, \sin \varphi_{n-1}, r, r \cos \varphi_{n-1})
\end{pmatrix} = T_{n+1}(\theta, \varphi_1, \ldots, \varphi_{n-2}, \varphi_{n-1}, r).
\]

So for example,

\[
\begin{align*}
x_1 &= r \sin \varphi_2 \sin \varphi_1 \cos \theta \\
x_2 &= r \sin \varphi_2 \sin \varphi_1 \sin \theta \\
x_3 &= r \sin \varphi_2 \cos \varphi_1 \\
x_4 &= r \cos \varphi_2
\end{align*}
\]

and more generally,

\[
\begin{align*}
x_1 &= r \sin \varphi_{n-2} \cdots \sin \varphi_2 \sin \varphi_1 \cos \theta \\
x_2 &= r \sin \varphi_{n-2} \cdots \sin \varphi_2 \sin \varphi_1 \sin \theta \\
x_3 &= r \sin \varphi_{n-2} \cdots \sin \varphi_2 \cos \varphi_1 \\
&\vdots \\
x_{n-2} &= r \sin \varphi_{n-2} \sin \varphi_{n-3} \cos \varphi_{n-4} \\
x_{n-1} &= r \sin \varphi_{n-2} \cos \varphi_{n-3} \\
x_n &= r \cos \varphi_{n-2}.
\end{align*}
\]

By the change of variables formula,

\[
\int_{\mathbb{R}^n} f(x)dm(x) = \int_0^\infty \int_{0 \leq \varphi_1 \leq \pi} \int_{0 \leq \theta \leq 2\pi} d\varphi_1 \cdots d\varphi_{n-2} d\theta \Delta_n(\theta, \varphi_1, \ldots, \varphi_{n-2}, r) f(T_n(\theta, \varphi_1, \ldots, \varphi_{n-2}, r))
\]

where

\[
\Delta_n(\theta, \varphi_1, \ldots, \varphi_{n-2}, r) := |\det T_n(\theta, \varphi_1, \ldots, \varphi_{n-2}, r)|.
\]

**Proposition 47.41.** The Jacobian, \( \Delta_n \) is given by

\[
\Delta_n(\theta, \varphi_1, \ldots, \varphi_{n-2}, r) = r^{n-1} \sin^{n-2} \varphi_{n-2} \cdots \sin^2 \varphi_2 \sin \varphi_1.
\]

If \( f \) is a function on \( rS^{n-1} \) – the sphere of radius \( r \) centered at 0 inside of \( \mathbb{R}^n \), then

\[
\int_{rS^{n-1}} f(x)d\sigma(x) = r^{n-1} \int_{S^{n-1}} f(r\omega)d\sigma(\omega)
\]

\[
= \int_{0 \leq \varphi_1 \leq \pi, 0 \leq \theta \leq 2\pi} f(T_n(\theta, \varphi_1, \ldots, \varphi_{n-2}, r)) \Delta_n(\theta, \varphi_1, \ldots, \varphi_{n-2}, r)d\varphi_1 \cdots d\varphi_{n-2} d\theta.
\]

**Proof.** We are going to compute \( \Delta_n \) inductively. Letting \( \rho := r \sin \varphi_{n-1} \) and writing \( \frac{\partial T_n}{\partial \xi} \) for \( \frac{\partial T_n}{\partial \xi}(\theta, \varphi_1, \ldots, \varphi_{n-2}, \rho) \) we have

\[
\Delta_{n+1}(\theta, \varphi_1, \ldots, \varphi_{n-2}, \varphi_{n-1}, r) = \begin{vmatrix}
    \frac{\partial T_n}{\partial \theta} & \frac{\partial T_n}{\partial \varphi_1} & \ldots & \frac{\partial T_n}{\partial \varphi_{n-2}} & \frac{\partial T_n}{\partial r} \\
    0 & 0 & \ldots & 0 & -r \sin \varphi_{n-1} & \cos \varphi_{n-1}
\end{vmatrix}
\]

\[
r (\cos^2 \varphi_{n-1} + \sin^2 \varphi_{n-1}) \Delta_n(\theta, \varphi_1, \ldots, \varphi_{n-2}, \rho)
\]

\[
r \Delta_n(\theta, \varphi_1, \ldots, \varphi_{n-2}, r \sin \varphi_{n-1}),
\]

i.e.

\[
\Delta_{n+1}(\theta, \varphi_1, \ldots, \varphi_{n-2}, \varphi_{n-1}, r) = r \Delta_n(\theta, \varphi_1, \ldots, \varphi_{n-2}, r \sin \varphi_{n-1}).
\]

To arrive at this result we have expanded the determinant along the bottom row. Starting with \( \Delta_2(\theta, r) = r \) already derived in Example 47.32 Eq. (47.60) implies,

\[
\Delta_3(\theta, \varphi_1, r) = r \Delta_2(\theta, r \sin \varphi_1) = r^2 \sin \varphi_1
\]

\[
\Delta_4(\theta, \varphi_1, \varphi_2, r) = r \Delta_3(\theta, \varphi_1, r \sin \varphi_2) = r^3 \sin^2 \varphi_2 \sin \varphi_1
\]

\[
\vdots
\]

\[
\Delta_n(\theta, \varphi_1, \ldots, \varphi_{n-2}, r) = r^{n-1} \sin^{n-2} \varphi_{n-2} \cdots \sin^2 \varphi_2 \sin \varphi_1
\]

which proves Eq. (47.58). Equation (47.59) now follows from Eqs. (47.36), (47.57) and (47.58). \( \blacksquare \)

As a simple application, Eq. (47.59) implies
\[
\sigma(S^{n-1}) = \int_{0 \leq \varphi_1 \leq \pi, 0 \leq \theta \leq 2\pi} \sin^{n-2} \varphi_{n-2} \cdots \sin^2 \varphi_2 \sin \varphi_1 d\varphi_1 \cdots d\varphi_{n-2} d\theta \\
= 2\pi \prod_{k=1}^{n-2} \gamma_k = \sigma(S^{n-2}) \gamma_{n-2} 
\]
(47.61)

where \( \gamma_k := \int_0^\pi \sin^k \varphi d\varphi \). If \( k \geq 1 \), we have by integration by parts that,

\[
\gamma_k = \int_0^\pi \sin^k \varphi d\varphi = -\int_0^\pi \sin^{k-1} \varphi \cos \varphi \ d\varphi = 2\delta_{k,1} + (k-1) \int_0^\pi \sin^{k-2} \varphi \cos^2 \varphi d\varphi \\
= 2\delta_{k,1} + (k-1) \int_0^\pi \sin^{k-2} \varphi \ (1-\sin^2 \varphi) \ d\varphi = 2\delta_{k,1} + (k-1) [\gamma_{k-2} - \gamma_k]
\]

and hence \( \gamma_k \) satisfies \( \gamma_0 = \pi, \gamma_1 = 2 \) and the recursion relation

\[
\gamma_k = \frac{k-1}{k} \gamma_{k-2} \quad \text{for} \quad k \geq 2.
\]

Hence we may conclude

\[
\gamma_0 = \pi, \quad \gamma_1 = 2, \quad \gamma_2 = \frac{1}{2} \pi, \quad \gamma_3 = \frac{3}{4} \pi, \quad \gamma_4 = \frac{31}{24} \pi, \quad \gamma_5 = \frac{42}{53} \pi, \quad \gamma_6 = \frac{631}{84} \pi
\]

and more generally by induction that

\[
\gamma_{2k} = \pi \frac{(2k-1)!!}{(2k)!!} \quad \text{and} \quad \gamma_{2k+1} = \frac{2}{(2k+1)!!},
\]

Indeed,

\[
\gamma_{2(k+1)+1} = \frac{2k+2}{2k+3} \gamma_{2k+1} = \frac{2k+2}{2k+3} \frac{(2k)!!}{(2k+1)!!} = \frac{2}{(2k+1)!!} \frac{[2(2k+1)]!!}{(2k+1)!!}
\]

and

\[
\gamma_{2(k+1)} = \frac{2k+1}{2k+2} \gamma_{2k} = \frac{2k+1}{2k+2} \frac{(2k-1)!!}{(2k)!!} = \pi \frac{(2k+1)!!}{(2k+2)!!}.
\]

The recursion relation in Eq. (47.61) may be written as

\[
\sigma(S^n) = \sigma(S^{n-1}) \gamma_{n-1} 
\]
(47.62)

which combined with \( \sigma(S^1) = 2\pi \) implies

\[
\sigma(S^1) = 2\pi, \\
\sigma(S^2) = 2\pi \cdot \gamma_1 = 2\pi \cdot 2, \\
\sigma(S^3) = 2\pi \cdot 2 \cdot \gamma_2 = 2\pi \cdot 2 \cdot \frac{1}{2} \pi = \frac{2^2\pi^2}{2!!}, \\
\sigma(S^4) = \frac{2^2\pi^2}{2!!} \cdot \gamma_3 = \frac{2^2\pi^2}{2!!} \cdot \frac{2}{3} \pi = \frac{2^3\pi^3}{3!!}, \\
\sigma(S^5) = 2\pi \cdot 2 \cdot \frac{1}{2} \pi \cdot \frac{2}{3} \cdot \frac{3}{4} \cdot \frac{5}{6} \pi = \frac{2^4\pi^3}{4!!}, \\
\sigma(S^6) = 2\pi \cdot 2 \cdot \frac{1}{2} \pi \cdot \frac{2}{3} \cdot \frac{3}{4} \cdot \frac{5}{6} \pi = \frac{2^4\pi^3}{5!!}
\]

and more generally that

\[
\sigma(S^{2n}) = \frac{2 (2\pi)^n}{(2n-1)!!} \quad \text{and} \quad \sigma(S^{2n+1}) = \frac{(2\pi)^{n+1}}{(2n)!!} (47.63)
\]

which is verified inductively using Eq. (47.62). Indeed,

\[
\sigma(S^{2n+1}) = \sigma(S^{2n}) \gamma_{2n} = \frac{2 (2\pi)^n}{(2n-1)!!} \cdot \frac{(2n-1)!!}{(2n)!!} = \frac{(2\pi)^{n+1}}{(2n)!!} \quad (47.63)
\]

and

\[
\sigma(S^{n+1}) = \sigma(S^{2n+2}) = \sigma(S^{2n+1}) \gamma_{2n+1} = \frac{(2\pi)^{n+1}}{(2n)!!} \cdot \frac{2 (2n)!!}{(2n+1)!!} = \frac{2 (2\pi)^{n+1}}{(2n+1)!!}.
\]

Using

\[
(2n)!! = 2n (2(n-1)) \cdots (2 \cdot 1) = 2^n n!
\]

we may write \( \sigma(S^{2n+1}) = \frac{2^{n+1}}{n!} \pi \) which shows that Eqs. (47.36) and (47.63) are in agreement. We may also write the formula in Eq. (47.63) as

\[
\sigma(S^n) = \begin{cases} 
\frac{2(2\pi)^{n/2}}{(n-1)!!} & \text{for } n \text{ even} \\
\frac{2(2\pi)^{n/2} (n-1)!}{(2n-1)!!} & \text{for } n \text{ odd.}
\end{cases}
\]

### 47.8 Exercises

More on Construction of Measures
Carathéodory’s Construction of Measures

The main goals of this chapter is to prove the two measure construction Theorems [43.49 and 27.9]. Throughout this chapter, $X$ will be a given set.

48.1 Premeasures

BRUCE: This needs to be rewritten reflecting the fact that the integral has already been defined. I guess that we have already seen that if a finitely additive measure $\mu$ is to have an extension to a measure then it must be a premeasure.

Proposition 43.27 shows how to construct an integral on the uniform closure of the simple functions based on an algebra $A$. Unfortunately, the function $\mu$ may be integrated this way are still limited and the continuity properties of this integral are not as strong as one would like.

Let $S_+ (A)$ denote those functions $f : X \to [0, \infty]$ which have countable range and for which $\{f = \lambda\} \in A$ for all $\lambda \in [0, \infty]$. For $f \in S_+ (A)$ it is natural to define $I_\mu (f)$ by

$$I_\mu (f) := \sum_{\lambda \in \text{Ran}(f)} \lambda \mu (f = \lambda).$$

Unfortunately, the function $I_\mu : S_+ (A) \to [0, \infty]$ is not necessarily “positive linear” without further restrictions being put on $\mu$, i.e. it is not necessarily true that $I_\mu (f + cg) = I_\mu (f) + c I_\mu (g)$ for all $c \geq 0$ and $f, g \in S_+ (A)$.

**Theorem 48.1.** Suppose that $\mu : A \to [0, \infty]$ is a finitely additive measure on an subalgebra, $A \subset 2^X$. Then $I_\mu$ is positive linear on $S_+ (A)$ iff $\mu$ is a premeasure.

**Proof.** Suppose $I_\mu$ is positive linear and suppose $A, A_n \in A$ with $A = \bigcup_{n=1}^{\infty} A_n$. If $\mu (A_n) = \infty$ for some $n$ then by monotonicity of $\mu$ it follows that $\mu (A) = \infty$ so that

$$\mu (A) = \infty = \sum_{n=1}^{\infty} \mu (A_n).$$

Hence we may now assume that $\mu (A_n) < \infty$ for all $n$. Choose distinct numbers, $\alpha_n \in (0, \infty)$ such that $\sum_{n=1}^{\infty} \alpha_n \mu (A_n) < \infty$ and then let $f = \sum_{n=1}^{\infty} \alpha_n 1_{A_n}$ and $g = 1_A = \sum_{n=1}^{\infty} 1_{A_n}$. Since

$$f + g = \sum_{n=1}^{\infty} (1 + \alpha_n) 1_{A_n},$$

and $\{1 + \alpha_n\}_{n=1}^{\infty}$ are all distinct numbers, it follows that

$$I_\mu (f + g) = \sum_{n=1}^{\infty} (1 + \alpha_n) \mu (A_n)$$

while on the other hand we have

$$I_\mu (f) + I_\mu (g) = \sum_{n=1}^{\infty} \alpha_n \mu (A_n) + \mu (A).$$

Comparing these two equations allows us to conclude again that $\mu (A) = \sum_{n=1}^{\infty} \mu (A_n)$ and thus $\mu$ is a premeasure on $A$.

Since

$$\{f + g = \lambda\} = \prod_{a+b=\lambda} \{f = a, f = b\}$$

and $\mu$ is a premeasure,

$$\mu (f + g = \lambda) = \sum_{a+b=\lambda} \mu (f = a, f = b).$$

Using this observation, the proof of the converse assertion that if $\mu$ is premeasure then $I_\mu$ is positive linear follows as in the proof of Proposition 43.26.

48.1.1 Old Stuff for Chapter 43

**Proof.** Conversely, suppose that $\mu$ is a premeasure on $A$ and $f, g \in S_+ (A)$ and $c > 0$. Then

$$I_\mu (f + cg) = \sum_{\lambda} \lambda \mu (f + cg = \lambda)$$

while, because $\mu$ is a premeasure, we have

$$\mu (f + cg = \lambda) = \mu (\cup_{a+cb=\lambda} \{f = a\} \cap \{g = b\}) = \sum_{a+cb=\lambda} \mu (\{f = a\} \cap \{g = b\}).$$
Thus it follows that
\[
I_\mu (f + cg) = \sum_\lambda \lambda \sum_{a + cb = \lambda} \mu (\{f = a\} \cap \{g = b\})
= \sum_\lambda \sum_{a + cb = \lambda} (a + cb) \mu (\{f = a\} \cap \{g = b\})
= \sum_{a,b} (a + cb) \mu (\{f = a\} \cap \{g = b\})
= \sum_{a,b} a \mu (\{f = a\} \cap \{g = b\})
+ c \sum_{a,b} b \mu (\{f = a\} \cap \{g = b\}).
\tag{48.2}
\]

Again using the fact that $\mu$ is a premeasure it follows that
\[
\sum_{b} \mu (\{f = a\} \cap \{g = b\}) = \mu (f = a) \quad \text{and}
\sum_{a} \mu (\{f = a\} \cap \{g = b\}) = \mu (f = b)
\]
which combined with Eq. (48.2) shows
\[
I_\mu (f + cg) = \sum_{a} a \mu (f = a) + c \sum_{b} b \mu (g = b)
= I_\mu (f) + cI_\mu (g)
\]
as desired. Let us further observe if $f,g \in S_+ (A)$ with $f \geq g$, then
\[
I_\mu (f) = \sum_{a} a \mu (f = a) = \sum_{a,b} a \mu (f = a,g = b)
= \sum_{a \geq b} a \mu (f = a,g = b) \geq \sum_{a \geq b} b \mu (f = a,g = b)
= \sum_{b} b \mu (g = b) = I_\mu (g)
\]
showing $I_\mu$ is monotone. \qed

Theorem 48.2 (BRUCE: Drop this theorem.). If $\mu$ is a premeasure then
the monotone convergence theorem holds, that is if $f_n \in S_+ (A)$ is a sequence
of functions such that $f_n \uparrow f \in S_+ (A)$, then $I_\mu (f_n) \uparrow I_\mu (f)$ as $n \to \infty$.

**Proof.** BRUCE: Drop the rest of this proof.

Now suppose $\mu$ is a premeasure, $f_n \in S_+ (A)$ is a sequence of functions such
that $f_n \uparrow f \in S_+ (A)$, and $\alpha \in (0,1)$. Then
\[
f_n \geq \mathbf{1}_{\{f_n \geq \alpha f\}} f_n \geq \alpha f \mathbf{1}_{\{f_n \geq \alpha f\}},
\]
and by monotonicity of $I_\mu$ it follows that
\[
I_\mu (f_n) \geq \alpha I_\mu (f) \mathbf{1}_{\{f_n \geq \alpha f\}) = \alpha \sum_a a \mu (\{f = a\} \cap \{f_n \geq \alpha f\})
\]
Since $a \to \mu (\{f = a\} \cap \{f_n \geq \alpha f\})$ is increasing as $n$ increases, it follows from
the monotone convergence theorem for sums that
\[
\lim_{n \to \infty} I_\mu (f_n) \geq \alpha \sum_a \lim_{n \to \infty} \mu (\{f = a\} \cap \{f_n \geq \alpha f\})
= \alpha \sum_a a \mu (\{f = a\}) = \alpha I_\mu (f)
\]
where in the first equality we have used Exercise 43.4. Since $\alpha$ is arbitrary in
this last inequality it follows that $\lim_{n \to \infty} I_\mu (f_n) \geq I_\mu (f)$. This completes the
proof, since by the monotonicity of $I_\mu$ we have $I_\mu (f_n) \leq I_\mu (f)$ for all $n$ and
thus that $\lim_{n \to \infty} I_\mu (f_n) \leq I_\mu (f)$.

### 48.2 Regularity and Density Results

**Theorem 48.3 (Regularity Theorem).** Suppose that $\mu$ is a $\sigma$–finite pre-
measure on an algebra $A$, $\bar{\mu}$ is the extension described in Theorem 43.49 and
$B \in \sigma (A)$ . Then:

1. \[
\bar{\mu} (B) := \inf \{ \bar{\mu} (C) : B \subset C \in \mathcal{A}_\sigma \}.
\]
2. For any $\epsilon > 0$ there exists $A \subset B \subset C$ such that $A \in \mathcal{A}_\delta$, $C \in \mathcal{A}_\sigma$ and
\[
\bar{\mu} (C \setminus A) < \epsilon.
\]
3. There exists $A \subset B \subset C$ such that $A \in \mathcal{A}_{\delta \sigma}$, $C \in \mathcal{A}_{\sigma \delta}$ and $\bar{\mu} (C \setminus A) = 0$.

**Proof.** 1. The first item is an easy consequence of the third item in Theorem
43.49 with $A = \mathcal{E}$.

2. Let $X_n \in A$ such that $\bar{\mu} (X_m) < \infty$ and $X_n \uparrow X$ as $n \to \infty$ and let
$B_m := X_n \cap B$. Then by item 1., there exists $C_m \in \mathcal{A}_\sigma$ such that $B_m \subset C_m$ and
\[
\bar{\mu} (C_m \setminus B_m) < 2^{-m+1}.
\]
So, letting $C = \bigcup_{m=1}^{\infty} C_m, C \in \mathcal{A}_\sigma$ and
\[
\bar{\mu} (C \setminus B) \leq \sum_{m=1}^{\infty} \bar{\mu} (C_m \setminus B_m) \leq \sum_{m=1}^{\infty} \bar{\mu} (C_m \setminus B_m) < \frac{\epsilon}{2}.
\]
Applying this result to $B^c$ implies there exists $D \in \mathcal{A}_\sigma$ such that $B^c \subset D$ and

$$\bar{\mu} (B \setminus D^c) = \bar{\mu} (D \setminus B^c) < \frac{\varepsilon}{2}.$$  

Therefore if we let $A := D^c \in \mathcal{A}_\delta$, then $A \subset B$ and $\bar{\mu} (B \setminus A) < \varepsilon/2$ and therefore

$$\bar{\mu} (C \setminus A) = \bar{\mu} (B \setminus A) + \bar{\mu} (C \setminus B) < \varepsilon.$$

3. By item 2 there exist $A_m \subset B \subset C_m$ with $C_m \in \mathcal{A}_\sigma$, $A_m \in \mathcal{A}_\delta$ and $\bar{\mu} (C_m \setminus A_m) < 1/m$ for all $m$. Letting $A := \bigcup_{m=1}^{\infty} A_m \in \mathcal{A}_\delta$ and $C := \bigcap_{m=1}^{\infty} C_m \in \mathcal{A}_\sigma$, we have

$$\bar{\mu} (C \setminus A) \leq \bar{\mu} (C_m \setminus A_m) \to 0 \text{ as } m \to \infty.$$

\[\text{Remark 48.4. Using this result we may recover Corollary 48.18 and Theorem 19.14 which state, under the assumptions of Theorem 48.3:}\]

1. for every $\varepsilon > 0$ and $B \in \sigma (\mathcal{A})$ such that $\bar{\mu} (B) < \infty$, there exists $D \in \mathcal{A}$ such that $\bar{\mu} (B \Delta D) < \varepsilon$.  

2. $\mathcal{S}_f (\mathcal{A}, \mu)$ is dense in $L^p (\mu)$ for all $1 \leq p < \infty$. 

Indeed by Theorem 48.3, there exists $C \in \mathcal{A}_\sigma$ such that $B \subset C$ and $\bar{\mu} (C \setminus B) < \varepsilon$. Now write $C = \bigcup_{n=1}^{\infty} C_n$ with $C_n \in \mathcal{A}$ for each $n$. By replacing $C_n$ by $\bigcup_{k=1}^{n} C_k \in \mathcal{A}$ if necessary, we may assume that $C_n \uparrow C$ as $n \to \infty$. Since $C_n \setminus B \subset C \setminus B$, $B \setminus C_n \setminus B = \emptyset$ as $n \to \infty$, and $\bar{\mu} (B \setminus C_n) \leq \bar{\mu} (B) < \varepsilon$, we know that

$$\lim_{n \to \infty} \bar{\mu} (C_n \setminus B) = \bar{\mu} (C \setminus B) < \varepsilon \text{ and } \lim_{n \to \infty} \bar{\mu} (B \setminus C_n) = \bar{\mu} (B \setminus C) = 0$$

Hence for $n$ sufficiently large,

$$\bar{\mu} (B \Delta C_n) = \bar{\mu} (C_n \setminus B) + \bar{\mu} (B \setminus C_n) < \varepsilon.$$  

Hence we are done with the first item by taking $D = C_n \in \mathcal{A}$ for an $n$ sufficiently large.

For the second item, notice that

$$\int_X |1_B - 1_D|^p d\mu = \bar{\mu} (B \Delta D) < \varepsilon \quad (48.3)$$

from which it easily follows that any simple function in $\mathcal{S}_f (\mathcal{M}, \mu)$ may be approximated arbitrary well by an element from $\mathcal{S}_f (\mathcal{A}, \mu)$. This completes the proof of item 2. since $\mathcal{S}_f (\mathcal{M}, \mu)$ is dense in $L^p (\mu)$ by Lemma 19.3.

\[\text{48.3 Outer Measures}\]

\textbf{Definition 48.5.} A function $\nu : 2^X \to [0, \infty]$ is an outer measure if $\nu (\emptyset) = 0$, $\nu$ is monotonic and sub-additive.

\textbf{Proposition 48.6 (Example of an outer measure.)}. Let $\mathcal{E} \subset 2^X$ be arbitrary collection of subsets of $X$ such that $\emptyset, X \in \mathcal{E}$. Let $\rho : \mathcal{E} \to [0, \infty]$ be a function such that $\rho (\emptyset) = 0$. For any $A \subset X$, define

$$\rho^* (A) = \inf \left\{ \sum_{i=1}^{\infty} \rho (E_i) : A \subset \bigcup_{i=1}^{\infty} E_i \text{ with } E_i \in \mathcal{E} \right\}.$$  

Then $\rho^*$ is an outer measure.

\textbf{Proof.} It is clear that $\rho^*$ is monotonic and $\rho^* (\emptyset) = 0$. Suppose for $i \in \mathbb{N}$, $A_i \in 2^X$ and $\rho^* (A_i) < \infty$; otherwise there will be nothing to prove. Let $\varepsilon > 0$ and choose $E_{ij} \in \mathcal{E}$ such that $A_i \subset \bigcup_{j=1}^{\infty} E_{ij}$ and $\rho^* (A_i) \geq \sum_{j=1}^{\infty} \rho (E_{ij}) - 2^{-i} \varepsilon$.

Since $\bigcup_{i=1}^{\infty} A_i \subset \bigcup_{i,j=1}^{\infty} E_{ij}$,

$$\rho^* \left( \bigcup_{i=1}^{\infty} A_i \right) \leq \sum_{i=1}^{\infty} \sum_{j=1}^{\infty} \rho (E_{ij}) \leq \sum_{i=1}^{\infty} (\rho^* (A_i) + 2^{-i} \varepsilon) = \sum_{i=1}^{\infty} \rho^* (A_i) + \varepsilon.$$  

Since $\varepsilon > 0$ is arbitrary in this inequality, we have shown $\rho^*$ is sub-additive. \(\blacksquare\)

\textbf{Lemma 48.7.} Suppose that $\mu$ is a premeasure on an algebra $\mathcal{A}$ and $\mu^*$ is the outer measure associated to $\mu$ as in Proposition 48.6. Then

$$\mu^* (B) = \inf \{ \mu (C) : B \subset C \in \mathcal{A}_\sigma \} \forall B \subset X,$$

and $\mu^* = \mu$ on $\mathcal{A}$, where $\mu$ has been extended to $\mathcal{A}_\sigma$ as described in Proposition 48.54.

\textbf{Lemma 48.8.} Suppose $(X, \tau)$ is a locally compact Hausdorff space, $I$ is a positive linear functionals on $C_c (X)$, and let $\mu : \tau \to [0, \infty]$ be defined in Eq. (27.4). Then $\mu$ is sub-additive on $\tau$ and the associate outer measure, $\mu^* : 2^X \to [0, \infty]$ associated to $\mu$ as in Proposition 48.6 may be described by

$$\mu^* (E) = \inf \{ \mu (U) : E \subset U \subset_o X \}. \quad (48.5)$$

In particular $\mu^* = \mu$ on $\tau$. 

Proof. Let \( \{U_j\}_{j=1}^\infty \subset \tau, U := \bigcup_{j=1}^\infty U_j, f \prec U \) and \( K = \text{supp}(f) \). Since \( K \) is compact, \( K \subset \bigcup_{j=1}^n U_j \) for some \( n \in \mathbb{N} \) sufficiently large. By Proposition 25.16 (partitions of unity proposition) we may choose \( h_j \prec U_j \) such that \( \sum_{j=1}^n h_j = 1 \) on \( K \). Since \( f = \sum_{j=1}^n h_j f \) and \( h_j f \prec U_j \),

\[
I(f) = \sum_{j=1}^n I(h_j f) \leq \sum_{j=1}^n \mu(U_j) \leq \sum_{j=1}^\infty \mu(U_j) .
\]

Since this is true for all \( f \prec U \) we conclude \( \mu(U) \leq \sum_{j=1}^\infty \mu(U_j) \) proving the countable sub-additivity of \( \mu \) on \( \tau \). The remaining assertions are a direct consequence of this sub-additivity.

\[\square\]

### 48.4 *The \( \sigma \)– Finite Extension Theorem*

This section may be skipped (at the loss of some motivation), since the results here will be subsumed by those in Section 48.5 below.

**Notation 48.9 (Inner Measure)** If \( \mu \) is a finite (i.e. \( \mu(X) < \infty \)) premeasure on an algebra \( \mathcal{A} \), we extend \( \mu \) to \( \mathcal{A}_\delta \) by defining

\[
\mu(A) := \mu(X) - \mu(A^c) .
\]

(\text{Note: } \mu(A^c) \text{ is defined since } A^c \in \mathcal{A}_\sigma.) \text{ Also let }

\[
\mu_*(B) := \sup \{ \mu(A) : A \supset B \} \quad \forall B \subset X
\]

and define

\[
\mathcal{M} = \mathcal{M}(\mu) := \{ B \subset X : \mu_*(B) = \mu^*(B) \} \quad (48.7)
\]

and \( \bar{\mu} := \mu^*|\mathcal{M} \). In words, \( B \) is in \( \mathcal{M} \) iff \( B \) may be well approximated from both inside and out by sets \( \mu \) can measure.

**Remark 48.10.** If \( A \in \mathcal{A}_\sigma \cap \mathcal{A}_\delta \), then \( A, A^c \in \mathcal{A}_\sigma \) and so by the strong additivity of \( \mu, \mu(A) + \mu(A^c) = \mu(X) \) from which it follows that the extension of \( \mu \) to \( \mathcal{A}_\delta \) is consistent with the extension of \( \mu \) to \( \mathcal{A}_\sigma \).

**Lemma 48.11.** Let \( \mu \) be a finite premeasure on an algebra \( \mathcal{A} \subset 2^X \) and continue the setup in Notation 48.9.

1. If \( A \in \mathcal{A}_\delta \) and \( C \in \mathcal{A}_\sigma \) with \( A \subset C \), then

\[
\mu(C \setminus A) = \mu(C) - \mu(A) .
\]

2. For all \( B \subset X, \mu_*(B) = \mu(X) - \mu^*(B^c) \), and

\[
\mathcal{M} := \{ B \subset X : \mu(X) = \mu^*(B) + \mu^*(B^c) \} . \quad (48.9)
\]

3. As subset \( B \subset X \) is in \( \mathcal{M} \) iff for all \( \varepsilon > 0 \) there exists \( A \in \mathcal{A}_\delta \) and \( C \in \mathcal{A}_\sigma \) such that \( A \subset B \subset C \) and \( \mu(C \setminus A) < \varepsilon \). In particular \( A \in \mathcal{M} \).

4. \( \mu \) is additive on \( \mathcal{A}_\delta \).

**Proof.** 1. The strong additivity Eq. (43.36) with \( B \in \mathcal{A}_\sigma \), and \( A \) being replaced by \( A^c \in \mathcal{A}_\sigma \), implies

\[
\mu(A^c \cup C) + \mu(C \setminus A) = \mu(A^c) + \mu(C) .
\]

Since \( X = A^c \cup C \) and \( \mu(A^c) = \mu(X) - \mu(A) \), the previous equality implies Eq. (48.8).

2. For the second assertion we have

\[
\mu_*(B) = \sup \{ \mu(A) : A \supset B \} = \sup \{ \mu(X) - \mu(A^c) : A \supset B \} = \sup \{ \mu(X) - \mu(C) : A \supset C^c \subset B \} = \mu(X) - \inf \{ \mu(C) : B^c \subset C \in \mathcal{A}_\sigma \}
\]

Thus the condition that \( \mu_*(B) = \mu^*(B) \) is equivalent to requiring that

\[
\mu(X) = \mu_*(X) = \mu^*(B^c) + \mu^*(B) . \quad (48.10)
\]

3. By definition \( B \subset X \) iff \( \mu_*(B) = \mu^*(B) \) which happens iff for each \( \varepsilon > 0 \) there exists \( A \in \mathcal{A}_\delta \) and \( C \in \mathcal{A}_\sigma \) such that \( A \subset B \subset C \) and \( \mu(C \setminus A) < \varepsilon \); i.e. by item 1, \( \mu(C \setminus A) < \varepsilon \). The containment, \( A \subset \mathcal{M} \), follows from what we have just proved or is a direct consequence of \( \mu \) being additive on \( \mathcal{A} \) and the fact that \( \mu^* = \mu_* = \mu \) on \( \mathcal{A} \).

4. Suppose \( A, B \in \mathcal{A}_\delta \) are disjoint sets, then by the strong additivity of \( \mu \) on \( \mathcal{A}_\sigma \) (use Eq. (43.36) with \( A \) and \( B \) being replaced by \( A^c \) and \( B^c \) respectively) gives

\[
2\mu(X) - \mu(A \cup B) = \mu(X) + \mu([A \cup B]^c) = \mu(A^c \cup B^c) + \mu(A^c \cap B^c) \]

\[
= \mu(A^c) + \mu(B^c) = 2\mu(X) - \mu(A) - \mu(B) ,
\]

i.e. \( \mu(A \cup B) = \mu(A) + \mu(B) \).

\[\square\]

**Theorem 48.12 (Finite Premeasure Extension Theorem)**. If \( \mu \) is a finite premeasure on an algebra \( \mathcal{A} \), then \( \mathcal{M} = \mathcal{M}(\mu) \) (as in Eq. (48.7)) is a \( \sigma \)– algebra, \( \mathcal{A} \subset \mathcal{M} \) and \( \bar{\mu} = \mu^*|\mathcal{M} \) is a countably additive measure such that \( \bar{\mu} = \mu \) on \( \mathcal{A} \).
By Lemma 48.11, $\varphi, X \in A \subset M$ and from Eq. (48.9) it follows that $M$ is closed under complementation. Now suppose $N \in \{2, 3, \ldots \} \cup \{\infty\}$ and $B_i \in M$ for $i < N$. Given $\varepsilon > 0$, by Lemma 48.11 there exists $A_i \subset B_i \subset C_i$ with $A_i \subset A_\sigma$ and $C_i \subset A_\sigma$ such that $\mu(C_i \setminus A_i) < \varepsilon 2^{-i}$ for all $i < N$. Let $B = \bigcup_{i<N} B_i, C := \bigcup_{i<N} C_i$ and $A := \bigcup_{i<N} A_i$ so that $A \subset B \subset C \in A_\sigma$.

For the moment assume $N < \infty$, then $A \in A_\delta, C \setminus A = C \cap A^c \in A_\sigma$,

$$ C \setminus A = \bigcup_{i<N} (C_i \setminus A) \subset \bigcup_{i<N} (C_i \setminus A_i) \in A_\sigma $$

and so by the sub-additivity of $\mu$ on $A_\sigma$ (Proposition 43.54),

$$ \mu(C \setminus A) \leq \sum_{i < N} \mu(C_i \setminus A) = \sum_{i < N} \varepsilon 2^{-i} < \varepsilon. $$

Since $\varepsilon > 0$ was arbitrary, it follows again by Lemma 48.11 that $B \in M$ and we have shown $M$ is an algebra.

Now suppose that $N = \infty$. Because $M$ is an algebra, to show $M$ is a $\sigma$–algebra it suffices to show $B = \bigcup_{i=1}^\infty B_i \in M$ under the additional assumption that the collection of sets, $\{B_i\}_{i=1}^\infty$, are also pairwise disjoint in which case the sets, $\{A_i\}_{i=1}^\infty$, are pairwise disjoint. Since $\mu$ is additive on $A_\delta$ (Lemma 48.11), for any $n \in \mathbb{N}$,

$$ \sum_{i=1}^n \mu(C_i) \leq \sum_{i=1}^n [\mu(A_i) + \varepsilon 2^{-i}] \leq \mu(\bigcup_{i=1}^n A_i) + \varepsilon. $$

This implies, using

$$ \mu(\bigcup_{i=1}^n A_i) = \mu(X) - \mu([\bigcup_{i=1}^n A_i]^c) \leq \mu(X), $$

that

$$ \sum_{i=1}^\infty \mu(C_i) = \lim_{n \to \infty} \sum_{i=1}^n \mu(C_i) \leq \mu(X) + \varepsilon < \infty. \quad (48.11) $$

Let $n \in \mathbb{N}$ and $A^n := \prod_{i=1}^n A_i \in A_\delta$. Then $A_\delta \ni A^n \subset B \subset C \in A_\sigma, C \setminus A^n \in A_\delta$ and

$$ C \setminus A^n = \bigcup_{i=1}^\infty (C_i \setminus A_i) \subset [\bigcup_{i=1}^\infty (C_i \setminus A_i)] \cup [\bigcup_{i=n+1}^\infty C_i] \in A_\sigma. $$

Therefore, using the sub-additivity of $\mu$ on $A_\sigma$ and the estimate (48.11),

$$ \mu(C \setminus A^n) \leq \sum_{i=1}^n \mu(C_i \setminus A_i) + \sum_{i=n+1}^\infty \mu(C_i) \leq \varepsilon + \sum_{i=n+1}^\infty \mu(C_i) \to \varepsilon \text{ as } n \to \infty. $$

Since $\varepsilon > 0$ was arbitrary it now follows from Lemma 48.7 that $B \in M$. Moreover, since

$$ \mu^*(B_i) \leq \mu(C_i) \leq \mu(A_i) + 2^{-i} \varepsilon, $$

$$ \sum_{i=1}^n (\mu^*(B_i) - 2^{-i} \varepsilon) \leq \sum_{i=1}^n \mu(A_i) = \mu(A^n) \leq \mu^*(B). $$

Letting $n \to \infty$ in this equation implies

$$ \sum_{i=1}^\infty \mu^*(B_i) - \varepsilon \leq \mu^*(B) \leq \sum_{i=1}^\infty \mu^*(B_i). $$

Because $\varepsilon > 0$ was arbitrary, it follows that $\sum_{i=1}^\infty \mu^*(B_i) = \mu^*(B)$ and we have also shown $\mu = \mu^*|M$ is a measure on $M$.

**Exercise 48.1.** Keeping the same hypothesis and notation as in Theorem 48.12 and suppose $B \in M$. Show there exists $A \subset C \subset B$ such that $A \in A_\sigma$, $C \subset A_\sigma$ and $\mu(C \setminus A) = 0$. (Hint: see the proof of Theorem 48.3 where the same statement is proved with $M$ replaced by $\sigma(A)$.) Conclude from this that $\mu$ is the completion of $\mu|\sigma(A)$. (See Lemma 43.30 for more about completion of measures.)

**Exercise 48.2.** Keeping the same hypothesis and notation as in Theorem 48.12 show $M = M'$ where $M'$ consists of those subset $B \subset X$ such that

$$ \mu^*(E) = \mu^*(B \cap E) + \mu^*(B^c \cap E) \quad \forall \ E \subset C. \quad (48.12) $$

**Hint:** To verify Eq. (48.12) holds for $B \in M$, “approximate” $E \subset X$ from the outside by a set $C \in A_\sigma$ and then make use the sub-additivity, the monotonicity of $\mu^*$ and the fact that $\mu^*$ is a measure on $M$.

**Theorem 48.13.** Suppose that $\mu$ is a $\sigma$–finite premeasure on an algebra $A$. Then

$$ \tilde{\mu}(B) := \inf \{ \mu(C) : B \subset C \in A_\sigma \} \quad B \in \sigma(A) \quad (48.13) $$

defines a measure on $\sigma(A)$ and this measure is the unique measure on $\sigma(A)$ which extends $\mu$.

**Proof.** The uniqueness of the extension $\tilde{\mu}$ was already proved in Theorem 45.43. For existence, let $\{X_n\}_{n=1}^\infty \subset A$ be chosen so that $\mu(X_n) < \infty$ for all $n$ and $X_n \uparrow X$ as $n \to \infty$ and let

$$ \mu_n(A) := \mu_n(A \cap X_n) \quad \text{for all } A \in A. $$

Each $\mu_n$ is a premeasure (as is easily verified) on $A$ and hence by Theorem 48.12 each $\mu_n$ has an extension, $\tilde{\mu}_n$, to a measure on $\sigma(A)$. Since the measure
Using the definition of $M$ and $E$ an algebra we must show that $M$ is measurable sets which proves the first item since $45.4$.

Proof. Clearly $\emptyset \subset (E\cap A) \cup (E \cap B)$ and if $A,B \subset X$ are increasing, $\bar{m}(C \setminus B) = \lim_{n \to \infty} \mu_m(C \setminus B) < \epsilon$. Then $C := \bigcup_{m=1}^{\infty} C_m \in \mathcal{A}_\sigma$ and, as usual,

$$\bar{m}(C \setminus B) \leq \bar{m}(C \setminus B) \leq \bar{m}(C \setminus B) < \epsilon.$$ 

Thus

$$\bar{m}(B) \leq \bar{m}(C) = \bar{m}(B) + \bar{m}(C \setminus B) \leq \bar{m}(B) + \epsilon$$

which proves the first item since $\epsilon > 0$ was arbitrary. 

\section{48.5 General Extension and Construction Theorem}

Exercise 48.2 motivates the following definition.

\begin{definition}
Let $\mu^* : 2^X \to [0,\infty]$ be an outer measure. Define the $\mu^*$-measurable sets to be

$$\mathcal{M}(\mu^*) := \{B \subset X : \mu^*(E) \geq \mu^*(E \cap B) + \mu^*(E \cap B^c) \forall E \subset X\}.$$ 

Because of the sub-additivity of $\mu^*$, we may equivalently define $\mathcal{M}(\mu^*)$ by

$$\mathcal{M}(\mu^*) := \{B \subset X : \mu^*(E) = \mu^*(E \cap B) + \mu^*(E \cap B^c) \forall E \subset X\}. \quad (48.14)$$

\end{definition}

\begin{theorem}[Carathéodory’s Construction Theorem]
Let $\mu^*$ be an outer measure on $X$ and $\mathcal{M} := \mathcal{M}(\mu^*)$. Then $\mathcal{M}$ is a $\sigma$-algebra and $\mu := \mu^*|_{\mathcal{M}}$ is a complete measure. 

\end{theorem}

\begin{proof}
Clearly $\emptyset \subset X \in \mathcal{M}$ and if $A \in \mathcal{M}$ then $A^c \in \mathcal{M}$. So to show that $\mathcal{M}$ is an algebra we must show that $\mathcal{M}$ is closed under finite unions, i.e. if $A,B \in \mathcal{M}$ and $E \subset X$ then

$$\mu^*(E) \geq \mu^*(E \cap (A \cup B)) + \mu(E \setminus (A \cup B)).$$

Using the definition of $\mathcal{M}$ three times, we have

$$\mu^*(E) = \mu^*(E \cap A) + \mu^*(E \setminus A). \quad (48.15)$$

By the sub-additivity of $\mu^*$ and the set identity,

$$E \cap (A \cup B) = (E \cap A) \cup (E \cap B)$$

$$= [(E \cap A) \setminus B] \cup [(E \cap A \cap B) \cup ((E \cap A) \setminus B) \cup (E \setminus A) \cap B],$$

we have

$$\mu^*(E \cap A \cap B) + \mu^*(E \setminus A \setminus B) \geq \mu^*(E \cap (A \cup B)).$$

Using this inequality in Eq. (48.15) shows

$$\mu^*(E) \geq \mu^*(E \cap (A \cup B)) + \mu^*(E \setminus (A \cup B)) \quad (48.17)$$

which implies $A \cup B \in \mathcal{M}$. Now suppose $A,B \in \mathcal{M}$ are disjoint, then taking $E = A \cup B$ in Eq. (48.15) implies

$$\mu^*(A \cup B) = \mu^*(A) + \mu^*(B)$$

and $\mu = \mu^*|_{\mathcal{M}}$ is finitely additive on $\mathcal{M}$.

We now must show that $\mathcal{M}$ is a $\sigma$-algebra and the $\mu$ is $\sigma$-additive. Let $A_i \in \mathcal{M}$ (without loss of generality assume $A_i \cap A_j = \emptyset$ if $i \neq j$) $B_n = \bigcup_{i=1}^{n} A_i$, and $B = \bigcup_{j=1}^{\infty} A_j$, then for $E \subset X$ we have

$$\mu^*(E \cap B_n) = \mu^*(E \cap B_n \cap A_n) + \mu^*(E \cap B_n \cap A_n^c)$$

$$= \mu^*(E \cap A_n) + \mu^*(E \cap B_n^c).$$

and so by induction,

$$\mu^*(E \cap B_n) = \sum_{k=1}^{n} \mu^*(E \cap A_k). \quad (48.18)$$

Therefore we find that

$$\mu^*(E) = \mu^*(E \cap B_n) + \mu^*(E \cap B_n^c)$$

$$= \sum_{k=1}^{n} \mu^*(E \cap A_k) + \mu^*(E \cap B_n^c)$$

$$\geq \sum_{k=1}^{n} \mu^*(E \cap A_k) + \mu^*(E \cap B_n^c)$$

where the last inequality is a consequence of the monotonicity of $\mu^*$ and the fact that $B_n^c \subset B_n^c$. Letting $n \to \infty$ in this equation shows that
\[ \mu^*(E) \geq \sum_{k=1}^{\infty} \mu^*(E \cap A_k) + \mu^*(E \cap B^c) \]
\[ \geq \mu^*(\cup_k (E \cap A_k)) + \mu^*(E \setminus B) \]
\[ = \mu^*(E \cap B) + \mu^*(E \setminus B) \geq \mu^*(E), \]

wherein we have used the sub-additivity \( \mu^* \) twice. Hence \( B \in \mathcal{M} \) and we have shown \( \mathcal{M} \) is a \( \sigma \)– algebra. Since \( \mu^*(E) \geq \mu^*(E \cap B_n) \) we may let \( n \to \infty \) in Eq. (48.18) to find
\[ \mu^*(E) \geq \sum_{k=1}^{\infty} \mu^*(E \cap A_k). \]
Letting \( E = B = \cup A_k \) in this inequality then implies \( \mu^*(B) \geq \sum_{k=1}^{\infty} \mu^*(A_k) \) and hence, by the sub-additivity of \( \mu^* \), \( \mu^*(B) = \sum_{k=1}^{\infty} \mu^*(A_k) \). Therefore, \( \mu = \mu^*|_{\mathcal{M}} \) is countably additive on \( \mathcal{M} \).

Finally we show \( \mu \) is complete. If \( N \subset F \in \mathcal{M} \) and \( \mu(F) = 0 = \mu^*(F) \), then \( \mu^*(N) = 0 \) and
\[ \mu^*(E) \leq \mu^*(E \cap N) + \mu^*(E \cap N^c) = \mu^*(E \cap N^c) \leq \mu^*(E). \]
which shows that \( N \in \mathcal{M} \).

### 48.5.1 Extensions of General Premeasures

In this subsection let \( X \) be a set, \( \mathcal{A} \) be a subalgebra of \( 2^X \) and \( \mu_0 : \mathcal{A} \to [0, \infty] \) be a premeasure on \( \mathcal{A} \).

**Theorem 48.16.** Let \( \mathcal{A} \subset 2^X \) be an algebra, \( \mu \) be a premeasure on \( \mathcal{A} \) and \( \mu^* \) be the associated outer measure as defined in Eq. (48.4) with \( \rho = \mu \). Let \( \mathcal{M} := \mathcal{M}(\mu^*) \supset \sigma(\mathcal{A}) \), then:

1. \( A \subset \mathcal{M}(\mu^*) \) and \( \mu^*|_{\mathcal{A}} = \mu \).
2. \( \bar{\mu} = \mu^*|_{\mathcal{M}} \) is a measure on \( \mathcal{M} \) which extends \( \mu \).
3. If \( \nu : \mathcal{M} \to [0, \infty] \) is another measure such that \( \nu = \mu \) on \( A \) and \( B \in \mathcal{M} \), then \( \nu(B) \leq \bar{\mu}(B) \) and \( \nu(B) = \bar{\mu}(B) \) whenever \( \bar{\mu}(B) < \infty \).
4. If \( \mu \) is \( \sigma \)-finite on \( \mathcal{A} \) then the extension, \( \bar{\mu} \), of \( \mu \) to \( \mathcal{M} \) is unique and moreover \( \mathcal{M} = \sigma(\mathcal{A})[\bar{\mu}|_{\sigma(\mathcal{A})}] \).

**Proof.** Recall from Proposition 48.54 and Lemma 48.7 that \( \mu \) extends to a countably additive function on \( \mathcal{A}_\sigma \) and \( \mu^* = \mu \) on \( \mathcal{A} \).

1. Let \( A \in \mathcal{A} \) and \( E \subset X \) such that \( \mu^*(E) < \infty \). Given \( \varepsilon > 0 \) choose pairwise disjoint sets, \( B_j \in \mathcal{A} \), such that \( E \subset B := \bigcap_{j=1}^{\infty} B_j \) and
\[ \mu^*(E) + \varepsilon \geq \mu(B) = \sum_{j=1}^{\infty} \mu(B_j). \]
Since \( A \cap E \subset \bigcap_{j=1}^{\infty} (B_j \cap A^c) \) and \( E \cap A^c \subset \bigcap_{j=1}^{\infty} (B_j \cap A^c) \), using the sub-additivity of \( \mu^* \) and the additivity of \( \mu \) on \( \mathcal{A} \) we have,
\[ \mu^*(E) + \varepsilon \geq \sum_{j=1}^{\infty} \mu(B_j) = \sum_{j=1}^{\infty} [\mu(B_j \cap A) + \mu(B_j \cap A^c)] \]
\[ \geq \mu^*(E \cap A) + \mu^*(E \cap A^c). \]
Since \( \varepsilon > 0 \) is arbitrary this shows that
\[ \mu^*(E) \geq \mu^*(E \cap A) + \mu^*(E \cap A^c) \]
and therefore that \( A \in \mathcal{M}(\mu^*) \).
2. This is a direct consequence of item 1 and Theorem 48.15
3. If \( A := \bigcap_{j=1}^{\infty} A_j \) with \( \{A_j\}_{j=1}^{\infty} \subset \mathcal{A} \) being a collection of pairwise disjoint sets, then
\[ \nu(A) = \sum_{j=1}^{\infty} \nu(A_j) = \sum_{j=1}^{\infty} \mu(A_j) = \mu(A). \]
This shows \( \nu = \mu = \bar{\mu} \) on \( \mathcal{A}_\sigma \). Consequently, if \( B \in \mathcal{M} \), then
\[ \nu(B) \leq \inf \{ \nu(A) : B \subset A \in \mathcal{A}_\sigma \} \]
\[ = \inf \{ \mu(A) : B \subset A \in \mathcal{A}_\sigma \} = \mu^*(B) = \bar{\mu}(B). \]
If \( \bar{\mu}(B) < \infty \) and \( \varepsilon > 0 \) is given, there exists \( A \in \mathcal{A}_\sigma \) such that \( B \subset A \) and \( \bar{\mu}(A) = \mu(A) \leq \bar{\mu}(B) + \varepsilon \). From Eq. (48.19), this implies
\[ \nu(A \setminus B) \leq \bar{\mu}(A \setminus B) \leq \varepsilon. \]
Therefore,
\[ \nu(B) \leq \bar{\mu}(B) \leq \nu(A) = \nu(B) + \nu(A \setminus B) \leq \nu(B) + \varepsilon \]
which shows \( \bar{\mu}(B) = \nu(B) \) because \( \varepsilon > 0 \) was arbitrary.
4. For the \( \sigma \)-finite case, choose \( X_j \in \mathcal{M} \) such that \( X_j \uparrow X \) and \( \bar{\mu}(X_j) < \infty \) then
\[ \bar{\mu}(B) = \lim_{j \to \infty} \bar{\mu}(B \cap X_j) = \lim_{j \to \infty} \nu(B \cap X_j) = \nu(B). \]
Theorem 48.17 (Regularity Theorem). Suppose that \( \mu \) is a \( \sigma \)–finite premeasure on an algebra \( A \), \( \tilde{\mu} \) is the extension described in Theorem 48.16 and \( B \in \mathcal{M} := \mathcal{M}(\mu^*) \). Then:

1. \( \tilde{\mu}(B) := \inf \{ \tilde{\mu}(C) : B \subset C \in \mathcal{A}_\sigma \} \).

2. For any \( \varepsilon > 0 \) there exists \( A \subset B \subset C \) such that \( A \in \mathcal{A}_\delta \), \( C \in \mathcal{A}_\sigma \) and \( \tilde{\mu}(C \setminus A) < \varepsilon \).

3. There exists \( A \subset B \subset C \) such that \( A \in \mathcal{A}_\delta \), \( C \in \mathcal{A}_\sigma \) and \( \tilde{\mu}(C \setminus A) = 0 \).

4. The algebra-\( \sigma \)-algebra, \( \mathcal{M} \), is the completion of \( \sigma(A) \) with respect to \( \tilde{\mu}|_{\sigma(A)} \).

Proof. The proofs of items 1. – 3. are the same as the proofs of the corresponding results in Theorem 48.33 and so will be omitted. Moreover, item 4. is a simple consequence of item 3. and Proposition 43.48.

The following proposition shows that measures may be “restricted” to nonmeasurable sets.

Proposition 48.18. Suppose that \((X, \mathcal{M}, \mu)\) is a probability space and \( \Omega \subset X \) is any set. Let \( \mathcal{M}_\Omega := \{ A \cap \Omega : A \in \mathcal{M} \} \) and set \( P(\mathcal{A} \cap \Omega) := \mu^*(A \cap \Omega) \). Then \( P \) is a measure on the \( \sigma \)-algebra \( \mathcal{M}_\Omega \). Moreover, if \( P^* \) is the outer measure generated by \( P \), then \( P^*(A) = \mu^*(A) \) for all \( A \subset \Omega \).

Proof. Let \( A, B \in \mathcal{M} \) such that \( A \cap B = \emptyset \). Then since \( A \in \mathcal{M} \subset \mathcal{M}(\mu^*) \) it follows from Eq. (48.12) with \( E := (A \cup B) \cap \Omega \) that

\[
\mu^*((A \cup B) \cap \Omega) = \mu^*((A \cup B) \cap \Omega \cap A) + \mu^*((A \cup B) \cap \Omega \cap A^c)
\]

\[
= \mu^*(\Omega \cap A) + \mu^*(B \cap \Omega)
\]

which shows that \( P \) is finitely additive. Now suppose \( A = \bigcap_{j=1}^{\infty} A_j \) with \( A_j \in \mathcal{M} \) and let \( B_n := \bigcap_{j=n+1}^{\infty} A_j \in \mathcal{M} \). By what we have just proved,

\[
\mu^*(A \cap \Omega) = \sum_{j=1}^{n} \mu^*(A_j \cap \Omega) + \mu^*(B_n \cap \Omega) \geq \sum_{j=1}^{n} \mu^*(A_j \cap \Omega).
\]

Passing to the limit as \( n \to \infty \) in this last expression and using the subadditivity of \( \mu^* \) we find

\[
\sum_{j=1}^{\infty} \mu^*(A_j \cap \Omega) \geq \mu^*(A \cap \Omega) \geq \sum_{j=1}^{\infty} \mu^*(A_j \cap \Omega).
\]

Thus

\[
\mu^*(A \cap \Omega) = \sum_{j=1}^{\infty} \mu^*(A_j \cap \Omega)
\]

and we have shown that \( P = \mu^*|_{\mathcal{M}_\Omega} \) is a measure. Now let \( P^* \) be the outer measure generated by \( P \). For \( A \subset \Omega \), we have

\[
P^*(A) = \inf \{ P(B) : A \subset B \in \mathcal{M}_\Omega \}
\]

\[
= \inf \{ P(B \cap \Omega) : A \subset B \in \mathcal{M} \}
\]

\[
= \inf \{ \mu^*(B \cap \Omega) : A \subset B \in \mathcal{M} \}
\]

(48.20)

and since \( \mu^*(B \cap \Omega) \leq \mu^*(B) \),

\[
P^*(A) \leq \inf \{ \mu^*(B) : A \subset B \in \mathcal{M} \}
\]

\[
= \inf \{ \mu(B) : A \subset B \in \mathcal{M} \} = \mu^*(A).
\]

On the other hand, for \( A \subset B \subset \mathcal{M} \), we have \( \mu^*(A) \leq \mu^*(B \cap \Omega) \) and therefore by Eq. (48.20)

\[
\mu^*(A) \leq \inf \{ \mu^*(B \cap \Omega) : A \subset B \in \mathcal{M} \} = P^*(A).
\]

and we have shown

\[
\mu^*(A) \leq P^*(A) \leq \mu^*(A).
\]

48.6 More Motivation of Carathéodory’s Construction

Theorem 48.15

The next Proposition helps to motivate this definition and the Carathéodory’s construction Theorem 48.15.

Proposition 48.19. Suppose \( \mathcal{E} = \mathcal{M} \) is a \( \sigma \)-algebra, \( \rho = \mu : \mathcal{M} \to [0, \infty] \) is a measure and \( \mu^* \) is defined as in Eq. (48.3). Then

1. For \( A \subset X \)

\[
\mu^*(A) = \inf \{ \mu(B) : B \in \mathcal{M} \text{ and } A \subset B \}.
\]

In particular, \( \mu^* = \mu \) on \( \mathcal{M} \).

2. Then \( \mathcal{M} \subset \mathcal{M}(\mu^*) \), i.e. if \( A \in \mathcal{M} \) and \( E \subset X \) then

\[
\mu^*(E) \geq \mu^*(E \cap A) + \mu^*(E \cap A^c).
\]

(48.21)

3. Assume further that \( \mu \) is \( \sigma \)-finite on \( \mathcal{M} \), then \( \mathcal{M}(\mu^*) = \mathcal{M} = \mathcal{M}(\mu) \) and \( \mu^*|_{\mathcal{M}(\mu^*)} = \tilde{\mu} \) where \( (\mathcal{M} = \mathcal{M}(\mu), \tilde{\mu}) \) is the completion of \( (\mathcal{M}, \mu) \).
Proof. Item 1. If $E_i \in \mathcal{M}$ such that $A \subset \bigcup E_i = B$ and $\bar{E}_i = E_i \setminus (E_1 \cup \cdots \cup E_{i-1})$ then

$$\sum \mu(E_i) \geq \sum \mu(\bar{E}_i) = \mu(B)$$

so

$$\mu^*(A) \leq \sum \mu(\bar{E}_i) = \mu(B) \leq \sum \mu(E_i).$$

Therefore, $\mu^*(A) = \inf \{\mu(B) : B \in \mathcal{M} \text{ and } A \subset B\}$.

Item 2. If $\mu^*(E) = \infty$ Eq. [48.21] holds trivially. So assume that $\mu^*(E) < \infty$.

Let $\varepsilon > 0$ be given and choose, by Item 1., $B \in \mathcal{M}$ such that $E \subset B$ and $\mu(B) \leq \mu^*(E) + \varepsilon$. Then

$$\mu^*(E) + \varepsilon \geq \mu(B) = \mu(B \cap A) + \mu(B \cap A^c) \geq \mu^*(E \cap A) + \mu^*(E \cap A^c).$$

Since $\varepsilon > 0$ is arbitrary we are done.

Item 3. Let us begin by assuming the $\mu(X) < \infty$. We have already seen that $\mathcal{M} \subset \mathcal{M}(\mu^*)$. Suppose that $A \in 2^X$ satisfies,

$$\mu^*(E) = \mu^*(E \cap A) + \mu^*(E \cap A^c) \forall E \in 2^X. \quad (48.22)$$

By Item 1., there exists $B_n \in \mathcal{M}$ such that $A \subset B_n$ and $\mu^*(B_n) \leq \mu^*(A) + \frac{1}{n}$ for all $n \in \mathbb{N}$. Therefore $B = \bigcap B_n \supset A$ and $\mu(B) \leq \mu^*(A) + \frac{1}{n}$ for all $n$ which implies that $\mu(B) \leq \mu^*(A)$ which implies that $\mu(B) = \mu^*(A)$. Similarly there exists $C \in \mathcal{M}$ such that $A^c \subset C$ and $\mu^*(A^c) = \mu(C)$. Taking $E = X$ in Eq. (48.22) shows

$$\mu(X) = \mu^*(A) + \mu^*(A^c) = \mu(B) + \mu(C)$$

so

$$\mu(C^c) = \mu(X) - \mu(C) = \mu(B).$$

Thus letting $D = C^c$, we have

$$D \subset A \subset B \text{ and } \mu(D) = \mu^*(A) = \mu(B)$$

so $\mu(B \setminus D) = 0$ and hence

$$A = D \cup [(B \setminus D) \cap A]$$

where $D \in \mathcal{M}$ and $(B \setminus D) \cap A \in \mathcal{N}$ showing that $A \in \bar{\mathcal{M}}$ and $\mu^*(A) = \bar{\mu}(A)$.

Now if $\mu$ is $\sigma$-finite, choose $X_n \in \mathcal{M}$ such that $\mu(X_n) < \infty$ and $X_n \uparrow X$. Given $A \in \mathcal{M}(\mu^*)$ set $A_n = X_n \cap A$. Therefore

$$\mu^*(E) = \mu^*(E \cap A) + \mu^*(E \cap A^c) \forall E \in 2^X.$$
For this consider the finite algebras $A' \subset 2^A$ and $B' \subset 2^B$ generated by $\{A_k\}_{k=1}^n$ and $\{B_k\}_{k=1}^n$ respectively. Let $B \subset A'$ and $\mathcal{G} \subset B'$ be partition of $A$ and $B$ respectively as found Proposition [43.15]. Then for each $k$ we may write

$$A_k = \prod_{\alpha \in \mathcal{F}, \alpha \subset A_k} \alpha \text{ and } B_k = \prod_{\beta \in \mathcal{V}, \beta \subset B_k} \beta.$$ 

Therefore,

$$\mu(A_k \times B_k) = \mu(A_k \times \bigcup_{\beta \subset B_k} \beta) = \sum_{\beta \subset B_k} \mu(A_k \times \beta) = \sum_{\beta \subset B_k} \mu((\bigcup_\alpha \alpha) \times \beta) = \sum_{\alpha \subset A_k, \beta \subset B_k} \mu(\alpha \times \beta)$$

so that

$$\sum_k \mu(A_k \times B_k) = \sum_k \sum_{\alpha \subset A_k, \beta \subset B_k} \mu(\alpha \times \beta) = \sum_{\alpha \subset A_k, \beta \subset B_k} \mu(\alpha \times \beta) = \sum_{\beta \subset B} \mu(\alpha \times \beta) = \mu(\alpha \times B)$$

as desired.

Proof. By Proposition [43.23] for each $A \in \mathcal{A}$, the function $(a, b) \mapsto \mu(A \times (a, b))$ extends to a unique measure on $B$ which we continue to denote by $\mu$. Now if $B \in \mathcal{B}$, then $B = \bigcup_k I_k$ with $I_k \in \mathcal{E}$, then

$$\mu(A \times B) = \sum_k \mu(A \times I_k)$$

from which we learn that $A \rightarrow \mu(A \times B)$ is still finitely additive. The proof is complete with an application of Theorem [48.20].

For $a, b \in \mathbb{R}^n$, write $a < b$ if $a_i < b_i$ for all $i$. For $a < b$, let $(a, b]$ denote the half open rectangle:

$$(a, b] = (a_1, b_1] \times (a_2, b_2] \times \cdots \times (a_n, b_n],$$

$$(a, b) = (a_1, b_1] \times (a_2, b_2] \times \cdots \times (a_n, b_n],$$

$$(a, b] = \{ (a, b) : a < b \} \cup \{ \mathbb{R}^n \}$$

and $\mathcal{A}(\mathbb{R}^n) \subset 2^n$ denote the algebra generated by $\mathcal{E}$. Suppose that $F : \mathbb{R}^n \rightarrow \mathbb{C}$ is a function, we wish to define a finitely additive complex valued measure $\mu_F$ on $\mathcal{A}(\mathbb{R}^n)$ associated to $F$. Intuitively the definition is to be

$$\mu_F((a, b]) = \int_{(a, b]} F(dt_1, dt_2, \ldots, dt_n)$$

$$\mu_F((a, b)] = \int_{(a, b]} \left( \partial_1 \partial_2 \cdots \partial_n F \right)(t_1, t_2, \ldots, t_n) dt_1, dt_2, \ldots, dt_n$$

where

$$\tilde{a}, \tilde{b} = (a_1, b_1] \times (a_2, b_2] \times \cdots \times (a_n, b_n].$$

Using this expression as motivation we are led to define $\mu_F$ by induction on $n$. For $n = 1$, let

$$\mu_F((a, b]) = F(b) - F(a)$$

and then inductively using

$$\mu_F((a, b]) = \mu_F(\cdot, t)(\tilde{a}, \tilde{b})|_{t = b_n}.$$

Proposition 48.22. The function $\mu_F$ extends uniquely to an additive function on $\mathcal{A}(\mathbb{R}^n)$. Moreover,

$$\mu_F((a, b]) = \sum_{A \subset S} (-1)^{|A|} F(a_A \times b_A)$$

(48.23)

where $S = \{1, 2, \ldots, n\}$ and

$$(a_A \times b_A)(i) = \begin{cases} a(i) \text{ if } i \in A \\ b(i) \text{ if } i \notin A. \end{cases}$$

Proof. Both statements of the proof will be by induction. For $n = 1$ we have $\mu_F((a, b]) = F(b) - F(a)$ so that Eq. (48.23) holds and we have already seen that $\mu_F$ extends to a additive measure on $\mathcal{A}(\mathbb{R})$. For general $n$, notice that $\mathcal{A}(\mathbb{R}^n) = \mathcal{A}(\mathbb{R}^{n-1}) \otimes \mathcal{A}(\mathbb{R})$. For $t \in \mathbb{R}$ and $A \in \mathcal{A}(\mathbb{R}^{n-1})$, let

$$\mu_t(A) = \mu_{t, (\cdot, t)}(A)$$

where $\mu_{t, (\cdot, t)}$ is defined by the induction hypothesis. Then

$$\mu_F(A \times (a, b]) = \mu_t(A) - \mu_{a}(A)$$

and by Proposition 48.21 has a unique extension to $\mathcal{A}(\mathbb{R}^{n-1}) \otimes \mathcal{A}(\mathbb{R})$ as a finitely additive measure. For $n = 1$, Eq. (48.23) says that
\[
\mu_F((a, b]) = F(b) - F(a)
\]
where the first term corresponds to \(A = \emptyset\) and second to \(A = \{1\}\). This agrees with the definition of \(\mu_F\) for \(n = 1\). Now for the induction step. Let \(T = \{1, 2, \ldots, n-1\}\) and suppose that \(a, b \in \mathbb{R}^n\), then
\[
\mu_F((a, b]) = \mu_F((t, ((a, b)])_{t=\alpha_n}^{\beta_n} = \sum_{\mathcal{A} \subseteq T} \left( \sum_{\mathcal{B} \subseteq A} (-1)^{|\mathcal{B}|} F(\alpha_B \times \beta_B, t) \right)
\]
\[
= \sum_{\mathcal{A} \subseteq T} \left( \sum_{\mathcal{B} \subseteq A} (-1)^{|\mathcal{B}|} F(\alpha_B \times \beta_B, a_n) \right)
\]
\[
= \sum_{\mathcal{A} \subseteq T} \left( \sum_{\mathcal{B} \subseteq A} (-1)^{|\mathcal{B}|} F(\alpha_B \times \beta_B, a_n) \right)
\]
as desired. \hfill \Box

### 48.8 Old Stuff: Construction of measures on a simple product space.

**Exercise 48.3.** Let \(Y := \{0,1\}^N\) (the set of sequences \(y = (y_1, y_2, \ldots)\) with \(y_i \in X := \{0,1\}\), \(Y_n := \{0,1\}^n\) for all \(n \in \mathbb{N}\), and \(\pi_n : Y \to Y_n\) be defined by \(\pi_n(y) = (y_1, y_2, \ldots, y_n)\). \(\mathcal{A}\) denote the collection of “cylinder sets” in \(Y\), i.e. sets of the form
\[
A = \pi_n^{-1}(C) \text{ where } n \in \mathbb{N} \text{ and } C \subset Y_n.
\]
In words a cylinder set is a subset of \(Y\) which is determined by restricting the values of only a finite number of coordinates of \(y \in Y\). For example \(A := \{y \in Y : y_{2i} = 0 \text{ for } i \in \mathbb{N}\}\) is not a cylinder set.

a) Show that \(\mathcal{A}\) is a algebra.
b) Show that if \(A_n \in \mathcal{A}\) and \(A_n \downarrow \emptyset\) then \(A_n = \emptyset\) for all \(n\) sufficiently large.
c) Conclude that any finitely additive measure \(\mu_0\) on \(\mathcal{A}\) is a premeasure.

1. **Solution**

a) Let \(\mathcal{A}_n := \pi_n^{-1}(P(Y_n))\) then \(\mathcal{A}_n\) is the pull-back of an algebra and hence an algebra. Next notice that \(\mathcal{A}_n \subseteq \mathcal{A}_{n+1}\) for each \(n\). To see this, let \(C \subset Y_n\) and set \(A = \pi_n^{-1}(C)\). Then \(A = \pi_n^{-1}(C \times X)\) where \(X := \{0,1\}\). This shows that \(A \in \mathcal{A}_{n+1}\) and hence that \(\mathcal{A}_n \subseteq \mathcal{A}_{n+1}\). Now it is not hard to check an increasing union of algebras is still an algebra and hence \(\mathcal{A} = \bigcup_n \mathcal{A}_n\) is an algebra.

b) We will prove the contra-positive of part b). Namely, suppose that \(A_k \in \mathcal{A}\) with \(A_k\) decreasing as \(k\) increases and \(A_N = \bigcap_{k=1}^{N} A_k \neq \emptyset\) for each \(N \in \mathbb{N}\), then \(\bigcap_{k=1}^{\infty} A_k \neq \emptyset\). Using the ideas in the proof of part a) above, we may choose an increasing sequence \(\{n_k\}\) and sets \(D_k \subset Y_{n_k}\) such that \(A_k = \pi_{n_k}^{-1}(D_k)\) for all \(k \in \mathbb{N}\). To simplify notation replace the sequence \(\{A_1, A_2, A_3, \ldots\}\) by the sequence of sets
\[
\{B_1, B_2, B_3, \ldots\} := \{\hat{Y}_1, \hat{Y}_2, A_1, A_2, A_3, \ldots\}.
\]
Then \(B_i\) is also decreasing, \(\bigcap_{i=1}^{\infty} B_i \neq \emptyset\) for all \(N \in \mathbb{N}\), and \(\bigcap_{i=1}^{\infty} B_i = \bigcap_{i=1}^{\infty} A_n\). Moreover, the \(B_i\) may be written in the form \(B_i = \pi_i^{-1}(C_i)\) where \(C_i \subset Y_i\) for all \(i \in \mathbb{N}\).

We will now finish the proof by proving part b by showing that \(\bigcap_{i=1}^{\infty} B_i = \emptyset\). To do this, notice that \(B_i = \pi_i^{-1}(C_i) \supset B_{i+1} = \pi_i^{-1}(C_{i+1})\) implies \(C_{i+1} \subset C_i \times X\) for each \(i \in \mathbb{N}\). So by induction,
\[
C_j \subset C_i \times X^{(i-j)} \text{ for all } j > i.
\]
(48.25)

Since no \(B_i\) is empty by assumption, no \(C_i\) is empty either. In particular this implies that \(\{x_1|x \in C_i\}\) is not empty for each \(i\). Choose \(\varepsilon_1\) so that the for infinitely many \(i\)'s, \(\varepsilon_1 \in \{x_1|x \in C_i\}\). Then by (48.25) it must happen that \(\varepsilon_1 \in \{x_1|x \in C_i\}\) is non empty for all \(i \geq 2\). Hence we may choose \(\varepsilon_2 \in \{0,1\}\) such that \((\varepsilon_1, \varepsilon_2) \in \{x_1, x_2\}\) for all \(i \geq 2\). By induction, one may show there exists \(\varepsilon_1, \varepsilon_2, \varepsilon_3, \ldots \in \{0,1\}\) such that \((\varepsilon_1, \ldots, \varepsilon_j) \in \{x_1, x_2, \ldots, x_j\}\) for all \(i \geq j\) and in particular \((\varepsilon_1, \ldots, \varepsilon_j) \in C_j\) for all \(j \in \mathbb{N}\). Set \(\varepsilon := (\varepsilon_1, \ldots, \varepsilon_j) \in Y\), then we have shown that
\[
\pi_j(\varepsilon) = (\varepsilon_1, \ldots, \varepsilon_j) \in C_j \text{ for all } j \in \mathbb{N}.
\]
This shows that \(\varepsilon \in B_j\) for all \(j\), i.e. \(\varepsilon \in \bigcap B_j = \bigcap A_n\) and hence \(\bigcap A_n \neq \emptyset\).

c) It follows, by Homework 3.1.1 and what we have just proved, that any finitely additive measure \(\mu_0\) on \(\mathcal{A}\) is actually countably additive on \(\mathcal{A}\), i.e.
\(\mu_0\) is a premeasure on \(\mathcal{A}\).

**Exercise 48.4.** Show there is a unique finitely additive measure \(\mu_0\) on \(\mathcal{A}\) such that \(\mu_0(A) = 2^{-n}\) if \(A\) is a set of the form
\[
A = \{y \in Y | y_i = \varepsilon_i \text{ for } i = 1, 2, \ldots, n\},
\]
(48.26)
where each \(\varepsilon_i \in \{0,1\}\). Use the above problems to conclude there exists unique measure \(\mu\) on \(\mathcal{M} := \sigma(\mathcal{A})\) such that \(\mu(A) = 2^{-n}\) if \(A\) is as in (48.26).
1. Solution: For $A \in \mathcal{P}(Y_n)$ let $\mu_n(A) = 2^{-n} \#(A)$, where $\#(A)$ denotes the number of elements in $A$. Then $\mu_n$ is a measure on $\mathcal{P}(Y_n)$. If $A \in \mathcal{A}_n \subset \mathcal{A}$ is of the form $A = \pi_n^{-1}(C)$ with $C \subset Y_n$, set $\mu_0(A) = \mu_n(C)$. We must show that $\mu_0$ is well defined. For this suppose that $A = \pi_n^{-1}(D)$ for some $D \subset Y_m$. Without loss of generality assume that $m > n$, then $D$ must be given by $D = C \times X^{(m-n)}$. Therefore

$$
\mu_m(D) = 2^{-m} \#(C \times X^{(m-n)}) = 2^{-m} 2^{(m-n)} \#(C) = 2^{-n} \#(C) = \mu_n(C),
$$

which shows that $\mu_0$ is well defined. Now it is easily checked that $\mu_0$ is a measure on $\mathcal{A}$ since $\mu_m$ is a measure on $\mathcal{A}_m$ for each $m$. Therefore by the last problem, $\mu_0$ is in fact a premeasure on $\mathcal{A}$. By Theorem 1.14 of Folland, it follows that $\mu$ extends to a measure on $\mathcal{M} = \sigma(\mathcal{A})$.

Remark 48.23 (A Cryptic Remark). The measure $\mu$ is essentially Lebesgue measure on the unit interval $[0, 1]$.

*** End of WORK material. ***

48.9 Exercises

Exercise 48.5 (Riesz Markov Theorem for an Interval). Suppose that $X = [0, 1]$ and $\lambda \in \mathcal{C}(X)^*$ and $\lambda \geq 0$. Define $F(1) := \lambda(1)$ and for $b \in [0, 1)$, let $F(b) = \inf_{\varepsilon > 0} \lambda(\varphi_{b,\varepsilon}) = \lim_{\varepsilon \to 0} \lambda(\varphi_{b,\varepsilon})$ where

$$
\varphi_{b,\varepsilon}(x) = \begin{cases} 
1 & \text{if } x \leq b \\
1 - (x - b)/\varepsilon & \text{if } b \leq x \leq b + \varepsilon \\
0 & \text{if } x \geq b + \varepsilon.
\end{cases}
$$

(48.27)

Show $F$ is an increasing right continuous function on $X$. Let $\mu$ be the unique measure on $\mathcal{B}_X$ such that $\mu([0, b]) = F(b)$ for all $b \in X$. Show also that

$$
\lambda(f) = \int_0^1 f \, d\mu \text{ for all } f \in \mathcal{C}(X).
$$

(48.28)

This is a simple version of Theorem 27.29.
The Daniell – Stone Construction of Integration and Measures

Now that we have developed integration theory relative to a measure on a σ-algebra, it is time to show how to construct the measures that we have been using. This is a bit technical because there tends to be no “explicit” description of the general element of the typical σ-algebras. On the other hand, we do know how to explicitly describe algebras which are generated by some class of sets \( E \subset 2^X \). Therefore, we might try to define measures on \( \sigma(E) \) by there restrictions to \( \mathcal{A}(E) \). Theorem 45.43 or Theorem 46.6 shows this is a plausible method.

So the strategy of this section is as follows: 1) construct finitely additive measure on an algebra, 2) construct “integrals” associated to such finitely additive measures, 3) extend these integrals (Daniell’s method) when possible to a larger class of functions, 4) construct a measure from the extended integral (Daniell – Stone construction theorem).

In this chapter, \( X \) will be a given set and we will be dealing with certain spaces of extended real valued functions \( f : X \to \mathbb{R} \) on \( X \). As before the convention that \( 0 \cdot (\pm \infty) = 0 \) will be in force in this chapter.

**Notation 49.1** Given functions \( f, g : X \to \mathbb{R} \), let \( f + g \) denote the collection of functions \( h : X \to \mathbb{R} \) such that \( h(x) = f(x) + g(x) \) for all \( x \) for which \( f(x) + g(x) \) is well defined, i.e. not of the form \( \infty - \infty \).

For example, if \( X = \{1, 2, 3\} \) and \( f(1) = \infty, f(2) = 2, f(3) = 5 \) and \( g(1) = g(2) = -\infty \) and \( g(3) = 4 \), then \( h \in f + g \) iff \( h(2) = -\infty \) and \( h(3) = 7 \). The value \( h(1) \) may be chosen freely. More generally if \( a, b \in \mathbb{R} \) and \( f, g : X \to \mathbb{R} \) we will write \( af + bg \) for the collection of functions \( h : X \to \mathbb{R} \) such that \( h(x) = af(x) + bg(x) \) for those \( x \in X \) where \( af(x) + bg(x) \) is well defined with the values of \( h(x) \) at the remaining points being arbitrary. It will also be useful to have some explicit representatives for \( af + bg \) which we define, for \( \alpha \in \mathbb{R} \), by

\[
(af + bg)_\alpha(x) = \begin{cases} af(x) + bg(x) & \text{when defined} \\ \alpha & \text{otherwise.} \end{cases}
\]

We will make use of this definition with \( \alpha = 0 \) and \( \alpha = \infty \) below.

**Notation 49.2** Given a collection of extended real valued functions \( \mathcal{C} \) on \( X \), let \( \mathcal{C}^+ := \{ f \in \mathcal{C} : f \geq 0 \} \) – denote the subset of positive functions \( f \in \mathcal{C} \).

**Definition 49.3.** A set, \( L \), of extended real valued functions on \( X \) is an extended vector space (or a vector space for short) if \( L \) is closed under scalar multiplication and addition in the following sense: if \( f, g \in L \) and \( \lambda \in \mathbb{R} \) then \( (f + \lambda g) \in L \). A vector space \( L \) is said to be an extended lattice (or a lattice for short) if it is also closed under the lattice operations;

\[
f \lor g = \max(f, g) \quad \text{and} \quad f \land g = \min(f, g).
\]

**A linear functional** \( I \) on \( L \) is a function \( I : L \to \mathbb{R} \) such that \( I(f + \lambda g) = I(f) + \lambda I(g) \) for all \( f, g \in L \) and \( \lambda \in \mathbb{R} \).

Equation (49.2) is to be interpreted as \( I(h) = I(f) + \lambda I(g) \) for all \( h \in (f + \lambda g) \), and in particular \( I \) is required to take the same value on all members of \( (f + \lambda g) \).

**Remark 49.4.** Notice that an extended lattice \( L \) is closed under the absolute value operation since \( |f| = f \lor 0 - f \land 0 = f \lor (-f) \). Also if \( I \) is positive on \( L \) then \( I(f) \leq I(g) \) when \( f, g \in L \) and \( f \leq g \). Indeed, \( f \leq g \) implies \((g - f)_0 \geq 0\), so

\[
0 = I(0) \leq I((g - f)_0) = I(g) - I(f)
\]

and hence \( I(f) \leq I(g) \). If \( L \) is a vector space of real-valued functions on \( X \), then \( L \) is a lattice iff \( f^+ = f \lor 0 \in L \) for all \( f \in L \). This is because

\[
|f| = f^+ + (-f)^+,
\]

\[
f \lor g = \frac{1}{2} (f + g + |f - g|) \quad \text{and} \quad f \land g = \frac{1}{2} (f + g - |f - g|).
\]

In the remainder of this chapter we fix a sub-lattice, \( S \subset \ell^\infty(X, \mathbb{R}) \) and a positive linear functional \( I : S \to \mathbb{R} \).

**Definition 49.5 (Property (D)).** A non-negative linear functional \( I \) on \( S \) is said to be continuous under monotone limits if \( I(f_n) \downarrow 0 \) for all \( \{f_n\}^\infty_{n=1} \subset S^+ \) satisfying (pointwise) \( f_n \downarrow 0 \). A positive linear functional on \( S \) satisfying property (D) is called a Daniell integral on \( S \). We will also write \( S \) as \( D(I) \) – the domain of \( I \).
Lemma 49.6. Let $I$ be a non-negative linear functional on a lattice $S$. Then property $(D)$ is equivalent to either of the following two properties:

$D_1$ If $\varphi, \varphi_n \in S$ satisfy $\varphi_n \leq \varphi_{n+1}$ for all $n$ and $\varphi \leq \lim_{n \to \infty} \varphi_n$, then $I(\varphi) \leq \lim_{n \to \infty} I(\varphi_n)$.

$D_2$ If $u_j \in S^+$ and $\varphi \in S$ is such that $\varphi \leq \sum_{j=1}^{\infty} u_j$ then $I(\varphi) \leq \sum_{j=1}^{\infty} I(u_j)$.

Proof. $(D) \implies (D_1)$ Let $\varphi, \varphi_n \in S$ be as in $D_1$. Then $\varphi \wedge \varphi_n \uparrow \varphi$ and $\varphi - (\varphi \wedge \varphi_n) \downarrow 0$ which implies

$$I(\varphi) = I(\varphi) - I(\varphi \wedge \varphi_n) = I(\varphi - (\varphi \wedge \varphi_n)) \downarrow 0.$$

Hence

$$I(\varphi) = \lim_{n \to \infty} I(\varphi \wedge \varphi_n) \leq \lim_{n \to \infty} I(\varphi_n).$$

$(D_1) \implies (D_2)$ Apply $(D_1)$ with $\varphi_n = \sum_{j=1}^{\infty} u_j$. $(D_2) \implies (D)$ Suppose $\varphi_n \in S$ with $\varphi_n \downarrow 0$ and let $u_n = \varphi_n - \varphi_{n+1}$. Then $\sum_{n=1}^{N} u_n = \varphi_1 - \varphi_{N+1} \uparrow \varphi_1$ and hence

$$I(\varphi_1) \leq \sum_{n=1}^{N} I(u_n) = \lim_{N \to \infty} \sum_{n=1}^{N} I(u_n) = \lim_{N \to \infty} I(\varphi_1) - \lim_{N \to \infty} I(\varphi_{N+1}) \leq 0.$$

from which it follows that $\lim_{N \to \infty} I(\varphi_{N+1}) \leq 0$. Since $I(\varphi_{N+1}) \geq 0$ for all $N$ we conclude that $\lim_{N \to \infty} I(\varphi_{N+1}) = 0$. ■

49.0.1 Examples of Daniell Integrals

Proposition 49.7. Suppose that $(X, \tau)$ is a locally compact Hausdorff space and $I$ is a positive linear functional on $S := C_c(X, \mathbb{R})$. Then for each compact subset $K \subseteq X$ there is a constant $C_K < \infty$ such that $|I(f)| \leq C_K \|f\|_{\infty}$ for all $f \in C_c(X, \mathbb{R})$ with $\text{supp}(f) \subseteq K$. Moreover, if $f_n \in C_c(X, [0, \infty))$ and $f_n \downarrow 0$ (pointwise) as $n \to \infty$, then $I(f_n) \downarrow 0$ as $n \to \infty$ and in particular $I$ is necessarily a Daniell integral on $S$.

Proof. Let $f \in C_c(X, \mathbb{R})$ with $\text{supp}(f) \subseteq K$. By Lemma 25.8 there exists $\psi_K \prec \chi$ such that $\psi_K = 1$ on $K$. Since $\|f\|_{\infty} \psi_K \pm f \geq 0$,

$$0 \leq I(\|f\|_{\infty} \psi_K \pm f) = \|f\|_{\infty} I(\psi_K) \pm I(f)$$

from which it follows that $I(\|f\|_{\infty} \psi_K) \|f\|_{\infty}$. So the first assertion holds with $C_K = I(\psi_K) < \infty$. Now suppose that $f_n \in C_c(X, [0, \infty))$ and $f_n \downarrow 0$ as $n \to \infty$. Let $K = \text{supp}(f_1)$ and notice that $\text{supp}(f_n) \subseteq K$ for all $n$. By Dini’s Theorem (see Exercise 17.16), $\|f_n\|_{\infty} \downarrow 0$ as $n \to \infty$ and hence

$$0 \leq I(f_n) \leq C_K \|f_n\|_{\infty} \downarrow 0 \text{ as } n \to \infty.$$

For example if $X = \mathbb{R}$ and $F$ is an increasing function on $\mathbb{R}$, then $I(f) := \int_{\mathbb{R}} f dF$ is a Daniell integral on $C_c(\mathbb{R}, \mathbb{R})$, see Lemma 43.28. However it is not generally true in this case that $I(f_n) \downarrow 0$ for all $f_n \in S$ ($S$ is the collection of compactly supported step functions on $\mathbb{R}$) such that $f_n \downarrow 0$. The next example and proposition addresses this question.

Example 49.8. Suppose $F : \mathbb{R} \to \mathbb{R}$ is an increasing function which is not right continuous at $x_0 \in \mathbb{R}$. Then, letting $f_n = 1_{(x_0-x_0+n^{-1})} \in S$, we have $f_n \downarrow 0$ as $n \to \infty$ but

$$\int_{\mathbb{R}} f_n dF = F(x_0 + n^{-1}) - F(x_0) \to F(x_0^+) - F(x_0) \neq 0.$$

Proposition 49.9. Let $(A, \mu, S) = S_f(A, \mu, I = I_\mu)$ be as in Definition 43.25. If $\mu$ is a premeasure (Definition 43.17) on $A$, then

$$\forall f_n \in S \text{ with } f_n \downarrow 0 \implies I(f_n) \downarrow 0 \text{ as } n \to \infty. \quad (49.3)$$

Hence $I$ is a Daniell integral on $S$.

Proof. Let $\varepsilon > 0$ be given and observe that

$$f_n = f_n 1_{f_n > \varepsilon} f_1 + f_n 1_{f_n \leq \varepsilon} f_1 - f_1 f_n > \varepsilon f_1 + \varepsilon f_1,$$

and

$$I(f_n) \leq I(f_1 1_{f_n > \varepsilon} f_1) + \varepsilon I(f_1) = \sum_{a>0} a \mu(f_1 = a, f_n > \varepsilon a) + \varepsilon I(f_1). \quad (49.4)$$

Because, for $a > 0$,

$$\mathcal{A} \ni \{f_1 = a, f_n > \varepsilon a\} \downarrow \emptyset \text{ as } n \to \infty$$

and $\mu(f_1 = a) < \infty$, $\lim_{a \to \infty} \mu(f_1 = a, f_n > \varepsilon a) = 0$. Passing to the limit in Eq. (49.4), noting that the sum in Eq. (49.4) is actually a finite sum, shows

$$\lim_{n \to \infty} I(f_n) \leq \sum_{a>0} a \mu(f_1 = a, f_n > \varepsilon a) + \varepsilon I(f_1). \quad (49.5)$$

Combining this with Eq. (49.5) and making use of the fact that $\varepsilon > 0$ is arbitrary we learn $\lim_{n \to \infty} I(f_n) = 0$. ■
49.1 Extending a Daniell Integral

In the remainder of this chapter we fix a lattice, $\mathcal{S}$, of bounded functions, $f : X \to \mathbb{R}$, and a positive linear functional $I : \mathcal{S} \to \mathbb{R}$ satisfying Property (D) of Definition 49.5.

**Lemma 49.10.** Suppose that $\{f_n\}, \{g_n\} \subset \mathcal{S}$.

1. If $f_n \uparrow f$ and $g_n \uparrow g$ with $f, g : X \to (-\infty, \infty]$ such that $f \leq g$, then
   $$\lim_{n \to \infty} I(f_n) \leq \lim_{n \to \infty} I(g_n).$$

2. If $f_n \downarrow f$ and $g_n \downarrow g$ with $f, g : X \to [-\infty, \infty)$ such that $f \leq g$, then Eq. (49.6) still holds.

   In particular, in either case if $f = g$, then
   $$\lim_{n \to \infty} I(f_n) = \lim_{n \to \infty} I(g_n).$$

**Proof.**

1. Fix $n \in \mathbb{N}$, then $g_k \land f_n \uparrow f$ as $k \to \infty$ and $g_k \land f_n \leq g_k$ and hence
   $$I(f_n) = \lim_{k \to \infty} I(g_k \land f_n) \leq \lim_{k \to \infty} I(g_k).$$

   Passing to the limit $n \to \infty$ in this equation proves Eq. (49.6).

2. Since $-f_n \uparrow (-f)$ and $-g_n \uparrow (-g)$ and $-g \leq (-f)$, what we just proved shows
   $$\lim_{n \to \infty} I(g_n) = \lim_{n \to \infty} I(-g_n) \leq \lim_{n \to \infty} I(-f_n) = -\lim_{n \to \infty} I(f_n)$$

   which is equivalent to Eq. (49.6).

**Definition 49.11.** Let

$$\mathcal{S}_\uparrow = \{f : X \to (-\infty, \infty] : \exists f_n \in \mathcal{S} \text{ such that } f_n \uparrow f\}$$

and

$$\mathcal{S}_\downarrow = \{f : X \to [-\infty, \infty) : \exists f_n \in \mathcal{S} \text{ such that } f_n \downarrow f\}.$$

Because of Lemma 49.10 for $f \in \mathcal{S}_\uparrow$ and $g \in \mathcal{S}_\downarrow$ we may define

$$I_\uparrow(f) = \lim_{n \to \infty} I(f_n) \quad \text{if } \mathcal{S} \ni f_n \uparrow f$$

and

$$I_\downarrow(g) = \lim_{n \to \infty} I(g_n) \quad \text{if } \mathcal{S} \ni g_n \downarrow g.$$

If $f \in \mathcal{S}_\uparrow \cap \mathcal{S}_\downarrow$, then there exists $f_n, g_n \in \mathcal{S}$ such that $f_n \uparrow f$ and $g_n \downarrow f$. Hence $\mathcal{S} \ni (g_n - f_n) \downarrow 0$ and hence by the continuity property (D),

$$I_\uparrow(f) - I_\downarrow(f) = \lim_{n \to \infty} [I(g_n) - I(f_n)] = \lim_{n \to \infty} (I(g_n) - I(f_n)) = 0.$$

Therefore $I_\uparrow = I_\downarrow$ on $\mathcal{S}_\uparrow \cap \mathcal{S}_\downarrow$.

**Notation 49.12** Using the above comments we may now simply write $I(f)$ for $I_\uparrow(f)$ or $I_\downarrow(f)$ when $f \in \mathcal{S}_\uparrow$ or $f \in \mathcal{S}_\downarrow$. Henceforth we will now view $I$ as a function on $\mathcal{S}_\uparrow \cup \mathcal{S}_\downarrow$.

Again because of Lemma 49.10 let $I_\uparrow := I|_{\mathcal{S}_\uparrow}$ or $I_\downarrow := I|_{\mathcal{S}_\downarrow}$ are positive functionals; i.e. if $f \leq g$ then $I(f) \leq I(g)$.

**Exercise 49.1.** Show $\mathcal{S}_\downarrow = -\mathcal{S}_\uparrow$ and for $f \in \mathcal{S}_\uparrow \cup \mathcal{S}_\downarrow$ that $I(-f) = -I(f) \in \mathbb{R}$.

**Proposition 49.13.** The set $\mathcal{S}_\uparrow$ and the extension of $I$ to $\mathcal{S}_\uparrow$ in Definition 49.11 satisfies:

1. (Monotonicity) $I(f) \leq I(g)$ if $f, g \in \mathcal{S}_\uparrow$ with $f \leq g$.
2. $\mathcal{S}_\uparrow$ is closed under the lattice operations, i.e. if $f, g \in \mathcal{S}_\uparrow$ then $f \land g \in \mathcal{S}_\uparrow$ and $f \lor g \in \mathcal{S}_\uparrow$. Moreover, if $f(\infty) < \infty \text{ and } I(\infty) < \infty$, then $I(f \lor g) < \infty$ and $I(f \land g) < \infty$.
3. (Positive Linearity) $I(f + \lambda g) = I(f) + \lambda I(g)$ for all $f, g \in \mathcal{S}_\uparrow$ and $\lambda \geq 0$.
4. $f \in \mathcal{S}_\uparrow^+$ if there exists $\varphi_n \in \mathcal{S}_\uparrow^+$ such that $f = \sum_{n=1}^{\infty} \varphi_n$. Moreover, $I(f) = \sum_{n=1}^{\infty} I(\varphi_n)$.
5. If $f, g \in \mathcal{S}_\uparrow^+$, then $\sum_{n=1}^{\infty} f_n = f \in \mathcal{S}_\uparrow^+$ and $I(f) = \sum_{n=1}^{\infty} I(f_n)$.

**Remark 49.14.** Similar results hold for the extension of $I$ to $\mathcal{S}_\downarrow$ in Definition 49.11.

**Proof.**

1. Monotonicity follows directly from Lemma 49.10.
2. If $f_n, g_n \in \mathcal{S}$ are chosen so that $f_n \uparrow f$ and $g_n \uparrow g$, then $f_n \land g_n \uparrow f \land g$ and $f_n \lor g_n \uparrow f \lor g$. If we further assume that $I(g) < \infty$, then $f \land g \leq g$ and hence $I(f \land g) \leq I(g) < \infty$. In particular it follows that $I(f \land 0) \in (-\infty, 0]$ for all $f \in \mathcal{S}_\uparrow$. Combining this with the identity,

$$I(f) = I(f \land 0 + f \lor 0) = I(f \land 0) + I(f \lor 0),$$

shows $I(f) < \infty$ iff $I(f \lor 0) < \infty$. Since $f \lor g \leq f \lor 0 + g \lor 0$, if both $I(f) < \infty$ and $I(g) < \infty$ then

$$I(f \lor g) \leq I(f \lor 0) + I(g \lor 0) < \infty.$$
3. Let \( f_n, g_n \in \mathbb{S} \) be chosen so that \( f_n \uparrow f \) and \( g_n \uparrow g \), then \( (f_n + \lambda g_n) \uparrow (f + \lambda g) \) and therefore

\[
I(f + \lambda g) = \lim_{n \to \infty} I(f_n + \lambda g_n) = \lim_{n \to \infty} I(f_n) + \lambda \lim_{n \to \infty} I(g_n) = I(f) + \lambda I(g).
\]

4. Let \( f \in \mathbb{S}_+^1 \) and \( g \in \mathbb{S} \) be chosen so that \( f_n \uparrow f \). By replacing \( f_n \) by \( f_n \wedge 0 \) if necessary we may assume that \( f_n \in \mathbb{S}_+^1 \). Now set \( \varphi_n = f_n - f_{n-1} \in \mathbb{S} \) for \( n = 1, 2, 3, \ldots \) with the convention that \( f_0 = 0 \in \mathbb{S} \). Then \( \sum_{n=1}^{\infty} \varphi_n = f \) and

\[
I(f) = \lim_{n \to \infty} I(f_n) = \lim_{n \to \infty} I(\sum_{m=1}^{n} \varphi_m) = \lim_{n \to \infty} I(\sum_{m=1}^{n} \varphi_m) = \sum_{m=1}^{\infty} I(\varphi_m).
\]

Conversely, if \( f = \sum_{m=1}^{\infty} \varphi_m \) with \( \varphi_m \in \mathbb{S}_+^1 \), then \( f_n := \sum_{m=1}^{n} \varphi_m \uparrow f \) as \( n \to \infty \) and \( f_n \in \mathbb{S}_+^1 \).

5. Using Item 4., \( f_n = \sum_{m=1}^{\infty} \varphi_{n,m} \) with \( \varphi_{n,m} \in \mathbb{S}_+^1 \). Thus

\[
f = \sum_{n=1}^{\infty} \sum_{m=1}^{\infty} \varphi_{n,m} = \lim_{N \to \infty} \sum_{m,n \leq N} \varphi_{n,m} \in \mathbb{S}_+^1
\]

and

\[
I(f) = \lim_{N \to \infty} I(\sum_{m,n \leq N} \varphi_{n,m}) = \lim_{N \to \infty} \sum_{m,n \leq N} I(\varphi_{n,m}) = \sum_{m=1}^{\infty} \sum_{n=1}^{\infty} I(\varphi_{n,m}) = \sum_{n=1}^{\infty} I(f_n).
\]

### Definition 49.15.

Given an arbitrary function \( g : X \to \overline{\mathbb{R}} \), let

\[
I^*(g) = \inf \{ I(f) : f \leq g \in \mathbb{S}_+ \} \in \overline{\mathbb{R}}
\]

and

\[
I_*(g) = \sup \{ I(f) : \mathbb{S}_+ \ni f \leq g \} \in \overline{\mathbb{R}}.
\]

with the convention that \( \sup \emptyset = -\infty \) and \( \inf \emptyset = +\infty \).

### Definition 49.16.

A function \( g : X \to \overline{\mathbb{R}} \) is integrable if \( I_*(g) = I^*(g) \in \overline{\mathbb{R}} \). Let

\[
L^1(I) := \{ g : X \to \overline{\mathbb{R}} : I_*(g) = I^*(g) \in \overline{\mathbb{R}} \}
\]

and for \( g \in L^1(I) \), let \( \tilde{I}(g) \) denote the common value \( I_*(g) = I^*(g) \).

#### Remark 49.17.

A function \( g : X \to \overline{\mathbb{R}} \) is integrable iff for any \( \varepsilon > 0 \) there exists \( f \in \mathbb{S}_+ \cap L^1(I) \) and \( h \in \mathbb{S}_+ \cap L^1(I) \) such that \( f \leq g \leq h \) and \( I(h - f) < \varepsilon \).

Indeed if \( g \) is integrable, then \( I_*(g) = I^*(g) \) and there exists \( f \in \mathbb{S}_+ \cap L^1(I) \) and \( h \in \mathbb{S}_+ \cap L^1(I) \) such that \( f \leq g \leq h \) and \( 0 \leq I_*(g) - I(f) < \varepsilon/2 \). Adding these two inequalities implies \( 0 \leq I(h) - I(f) = I(h - f) < \varepsilon \). Conversely, if there exists \( f \in \mathbb{S}_+ \cap L^1(I) \) and \( h \in \mathbb{S}_+ \cap L^1(I) \) such that \( f \leq g \leq h \) and \( I(h - f) < \varepsilon \), then

\[
I(f) = I_*(f) \leq I_*(g) = I_*(h) = I(h)
\]

and therefore

\[
0 \leq I^*(g) - I_*(g) \leq I(h) - I(f) = I(h - f) < \varepsilon.
\]

Since \( \varepsilon > 0 \) is arbitrary, this shows \( I^*(g) = I_*(g) \).

#### Proposition 49.18.

Given functions \( f, g : X \to \overline{\mathbb{R}} \), then:

1. \( I^*(\lambda f) = \lambda I^*(f) \) for all \( \lambda \geq 0 \).
2. (Chebyshev’s Inequality.) Suppose \( f : X \to [0, \infty] \) is a function and \( \alpha \in (0, \infty) \), then \( I^*(L_{\{f \geq \alpha\}}) \leq \frac{1}{\alpha} I^*(f) \) and if \( I^*(f) < \infty \) then \( I^*(L_{\{f = \infty\}}) = 0 \).
3. \( I^* \) is sub-additive, i.e. if \( I^*(f) + I^*(g) \) is not of the form \( \infty - \infty \) or \( -\infty + \infty \), then

\[
I^*(f + g) \leq I^*(f) + I^*(g).
\]

This inequality is to be interpreted to mean,

\[
I^*(h) \leq I^*(f) + I^*(g) \text{ for all } h \in (f + g).
\]

4. \( I_*(-g) = -I^*(g) \).
5. \( I_*(g) \leq I^*(g) \).
6. If \( f \leq g \) then \( I^*(f) \leq I^*(g) \) and \( I_*(f) \leq I_*(g) \).
7. If \( g \in \mathbb{S}_+ \) and \( I^*(g) < \infty \) or \( g \in \mathbb{S}_+ \) and \( I_*(g) > -\infty \) then \( I_*(g) = I^*(g) = I(g) \).

#### Proof.

1. Suppose that \( \lambda > 0 \) (the \( \lambda = 0 \) case being trivial), then

\[
I^*(\lambda f) = \inf \{ I(h) : \lambda f \leq h \in \mathbb{S}_+ \} = \inf \{ I(h) : f \leq \lambda^{-1} h \in \mathbb{S}_+ \}
\]

and

\[
I^*(\lambda g) : f \leq g \in \mathbb{S}_+ \} = \inf \{ I(h) : f \leq g \in \mathbb{S}_+ \} = \lambda I^*(f).
\]

1 Equivalently, \( f \in \mathbb{S}_+ \) with \( I(f) > -\infty \) and \( h \in \mathbb{S}_+ \) with \( I(h) < \infty \).
4. From the definitions and Exercise 49.1, the assertion is trivially true if \( g \) \( \in I \) and we may assume by interchanging arbitrary.

5. \( I^*(f) = \inf \{ I(h) : f \leq h \in S_\uparrow \} \leq \inf \{ I(h) : g \leq h \in S_\uparrow \} = I^*(g) \) 

6. If \( f \leq g \) then

\[
I^*(f) = \inf \{ I(h) : f \leq h \in S_\uparrow \} \leq \inf \{ I(h) : g \leq h \in S_\uparrow \} = I^*(g)
\]

and

\[
I_*(f) = \sup \{ I(h) : S_\downarrow \ni h \leq f \} \leq \sup \{ I(h) : S_\downarrow \ni h \leq g \} = I_*(g).
\]

7. Let \( g \in S_\uparrow \) with \( I(g) < \infty \) and choose \( g_n \in S \) such that \( g_n \uparrow g \). Then

\[
I^*(g) \geq I_*(g) \geq I(g_n) \to I(g) \text{ as } n \to \infty.
\]

Combining this with

\[
I^*(g) = \inf \{ I(f) : g \leq f \in S_\uparrow \} = I(g)
\]

shows

\[
I^*(g) \geq I_*(g) \geq I(g) = I^*(g)
\]

and hence \( I_*(-) = I^*(g) \). If \( g \in S_\downarrow \) and \( I(g) > -\infty \), then by what we have just proved,

\[
I_*(-g) = I(-g) = I^*(-g).
\]

This finishes the proof since \( I_*(-g) = -I^*(g) \) and \( I(-g) = -I(g) \).

Lemma 49.19 (Countable Sub-additivity of \( I^* \)). Let \( f_n : X \to [0, \infty] \) be a sequence of functions and \( F := \sum_{n=1}^{\infty} f_n \). Then

\[
I^*(F) = \sum_{n=1}^{\infty} I^*(f_n) \leq \sum_{n=1}^{\infty} I^*(f_n).
\]

Proof. Suppose \( \sum_{n=1}^{\infty} I^*(f_n) < \infty \), for otherwise the result is trivial. Let \( \varepsilon > 0 \) be given and choose \( g_n \in S_\uparrow \) such that \( f_n \leq g_n \) and \( I(g_n) = I^*(f_n) + \varepsilon_n \) where \( \sum_{n=1}^{\infty} \varepsilon_n \leq \varepsilon \). (For example take \( \varepsilon_n = 2^{-n} \varepsilon \)). Then \( \sum_{n=1}^{\infty} g_n =: G \in S_\uparrow \), \( F \leq G \) and so

\[
I^*(F) \leq I^*(G) = I(G) = \sum_{n=1}^{\infty} I(g_n) = \sum_{n=1}^{\infty} (I^*(f_n) + \varepsilon_n) \leq \sum_{n=1}^{\infty} I^*(f_n) + \varepsilon.
\]

Since \( \varepsilon > 0 \) is arbitrary, the proof is complete.

Proposition 49.20. The space \( L^1(I) \) is an extended lattice and \( \bar{I} : L^1(I) \to \mathbb{R} \) is linear in the sense of Definition [49.3].
Proof. Let us begin by showing that $L^1(I)$ is a vector space. Suppose that $g_1, g_2 \in L^1(I)$ and $g \in (g_1 + g_2)$. Given $\varepsilon > 0$ there exists $f_i \in S_\ell \cap L^1(I)$ and $h_i \in S_\ell \cap L^1(I)$ such that $f_i \leq g_i \leq h_i$ and $I(h_i - f_i) < \varepsilon/2$. Let us now show

$$f_1(x) + f_2(x) \leq g(x) \leq h_1(x) + h_2(x) \forall x \in X.$$  \hfill (49.9)

This is clear at points $x \in X$ where $g_1(x) + g_2(x)$ is well defined. The other case to consider is where $g_1(x) = \infty = -g_2(x)$ in which case $h_1(x) = \infty$ and $f_1(x) = -\infty$ while $h_2(x) = -\infty$ and $f_1(x) < \infty$ because $h_2 \in S_\ell$ and $f_1 \in S_\ell$. Therefore, $f_1(x) + f_2(x) = -\infty$ and $h_1(x) + h_2(x) = \infty$ so that Eq. (49.9) is valid no matter how $g(x)$ is chosen. Since $f_1 + f_2 \in S_\ell \cap L^1(I)$, $h_1 + h_2 \in S_\ell \cap L^1(I)$ and

$$I(g_i) \leq I(f_i) + \varepsilon/2 \quad \text{and} \quad -\varepsilon/2 + I(h_i) \leq I(g_i),$$

we find

$$I(g_1) + I(g_2) - \varepsilon \leq I(f_1) + I(f_2) \leq I(f_1 + f_2) \leq I^*(g) \leq I^*(f_1 + f_2) \leq I^*(g) \leq I^*(f_1) + I^*(g_2) + \varepsilon.$$

Because $\varepsilon > 0$ is arbitrary, we have shown that $g \in L^1(I)$ and $I(g_1) + I(g_2) = I(g)$, i.e. $I(g_1 + g_2) = I(g)$. It is a simple matter to show $\lambda g \in L^1(I)$ and $I(\lambda g) = \lambda I(g)$ for all $g \in L^1(I)$ and $\lambda \in \mathbb{R}$. For example if $\lambda = -1$ (the most interesting case), choose $f \in S_\ell \cap L^1(I)$ and $h \in S_\ell \cap L^1(I)$ such that $f \leq h < h$ and $I(h - f) < \varepsilon$. Therefore,

$$S_\ell \cap L^1(I) \ni -h \leq -g \leq -f \in S_\ell \cap L^1(I)$$

with $I(-f) = I(h - f) < \varepsilon$ and this shows that $-g \in L^1(I)$ and $I(-g) = -I(g)$. We have now shown that $L^1(I)$ is a vector space of extended real valued functions and $I : L^1(I) \to \mathbb{R}$ is linear. To show $L^1(I)$ is a lattice, let $g_1, g_2 \in L^1(I)$ and $f_1 \in S_\ell \cap L^1(I)$ and $h_1 \in S_\ell \cap L^1(I)$ such that $f_1 \leq g_1 \leq h_1$ and $I(h_1 - f_1) < \varepsilon/2$ as above. Then using Proposition 49.13 and Remark 49.14

$$S_\ell \cap L^1(I) \ni f_1 \wedge f_2 \leq g_1 \wedge g_2 \leq h_1 \wedge h_2 \in S_\ell \cap L^1(I).$$

Moreover,

$$0 \leq h_1 \wedge h_2 - f_1 \wedge f_2 \leq h_1 - f_1 + h_2 - f_2,$$

because, for example, if $h_1 \wedge h_2 = h_1$ and $f_1 \wedge f_2 = f_2$ then

$$h_1 \wedge h_2 - f_1 \wedge f_2 = h_1 - f_1 + h_2 - f_2.$$

Therefore,

$$I(h_1 \wedge h_2 - f_1 \wedge f_2) \leq I(h_1 - f_1 + h_2 - f_2) < \varepsilon$$

and hence by Remark 49.17 $g_1 \wedge g_2 \in L^1(I)$. Similarly

$$0 \leq h_1 \vee h_2 - f_1 \vee f_2 \leq h_1 - f_1 + h_2 - f_2,$$

because, for example, if $h_1 \vee h_2 = h_1$ and $f_1 \vee f_2 = f_2$ then

$$h_1 \vee h_2 - f_1 \vee f_2 = h_1 - f_1 + h_2 - f_2.$$

Therefore,

$$I(h_1 \vee h_2 - f_1 \vee f_2) \leq I(h_1 - f_1 + h_2 - f_2) < \varepsilon$$

and hence by Remark 49.17 $g_1 \vee g_2 \in L^1(I)$.
\[ \bar{I}(\liminf_{n \to \infty} f_n) = \lim_{k \to \infty} \bar{I}(u_k) \leq \liminf_{n \to \infty} \bar{I}(f_n). \]

Before stating the dominated convergence theorem, it is helpful to remove some of the annoyances of dealing with extended real valued functions. As we have done when studying integrals associated to a measure, we can do this by modifying integrable functions by a “null” function.

**Definition 49.23.** A function \( n : X \to \mathbb{R} \) is a null function if \( I^*(|n|) = 0 \). A subset \( E \subset X \) is said to be a null set if \( 1_E \) is a null function. Given two functions \( f, g : X \to \mathbb{R} \) we will write \( f = g \) a.e. if \( \{ f \neq g \} \) is a null set.

Here are some basic properties of null functions and null sets.

**Proposition 49.24.** Suppose that \( n : X \to \mathbb{R} \) is a null function and \( f : X \to \mathbb{R} \) is an arbitrary function. Then

1. \( n \in L^1(I) \) and \( \bar{I}(n) = 0 \).
2. The function \( n \cdot f \) is a null function.
3. The set \( \{ x \in X : n(x) \neq 0 \} \) is a null set.
4. If \( E \) is a null set and \( f \in L^1(I) \), then \( 1_E \cdot f \in L^1(I) \) and \( \bar{I}(f) = \bar{I}(1_E \cdot f) \).
5. If \( g \in L^1(I) \) and \( f = g \) a.e. then \( f \in L^1(I) \) and \( \bar{I}(f) = \bar{I}(g) \).
6. If \( f \in L^1(I) \), then \( E := \{|f| = \infty\} \) is a null set.

**Proof.**

1. If \( n \) is null, using \( \pm n \leq |n| \) one finds \( I^*(\pm n) \leq I^*(|n|) = 0 \), i.e. \( I^*(n) \leq 0 \) and \( -I^*(n) \leq 0 \). Thus it follows that \( I^*(n) \leq 0 \leq I_*(n) \) and therefore \( n \in L^1(I) \) with \( \bar{I}(n) = 0 \).
2. Since \( |n \cdot f| \leq |n| \cdot |f| \), \( I^*(|n \cdot f|) \leq I^*(|n|) \cdot |f| \). For \( k \in \mathbb{N}, \ k \cdot |n| \in L^1(I) \) and \( \bar{I}(k|n|) = k \bar{I}(|n|) = 0 \), so \( k \cdot |n| \) is a null function. By the monotone convergence Theorem 49.21 the fact \( k \cdot |n| \to \infty \cdot |n| \in L^1(I) \) as \( k \to \infty \), \( \bar{I}(\infty \cdot |n|) = \lim_{k \to \infty} \bar{I}(k|n|) = 0 \). Therefore \( \infty \cdot |n| \) is a null function and hence so is \( n \cdot f \).
3. Since \( 1_{n \neq 0} \leq \infty \cdot 1_{n \neq 0} = \infty \cdot |n| \), \( I^*(1_{n \neq 0}) \leq I^*(\infty \cdot |n|) = 0 \) showing \( n \neq 0 \) is a null set.
4. Since \( 1_E \cdot f \in L^1(I) \) and \( \bar{I}(1_E \cdot f) = 0 \),
   \[ f1_E^c = (f - 1_E \cdot f) \in (f - 1_E \cdot f) \subset L^1(I) \]
   and \( \bar{I}(f1_E^c) = \bar{I}(f - 1_E \cdot f) = \bar{I}(f) \).
5. Letting \( E \) be the null set \( \{ f \neq g \} \), then \( 1_E \cdot f = 1_E \cdot g \in L^1(I) \) and \( 1_E \cdot f \) is a null function and therefore, \( f = 1_E \cdot f + 1_E \cdot f \in L^1(I) \) and
   \[ \bar{I}(f) = \bar{I}(1_E \cdot f) \leq \bar{I}(f1_E^c) = \bar{I}(1_E \cdot f) = \bar{I}(1_E \cdot g) = \bar{I}(g). \]

6. By Proposition 49.20 \(|f| \in L^1(I) \) and so by Chebyshev’s inequality (Item 2 of Proposition 49.18), \(|f| = \infty \) is a null set.

**Theorem 49.25 (Dominated Convergence Theorem).** Suppose that \( \{ f_n : n \in \mathbb{N} \} \subset L^1(I) \) such that \( f := \lim f_n \) exists pointwise and there exists \( g \in L^1(I) \) such that \(|f_n| \leq g \) for all \( n \). Then \( f \in L^1(I) \) and
   \[ \lim_{n \to \infty} \bar{I}(f_n) = \bar{I}(\lim_{n \to \infty} f_n) = \bar{I}(f). \]

**Proof.** By Proposition 49.24 the set \( E := \{ g = \infty \} \) is a null set and \( \bar{I}(1_E \cdot f_n) = \bar{I}(f_n) \) and \( \bar{I}(1_E \cdot g) = \bar{I}(g) \). Since
   \[ \bar{I}(1_E (g + f_n)) \leq 2 \bar{I}(1_E \cdot g) = 2 \bar{I}(g) < \infty, \]
we may apply Fatou’s Lemma 49.22 to find \( 1_E \cdot (g + f) \in L^1(I) \) and
   \[ \bar{I}(1_E \cdot (g + f)) \leq \liminf_{n \to \infty} \bar{I}(1_E \cdot (g + f_n)) = \lim inf \{ \bar{I}(1_E \cdot g) \pm \bar{I}(1_E \cdot f_n) \} = \liminf_{n \to \infty} \bar{I}(f_n) \bigg\} . \]
Since \( f = 1_E \cdot f \) a.e. and \( 1_E \cdot f = \frac{1}{2} (1_E \cdot g + f - (g + f)) \in L^1(I) \), Proposition 49.24 implies \( f \in L^1(I) \). So the previous inequality may be written as
   \[ \bar{I}(g) \leq \bar{I}(f) \leq \bar{I}(1_E \cdot g) \leq \bar{I}(1_E \cdot f), \]
wherein we have used \( \liminf_{n \to \infty} (-a_n) = -\limsup_{n \to \infty} a_n \). These two inequalities imply \( \limsup_{n \to \infty} \bar{I}(f_n) \leq \bar{I}(f) \leq \liminf_{n \to \infty} \bar{I}(f_n) \), which shows that \( \lim_{n \to \infty} \bar{I}(f_n) \) exists and is equal to \( \bar{I}(f) \).

49.2 The Structure of \( L^1(I) \)

Let \( S_{\uparrow 1} (I) \) denote the collections of functions \( f : X \to \mathbb{R} \) for which there exists \( f_n \in S_{\uparrow 1} \cap L^1(I) \) such that \( f_n \downarrow f \) as \( n \to \infty \) and \( \lim_{n \to \infty} \bar{I}(f_n) > -\infty \). Applying the monotone convergence theorem to \( f_1, f_n \), it follows that \( f_1 - f_n \in L^1(I) \) and hence \( -f \in L^1(I) \) so that \( S_{\uparrow 1} (I) \subset L^1(I) \).

**Lemma 49.26.** Let \( f : X \to \mathbb{R} \) be a function. If \( I^*(f) \in \mathbb{R} \), then there exists \( g \in S_{\uparrow 1} (I) \) such that \( f \leq g \) and \( I^*(f) = I(g) \). (Consequently, \( n : X \to [0, \infty) \) is a positive null function iff there exists \( g \in S_{\uparrow 1} (I) \) such that \( g \geq n \) and \( I(g) = 0 \).) Moreover, \( f \in L^1(I) \) iff there exists \( g \in S_{\uparrow 1} (I) \) such that \( g \geq f \) and \( f = g \) a.e.
The converse statement has already been proved in Proposition \ref{prop:monotone-convergence}. So \( I \) and the decreasing sequence. Then \( \lim_{k \to \infty} g_k = -\infty \), and since \( \lim_{k \to \infty} I(g_k) = I^*(f) > -\infty \), \( g \in S_{T_1}(I) \). By the monotone convergence theorem applied to \( g_1, g_2, \ldots, g_k \),

\[
I(g_1) - g = \lim_{k \to \infty} I(g_1 - g) = \bar{I}(g_1) - I^*(f),
\]

so \( I(g) = I^*(f) \). Now suppose that \( f \in L^1(I) \), then \( (g - f)_0 \geq 0 \) and

\[
I((g - f)_0) = I(g) - I(f) = \bar{I}(g) - I^*(f) = 0.
\]

Therefore \( (g - f)_0 \) is a null functions and hence so is \( \infty \cdot (g - f)_0 \), because.

\[
1_{\{f \neq g\}} = 1_{\{f < g\}} \leq \infty \cdot (g - f)_0.
\]

\( \{f \neq g\} \) is a null set so if \( f \in L^1(I) \) there exists \( g \in S_{T_1}(I) \) such that \( f = g \) a.e. The converse statement has already been proved in Proposition \ref{prop:monotone-convergence}.

**Proposition 49.27.** Suppose that \( I \) and \( S \) are as above and \( J \) is another Daniell integral on a vector lattice \( T \) such that \( S \subset T \) and \( I = J|_S \). (We abbreviate this by writing \( I \subset J \).) Then \( L^1(I) \subset L^1(J) \) and \( \bar{I} = \bar{J} \) on \( L^1(I) \), or in abbreviated form: if \( I \subset J \) then \( \bar{I} \subset \bar{J} \).

**Proof.** From the construction of the extensions, it follows that \( S_{T_1} \subset T_{T_1} \) and the \( I = J \) on \( S_{T_1} \). Similarly, it follows that \( S_{T_{T_1}}(I) \subset T_{T_1}(J) \) and \( \bar{I} = \bar{J} \) on \( S_{T_{T_1}}(I) \). From Lemma \ref{lem:extension} we learn, if \( n \geq 0 \) is an \( I \) -- null function then there exists \( g \in S_{T_{T_1}}(I) \subset T_{T_1}(J) \) such that \( n \leq g \) and \( 0 = I(g) = J(g) \). This shows that \( n \) is also a \( J \) -- null function and in particular every \( I \) -- null set is a \( J \) -- null set. Again by Lemma \ref{lem:extension} if \( f \in L^1(I) \) there exists \( g \in S_{T_{T_1}}(I) \subset T_{T_1}(J) \) such that \( \{f \neq g\} \) is an \( I \) -- null set and hence a \( J \) -- null set. So by Proposition \ref{prop:monotone-convergence} \( f \in L^1(J) \) and \( I(f) = I(g) = J(g) = J(f) \).

**49.3 Relationship to Measure Theory**

**Definition 49.28.** A function \( f : X \to [0, \infty] \) is said to be \( I \) -measurable (or just measurable) if \( f \) and \( g \in L^1(I) \) for all \( g \in L^1(I) \).

**Lemma 49.29.** The set of non-negative measurable functions is closed under pairwise minimums and maximums and pointwise limits.

**Proof.** Suppose that \( f, g : X \to [0, \infty] \) are measurable functions. The fact that \( f \wedge g \) and \( f \vee g \) are measurable (i.e. \( (f \wedge g) \wedge h \) and \( (f \vee g) \wedge h \) are in \( L^1(I) \) for all \( h \in L^1(I) \)) follows from the identities

\[
(f \wedge g) \wedge h = f \wedge (g \wedge h) \quad \text{and} \quad (f \vee g) \wedge h = (f \vee h) \vee (g \wedge h)
\]

and the fact that \( L^1(I) \) is a lattice. If \( f_n : X \to [0, \infty] \) is a sequence of measurable functions such that \( f = \lim_{n \to \infty} f_n \) exists pointwise, then for \( h \in L^1(I) \), we have \( h \wedge f_n \to h \wedge f \). By the dominated convergence theorem (using \( |h \wedge f_n| \leq |h| \)) it follows that \( h \wedge f \in L^1(I) \). Since \( h \in L^1(I) \) is arbitrary we conclude that \( f \) is measurable as well.

**Lemma 49.30.** A non-negative function \( f \) on \( X \) is measurable iff \( f \wedge g \in L^1(I) \) for all \( g \in S_{T_1}(I) \).

**Proof.** Suppose \( f : X \to [0, \infty] \) is a function such that \( f \wedge g \in L^1(I) \) for all \( g \in S_{T_1}(I) \). Choose \( \varphi_n \in S \) such that \( \varphi_n \uparrow g \) as \( n \to \infty \), then \( \varphi_n \wedge f \in L^1(I) \) and by the monotone convergence theorem \ref{prop:monotone-convergence} it follows that \( g \wedge f \in L^1(I) \) for all \( g \in S_{T_1}(I) \). Similarly, using the dominated convergence Theorem \ref{prop:dominated-convergence}, \( f \wedge g \in L^1(I) \). Finally for any \( h \in L^1(I) \), there exists \( g \in S_{T_1}(I) \) such that \( h = g \) a.e. and hence \( h \wedge f = g \wedge f \) a.e. and therefore by Proposition \ref{prop:monotone-convergence} \( h \wedge f \in L^1(I) \). This completes the proof since the converse direction is trivial.

**Definition 49.31.** A set \( A \subset X \) is measurable if \( 1_A \) is measurable and \( A \) is integrable if \( 1_A \in L^1(I) \). Let \( \mathcal{R} \) denote the collection of measurable subsets of \( X \).

**Remark 49.32.** Suppose that \( f \geq 0 \), then \( f \in L^1(I) \) iff \( f \) is measurable and \( I^*(f) < \infty \). Indeed, if \( f \) is measurable and \( I^*(f) < \infty \), there exists \( g \in S_{T_1}(I) \) such that \( f \leq g \). Since \( f \) is measurable, \( f = f \wedge g \in L^1(I) \). In particular if \( A \in \mathcal{R} \), then \( A \) is integrable iff \( I^*(1_A) < \infty \).

**Lemma 49.33.** The set \( \mathcal{R} \) is a ring which is a \( \sigma \) -- algebra if \( 1 \) is measurable. (Notice that \( 1 \) is measurable iff \( 1 \wedge \varphi \in L^1(I) \) for all \( \varphi \in S \). This condition is clearly implied by assuming \( 1 \wedge \varphi \in S \) for all \( \varphi \in S \). This will be the typical case in applications.)

**Proof.** Suppose that \( A, B \in \mathcal{R} \), then \( A \cap B \) and \( A \cup B \) are in \( \mathcal{R} \) by Lemma \ref{lem:intersection} because

\[
1_{A \cap B} = 1_A \wedge 1_B \quad \text{and} \quad 1_{A \cup B} = 1_A \vee 1_B.
\]

If \( A \in \mathcal{R} \), then the identities,

\[
1_{\bigcup_{k=1}^\infty A_k} = \lim_{n \to \infty} 1_{\bigcap_{k=1}^n A_k} \quad \text{and} \quad 1_{\bigcap_{k=1}^\infty A_k} = \lim_{n \to \infty} 1_{\bigcup_{k=1}^n A_k}
\]

along with Lemma \ref{lem:intersection} shows that \( \bigcup_{k=1}^\infty A_k \) and \( \bigcap_{k=1}^\infty A_k \) are in \( \mathcal{R} \) as well. Also if \( A, B \in \mathcal{R} \) and \( g \in S \), then

\[
g \wedge 1_{A \cap B} = g \wedge 1_A - g \wedge 1_{A \cap B} + g \wedge 0 \in L^1(I)
\]
Lemma 49.34 (Chebyshev’s Inequality). Suppose that 1 is measurable.

1. If \( f \in [L^1(I)]^+ \) then, for all \( \alpha \in \mathbb{R} \), the set \( \{ f > \alpha \} \) is measurable. Moreover, if \( \alpha > 0 \) then \( \{ f > \alpha \} \) is integrable and \( \bar{I}(1_{\{f>\alpha\}}) \leq \alpha^{-1} \bar{I}(f) \).

2. \( \sigma(S) \subset \mathcal{R} \).

Proof.

1. If \( \alpha < 0, \{ f > \alpha \} = X \in \mathcal{R} \) since 1 is measurable. For \( \alpha \geq 0 \) define \( g = g_\alpha \in L^1(I) \) by \( g = \alpha^{-1}f - (\alpha^{-1}f)\land 1 \) if \( \alpha > 0 \) and \( g = f \) if \( \alpha = 0 \). (Notice that \( g_\alpha \) for \( \alpha > 0 \) is a difference of two \( L^1(I) \) functions and hence in \( L^1(I) \).) The function \( g \in [L^1(I)]^+ \) has been manufactured so that \( \{ g > 0 \} = \{ f > \alpha \} \).

Now let \( \varphi_n := (ng) \land 1 \in [L^1(I)]^+ \) then \( \varphi_n \uparrow 1_{\{f>\alpha\}} \) as \( n \to \infty \) showing \( 1_{\{f>\alpha\}} \) is measurable and hence that \( \{ f > \alpha \} \) is measurable. Finally if \( \alpha > 0 \),

\[
1_{\{f>\alpha\}} = 1_{\{f>\alpha\}} \land (\alpha^{-1}f) \in L^1(I)
\]

showing the \( \{ f > \alpha \} \) is integrable and

\[
\bar{I}(1_{\{f>\alpha\}}) = \bar{I}(1_{\{f>\alpha\}} \land (\alpha^{-1}f)) \leq \bar{I}(\alpha^{-1}f) = \alpha^{-1}\bar{I}(f).
\]

2. Since \( f \in S_+ \) is \( \mathcal{R} \) measurable by (1) and \( S = S_+ - S_+ \), it follows that any \( f \in \mathcal{R} \) measurable, \( \sigma(S) \subset \mathcal{R} \).

Lemma 49.35. Let 1 be measurable. Define \( \mu_\pm : \mathcal{R} \to [0, \infty] \) by

\[
\mu_+(A) = \bar{I}(1_A) \quad \text{and} \quad \mu_-(A) = I_*(1_A)
\]

Then \( \mu_\pm \) are measures on \( \mathcal{R} \) such that \( \mu_- \leq \mu_+ \) and \( \mu_-(A) = \mu_+(A) \) whenever \( \mu_+(A) < \infty \).

Notice by Remark 49.32 that

\[
\mu_+(A) = \begin{cases} 
\bar{I}(1_A) & \text{if } A \text{ is integrable} \\
\infty & \text{if } A \in \mathcal{R} \text{ but } A \text{ is not integrable}.
\end{cases}
\]

Proof. Since \( 1_\emptyset = 0, \mu_+(\emptyset) = \bar{I}(0) = 0 \) and if \( A, B \in \mathcal{R}, A \subset B \) then

\( \mu_+(A) = \bar{I}^*(1_A) \leq \bar{I}^*(1_B) = \mu_+(B) \)

and similarly, \( \mu_-(A) = I_*(1_A) \leq I_*(1_B) = \mu_-(B) \). Hence \( \mu_\pm \) are monotonic. By Remark 49.32 if \( \mu_+(A) < \infty \) then \( A \) is integrable so

\[\mu_-(A) = I_*(1_A) = \bar{I}(1_A) = \bar{I}^*(1_A) = \mu_+(A).\]

Now suppose that \( \{ E_j \}_{j=1}^\infty \subset \mathcal{R} \) is a sequence of pairwise disjoint sets and let

\( E := \bigcup_{j=1}^\infty E_j \in \mathcal{R}. \)

If \( \mu_+(E_i) = \infty \) for some \( i \) then by monotonicity \( \mu_+(E) = \infty \) as well. If \( \mu_+(E_j) < \infty \) for all \( j \) then \( f_n := \sum_{j=1}^n 1_{E_j} \in [L^1(I)]^+ \) with \( f_n \uparrow 1_E \). Therefore, by the monotone convergence theorem, \( 1_E \) is integrable iff

\[
\lim_{n \to \infty} \bar{I}(f_n) = \sum_{j=1}^\infty \mu_+(E_j) < \infty
\]

in which case \( 1_E \in L^1(I) \) and \( \lim_{n \to \infty} \bar{I}(f_n) = \bar{I}(1_E) = \mu_+(E) \). Thus we have shown that \( \mu_+ \) is a measure and \( \mu_-(E) = \mu_+(E) \) whenever \( \mu_+(E) < \infty \). The fact the \( \mu_- \) is a measure will be shown in the course of the proof of Theorem 49.35.

Example 49.36. Suppose \( X \) is a set, \( S = \{0\} \) is the trivial vector space and \( I(0) = 0 \). Then clearly \( I \) is a Daniel integral,

\[
\bar{I}(g) = \begin{cases} 
\infty & \text{if } g(x) > 0 \text{ for some } x \\
0 & \text{if } g \leq 0
\end{cases}
\]

and similarly,

\[
I_*(g) = \begin{cases} 
\infty & \text{if } g(x) < 0 \text{ for some } x \\
0 & \text{if } g \geq 0
\end{cases}
\]

Therefore, \( L^1(I) = \{0\} \) and for any \( A \subset X \) we have \( 1_A \land 0 = 0 \in S \) so that \( \mathcal{R} = 2^X \). Since \( 1_A \notin L^1(I) = \{0\} \) unless \( A = \emptyset \) set, the measure \( \mu_+ \) in Lemma 49.35 is given by \( \mu_+(A) = \infty \) if \( A \neq \emptyset \) and \( \mu_+(\emptyset) = 0 \), i.e. \( \mu_+(A) = \bar{I}^*(1_A) \).

while \( \mu_- \equiv 0 \).

Lemma 49.37. For \( A \in \mathcal{R} \), let

\[
\alpha(A) := \sup\{ \mu_+(B) : B \in \mathcal{R}, B \subset A \text{ and } \mu_+(B) < \infty \},
\]

then \( \alpha \) is a measure on \( \mathcal{R} \) such that \( \alpha(A) = \mu_+(A) \) whenever \( \mu_+(A) < \infty \). If \( \nu \) is any measure on \( \mathcal{R} \) such that \( \nu(B) = \mu_+(B) \) when \( \mu_+(B) < \infty \), then \( \alpha \leq \nu \).

Moreover, \( \alpha \leq \mu_- \).
Theorem 49.38 (Stone). Suppose that 1 is measurable and $\mu_+$ and $\mu_-$ are as defined in Lemma 49.37 then:

1. $L^1(I) = L^1(X, \mathcal{R}, \mu_+) = L^1(\mu_+)$ and for integrable $f \in L^1(\mu_+)$,

$$I(f) = \int_X f \, d\mu_+.$$  (49.12)

2. If $\nu$ is any measure on $\mathcal{R}$ such that $\mathcal{S} \subset L^1(\nu)$ and

$$\tilde{I}(f) = \int_X f \, d\nu$$

then $\mu_-(A) \leq \nu(A) \leq \mu_+(A)$ for all $A \in \mathcal{R}$ with $\mu_-(A) = \nu(A) = \mu_+(A)$ whenever $\mu_+(A) < \infty$.

3. Letting $\alpha$ be as defined in Lemma 49.37, $\mu_- = \alpha$ and hence $\mu_-$ is a measure. (So $\mu_-$ is the maximal and $\mu_-$ is the minimal measure for which Eq. (49.13) holds.)

4. Conversely if $\nu$ is any measure on $\sigma(\mathcal{S})$ such that $\nu(A) = \mu_+(A)$ when $A \in \sigma(\mathcal{S})$ and $\mu_+(A) < \infty$, then Eq. (49.13) is valid.

Proof.

1. Suppose that $f \in [L^1(I)]^+$, then Lemma 49.34 implies that $f$ is $\mathcal{R}$ measurable. Given $n \in \mathbb{N}$, let

$$\varphi_n := \sum_{k=1}^{2^n} \frac{k}{2^n} 1_{\{\frac{k}{2^n} < f \leq \frac{k+1}{2^n}\}} = 2^{-n} \sum_{k=1}^{2^n} 1_{\{\frac{k}{2^n} < f\}}.$$  (49.14)

Then we know $\{\frac{k}{2^n} < f\} \in \mathcal{R}$ and that $1_{\{\frac{k}{2^n} < f\}} = 1_{\{\frac{k}{2^n} < f\}} \wedge \left(\frac{2^n}{2^n} f\right) \in L^1(I)$, i.e. $\mu_+\left(\frac{k}{2^n} < f\right) < \infty$. Therefore $\varphi_n \in [L^1(I)]^+$ and $\varphi_n \uparrow f$. Suppose that $\nu$ is any measure such that $\nu(A) = \mu_+(A)$ when $\mu_+(A) < \infty$, then by the monotone convergence theorems for $\tilde{I}$ and the Lebesgue integral,

$$\tilde{I}(f) = \lim_{n \to \infty} \tilde{I}(\varphi_n) = \lim_{n \to \infty} 2^{-n} \sum_{k=1}^{2^n} \tilde{I}(1_{\{\frac{k}{2^n} < f\}}) = \lim_{n \to \infty} 2^{-n} \sum_{k=1}^{2^n} \mu_+\left(\frac{k}{2^n} < f\right).$$

$$= \lim_{n \to \infty} 2^{-n} \sum_{k=1}^{2^n} \nu\left(\frac{k}{2^n} < f\right) = \lim_{n \to \infty} \int_X \varphi_n \, d\nu = \int_X f \, d\nu.$$  (49.15)

This shows that $f \in [L^1(\nu)]^+$ and that $\tilde{I}(f) = \int_X f \, d\nu$. Since every $f \in L^1(I)$ is of the form $f = f^+ - f^-$ with $f^\pm \in [L^1(I)]^+$, it follows that $L^1(I) \subset L^1(\mu_+) \subset L^1(\nu) \subset L^1(\alpha)$ and Eq. (49.13) holds for all $f \in L^1(I)$. Conversely suppose that $f \in [L^1(\mu_+)]^+$. Define $\varphi_n$ as in Eq. (49.14). Chebyshev’s inequality implies that $\mu_+\left(\frac{k}{2^n} < f\right) < \infty$ and hence $\{\frac{k}{2^n} < f\}$ is $\tilde{I}$ integrable. Again by the monotone convergence for Lebesgue integrals and the computations in Eq. (49.15),

$$\infty > \int_X f \, d\mu_+ = \lim_{n \to \infty} \tilde{I}(\varphi_n)$$

and therefore by the monotone convergence theorem for $\tilde{I}$, $f \in L^1(I)$ and

$$\int_X f \, d\mu_+ = \lim_{n \to \infty} \tilde{I}(\varphi_n) = \tilde{I}(f).$$

2. Suppose that $\nu$ is any measure such that Eq. (49.13) holds. Then by the monotone convergence theorem,

$$\tilde{I}(f) = \int_X f \, d\nu$$

for all $f \in \mathcal{S}_1 \cup \mathcal{S}_1$. 

Page: 596  job: newanal  macro: svmonob.cls  date/time: 6-Jan-2012/17:01
Let $A \in \mathcal{R}$ and assume that $\mu_+(A) < \infty$, i.e. $1_A \in L^1(I)$. Then there exists $f \in S_\tau \cap L^1(I)$ such that $1_A \leq f$ and integrating this inequality relative to $\nu$ implies

$$\nu(A) = \int_X 1_A d\nu \leq \int_X f d\nu = \bar{I}(f).$$

Taking the infimum of this equation over those $f \in S_\tau$ such that $1_A \leq f$ implies $\nu(A) \leq \bar{I}(1_A) = \mu_+(A)$ which is also trivially valid if $\mu_+(A) = \infty$. Similarly, if $A \in \mathcal{R}$ and $f \in S_\mu$ such that $0 \leq f \leq 1_A$, then

$$\nu(A) = \int_X 1_A d\nu \geq \int_X f d\nu = \bar{I}(f).$$

Taking the supremum of this equation over those $f \in S_\mu$ such that $0 \leq f \leq 1_A$ then implies $\nu(A) \geq \mu_-(A)$. So we have shown that $\mu_- \leq \nu \leq \mu_+$. Let $A$ satisfy $\nu \leq f \in S_\mu$ then $\nu \leq \mu_+$. If $f \in A$ and $\nu$ then implies $f \in A$.

By Lemma 49.37 $\nu = \alpha$ is a measure as in (2) satisfying $\alpha \leq \mu_- \leq \alpha$ and hence we have shown that $\alpha = \mu_-$. This also shows that $\mu_- \leq \alpha$ is a measure.

4. This can be done by the same type of argument used in the proof of (1).

## Proposition 49.39 (Uniqueness).

Suppose that $1$ is measurable and there exists a function $\chi \in L^1(I)$ such that $\chi(x) > 0$ for all $x$. Then there is only one measure $\mu$ on $\sigma(S)$ such that

$$\bar{I}(f) = \int_X f d\mu \text{ for all } f \in S.$$

## Remark 49.40.

The existence of a function $\chi \in L^1(I)$ such that $\chi(x) > 0$ for all $x$ is equivalent to the existence of a function $\tilde{\chi} \in S_\tau \cap L^1(I)$ such that $\tilde{I}(\chi) < \infty$ and $\chi(x) > 0$ for all $x \in X$. Indeed by Lemma 49.26 if $\chi \in L^1(I)$ there exists $\chi \in S_\tau \cap L^1(I)$ such that $\tilde{\chi} \geq \chi$.

## Proof.

As in Remark 49.40 we may assume $\chi \in S_\tau \cap L^1(I)$. The sets $X_n := \{\chi > 1/n\} \in \sigma(S) \subset \mathcal{R}$ satisfy $\mu(X_n) \leq n\bar{I}(\chi) < \infty$. The proof is completed using Theorem 49.38 to conclude, for any $A \in \sigma(S)$, that

$$\mu_+ (A) = \lim_{n \to \infty} \mu_+(A \cap X_n) = \lim_{n \to \infty} \mu_-(A \cap X_n) = \mu_-(A).$$

Since $\mu_- \leq \mu \leq \mu_+ = \mu_-$, we see that $\mu = \mu_+ = \mu_-$. Let $X$ be an uncountable set, $\tau = 2^X$ be the discrete topology on $X$, $\mathcal{S} = C_c(X, \mathbb{R})$, $\rho : X \to [0, \infty)$ be a function, and

$$I(f) := \sum_{x \in X} \rho(x) f(x) \text{ for all } f \in \mathcal{S}.$$
The Daniell–Stone Construction of Integration and Measures

\[ \mu_0(X_n) < \infty \text{ and } X_n \uparrow X \text{ as } n \to \infty. \] Then \( \mu_0 \) has a unique extension to a measure, \( \mu \), on \( M := \sigma(A) \). Moreover, if \( A \in M \) and \( \varepsilon > 0 \) is given, there exists \( B \in A_\sigma \) such that \( A \subset B \) and \( \mu(B \setminus A) < \varepsilon \). In particular,

\[
\mu(A) = \inf \{ \mu_0(B) : A \subset B \in A_\sigma \} = \inf \{ \sum_{n=1}^\infty \mu_0(A_n) : A \subset \bigcap_{n=1}^\infty A_n \text{ with } A_n \in A \}. \tag{49.16}
\]

**Proof.** Let \( (A, \mu_0, I = I_{\mu_0}) \) be as in Definition \ref{definition}. By Proposition \ref{prop}, \( I \) is a Daniell integral on the lattice \( \mathcal{S} = \mathcal{S}_f(A, \mu_0) \). It is clear that \( 1 \land \varphi \in \mathcal{S} \) for all \( \varphi \in \mathcal{S} \). Since \( 1_{X_n} \in \mathcal{S} \) and \( \sum_{n=1}^\infty 1_{X_n} > 0 \) on \( X \), by Remark \ref{remark} there exists \( \chi \in \mathcal{S}_f \) such that \( I(\chi) < \infty \) and \( \chi > 0 \). So the hypothesis of Theorem \ref{theorem} holds and hence there exists a unique measure \( \mu \) on \( M \) such that \( I(f) = \int_X f d\mu \) for all \( f \in \mathcal{S} \). Taking \( f = 1_A \) with \( A \in A \) and \( \mu_0(A) < \infty \) shows \( \mu(A) = \mu_0(A) \). For general \( A \in A \), we have

\[
\mu(A) = \lim_{n \to \infty} \mu(A \cap X_n) = \lim_{n \to \infty} \mu_0(A \cap X_n) = \mu_0(A). \tag{49.17}
\]

The fact that \( \mu \) is the only extension of \( \mu_0 \) to \( M \) follows from Theorem \ref{theorem} or Theorem \ref{theorem}. It is also can be proved using Theorem \ref{theorem}. Indeed, if \( \nu \) is another measure on \( M \) such that \( \nu = \mu \) on \( A \), then \( I_\nu = I \) on \( \mathcal{S} \). Therefore by the uniqueness assertion in Theorem \ref{theorem}, \( \mu = \nu \) on \( M \). By Eq. \eqref{eq1}, for \( A \in M \),

\[
\mu(A) = I^*(1_A) = \inf \{ I(f) : f \in \mathcal{S}_f \text{ with } 1_A \leq f \}
= \inf \left\{ \int_X f d\mu : f \in \mathcal{S}_f \text{ with } 1_A \leq f \right\}.
\]

For the moment suppose \( \mu(A) < \infty \) and \( \varepsilon > 0 \) is given. Choose \( f \in \mathcal{S}_f \) such that \( 1_A \leq f \) and

\[
\int_X f d\mu = I(f) < \mu(A) + \varepsilon. \tag{49.18}
\]

Let \( f_n \in \mathcal{S} \) be a sequence such that \( f_n \uparrow f \) as \( n \to \infty \) and for \( \alpha \in (0, 1) \) set

\[
B_\alpha := \{ f > \alpha \} = \cup_{n=1}^\infty \{ f_n > \alpha \} \in A_\sigma.
\]

Then \( A \subset \{ f \geq 1 \} \subset B_\alpha \) and by Chebyshev’s inequality,

\[
\mu(B_\alpha) \leq \alpha^{-1} \int_X f d\mu = \alpha^{-1} I(f)
\]

which combined with Eq. \ref{eq1} implies \( \mu(B_\alpha) < \mu(A) + \varepsilon \) for all \( \alpha \) sufficiently close to 1. For such \( \alpha \) we then have \( A \subset B_\alpha \in A_\sigma \) and \( \mu(B_\alpha \setminus A) = \mu(B_\alpha) - \mu(A) < \varepsilon. \) For general \( A \in A \), choose \( X_n \uparrow X \) with \( X_n \in A \). Then there exists \( B_n \in A_\sigma \) such that \( \mu(B_n \setminus (A \cap X_n)) < \varepsilon 2^{-n} \). Define \( B := \bigcup_{n=1}^\infty B_n \in A_\sigma \). Then

\[
\mu(B \setminus A) = \mu(\bigcup_{n=1}^\infty (B_n \setminus A)) \leq \sum_{n=1}^\infty \mu((B_n \setminus A)) \leq \sum_{n=1}^\infty \mu((B_n \setminus (A \cap X_n))) < \varepsilon.
\]

Eq. \ref{eq1} is an easy consequence of this result and the fact that \( \mu(B) = \mu_0(B) \).

**Corollary 49.44 (Regularity of \( \mu \)).** Let \( A \subset 2^X \) be an algebra of sets, \( M = \sigma(A) \) and \( \mu : M \to [0, \infty] \) be a measure on \( M \) which is \( \sigma \)–finite on \( A \). Then

1. For all \( A \in M \),

\[
\mu(A) = \inf \{ \mu(B) : A \subset B \in A_\sigma \}. \tag{49.19}
\]

2. If \( A \in M \) and \( \varepsilon > 0 \) are given, there exists \( B \in A_\sigma \) such that \( A \subset B \) and \( \mu(B \setminus A) < \varepsilon \).

3. For all \( A \in M \) and \( \varepsilon > 0 \) there exists \( B \in A_\delta \) such that \( B \subset A \) and \( \mu(A \setminus B) < \varepsilon \).

4. For any \( B \in M \) there exists \( A \in A_\delta \) and \( C \in A_\delta \) such that \( A \subset B \subset C \) and \( \mu(C \setminus A) = 0 \).

5. The linear space \( \mathcal{S} := \mathcal{S}_f(A, \mu) \) is dense in \( L^p(\mu) \) for all \( p \in [1, \infty) \), briefly put, \( \mathcal{S} \subseteq L^p(\mu) \).

**Proof.** Items 1. and 2. follow by applying Theorem \ref{theorem} to \( \mu_0 = \mu |_A \). Items 3. and 4. follow from Items 1. and 2. as in the proof of Corollary \ref{corollary} above. Item 5. This has already been proved in Theorem \ref{theorem} but we will give yet another proof here. When \( p = 1 \) and \( g \in L^1(\mu; \mathbb{R}) \), there exists, by Eq. \ref{eq1}, \( h \in \mathcal{S}_f \) such that \( g \leq h \) and \( ||h - g||_1 = \int_X (h - g) d\mu < \varepsilon \). Let \( \{h_n\}_{n=1}^\infty \subset \mathcal{S}_f \) be chosen so that \( h_n \uparrow h \) as \( n \to \infty \). Then by the dominated convergence theorem, \( ||h_n - g||_1 \to ||h - g||_1 < \varepsilon \) as \( n \to \infty \). Therefore for \( n \) large we have \( h_n \in \mathcal{S} \) with \( ||h_n - g||_1 < \varepsilon \). Since \( \varepsilon > 0 \) is arbitrary this shows, \( \mathcal{S}_f(A, \mu) \subseteq L^1(\mu) \). Now suppose \( p > 1 \), \( g \in L^p(\mu; \mathbb{R}) \) and \( X_n \in A \) are sets such that \( X_n \uparrow X \) and \( \mu(X_n) < \infty \). By the dominated convergence theorem, \( 1_{X_n} : \mathcal{S}_f(A, \mu) \to L^p(\mu) \rightarrow g \) in \( L^p(\mu) \) as \( n \to \infty \), so it suffices to consider \( g \in L^p(\mu; \mathbb{R}) \) with \( \{g \neq 0\} \subset X_n \). It is left for the reader to verify that the integrals of the intersection, say \( \mu(X \cap \{g \neq 0\}) < \infty \). By Hölder’s inequality, such a \( g \) is in \( L^1(\mu) \). So if \( \varepsilon > 0 \), by the \( p = 1 \) case, we may find \( h \in \mathcal{S} \) such that \( ||h - g||_1 < \varepsilon \). By replacing \( h \) by \( (h \wedge n) \vee (-n) \in \mathcal{S} \), we may assume \( h \) is bounded by \( n \) as well.
$$\|h - g\|_p^p = \int_X |h - g|^p \, d\mu = \int_X |h - g|^{p-1} |h - g| \, d\mu \leq (2n)^{p-1} \int_X |h - g| \, d\mu < (2n)^{p-1} \varepsilon.$$ 

Since $\varepsilon > 0$ was arbitrary, this shows $S$ is dense in $L^p(\mu; \mathbb{R})$. 

\textbf{Remark 49.45.} If we drop the $\sigma$–finiteness assumption on $\mu_0$ we may lose uniqueness in assertion in Theorem 49.44. For example, let $X = \mathbb{R}$, $\mathcal{B}_R$ and $A$ be the algebra generated by $\mathcal{E} := \{(a, b) \cap \mathbb{R} : -\infty \leq a < b \leq \infty\}$. Recall $\mathcal{B}_R = \sigma(\mathcal{E})$. Let $D \subset \mathbb{R}$ be a countable dense set and define $\mu_D(A) := \#(D \cap A)$. Then $\mu_D(A) = \infty$ for all $A \in A$ such that $A \neq \emptyset$. So if $D' \subset \mathbb{R}$ is another countable dense subset of $\mathbb{R}$, $\mu_D = \mu_D$ on $A$ while $\mu_D \neq \mu_D'$ on $\mathcal{B}_R$. Also notice that $\mu_D$ is $\sigma$–finite on $\mathcal{B}_R$ but not on $A$.

It is now possible to use Theorem 49.43 to give a proof of Theorem 43.51, see subsection 48.5.1 below. However rather than do this now let us give another application of Theorem 49.43 based on Proposition 49.9 and use the result to prove Theorem 43.51.

### 49.4.1 A Useful Version: BRUCE: delete this if incorporated above.

We are now in a position to state the main construction theorem. The theorem we state here is not as general as possible but it will suffice for our present purposes.

\textbf{Theorem 49.46 (Daniell–Stone).} Let $\mathcal{S}$ be a lattice of bounded functions on a set $X$ such that $1 \land \varphi \in \mathcal{S}$ for all $\varphi \in \mathcal{S}$ and let $I$ be a Daniel integral on $\mathcal{S}$. Further assume there exists $\chi \in \mathcal{S}_+$ such that $I(\chi) < \infty$ and $\chi(x) > 0$ for all $x \in X$. Then there exists a unique measure $\mu$ on $\mathcal{M} := \sigma(\mathcal{S})$ such that

$$I(f) = \int_X f \, d\mu \text{ for all } f \in \mathcal{S}. \tag{49.20}$$

Moreover, for all $g \in L^1(X, \mathcal{M}, \mu),$

$$\sup \{I(f) : \mathcal{S}_+ \ni f \leq g\} = \int_X g \, d\mu = \inf \{I(h) : g \leq h \in \mathcal{S}_+\}. \tag{49.21}$$

\textbf{Proof.} Only a sketch of the proof will be given here. Full details may be found in Section 49 below.

\textbf{Existence.} For $g : X \to \mathbb{R}$, define

$$I^*(g) := \inf \{I(h) : h \leq g \in \mathcal{S}_+\},$$

and set

$$L^1(I) := \{g : X \to \mathbb{R} : I^*(g) = I_*(g) \in \mathbb{R}\}.$$

For $g \in L^1(I)$, let $\bar{I}(g) = I^*(g) = I_*(g)$. Then, as shown in Proposition 49.20, $L^1(I)$ is a “extended” vector space and $\bar{I} : L^1(I) \to \mathbb{R}$ is linear as defined in Definition 49.3 below. By Proposition 49.18, if $f \in \mathbb{R}$ with $I(f) < \infty$ then $f \in L^1(I)$. Moreover, $\bar{I}$ obeys the monotone convergence theorem, Fatou’s lemma, and the dominated convergence theorem, see Theorem 49.21, Lemma 49.22 and Theorem 49.25 respectively. Let

$$\mathcal{R} := \{A \subset X : 1 \land f \in L^1(I) \text{ for all } f \in \mathcal{S}\}$$

and for $A \in \mathcal{R}$ set $\mu(A) := I^*(1_A)$. It can then be shown: 1) $\mathcal{R}$ is a $\sigma$ algebra (Lemma 49.33) containing $\sigma(\mathcal{S})$ (Lemma 49.34), $\mu$ is a measure on $\mathcal{R}$ (Lemma 49.35), and that Eq. (49.20) holds. In fact it is shown in Theorem 49.38 and Proposition 49.39 below that $L^1(X, \mathcal{M}, \mu) \subset L^1(I)$ and

$$I(g) = \int_X g \, d\mu \text{ for all } g \in L^1(X, \mathcal{M}, \mu).$$

The assertion in Eq. (49.21) is a consequence of the definition of $L^1(I)$ and $I$ and this last equation.

\textbf{Uniqueness.} Suppose that $\nu$ is another measure on $\sigma(\mathcal{S})$ such that

$$I(f) = \int_X f \, d\nu \text{ for all } f \in \mathcal{S}.$$ 

By the monotone convergence theorem and the definition of $I$ on $\mathcal{S}_+$,

$$I(f) = \int_X f \, d\nu \text{ for all } f \in \mathcal{S}_+.$$ 

Therefore if $A \in \sigma(\mathcal{S}) \subset \mathcal{R},$

$$\mu(A) = I^*(1_A) = \inf \{I(h) : 1_A \leq h \in \mathcal{S}_+\}$$

$$= \inf \left\{ \int_X h \, d\nu : 1_A \leq h \in \mathcal{S}_+ \right\} \geq \int_X 1_A \, d\nu = \nu(A)$$

which shows $\nu \leq \mu$. If $A \in \sigma(\mathcal{S}) \subset \mathcal{R}$ with $\mu(A) < \infty$, then, by Remark 49.32 below, $1_A \in L^1(I)$ and therefore

$$\mu(A) = I^*(1_A) = I(1_A) = I_*(1_A) = \sup \{I(f) : \mathcal{S}_+ \ni f \leq 1_A\} = \sup \left\{ \int_X f \, d\nu : \mathcal{S}_+ \ni f \leq 1_A \right\} \leq \nu(A).$$
Hence $\mu(A) \leq \nu(A)$ for all $A \in \sigma(\mathcal{S})$ and $\nu(A) = \mu(A)$ when $\mu(A) < \infty$. To prove $\nu(A) = \mu(A)$ for all $A \in \sigma(\mathcal{S})$, let $X_n := \{|\chi| \geq 1/n\} \in \sigma(\mathcal{S})$. Since $1_X \leq n\chi$,

$$
\mu(X_n) = \int_X 1_X \, d\mu \leq \int_X n\chi \, d\mu = n\mu(\chi) < \infty.
$$

Since $\chi > 0$, $X \downarrow X$ and therefore by continuity of $\nu$ and $\mu$,

$$
\nu(A) = \lim_{n \to \infty} \nu(A \cap X_n) = \lim_{n \to \infty} \mu(A \cap X_n) = \mu(A)
$$

for all $A \in \sigma(\mathcal{S})$. \hfill \qed

**Remark 49.47.** To check the hypothesis in Theorem 49.46 that there exists $\chi \in S^+$ such that $I(\chi) < \infty$ and $\chi(x) > 0$ for all $x \in X$, it suffices to find $\varphi_n \in S^+$ such that $\sum_{n=1}^{\infty} \varphi_n > 0$ on $X$. To see this let $M_n := \max \{\|\varphi_n\| : I(\varphi_n), 1\}$ and define $\chi := \sum_{n=1}^{\infty} \frac{1}{M_n} \varphi_n$, then $\chi \in S^+$, $0 < \chi \leq 1$ and $I(\chi) < 1 < \infty$.

### 49.5 Riesz Representation Theorem

**Definition 49.48.** Given a second countable locally compact Hausdorff space $(X, \tau)$, let $\mathcal{M}_+$ denote the collection of positive measures, $\mu$, on $\mathcal{B}_X := \sigma(\tau)$ with the property that $\mu(K) < \infty$ for all compact subsets $K \subset X$. Such a measure $\mu$ will be called a **Radon** measure on $X$. For $\mu \in \mathcal{M}_+$ and $f \in C_c(X, \mathbb{R})$ let $I_\mu(f) := \int_X f \, d\mu$.

**Theorem 49.49 (Riesz Representation Theorem).** Let $(X, \tau)$ be a second countable locally compact Hausdorff space. Then the map $\mu \mapsto I_\mu$, taking $\mathcal{M}_+$ to positive linear functionals on $C_c(X, \mathbb{R})$ is bijective. Moreover every measure $\mu \in \mathcal{M}_+$ has the following properties:

1. For all $\varepsilon > 0$ and $B \in \mathcal{B}_X$, there exists $F \subset B \subset U$ such that $U$ is open and $F$ is closed and $\mu(U \setminus F) < \varepsilon$. If $\mu(B) < \infty$, $F$ may be taken to be a compact subset of $X$.

2. For all $B \in \mathcal{B}_X$ there exists $A \in \mathcal{F}_\tau$ and $C \in \tau_\beta$ (whose $G_\delta$ is more conventionally written as $G_\delta$) such that $A \subset B \subset C$ and $\mu(C \setminus A) = 0$.

3. For all $B \in \mathcal{B}_X$,

$$
\mu(B) = \inf \{ \mu(U) : B \subset U \text{ and } U \text{ is open} \} = \sup \{ \mu(K) : K \subset B \text{ and } K \text{ is compact} \}.
$$

4. For all open subsets, $U \subset X$,

$$
\mu(U) = \sup \{ \int_X f \, d\mu : f < X \} = \sup \{ I_{\mu}(f) : f < X \}.
$$

5. For all compact subsets $K \subset X$,

$$
\mu(K) = \inf \{ I_{\mu}(f) : 1_K \subset f \subset X \}.
$$

6. If $\|I_\mu\|$ denotes the dual norm on $C_c(X, \mathbb{R})^*$, then $\|I_\mu\| = \mu(X)$. In particular $I_\mu$ is bounded iff $\mu(X) < \infty$.

7. $C_c(X, \mathbb{R})$ is dense in $L^p(\mu; \mathbb{R})$ for all $1 \leq p < \infty$.

**Proof.** First notice that $I_\mu$ is a positive linear functional on $\mathcal{S} := C_c(X, \mathbb{R})$ for all $\mu \in \mathcal{M}_+$ and $S$ is a lattice such that $1 \wedge f \in \mathcal{S}$ for all $f \in \mathcal{S}$. Proposition 49.7 shows that any positive linear functional, $I$, on $S$ is a Daniell integral on $S$. By Lemma 24.3, there exists compact sets $K_n \subset X$ such that $K_n \uparrow X$. By Urysohn’s lemma, there exists $\varphi_n < X$ such that $\varphi_n = 1$ on $K_n$. Since $\varphi_n \in S^+$ and $\sum_{n=1}^{\infty} \varphi_n > 0$ on $X$ it follows from Remark 49.47 that there exists $\chi \in S^+$ such that $\chi > 0$ on $X$ and $I(\chi) < \infty$. So the hypothesis of the Daniell – Stone Theorem 49.46 hold and hence there exists a unique measure $\mu \in \sigma(S) = \mathcal{B}_X$ (Lemma 11.32) such that $I = I_\mu$. Hence the map $\mu \mapsto I_\mu$ taking $\mathcal{M}_+$ to positive linear functionals on $C_c(X, \mathbb{R})$ is bijective. We will now prove the remaining seven assertions of the theorem.

1. Suppose $\varepsilon > 0$ and $B \in \mathcal{B}_X$ satisfies $\mu(B) < \infty$. Then $1_B \in L^1(\mu)$ so there exists functions $f_n \in C_c(X, \mathbb{R})$ such that $f_n \uparrow f$, $1_B \leq f_n$, and

$$
\int_X f_n \, d\mu = \int_X f \, d\mu + \varepsilon. \quad (49.26)
$$

Let $\alpha \in (0, 1)$ and $U_\alpha := \{ f > \alpha \} \cup \{ f_n > \alpha \} \in \tau$. Since $1_B \leq f_n \leq f$, $B \subset \{ f \geq 1 \} \subset U_\alpha$ and by Chebyshev’s inequality, $\mu(U_\alpha) \leq \alpha^{-1} \int_X f \, d\mu = \alpha^{-1} I(f)$. Combining this estimate with Eq. (49.26) shows $\mu(U_\alpha \setminus B) = \mu(U_\alpha) - \mu(B) < \varepsilon$ for $\alpha$ sufficiently close to 1. For general $B \in \mathcal{B}_X$, by what we have just proved, there exists open sets $U_n \subset X$ such that $B \cap U_n \subset U_n$ and $\mu(U_n \setminus (B \cap K_n)) < \varepsilon 2^{-n}$ for all $n$. Let $U = \bigcup_{n=1}^{\infty} U_n$, then $B \subset U \in \tau$ and
\[ \mu(U \setminus B) = \mu(\bigcup_{n=1}^{\infty} (U_n \setminus B)) \leq \sum_{n=1}^{\infty} \mu(U_n \setminus B) \leq \sum_{n=1}^{\infty} \mu(U_n \setminus (B \cap K_n)) \leq \sum_{n=1}^{\infty} \varepsilon 2^{-n} = \varepsilon. \]

Applying this result to \( B^c \) shows there exists a closed set \( F \subset X \) such that \( B^c \subset F^c \) and
\[ \mu(B \setminus F) = \mu(F^c \setminus B^c) < \varepsilon. \]

So we have produced \( F \subset B \subset U \) such that \( \mu(U \setminus F) = \mu(U \setminus B) + \mu(B \setminus F) < 2\varepsilon \). If \( \mu(B) < \infty \), using \( B = (K_n \cap F) \uparrow B \setminus F \) as \( n \to \infty \), we may choose \( n \) sufficiently large so that \( \mu(B \setminus (K_n \cap F)) < \varepsilon \). Hence we may replace \( F \) by the compact set \( F \cap K_n \) if necessary.

2. Choose \( F_n \subset B \subset U_n \) such \( F_n \) is closed, \( U_n \) is open and \( \mu(U_n \setminus F_n) < 1/n \).

Let \( B = \bigcup_n F_n \in F_\sigma \) and \( C := \bigcap_n U_n \in \tau_\delta \). Then \( A \subset B \subset C \) and
\[ \mu(C \setminus A) \leq \mu(F_n \setminus U_n) < \frac{1}{n} \to 0 \quad \text{as} \quad n \to \infty. \]

3. From Item 1, one easily concludes that
\[ \mu(B) = \inf \{\mu(U) : B \subset U \subset X\} \]
for all \( B \in B_X \)

and
\[ \mu(B) = \sup \{\mu(K) : K \subset B \} \]
for all \( B \in B_X \) with \( \mu(B) < \infty \). So now suppose \( B \in B_X \) and \( \mu(B) = \infty \).

Using the notation at the end of the proof of Item 1, we have \( \mu(F) = \infty \) and \( \mu(F \cap K_n) \uparrow \infty \) as \( n \to \infty \). This shows \( \sup \{\mu(K) : K \subset B \} = \infty = \mu(B) \) as desired.

4. For \( U \subset O \), let
\[ \nu(U) := \sup \{I_\mu(f) : f \setminus U\}. \]

It is evident that \( \nu(U) \leq \mu(U) \) because \( f \setminus U \) implies \( f \leq 1_U \). Let \( K \) be a compact subset of \( U \). By Urysohn’s Lemma \([25.8]\) there exists \( f < U \) such that \( f = 1 \) on \( K \). Therefore,
\[ \mu(K) \leq \int_X f \, d\mu \leq \nu(U) \tag{49.27} \]
and we have
\[ \mu(K) \leq \nu(U) \leq \mu(U) \quad \text{for all} \quad U \subset O \quad \text{and} \quad K \subset C \quad \text{U}. \tag{49.28} \]

By Item 3,
\[ \mu(U) = \sup \{\mu(K) : K \subset U\} \leq \nu(U) \leq \mu(U) \]
which shows that \( \mu(U) = \nu(U) \), i.e. Eq. \([49.24]\) holds.

5. Now suppose \( K \) is a compact subset of \( X \). From Eq. \([49.27]\),
\[ \mu(K) \leq \inf \{I_\mu(f) : 1_K \leq f < X\} \leq \mu(U) \]
for any open subset \( U \) such that \( K \subset U \). Consequently by Eq. \([49.22]\),
\[ \mu(K) \leq \inf \{I_\mu(f) : 1_K \leq f < X\} \leq \inf \{\mu(U) : K \subset U \subset O \} = \mu(K) \]
which proves Eq. \([49.25]\).

6. For \( f \in C_c(X, \mathbb{R}) \),
\[ |I_\mu(f)| \leq \int_X |f| \, d\mu \leq \|f\|_\infty \mu(\text{supp}(f)) \leq \|f\|_\infty \mu(X) \tag{49.29} \]
which shows \( \|I_\mu\| \leq \mu(X) \). Let \( K \subset X \) and \( f < X \) such that \( f = 1 \) on \( K \).

By Eq. \([49.27]\),
\[ \mu(K) \leq \int_X f \, d\mu = I_\mu(f) \leq \|I_\mu\| \|f\|_\infty = \|I_\mu\| \]
and therefore,
\[ \mu(X) = \sup \{\mu(K) : K \subset X\} \leq \|I_\mu\|. \]

7. This has already been proved by two methods in Theorem \([19.8]\) but we will give yet another proof here. When \( p = 1 \) and \( g \in L^1(\mu; \mathbb{R}) \), there exists, by Eq. \([49.21]\), \( h \in S^* = C_c(X, \mathbb{R}) \) such that \( g \leq h \) and \( \|h - g\|_1 = \int_X (h - g) \, d\mu < \varepsilon \). Let \( \{h_n\}_{n=1}^\infty \subset \mathbb{S} = C_c(X, \mathbb{R}) \) be chosen so that \( h_n \uparrow h \) as \( n \to \infty \).

Then by the dominated convergence theorem (notice that \( |h_n| \leq |h_1| + |h| \), \( \|h_n - g\|_1 \to \|h - g\|_1 < \varepsilon \) as \( n \to \infty \). Therefore for large \( n \) we have \( h_n \in C_c(X, \mathbb{R}) \) with \( \|h_n - g\|_1 < \varepsilon \). Since \( \varepsilon > 0 \) is arbitrary this shows,
Remark 49.50. We may give a direct proof of the fact that $\mu \to I_\mu$ is injective. Indeed, suppose $\mu, \nu \in M_+$ satisfy $I_\mu(f) = I_{\nu}(f)$ for all $f \in C_c(X, \mathbb{R})$. By Theorem 19.8 if $A \in B_X$ is a set such that $\mu(A) + \nu(A) < \infty$, there exists $f_\mu \in C_c(X, \mathbb{R})$ such that $f_\mu \to 1_A$ in $L^1(\mu + \nu)$. Since $f_\mu \to 1_A$ in $L^1(\mu)$ and $L^1(\nu)$,

$$\mu(A) = \lim_{n \to \infty} I_\mu(f_\mu) = \lim_{n \to \infty} I_\nu(f_\mu) = \nu(A),$$

For general $A \in B_X$, choose compact subsets $K_n \subset X$ such that $K_n \uparrow X$. Then

$$\mu(A) = \lim_{n \to \infty} \mu(A \cap K_n) = \nu(A \cap K_n) = \nu(A)$$

showing $\mu = \nu$. Therefore the map $\mu \to I_\mu$ is injective.

Theorem 49.51 (Lusin’s Theorem). Suppose $(X, \tau)$ is a locally compact and second countable Hausdorff space, $B_X$ is the Borel $\sigma$-algebra on $X$, and $\mu$ is a measure on $(X, B_X)$ which is finite on compact sets of $X$. Also let $\varepsilon > 0$ be given. If $f : X \to \mathbb{C}$ is a measurable function such that $\mu(f \neq 0) < \infty$, there exists a compact set $K \subset \{f \neq 0\}$ such that $f|_K$ is continuous and $\mu(f \neq 0) \setminus K < \varepsilon$. Moreover there exists $\varphi \in C_c(X)$ such that $\mu(\varphi \neq f) < \varepsilon$ and if $f$ is bounded the function $\varphi$ may be chosen so that $\|\varphi\|_\infty \leq \|f\|_\infty := \sup_{x \in X} |f(x)|$.

Proof. Suppose first that $f$ is bounded, in which case

$$\int_X |f| \, d\mu \leq \|f\|_\mu \mu(f \neq 0) < \infty.$$

By Theorem 19.8 or Item 7 of Theorem 49.49 there exists $f_\mu \in C_c(X)$ such that $f_\mu \to f$ in $L^1(\mu)$ as $n \to \infty$. By passing to a subsequence if necessary, we may assume $\|f - f_n\|_1 < \varepsilon n^{-2} < \varepsilon n^{-2}$ for all $n$ and thus $\mu(f - f_n) > n^{-1} < \varepsilon 2^{-n}$ for all $n$. Let $E := \cup_{n=1}^\infty \{|f - f_n| > n^{-1}\}$, so that $\mu(E) < \varepsilon$. On $E^c$, $|f - f_n| \leq 1/n$, i.e. $f_n \to f$ uniformly on $E^c$ and hence $f|_{E^c}$ is continuous. Let $A := \{f \neq 0\} \setminus E$. By Theorem 49.49 (or see Exercises 46.4 and 46.5) there exists a compact set $K$ and open set $V$ such that $K \subset A \subset V$ such that $\mu(V \setminus K) < \varepsilon$. Notice that

$$\mu(f \neq 0) \setminus K \leq \mu(A \setminus K) + \mu(E) < 2\varepsilon.$$

By the Tietze extension Theorem 25.9, there exists $F \in C(X)$ such that $F = f|_K$. By Urysohn’s Lemma 25.8 there exists $\psi < V$ such that $\psi = 1$ on $K$. So letting $\varphi = \psi F \in C_c(X)$, we have $\varphi = f$ on $K$, $\|\varphi\|_\infty \leq \|f\|_\infty$ and since $\{\varphi \neq f\} \subset E \cup (V \setminus K)$, $\mu(\varphi \neq f) < 3\varepsilon$. This proves the assertions in the theorem when $f$ is bounded. Suppose that $f : X \to \mathbb{C}$ is (possibly) unbounded. By Lemmas 11.32 and 24.5, there exists compact sets $K_N$ of $X$ such that $K_N \uparrow X$. Hence $B_\infty := K_N \cap \{0 < |f| \leq N\} \uparrow \{f \neq 0\}$ as $N \to \infty$. Therefore if $\varepsilon > 0$ is given there exists an $N$ such that $\mu(f \neq 0) \setminus B_N < \varepsilon$. We now apply what we have just proved to $1_{B_N} f$ to find a compact set $K \subset \{1_{B_N} f \neq 0\}$, and open set $V \subset X$ and $\varphi \in C_c(V) \subset C_c(X)$ such that $\mu(V \setminus K) < \varepsilon$, $\mu(\{1_{B_N} f \neq 0\} \setminus K) < \varepsilon$ and $\varphi = f$ on $K$. The proof is now complete since

$$\{\varphi \neq f\} \subset \{(f \neq 0) \setminus B_N\} \cup \{(1_{B_N} f \neq 0) \setminus K\} \cup (V \setminus K)$$

so that $\mu(\varphi \neq f) < 3\varepsilon$.

To illustrate Theorem 49.51 suppose that $X = (0, 1)$, $\mu = m$ is Lebesgue measure and $f = 1_{(0,1)\setminus\mathbb{Q}}$. Then Lusin’s theorem asserts for any $\varepsilon > 0$ there exists a compact set $K \subset (0, 1)$ such that $m((0, 1) \setminus K) < \varepsilon$ and $f|_K$ is continuous. To see this directly, let $\{r_n\}_{n=1}^\infty$ be an enumeration of the rationals in $(0, 1)$,

$$J_n = (r_n - \varepsilon 2^{-n}, r_n + \varepsilon 2^{-n}) \cap (0, 1)$$

and $W = \cup_{n=1}^\infty J_n$. Then $W$ is an open subset of $X$ and $\mu(W) < \varepsilon$. Therefore $K_n := [1/n, 1-1/n] \setminus W$ is a compact subset of $X$ and $m(X \setminus K_n) \leq \frac{2}{n} + \mu(W)$. Taking $n$ sufficiently large we have $m(X \setminus K_n) < \varepsilon$ and $f|_{K_n} \equiv 0$ is continuous.

49.6 The General Riesz Representation by Daniell Integrals (Move Later?)

This section is rather a mess and is certainly not complete. Here is the upshot of what I understand at this point.

When using the Daniell integral to construct measures on locally compact Hausdorff spaces the natural answer is in terms of measures on the Baire $\sigma$-algebra. To get the Rudin or Folland version of the theorem one has to extend this measure to the Borel $\sigma$-algebra. Checking all of the details here seems to be rather painful. Just as painful and giving the full proof in Rudin!! Argh.

Definition 49.52. Let $X$ be a locally compact Hausdorff space. The Baire $\sigma$-algebra on $X$ is $B^0_X := \sigma(C_c(X))$.

Notice that if $f \in C_c(X, \mathbb{R})$ then $f = f^+ - f^-$ with $f^\pm \in C_c(X, \mathbb{R})$. Therefore $B^0_X$ is generated by sets of the form $K := \{f \geq \alpha\} \subset supp(f)$ with $\alpha > 0$. Notice that $K$ is compact and $K = \cap_{\alpha=1}^\infty \{f > \alpha - 1/n\}$ showing $K$ is a compact $G_\delta$. Thus we have shown $B^0_X \subset \sigma(\text{compact } G_\delta)$s. For the converse we will need the following exercise.

Exercise 49.2. Suppose that $X$ is a locally compact Hausdorff space and $K \subset X$ is a compact $G_\delta$ then there exists $f \in C_c([0, 1])$ such that $f = 1$ on $K$ and $f < 1$ on $K^c$. 

Page: 602  job: newanal  macro: svmonob.cls  date/time: 6-Jan-2012/17:01
This exercise shows that $\sigma(\text{compact } G^*_d s) \subset \sigma(C_c(X))$. Indeed, if $K$ is a compact $G^*_d$ set by Exercise 49.2 there exist $f \prec X$ such that $f = 1$ on $K$ and $f < 1$ on $K^c$. Therefore $1_K = \lim_{n \to \infty} f^n$ is $B^0_X$ - measurable. Therefore we have proved $B^0_X = \sigma(\text{compact } G^*_d s)$.

**Definition 49.53.** Let $(X, \tau)$ be a local compact topological space. We say that $E \subset X$ is bounded if $E \subset K$ for some compact set $K$ and $E$ is $\sigma$ - bounded if $E \subset \bigcup K_n$ for some sequence of compact sets $\{K_n\}_{n=1}^\infty$.

**Lemma 49.54.** If $A \in B^0_X$, then either $A$ or $A^c$ is $\sigma$ - bounded.

**Proof.** Let $A = \{a \subset X : \text{either } A \text{ or } A^c \text{ is } \sigma \text{ - bounded}\}$. Clearly $X \in A$ and $A$ is closed under complementation. Moreover if $A_1 \subset A$ then $A = \bigcup A_i \subset A \in A$. Indeed, if each $A_i$ is $\sigma$ - bounded then $A$ is $\sigma$ - bounded and if some $A^c_j$ is $\sigma$ - bounded then $A^c = \bigcap A^c_j \subset A^c_j$ is $\sigma$ - bounded. Therefore, $A$ is a $\sigma$ - algebra containing the compact $G^*_d s$ and therefore $B^0_X \subset A$.

Now the $\sigma$ - algebra $B^0_X$ is called the Baire $\sigma$ - algebra and may not necessarily be as large as the Borel $\sigma$ - algebra. However if every open subset of $X$ is $\sigma$ - compact, then the Borel $B_Z$ and the Baire $\sigma$ - algebras are the same. Indeed, if $U \cap x$ and $K \cap U$ with $K$ being compact. There exists $f_n < U$ such that $f_n = 1$ on $K_n$. Now $f := \lim_{n \to \infty} f_n = 1_U$ showing $U \in \sigma(C_c(X)) = B^0_X$.

**Lemma 49.55.** In Halmos on p.221 it is shown that a compact Baire set is necessarily a compact $G^*_d$.

**Proof.** Let $K$ be a compact Baire set and let $K_G^*_d$ denote the space of compact $G^*_d$'s. Recall in general that if $D$ is some collection of subsets of a space $X$, then

$$\sigma(D) = \bigcup \{\sigma(E) : E \text{ is a countable subset of } D\}.$$  

This is because the right member of this equation is a $\sigma$ - algebra. Therefore, there exist $\{C_n\}_{n=1}^\infty \subset K_G^*_d$ such that $K \in \sigma(\{C_n\}_{n=1}^\infty)$. Let $f_n \in C(X, [0, 1])$ such that $C_n = \{f_n = 0\}$, see Exercise 49.2 above. Now define

$$d(x, y) := \sum_{n=1}^\infty 2^{-n} |f_n(x) - f_n(y)|.$$  

Then $d$ would be a metric on $X$ except for the fact that $d(x, y)$ may be zero even though $x \neq y$. Let $X \sim y$ iff $d(x, y) = 0$ iff $f_n(x) = f_n(y)$ for all $n$. It is easily seen that $\sim$ is an equivalence relation and $Z := X/ \sim$ with the induced metric $d$ is a metric space. Also let $x : X \to Z$ be the canonical projection map. Notice that if $x \in C_n$, then $y \in C_n$ for all $x \sim y$, and therefore $\pi^{-1}(\pi(C_n)) = C_n$ for all $n$. In particular this shows that

$$K \in \sigma(\{C_n\}_{n=1}^\infty) \subset \pi^{-1}(P(Z)),$$

i.e. $K = \pi^{-1}(\pi(K))$. Now $\pi$ is continuous, since if $x \in X$ and $y \in \cap_{n=1}^\infty \{f_k(y) - f_k(x)\} < \varepsilon \subset o$ then

$$d(\pi(x), \pi(y)) = d(x, y) = \varepsilon < + 2^{-N+1}$$

which can be made as small as we please. Hence $\pi(K)$ is compact and hence closed in $Z$. Let $W_n := \{z \in Z : d(\pi(K)) < 1/n\}$, then $W_n$ is open in $Z$ and $W_n \downarrow \pi(K)$ as $n \to \infty$. Let $V_n := \pi^{-1}(W_n)$, open in $X$ since $\pi$ is continuous, then $V_n \downarrow K$ as $n \to \infty$.

The following facts are taken from Halmos, section 50 starting on p. 216.

**Theorem 49.56.** 1. If $K \subset X$ and $K \subset U \cup V$ with $U, V, \tau$ then $K = K \cap K_2 \cap U \cup K_2 \cap V$.

2. If $K \subset X$ and $F \subset X$ are disjoint, then there exists $f \in C(X, [0, 1])$ such that $f = 0$ on $K$ and $f = 1$ on $F$.

3. If $f$ is a real valued continuous function, then for all $c \in \mathbb{R}$ the sets $\{f \geq c\}$, $\{f \leq c\}$ and $\{f = c\}$ are closed $G^*_d$.

4. If $K \subset X \subset X$ then there exists $K \subset U_0 \subset K \subset U$ such that $K_0$ is a compact $G^*_d$ and $U_0$ is a $\sigma$ - compact open set.

5. If $X$ is separable, then every compact subset of $X$ is a $G^*_d$. (I think the proof of this point is wrong in Halmos!)

**Proof.** 1. $K \setminus U$ and $K \setminus V$ are disjoint compact sets and hence there exists two disjoint open sets $U'$ and $V'$ such that $K \setminus U \subset U'$ and $K \setminus V \subset V'$.

Let $K_1 := K \setminus V' \subset U$ and $K_2 := K \setminus U' \subset V$. 2. Tietze extension theorem with elementary proof in Halmos. 3. $\{f \leq c\} = \cap_{n=1}^\infty \{f < c + 1/n\}$ with similar formula for the other cases. The converse has already been mentioned. 4. For each $x \in K$, let $V_x$ be an open neighborhood of $K$ such that $V_x \subset U$ and set $V = \cup_{x \in A} V_x$ where $A \subset K$ is a finite set such that $K \subset V$. Since $V = \cup_{x \in A} V_x$ is compact, we may replace $U$ by $V$ if necessary and assume that $U$ is bounded. Let $f \in C(X, [0, 1])$ such that $f = 0$ on $K$ and $f = 1$ on $U^c$. Take $U_0 = \{f < 1/2\}$ and $K_0 = \{f \leq 1/2\}$. Then $K \subset U_0 \subset K_0 \subset U$, $K_0$ is compact $G^*_d$ and $U_0$ is a $\sigma$ - compact open set since $U_0 = \cup_{n=1}^\infty \{f \leq 1/2 + 1/n\}$. 5. Let $K \subset X$ and $D$ be a countable dense subset of $X$. For all $x \notin K$ there exist disjoint open sets $V_x$ and $U_x$ such that $x \in U_x$ and $K \subset V_x$. (I don’t see how to finish this off at the moment.)
49.7 Regularity Results

**Proposition 49.57.** Let $X$ be a compact Hausdorff space and $\mu$ be a Baire measure on $\mathcal{B}_X^0$. Then for each $A \in \mathcal{B}_X^0$ and $\varepsilon > 0$ there exists $K \subset A \subset V$ where $K$ is a compact $\mathcal{G}_\delta$ and $V$ is an open, Baire and $\sigma$-compact, such that $\mu(V \setminus K) < \varepsilon$.

**Proof.** Let $I(f) = \int_X f \, d\mu$ for $f \in \mathcal{S} := C(X)$, so that $I$ is a Daniell integral on $C(X)$. Since $1 \in \mathcal{S}$, the measure $\mu$ from the Daniell–Stone construction theorem is the same as the measure $\mu$. Hence for $g \in L^1(\mu)$, we have

$$\sup \{ I(f) : f \in \mathcal{S} \text{ with } f \leq h \} = \int_X g \, d\mu = \inf \left\{ \int h \, d\mu : h \in \mathcal{S} \text{ with } g \leq h \right\}.$$ 

Suppose $\varepsilon > 0$ and $B \in \mathcal{B}_X^0$ are given. There exists $h_n \in \mathcal{S}$ such that $h_n \uparrow h$, $1_B \leq h$, and $\mu(h) < \mu(B) + \varepsilon$. The condition $1_B \leq h$ implies $1_B \leq 1_{\{h \geq 1\}} \leq h$ and hence

$$\mu(B) \leq \mu(h \geq 1) \leq \mu(h) < \mu(B) + \varepsilon. \quad (49.30)$$

Moreover, letting

$$V_m := \bigcap_{n=1}^{\infty} \{ h_n > 1 - 1/m \} = \bigcup_{n=1}^{\infty} \cap_{k=1}^{\infty} \{ h_n \geq 1 - 1/m + 1/k \}$$

(a $\sigma$-compact, open Baire set) we have $V_m \downarrow \{ h \geq 1 \} \subset B$ hence $\mu(V_m) \downarrow \mu(h \geq 1) \geq \mu(B)$ as $m \to \infty$. Combining this observation with Eq. (49.30), we may choose $m$ sufficiently large so that $B \subset V_m$ and

$$\mu(V_m \setminus B) = \mu(V_m) - \mu(B) < \varepsilon.$$ 

Hence there exists $V \in \tau$ such that $B \subset V$ and $\mu(V \setminus B) < \varepsilon$. Similarly, there exists $f \in \mathcal{S}$ such that $f \leq 1_B$ and $\mu(B) < \mu(f) + \varepsilon$. We clearly may assume that $f \geq 0$. Let $f_n \in \mathcal{S}$ be chosen so that $f_n \downarrow f$ as $n \to \infty$. Since $0 \leq f \leq 1_B$ we have

$$0 \leq f \leq \inf_{\{f > 0\}} \leq 1_B$$

so that $\{f > 0\} \subset B$ and $\mu(B) < \mu(f) + \varepsilon$. For each $m \in \mathbb{N}$, let

$$K_m := \bigcap_{n=1}^{\infty} \{ f_n \geq 1/m \} = \bigcap_{k=1}^{\infty} \bigcap_{n=1}^{\infty} \{ f_n \geq 1/m - 1/k \},$$

a compact $\mathcal{G}_\delta$, then $K_m \uparrow \{ f > 0 \}$ as $m \to \infty$. Therefore for large $m$ we will have $\mu(B) < \mu(K_m) + \varepsilon$, i.e. $K_m \subset B$ and $\mu(B \setminus K_m) < \varepsilon$.

**Remark 49.58.** The above proof does not in general work when $X$ is a locally compact Hausdorff space and $\mu$ is a finite Baire measure on $\mathcal{B}_X^0$ since it may happen that $\mu \neq \mu_+$, i.e. $\mu_+(X)$ might be infinite, see Example 49.59 below. However, if $\mu_+(X) < \infty$, then the above proof works in this context as well.

**Example 49.59.** Let $X$ be an uncountable set and $\tau = 2^X$ be the discrete topology on $X$. In this case $K \subset X$ is compact iff $K$ is a finite set. Since every set is open, $K$ is necessarily a $\mathcal{G}_\delta$ and hence a Baire set. So $\mathcal{B}_X^0$ is the $\sigma$-algebra generated by the finite subsets of $X$. We may describe $\mathcal{B}_X^0$ by $A \in \mathcal{B}_X^0$ iff $A$ is countable or $A^c$ is countable. For $A \in \mathcal{B}_X^0$, let

$$\mu(A) = \begin{cases} 0 \text{ if } A \text{ is countable} \\ 1 \text{ if } A^c \text{ is uncountable} \end{cases}$$

To see that $\mu$ is a measure suppose that $A$ is the disjoint union of $\{A_n\} \subset \mathcal{B}_X^0$. If $A_n$ is countable for all $n$, then $A$ is countable and $\mu(A) = 0 = \sum_{n=1}^{\infty} \mu(A_n)$. If $A_n^c$ is countable for some $m$, then $A_i \subset A_n^c$ is countable for all $i \neq m$. Therefore, $\sum_{n=1}^{\infty} \mu(A_n) = 1$, now $A^c = \cap A_n \subset A_m^c$ is countable as well, so $\mu(A) = 1$. Therefore $\mu$ is a measure.

The measure $\mu$ is clearly a finite Baire measure on $\mathcal{B}_X^0$ which is non-regular. Letting $I(f) = \int_X f \, d\mu$ for all $f \in \mathcal{S} = C_c(X)$ – the functions with finite support, then $I(f) = 0$ for all $f$. If $B \subset X$ is a set such that $B^c$ is countable, there are no functions $f \in (C_c(X))^\tau$ such that $1_B \leq f$. Therefore $\mu_+(B) = \mu_+(1_B) = \infty$. That is

$$\mu_+(A) = \begin{cases} 0 \text{ if } A \text{ is countable} \\ \infty \text{ otherwise.} \end{cases}$$

On the other hand, one easily sees that $\mu_-(A) = 0$ for all $A \in \mathcal{B}_X^0$. The measure $\mu_-$ represents $I$ as well.

**Definition 49.60.** A Baire measure $\mu$ on a locally compact Hausdorff space is regular if for each $A \in \mathcal{B}_X^0$, ($\mathcal{B}_X^0$ – being the Baire $\sigma$-algebra)

$$\mu(A) = \sup \{ \mu(K) : K \subset A \text{ and } K \text{ is a compact } \mathcal{G}_\delta \}.$$ 

**Proposition 49.61.** Let $\mu$ be a Baire measure on $X$ and set

$$\nu(A) := \sup \{ \mu(K) : K \subset A \text{ and } K \text{ is a compact } \mathcal{G}_\delta \}.$$ 

Then $\nu(A) = \mu(A)$ for any $\sigma$-bounded sets $A$ and $\nu$ is a regular Baire measure on $X$.

**Proof.** Let $A$ be a $\sigma$-bounded set and $K_n$ be compact $\mathcal{G}_\delta$’s (which exist by Theorem 49.56) such that $A \subset \cup K_n$. By replacing $K_n$ by $\cup_{k=1}^{\infty} K_k$ if necessary, we may assume that $K_n$ is increasing in $n$. By Proposition 49.57 there exists compact $\mathcal{G}_\delta$’s, such that $C_n \subset A \cap K_n$ and $\mu(A \cap K_n \setminus C_n) < \varepsilon 2^{-n}$ for all $n$. Let $C_n := \cup_{n=1}^{\infty} C_n$, then $C_n$ is a compact $\mathcal{G}_\delta$, $C_n \subset A$ and $\mu(A \cap K_n \setminus C_n) < \varepsilon$ for all $n$. From this equation it follows that $\mu(A \cap C_n) < \varepsilon$ for large $N$ if $\mu(A) < \infty$ and $\mu(C_n) \to \infty$ if $\mu(A) = \infty$. In either case we have that $\nu(A) = \mu(A)$.

Now let us show that $\nu$ is a measure on $\mathcal{B}_X^0$. Suppose $A = \bigcup_{n=1}^{\infty} A_n$ and
\[ K_n \subset A_n \text{ for each } n \text{ with } K_n \text{ being a compact } G_\delta. \text{ Then } K_N := \bigcup_{n=1}^{N} K_n \text{ is also a compact } G_\delta \text{ and since } K_N \subset A, \text{ it follows that} \]
\[
\nu(A) \geq \mu(K_N) = \sum_{n=1}^{N} \mu(K_n).
\]

Since \( K_n \subset A_n \) are arbitrary, we learn that \( \nu(A) \geq \sum_{n=1}^{N} \nu(A_n) \) for all \( N \) and hence letting \( N \to \infty \) shows
\[
\nu(A) \geq \sum_{n=1}^{\infty} \nu(A_n).
\]

We now wish to prove the converse inequality. Owing to the above inequality, it suffices not to consider the case where \( \sum_{n=1}^{\infty} \nu(A_n) < \infty \). Let \( K \subset A \) be a compact \( G_\delta \). Then
\[
\mu(K) = \sum_{n=1}^{\infty} \mu(K \cap A_n) = \sum_{n=1}^{\infty} \nu(K \cap A_n) \leq \sum_{n=1}^{\infty} \nu(A_n)
\]
and since \( K \) is arbitrary, it follows that \( \nu(A) \leq \sum_{n=1}^{\infty} \nu(A_n) \). So \( \nu \) is a measure. Finally if \( A \in B_X^0 \), then
\[
\sup \{ \nu(K) : K \subset A \text{ and } K \text{ is a compact } G_\delta \}
= \sup \{ \mu(K) : K \subset A \text{ and } K \text{ is a compact } G_\delta \} = \nu(A)
\]
showing \( \nu \) is regular.

**Corollary 49.62.** Suppose that \( \mu \) is a finite Baire measure on \( X \) such
\[
\mu(X) := \sup \{ \mu(K) : K \subset X \text{ and } K \text{ is a compact } G_\delta \},
\]
then \( \mu = \nu \), in particular \( \mu \) is regular.

**Proof.** The assumption asserts that \( \mu(X) = \nu(X) \). Since \( \mu = \nu \) on the \( \pi \) – class consisting of the compact \( G_\delta \)'s, we may apply Theorem 45.43 to learn \( \mu = \nu \).

**Proposition 49.63.** Suppose that \( \mu \) is a Baire measure on \( X \), then for all \( A \in B_X^{0} \) which is \( \sigma \) – bounded and \( \varepsilon > 0 \) there exists \( V \in \tau \cap B_X^{0} \) such that \( A \subset V \) and \( \mu(V \setminus A) < \varepsilon \). Moreover if \( \mu \) is regular then
\[
\mu(A) = \inf \{ \mu(V) : A \subset V \in \tau \cap B_X^{0} \}.
\]
holds for all \( A \in B_X^{0} \).

**Proof.** Suppose \( A \) is \( \sigma \) – bounded Baire set. Let \( K_n \) be compact \( G_\delta \)'s (which exist by Theorem 49.56) such that \( A \subset \bigcup K_n \). By replacing \( K_n \) by \( \bigcup_{k=1}^{n} K_k \) if necessary, we may assume that \( K_n \) is increasing in \( n \). By Proposition 45.47 (applied to \( d\mu_n := I_{U_n} \mu \) with \( U_n \) an open Baire set such that \( K_n \subset U_n \) and \( U_n \subset C_n \) where \( C_n \) is a compact Baire set, see Theorem 49.56), there exists open Baire sets \( V_n \) of \( X \) such that \( A \cap K_n \subset V_n \) and \( \mu(V_n \setminus A \cap K_n) < \varepsilon 2^{-n} \) for all \( n \). Let \( V = \bigcup_{n=1}^{\infty} V_n \in \tau \cap B_X^{0} \), \( A \subset V \) and \( \mu(V \setminus A) < \varepsilon \). Now suppose that \( \mu \) is regular and \( A \in B_X^{0} \). If \( \mu(A) = \infty \) then clearly \( \inf \{ \mu(V) : A \subset V \in \tau \cap B_X^{0} \} = \infty \). So we will now assume that \( \mu(A) < \infty \). By inner regularity, there exists compact \( G_\delta \)'s, \( K_n \), such that \( K_n \uparrow_k K_n \subset A \) for all \( n \) and \( \mu(K_n \setminus K_n) \downarrow_k 0 \) as \( n \to \infty \). Letting \( B = \bigcup K_n \subset A \), then \( B \) is a \( \sigma \) – bounded set, \( \mu(A \setminus B) = 0 \). Since \( B \) is \( \sigma \) – bounded there exists an open Baire \( V \) such that \( B \subset V \) and \( \mu(V \setminus B) \) is a small as we please. These remarks reduce the problem to considering the truth of the proposition for the null set \( A \setminus B \). So we now assume that \( \mu(A) = 0 \). If \( A \) is \( \sigma \) – bounded we are done by the first part of the proposition, so we will now assume that \( A \subset A \) is not \( \sigma \) – bounded. By Lemma 49.54 it follows that \( A^c \) is \( \sigma \) – bounded. (I am a little stuck here, so assume for now that \( \mu(X) < \infty \), in which case we do not use the fact that \( A^c \) can be assumed to be \( \sigma \) – bounded.) If \( \mu(X) < \infty \) and \( \varepsilon > 0 \) is given, by inner regularity there exists a compact Baire subset \( K \subset A^c \) such that
\[
\varepsilon > \mu(A^c \setminus K) = \mu(K^c \setminus A)
\]
and since \( A \subset K^c \) is an open, Baire set the proof is finished when \( \mu \) is a finite measure.

**Example 49.64.** 1) Suppose that \( X = \mathbb{R} \) with the standard topology and \( \mu \) is counting measure on \( X \). Then clearly \( \mu \) is not finite on all compact sets, so \( \mu \) is not \( K \)–finite measure. 2) Let \( X = \mathbb{R} \) and \( \tau = \tau_d = 2^{\infty} \) be the discrete topology on \( X \). Now let \( \mu(A) = 0 \) if \( A \) is countable and \( \mu(A) = \infty \) otherwise. Then \( \mu(K) = 0 < \infty \) if \( K \) is \( \tau_d \) – compact yet \( \mu \) is not inner regular on open sets, i.e. all sets. So again \( \mu \) is not Radon. Moreover, the functional
\[
I_{\mu}(f) = \int \! f \, d\mu = 0 \text{ for all } f \in C_c(X).
\]
This shows that with out the restriction that \( \mu \) is Radon in Example 27.10 the correspondence \( \mu \to I_{\mu} \) is not injective.

**Theorem 49.65 (Riesz Representation Theorem).** Let \( X \) be a locally compact Hausdorff space. The map \( \nu \to I_{\nu} \) taking Radon measures on \( X \) to positive linear functionals on \( C_c(X) \) is bijective. Moreover if \( I \) is a positive linear functional on \( C_c(X) \), then \( I = I_{\nu} \) where \( \nu \) is the unique Radon measure \( \nu \) such that
\[
\nu(U) = \inf \{ I(f) : f < U \}
\]
for all \( U \subset X \).
Proof. Given a positive linear functional on $C_c(X)$, the Daniell–Stone integral construction theorem gives the existence of a measure $\mu$ on $B^0_X := \sigma(C_c(X))$ (the Baire $\sigma$–algebra) such that
\[
\int_X f d\mu = I(f) \text{ for all } f \in C_c(X)
\]
and for $g \in L^1(\mu)$,
\[
\sup \{ I(f) : \mathbb{S}_n \ni f \leq g \} = \int_X g d\mu = \inf \{ I(h) : g \leq h \in \mathbb{S}_1 \}
\]
with $\mathbb{S} := C_c(X, \mathbb{R})$. Suppose that $K$ is a compact subset of $X$ and $E \subset K$ is a Baire set. Let $f \prec X$ be a function such that $f = 1$ on $K$, then $1_E \leq f$ implies $\mu(E) = I(1_E) \leq I(f) < \infty$. Therefore any bounded (i.e. subset of a compact set) Baire set $E$ has finite measure. Suppose that $K$ is a compact Baire set, i.e. a compact $G_δ$, and $f$ is as in Exercise 49.2 then
\[
\mu(K) \leq \int f^n d\mu = I(f^n) < \infty
\]
showing $\mu$ is finite on compact Baire sets and by the dominated convergence theorem that
\[
\mu(K) = \lim_{n \to \infty} I(f^n)
\]
showing $\mu$ is uniquely determined on compact Baire sets. Suppose that $A \in B^0_X$ and $\mu(A) = I^*(1_A) < \infty$. Given $\varepsilon > 0$, there exists $f \in \mathbb{S}_\varepsilon$ such that $1_A \leq f$ and $\mu(f) < \mu(A) + \varepsilon$. Let $f_n \in C_c(X)$ such that $f_n \uparrow f$, then $1_A \leq 1_{\{f_n \geq 1\}} \leq f$ which shows
\[
\mu(A) \leq \mu(f \geq 1) \leq \int f d\mu = I(f) < \mu(A) + \varepsilon.
\]
Let $V_m := \cup_{n=1}^{\infty} \{ f_n > 1 - 1/m \}$, then $V_m$ is open and $V_m \downarrow \{ f \geq 1 \}$ as $m \to \infty$. Notice that
\[
\mu(V_m) = \lim_{n \to \infty} \mu(f_n > 1 - 1/m) \leq \mu(f > 1 - 1/m)
\]
\[
\leq \frac{1}{1 - 1/m} \mu(f) < \frac{1}{1 - 1/m} (\mu(A) + \varepsilon)
\]
showing $\mu(V_m) < \mu(A) + \varepsilon$ for all $m$ large enough. Therefore if $A \in B^0_X$ and $\mu(A) < \infty$, there exists a Baire open set, $V$, such that $A \subset V$ and $\mu(V \setminus A)$ is as small as we please. Suppose that $A \in B^0_X$ is a $\sigma$–bounded Baire set, then using Item 4. of Theorem 49.56 there exists compact $G_δ$, $K_n$, such that $A \subset \cup K_n$. Hence there exists $V_n$ open Baire sets such that $K_n \cap A \subset V_n$ and $\mu(V_n \setminus K_n \cap A) < \varepsilon 2^{-n}$ for all $n$. Now let $V := \cup V_n$, an open Baire set, then $A \subset V$ and $\mu(V \setminus A) < \varepsilon$. Hence we have shown if $A$ is $\sigma$–bounded then
\[
\mu(A) = \inf \{ \mu(V) : A \subset V \subset_o X \text{ and } V \text{ is Baire} \}
\]
Again let $A$ and $K_n$ be as above. Replacing $K_n$ by $\cup_{k=1}^n K_k$ we may also assume that $K_n \uparrow$ as $n \uparrow$. Then $K_n \cap A$ is a bounded Baire set. Let $F_n$ be a compact $G_δ$ such that $K_n \cap A \subset F_n$ and choose $\sigma$–compact open set $V_n$ such that $F_n \setminus K_n \cap A \subset V_n$ and $\mu(V_n \setminus (F_n \setminus K_n \cap A)) < \varepsilon 2^{-n}$. ....... In the end the desired measure $\nu$ should be defined by
\[
\nu(U) = \sup \{ I(f) : f \prec U \} \text{ for all } U \subset_o X
\]
and for general $A \in B_X$ set
\[
\nu(A) := \inf \{ \nu(U) : A \subset U \subset_o X \}
\]
Let us note that if $f \prec U$ and $K = \text{supp}(f)$, then there exists $K \subset U_0 \subset K_0 \subset U$ as in Theorem 49.56. Therefore, $f \leq 1_{K_0}$ and hence $I(f) \leq \nu(K_0)$ which shows that
\[
\nu(U) \leq \sup \{ \mu(K_0) : K_0 \subset U \text{ and } K_0 \text{ is a compact } G_δ \}.
\]
The converse inequality is easily proved by letting $g \prec U$ such that $g = 1$ on $K_0$. Then $\mu(K_0) \leq I(g) \leq \nu(U)$ and hence
\[
\nu(U) = \sup \{ \mu(K_0) : K_0 \subset U \text{ and } K_0 \text{ is a compact } G_δ \}.
\]
Let us note that $\nu$ is sub-additive on open sets (see p. 314 of Royden. Let
\[
\nu^*(A) := \inf \{ \nu(U) : A \subset U \subset_o X \}
\]
Then $\nu^*$ is an outer measure as well I think and $\mathcal{N} := \{ A \subset X : \nu^*(A) = 0 \}$ is closed under countable unions. Moreover if $E$ is Baire measurable and $E \in \mathcal{N}$, then there exists $O$ open $\nu(O) < \varepsilon$ and $E \subset O$. Hence for all compact $G_δ$, $K \subset O$, $\mu(K) < \varepsilon$. Royden uses assumed regularity here to show that $\nu(E) = 0$. I don’t see how to get this assume regularity at this point.

49.8 Metric space regularity results resisted

Proposition 49.66. Let $(X, d)$ be a metric space and $\mu$ be a measure on $\mathcal{M} = B_X$ which is $\sigma$–finite on $\tau := \tau_d$.

1. For all $\varepsilon > 0$ and $B \in \mathcal{M}$ there exists an open set $V \in \tau$ and a closed set $F$ such that $F \subset B \subset V$ and $\mu(V \setminus F) \leq \varepsilon$. 

Page: 606  job: newanal macro: svmobob.cls date/time: 6-Jan-2012/17:01
2. For all \( B \in \mathcal{M} \), there exists \( A \in \mathcal{F}_\tau \) and \( C \in G_d \) such that \( A \subset B \subset C \) and \( \mu(C \setminus A) = 0 \). Here \( \mathcal{F}_\tau \) denotes the collection of subsets of \( X \) which may be written as a countable union of closed sets and \( G_d = \tau_d \) is the collection of subsets of \( X \) which may be written as a countable intersection of open sets.

3. The space \( BC_f(X) \) of bounded continuous functions on \( X \) such that \( \mu(f) < 0 \) is dense in \( L^p(\mu) \).

**Proof.** Let \( \mathcal{S} := BC_f(X) \), \( I(f) := \int_X f d\mu \) for \( f \in \mathcal{S} \) and \( X_n \in \tau \) be chosen so that \( \mu(X_n) < \infty \) and \( X_n \uparrow X \) as \( n \to \infty \). Then \( 1 \in \mathcal{S} \) for all \( f \in \mathcal{S} \) and if \( \varphi_n \equiv 1 \wedge (dX_n) \in \mathcal{S}^+ \), then \( \varphi_n \uparrow 1 \) as \( n \to \infty \) and so by Remark 49.47 there exists \( \varphi \in \mathcal{S} \) such that \( \varphi > 0 \) on \( X \) and \( I(\varphi) < \infty \). Similarly if \( V \in \tau \), the function \( g_n := 1 \wedge (dX_n) \in \mathcal{S} \) and \( g_n \to 1 \) as \( n \to \infty \), showing \( \sigma(\mathcal{S}) = B_X \). If \( f_n \in \mathcal{S}^+ \) and \( f_n \downarrow 0 \) as \( n \to \infty \), it follows by the dominated convergence theorem that \( I(f_n) \downarrow 0 \) as \( n \to \infty \). So the hypothesis of the Daniell–Stone Theorem 49.46 hold and hence \( \mu \) is the unique measure on \( B_X \) such that \( I = I(\mu) \) and for \( B \in B_X \)

\[
\mu(B) = I^*(1_B) = \inf \{ I(f) : f \in \mathcal{S} \text{ with } 1_B \leq f \}
\]

Suppose \( \epsilon > 0 \) and \( B \in B_X \) are given. There exists \( f_n \in BC_f(X) \) such that \( f_n \uparrow f \), \( 1_B \leq f_n \), and \( \mu(f) < \mu(B) + \epsilon \). The condition \( 1_B \leq f_n \) implies \( 1_B \leq f \) and hence that

\[
\mu(B) \leq \mu(f) \leq \mu(f_n) < \mu(B) + \epsilon.
\]

Moreover, letting \( V_m := \bigcup_{n=1}^{\infty} \{ f_n \geq 1 - 1/m \} \in \tau_d \), we have \( V_m \downarrow \{ f \geq 1 \} \supset B \) and hence \( \mu(V_m) \downarrow \mu(f) \geq \mu(B) \) as \( m \to \infty \). Combining this observation with Eq. 49.32, we may choose \( m \) sufficiently large so that \( B \subset V_m \) and

\[
\mu(V_m \setminus B) = \mu(V_m) - \mu(B) < \epsilon.
\]

Hence there exists \( V \in \tau \) such that \( B \subset V \) and \( \mu(V \setminus B) < \epsilon \). Applying this result to \( B^c \) shows there exists \( F \subset X \) such that \( B^c \subset F^c \) and

\[
\mu(B \setminus F) = \mu(F^c \setminus B^c) < \epsilon.
\]

So we have proved \( F \subset B \subset C \) such that \( \mu(V \setminus F) = \mu(V \setminus B) + \mu(B \setminus F) < 2\epsilon \). The second assertion is an easy consequence of the first and the third follows in similar manner to any of the proofs of Item 7. in Theorem 49.49.

### 49.9 General Product Measures

In this section we drop the topological assumptions used in the last section.

**Theorem 49.67.** Let \( \{(X_\alpha, \mathcal{M}_\alpha, \mu_\alpha)\}_{\alpha \in A} \) be a collection of probability spaces, that is \( \mu_\alpha(X_\alpha) = 1 \) for all \( \alpha \in A \). Let \( X := \prod_{\alpha \in A} X_\alpha, \mathcal{M} = \sigma(\pi_\alpha : \alpha \in A) \) and for \( A \subset A \) let \( X_A := \prod_{\alpha \in A} X_\alpha \) and \( \pi_\alpha : X \to X_A \) be the projection map \( \pi_A(x) = x|_A \) and \( \mu_A := \prod_{\alpha \in A} \mu_\alpha \) be product measure on \( \mathcal{M}_A := \otimes_{\alpha \in A} \mathcal{M}_\alpha \). Then there exists a unique measure \( \mu \) on \( \mathcal{M} \) such that \( \mu(x) = \mu_A \mu(x) \) for all \( \alpha \in A \), i.e. if \( f : X_A \to \mathbb{R} \) is a bounded measurable function then

\[
\int_X f(\pi_A(x)) d\mu_A(x) = \int_{X_A} f(y) d\mu_A(y).
\]

**Proof.** Let \( \mathcal{S} \) denote the collection of functions \( f : X \to \mathbb{R} \) such that there exists \( A \subset A \) and a bounded measurable function \( f : X_A \to \mathbb{R} \) such that \( f = f \circ \pi_\alpha \). For \( f = f \circ \pi_\alpha \in \mathcal{S} \), let \( I(f) = \int_{X_A} f d\mu_A \). Let us verify that \( I \) is well defined. Suppose that \( f \) may also be expressed as \( f = f \circ \pi_\Gamma \) with \( \Gamma \subset A \) and \( G : X_\Gamma \to \mathbb{R} \) bounded and measurable. By replacing \( \Gamma \) by \( \Gamma \cup A \) if necessary, we may assume that \( A \subset \Gamma \). Making use of Fubini’s theorem we learn

\[
\int_{X_\Gamma} G(z) d\mu_\Gamma(z) = \int_{X_\Lambda \times X_\Gamma \setminus \Lambda} F \circ \pi_\Lambda(x) d\mu_\Lambda(x) d\mu_\Gamma(x) \\
= \int_{X_\Lambda} F \circ \pi_\Lambda(x) d\mu_\Lambda(x) \cdot \int_{X_\Gamma \setminus \Lambda} d\mu_\Gamma(x) \\
= \mu_\Gamma \setminus \Lambda \left( X_\Gamma \setminus \Lambda \right) \cdot \int_{X_\Lambda} F \circ \pi_\Lambda(x) d\mu_\Lambda(x) \\
= \int_{X_\Lambda} F \circ \pi_\Lambda(x) d\mu_\Lambda(x),
\]

wherein we have used the fact that \( \mu_\Lambda(X_\Lambda) = 1 \) for all \( \Lambda \subset A \) since \( \mu_\alpha(X_\alpha) = 1 \) for all \( \alpha \in A \). It is now easy to check that \( I \) is a positive linear functional on the lattice \( \mathcal{S} \). We will now show that \( I \) is a Daniel integral. Suppose that \( f_n \in \mathcal{S}^+ \) is a decreasing sequence such that \( \inf_n I(f_n) = \epsilon > 0 \). We need to show \( f := \lim_{n \to \infty} f_n \) is not identically zero. As in the proof that \( I \) is well defined, there exists \( \Lambda_n \subset \subset A \) and bounded measurable functions \( F_n : X_{\Lambda_n} \to (0, \infty) \) such that \( \Lambda_n \) is increasing in \( n \) and \( f_n = F_n \circ \pi_{\Lambda_n} \) for each \( n \). For \( k \leq n \), let \( F_{n,k} : X_{\Lambda_k} \to (0, \infty) \) be the bounded measurable function

\[
F_{n,k}(x) = \int_{X_{\Lambda_n \setminus \Lambda_k}} F_n(x \times y) d\mu_{\Lambda_n \setminus \Lambda_k}(y)
\]

where \( x \times y \in X_{\Lambda_n} \) is defined by \( (x \times y)(\alpha) = x(\alpha) \) if \( \alpha \in A_k \) and \( (x \times y)(\alpha) = y(\alpha) \) for \( \alpha \in \Lambda_n \setminus A_k \). By convention we set \( F_{n,k} = F_n \) for \( k = n \). Since \( f_n \) is decreasing it follows that \( F_{n,k} \leq F_{n,k+1} \) for all \( k \) and \( n \geq k \) and therefore \( F^k := \lim_{n \to \infty} F_{n,k} \) exists. By Fubini’s theorem,
and hence letting $n \to \infty$ in this equation shows
\[
F^k(x) = \int_{X_{\Lambda_n \setminus \Lambda_k}} F^{k+1}(x \times y) d\mu_{\Lambda_k \setminus \Lambda_k}(y)
\]  
(49.34)
for all $k$. Now
\[
\int_{X_{\Lambda_1}} F^1(x) d\mu_{\Lambda_1}(x) = \lim_{n \to \infty} \int_{X_{\Lambda_1}} F_n^1(x) d\mu_{\Lambda_1}(x) = \lim_{n \to \infty} I(f_n) = \varepsilon > 0
\]
so there exists
\[
x_1 \in X_{\Lambda_1} \text{ such that } F^1(x_1) \geq \varepsilon.
\]
From Eq. (49.34) with $k = 1$ and $x = x_1$ it follows that
\[
\varepsilon \leq \int_{X_{\Lambda_2 \setminus \Lambda_1}} F^2(x_1 \times y) d\mu_{\Lambda_2 \setminus \Lambda_1}(y)
\]
and hence there exists
\[
x_2 \in X_{\Lambda_2 \setminus \Lambda_1} \text{ such that } F^2(x_1 \times x_2) \geq \varepsilon.
\]
Working this way inductively using Eq. (49.34) implies there exists
\[
x_1 \in X_{\Lambda_1 \setminus \Lambda_{n-1}} \text{ such that } F^n(x_1 \times x_2 \times \cdots \times x_n) \geq \varepsilon
\]
for all $n$. Now $F_k^n \geq F^n_k$ for all $k \leq n$ and in particular for $k = n$, thus
\[
F_n(x_1 \times x_2 \times \cdots \times x_n) = F^n_n(x_1 \times x_2 \times \cdots \times x_n) \geq F^n(x_1 \times x_2 \times \cdots \times x_n) \geq \varepsilon
\]  
(49.35)
for all $n$. Let $x \in X$ be any point such that
\[
\pi_{\Lambda_n}(x) = x_1 \times x_2 \times \cdots \times x_n
\]
for all $n$. From Eq. (49.35) it follows that
\[
f_n(x) = F_n \circ \pi_{\Lambda_n}(x) = F_n(x_1 \times x_2 \times \cdots \times x_n) \geq \varepsilon
\]
for all $n$ and therefore $f(x) := \lim_{n \to \infty} f_n(x) \geq \varepsilon$ showing $f$ is not zero. Therefore, $I$ is a Daniell integral and there exists a unique measure $\mu$ on $(X, \sigma(S) = \mathcal{M})$ such that
\[
I(f) = \int_X f d\mu \text{ for all } f \in S.
\]
Taking $f = 1_A \circ \pi_A$ in this equation implies
\[
\mu_A(A) = I(f) = \mu \circ \pi_A^{-1}(A)
\]
and the result is proved.
Since $g = g_1 + g_2$ with $S^+ \ni g_i \leq f_i$, 
\[ I(g) = I(g_1) + I(g_2) \leq I_+(f_1) + I_+(f_2) \]
and since $S^+ \ni g \leq f_1 + f_2$ was arbitrary, we may conclude 
\[ I_+(f_1 + f_2) \leq I_+(f_1) + I_+(f_2). \tag{49.37} \]
Combining Eqs. (49.36) and (49.37) shows that 
\[ I_+(f_1 + f_2) = I_+(f_1) + I_+(f_2) \text{ for all } f_i \in S^+. \tag{49.38} \]
We now extend $I_+$ to $S$ by defining, for $f \in S$,
\[ I_+(f) = I_+(f_+) - I_+(f_-) \]
where $f_+ = f \lor 0$ and $f_- = -(f \land 0) = (-f) \lor 0$. (Notice that $f = f_+ - f_-$.)
We will now show that $I_+$ is linear. If $c \geq 0$, we may use $(cf)_\pm = cf_\pm$ to conclude that 
\[ I_+(cf) = I_+(cf_+) - I_+(cf_-) = cI_+(f_+) - cI_+(f_-) = cI_+(f). \]
Similarly, using $(-f)_\pm = f_\pm$ it follows that $I_+(-f) = I_+(f_-) - I_+(f_+) = -I_+(f)$. Therefore we have shown 
\[ I_+(cf) = cI_+(f) \text{ for all } c \in \mathbb{R} \text{ and } f \in S. \]
If $f = u - v$ with $u, v \in S^+$ then 
\[ v + f_+ = u + f_- \in S^+ \]
and so by Eq. (49.38), $I_+(v) + I_+(f_+) = I_+(u) + I_+(f_-)$ or equivalently 
\[ I_+(f) = I_+(f_+) - I_+(f_-) = I_+(u) - I_+(v). \tag{49.39} \]
Now if $f, g \in S$, then 
\[ I_+(f + g) = I_+(f_+ + g_+ - (f_- + g_-)) = I_+(f_+ + g_+) - I_+(f_- + g_-) = I_+(f_+) + I_+(g_+) - I_+(f_-) - I_+(g_-) = I_+(f) + I_+(g) \]
wherein the second equality we used Eq. (49.39). The last two paragraphs show $I_+: S \rightarrow \mathbb{R}$ is linear. Moreover, 
\[ ||I_+(f)|| = ||I_+(f_+) - I_+(f_-)|| \leq \max(||I_+(f_+)||, ||I_+(f_-)||) \leq ||I|| \max(||f_+||, ||f_-||) = ||I|| ||f|| \]
which shows that $||I_+|| \leq ||I||$. That is $I_+$ is a bounded positive linear functional on $S$. Let $I_- = I_+ - I \in S^*$. Then by definition of $I_+(f), I_-(f) = I_+(f) - I(f) \geq 0$ for all $S \ni f \geq 0$. Therefore $I = I_+ - I_-$ with $I_\pm$ being positive linear functionals on $S$. 

Corollary 49.70. Suppose $X$ is a second countable locally compact Hausdorff space and $I \in C_0(X, \mathbb{R})^*$, then there exists $\mu = \mu_+ - \mu_-$ where $\mu$ is a finite signed measure on $\mathcal{B}_X$ such that $I(f) = \int_X f \, d\mu$ for all $f \in C_0(X, \mathbb{R})$. Similarly if $I \in C_0(X, \mathbb{C})^*$ there exists a complex measure $\mu$ such that $I(f) = \int_X f \, d\mu$ for all $f \in C_0(X, \mathbb{C})$. 

Proof. Let $I = I_+ - I_-$ be the decomposition given as above. Then we know there exists finite measure $\mu_\pm$ such that 
\[ I_\pm(f) = \int_X f \, d\mu_\pm \text{ for all } f \in C_0(X, \mathbb{R}). \]
and therefore $I(f) = \int_X f \, d\mu$ for all $f \in C_0(X, \mathbb{R})$ where $\mu = \mu_+ - \mu_-$. Moreover the measure $\mu$ is unique. Indeed if $I(f) = \int_X f \, d\mu$ for some finite signed measure $\mu$, then the next result shows that $I_\pm(f) = \int_X f \, d\mu_\pm$ where $\mu_\pm$ is the Hahn decomposition of $\mu$. Now the measures $\mu_\pm$ are uniquely determined by $I_\pm$. The complex case is a consequence of applying the real case just proved to $\text{Re} \, I$ and $\text{Im} \, I$. 

Proposition 49.71. Suppose that $\mu$ is a signed Radon measure and $I = I_\mu$. Let $\mu_+ \text{ and } \mu_-$ be the Radon measures associated to $I_\pm$, then $\mu = \mu_+ - \mu_-$ is the Jordan decomposition of $\mu$. 

Proof. Let $X = P \cup P^c$ where $P$ is a positive set for $\mu$ and $P^c$ is a negative set. Then for $A \in \mathcal{B}_X$,
\[ \mu(P \cap A) = \mu_+(P \cap A) - \mu_-(P \cap A) \leq \mu_+(P \cap A) \leq \mu_+(A). \tag{49.40} \]
To finish the proof we need only prove the reverse inequality. To this end let $\varepsilon > 0$ and choose $K \subseteq P \cap A \subset U \subseteq X$ such that $|\mu|(U \setminus K) < \varepsilon$. Let $f, g \in C_c(U, [0, 1])$ with $f \leq g$, then 
\[ I(f) = \mu(f) = \mu(f : K) + \mu(f : U \setminus K) \leq \mu(g : K) + O(\varepsilon) \leq \mu(K) + O(\varepsilon) \leq \mu(P \cap A) + O(\varepsilon). \]
Taking the supremum over all such $f \leq g$, we learn that $I_\mu(g) \leq \mu(P \cap A) + O(\varepsilon)$ and then taking the supreme over all such $g$ shows that 
\[ \mu_+(U) \leq \mu(P \cap A) + O(\varepsilon). \]
Taking the infimum over all $U \subset X$ such that $P \cap A \subset U$ shows that 
\[ \mu_+(P \cap A) \leq \mu(P \cap A) + O(\varepsilon). \tag{49.41} \]
From Eqs. (49.40) and (49.41) it follows that $\mu(P \cap A) = \mu_+(P \cap A)$. Since
\[ I_-(f) = \sup_{0 \leq g \leq f} I(g) - I(f) = \sup_{0 \leq g \leq f} I(g - f) = \sup_{0 \leq g \leq f} -I(f - g) = \sup_{0 \leq h \leq f} -I(h) \]

the same argument applied to \(-I\) shows that
\[ -\mu(P^c \cap A) = \mu_-(P^c \cap A). \]

Since
\[ \mu(A) = \mu(P \cap A) + \mu(P^c \cap A) = \mu_+(P \cap A) - \mu_-(P^c \cap A) \]
\[ \mu(A) = \mu_+(A) - \mu_-(A) \]

it follows that
\[ \mu_+(A \setminus P) = \mu_-(A \setminus P^c) = \mu_-(A \cap P). \]

Taking \(A = P\) then shows that \(\mu_-(P) = 0\) and taking \(A = P^c\) shows that \(\mu_+(P^c) = 0\) and hence
\[ \mu(P \cap A) = \mu_+(P \cap A) = \mu_+(A) \]
\[ -\mu(P^c \cap A) = \mu_-(P^c \cap A) = \mu_-(A) \]

as was to be proved. \[\blacksquare\]
Part XII

Calculus and Ordinary Differential Equations in Banach Spaces
The Riemann Integral

In this Chapter, the Riemann integral for Banach space valued functions is defined and developed. Our exposition will be brief, since the Lebesgue integral and the Bochner Lebesgue integral will subsume the content of this chapter. In Definition [17.54] below, we will give a general notion of a compact subset of a “topological” space. However, by Corollary [17.62] below, when we are working with subsets of $\mathbb{R}^d$ this definition is equivalent to the following definition.

**Definition 50.1.** A subset $A \subset \mathbb{R}^d$ is said to be **compact** if $A$ is closed and bounded.

**Theorem 50.2.** Suppose that $K \subset \mathbb{R}^d$ is a compact set and $f \in C(K, X)$. Then

1. Every sequence $\{u_n\}_{n=1}^{\infty} \subset K$ has a convergent subsequence.
2. The function $f$ is uniformly continuous on $K$, namely for every $\varepsilon > 0$ there exists a $\delta > 0$ only depending on $\varepsilon$ such that $\|f(u) - f(v)\| < \varepsilon$ whenever $u, v \in K$ and $|u - v| < \delta$ where $|\cdot|$ is the standard Euclidean norm on $\mathbb{R}^d$. 

**Proof.**

1. (This is a special case of Theorem [17.60] and Corollary [17.62] below.) Since $K$ is bounded, $K \subset [-R, R]^d$ for some sufficiently large $d$. Let $t_n$ be the first component of $u_n$ so that $t_n \in [-R, R]$ for all $n$. Let $J_1 = [0, R]$ if $t_n \in J_1$ for infinitely many $n$ otherwise let $J_1 = [-R, 0]$. Similarly split $J_1$ in half and let $J_2 \subset J_1$ be one of the halves such that $t_n \in J_2$ for infinitely many $n$. Continue this way inductively to find a nested sequence of intervals $J_1 \supset J_2 \supset J_3 \supset J_4 \supset \ldots$ such that the length of $J_k$ is $2^{-(k-1)}R$ and for each $k$, $t_n \in J_k$ for infinitely many $n$. We may now choose a subsequence, $\{n_k\}_{k=1}^{\infty}$ of $\{n\}_{n=1}^{\infty}$ such that $t_{n_k} = t_{n_k} \in J_k$ for all $k$. The sequence $\{n_k\}_{k=1}^{\infty}$ is Cauchy and hence convergent. Thus by replacing $\{u_n\}_{n=1}^{\infty}$ by a subsequence if necessary we may assume the first component of $\{u_n\}_{n=1}^{\infty}$ is convergent. Repeating this argument for the second, then the third and all the way through the $d$th – components of $\{u_n\}_{n=1}^{\infty}$, we may, by passing to further subsequences, assume all of the components of $u_n$ are convergent. But this implies $\lim u_n = u$ exists and since $K$ is closed, $u \in K$.

2. (This is a special case of Exercise [17.19] below.) If $f$ were not uniformly continuous on $K$, there would exist an $\varepsilon > 0$ and sequences $\{u_n\}_{n=1}^{\infty}$ and $\{v_n\}_{n=1}^{\infty}$ in $K$ such that

$$\|f(u_n) - f(v_n)\| \geq \varepsilon \text{ while } \lim_{n \to \infty} |u_n - v_n| = 0.$$

By passing to subsequences if necessary we may assume that $\lim_{n \to \infty} u_n$ and $\lim_{n \to \infty} v_n$ exists. Since $\lim_{n \to \infty} |u_n - v_n| = 0$, we must have

$$\lim_{n \to \infty} u_n = u = \lim_{n \to \infty} v_n$$

for some $u \in K$. Since $f$ is continuous, vector addition is continuous and the norm is continuous, we may now conclude that

$$\varepsilon \leq \lim_{n \to \infty} \|f(u_n) - f(v_n)\| = \|f(u) - f(v)\| = 0$$

which is a contradiction. $\blacksquare$

For the remainder of the chapter, let $[a, b]$ be a fixed compact interval and $X$ be a Banach space. The collection $\mathcal{S} = \mathcal{S}([a, b], X)$ of **step functions**, $f: [a, b] \to X$, consists of those functions $f$ which may be written in the form

$$f(t) = \sum_{i=1}^{n-1} x_i \chi_{(t_i, t_{i+1}]}(t),$$

(50.1)

where $\pi := \{a = t_0 < t_1 < \cdots < t_n = b\}$ is a partition of $[a, b]$ and $x_i \in X$. For $f$ as in Eq. (50.1), let

$$I(f) := \sum_{i=0}^{n-1} (t_{i+1} - t_i)x_i \in X.$$

(50.2)

**Exercise 50.1.** Show that $I(f)$ is well defined, independent of how $f$ is represented as a step function. (Hint: show that adding a point to a partition $\pi$ of $[a, b]$ does not change the right side of Eq. (50.2).) Also verify that $I: \mathcal{S} \to X$ is a linear operator.

**Notation 50.3** Let $\bar{\mathcal{S}}$ denote the closure of $\mathcal{S}$ inside the Banach space, $\ell^\infty([a, b], X)$ as defined in Remark [14.6].

The following simple “Bounded Linear Transformation” theorem will often be used in the sequel to define linear transformations.
Theorem 50.4 (B. L. T. Theorem). Suppose that \( Z \) is a normed space, \( X \) is a Banach space, and \( S \subset Z \) is a dense linear subspace of \( Z \). If \( T : S \to X \) is a bounded linear transformation (i.e. there exists \( C < \infty \) such that \( \|Tz\| \leq C \|z\| \) for all \( z \in S \), then \( T \) has a unique extension to an element \( \bar{T} \in L(Z,X) \) and this extension still satisfies
\[
\|Tz\| \leq C \|z\| \quad \text{for all} \quad z \in \bar{S}.
\]

Exercise 50.2. Prove Theorem 50.4

Proposition 50.5 (Riemann Integral). The linear function \( I : S \to X \) extends uniquely to a continuous linear operator \( \bar{I} \) from \( \bar{S} \) to \( X \) and this operator satisfies,
\[
\|\bar{I}(f)\| \leq (b-a) \|f\|_\infty \quad \text{for all} \quad f \in \bar{S}.
\]

Furthermore, \( C([a,b],X) \subset \bar{S} \subset \ell^\infty([a,b],X) \) and for \( f \in C([a,b],X) \), \( \bar{I}(f) \) may be computed as
\[
\bar{I}(f) = \lim_{|\pi| \to 0} \sum_{i=0}^{n-1} f(c^*_i)(t_{i+1} - t_i)
\]

where \( \pi := \{a = t_0 < t_1 < \cdots < t_n = b\} \) denotes a partition of \([a,b]\), \( |\pi| = \max \{|t_{i+1} - t_i| : i = 0, \ldots, n - 1\} \) is the mesh size of \( \pi \) and \( c^*_i \) may be chosen arbitrarily inside \([t_i, t_{i+1})\). See Figure 50.1.

Proof. Taking the norm of Eq. (50.2) and using the triangle inequality shows,
\[
\|I(f)\| \leq \sum_{i=0}^{n-1} (t_{i+1} - t_i) \|x_i\| \leq \sum_{i=0}^{n-1} (t_{i+1} - t_i) \|f\|_\infty \leq (b-a) \|f\|_\infty.
\]

The existence of \( \bar{I} \) satisfying Eq. (50.3) is a consequence of Theorem 50.4. Given \( f \in C([a,b],X) \), \( \pi := \{a = t_0 < t_1 < \cdots < t_n = b\} \) a partition of \([a,b]\), and \( c^*_i \in [t_i, t_{i+1}) \) for \( i = 0, 1, 2, \ldots, n-1 \), let \( f_\pi \in \bar{S} \) be defined by
\[
f_\pi(t) := f(c_0)\chi_{[t_0,t_1]}(t) + \sum_{i=1}^{n-1} f(c^*_i)\chi_{(t_i,t_{i+1})}(t).
\]

Then by the uniform continuity of \( f \) on \([a,b]\) (Theorem 50.2), \( \lim_{|\pi| \to 0} \|f - f_\pi\|_\infty = 0 \) and therefore \( f \in \bar{S} \). Moreover,
\[
I(f) = \lim_{|\pi| \to 0} I(f_\pi) = \lim_{|\pi| \to 0} \sum_{i=1}^{n-1} f(c^*_i)(t_{i+1} - t_i)
\]
which proves Eq. (50.4).

If \( f_n \in S \) and \( f \in \bar{S} \) such that \( \lim_{n \to \infty} \|f - f_n\|_\infty = 0 \), then for \( \alpha \leq \beta \leq b \), then \( 1_{(\alpha,\beta]}f_n \in S \) and \( \lim_{n \to \infty} \|1_{(\alpha,\beta]}f - 1_{(\alpha,\beta]}f_n\|_\infty = 0 \). This shows \( 1_{(\alpha,\beta]}f \in \bar{S} \) whenever \( f \in \bar{S} \).

Notation 50.6 For \( f \in \bar{S} \) and \( a \leq \alpha \leq \beta \leq b \) we will denote \( \overline{I}(1_{(\alpha,\beta]}f) \) by \( \int_\alpha^\beta f(t) \, dt \) or \( \int_{(\alpha,\beta]} f(t) \, dt \). Also following the usual convention, if \( a \leq \beta \leq \alpha \leq b \), we will let
\[
\int_\alpha^\beta f(t) \, dt = -\int_\beta^\alpha f(t) \, dt.
\]

The next Lemma, whose proof is left to the reader, contains some of the many familiar properties of the Riemann integral.

Lemma 50.7. For \( f \in \bar{S}([a,b],X) \) and \( \alpha, \beta, \gamma \in [a,b] \), the Riemann integral satisfies:

1. \( \left\| \int_\alpha^\beta f(t) \, dt \right\|_X \leq (\beta - \alpha) \sup \{ \|f(t)\| : \alpha \leq t \leq \beta \} \).
2. \( \int_\alpha^\beta f(t) \, dt = \int_\alpha^\gamma f(t) \, dt + \int_\gamma^\beta f(t) \, dt \).
3. The function \( G(t) := \int_\alpha^t f(\tau) \, d\tau \) is continuous on \([a,b]\).
4. If \( Y \) is another Banach space and \( T \in L(X,Y) \), then \( Tf \in \bar{S}([a,b],Y) \) and
\[
T \left( \int_\alpha^\beta f(t) \, dt \right) = \int_\alpha^\beta T f(t) \, dt.
\]
5. The function \( t \to \|f(t)\|_X \) is in \( \mathcal{S}([a, b], \mathbb{R}) \) and
\[
\left\| \int_a^b f(t) \, dt \right\|_X \leq \int_a^b \|f(t)\|_X \, dt.
\]

6. If \( f, g \in \mathcal{S}([a, b], \mathbb{R}) \) and \( f \leq g \), then
\[
\int_a^b f(t) \, dt \leq \int_a^b g(t) \, dt.
\]

**Exercise 50.3.** Prove Lemma 50.7.

**Remark 50.8 (BRUCE: todo?).** Perhaps the Riemann Stieljes integral, Lemma 43.28 should be done here. Maybe this should be done in the more general context of Banach valued functions in preparation of T. Lyon’s rough path analysis. The point would be to let \( X_t \) take values in a Banach space and assume that \( X_t \) had finite variation. Then define \( \mu_X(t) := \sup_\pi \sum_i \|X_{t \wedge t_i} - X_{t \wedge t_{i-1}}\| \). Then we could define
\[
\int_0^T Z_t dX_t := \lim_{|\pi| \to 0} \sum Z_{t_{i-1}} \left( X_{t \wedge t_i} - X_{t \wedge t_{i-1}} \right)
\]
for continuous operator valued paths, \( Z_t \). This integral would then satisfy the estimates,
\[
\left\| \int_0^T Z_t dX_t \right\| \leq \int_0^T \|Z_t\| d\mu_X(t) \leq \sup_{0 \leq t \leq T} \|Z_t\| \mu_X(T).
\]

## 50.1 The Fundamental Theorem of Calculus

Our next goal is to show that our Riemann integral interacts well with differentiation, namely the fundamental theorem of calculus holds. Before doing this we will need a couple of basic definitions and results of differential calculus, more details and the next few results below will be done in greater detail in Chapter 52.

**Definition 50.9.** Let \( (a, b) \subset \mathbb{R} \). A function \( f : (a, b) \to X \) is differentiable at \( t \in (a, b) \) iff
\[
L := \lim_{h \to 0} \left( h^{-1} [f(t + h) - f(t)] \right) = \lim_{h \to 0} \frac{f(t + h) - f(t)}{h}
\]
exists in \( X \). The limit \( L \), if it exists, will be denoted by \( f'(t) \) or \( \frac{df}{dt}(t) \). We also say that \( f \in C^1((a, b), X) \) if \( f \) is differentiable at all points \( t \in (a, b) \) and \( f \in C((a, b), X) \).

As for the case of real valued functions, the derivative operator \( \frac{d}{dt} \) is easily seen to be linear. The next two results have proofs very similar to their real valued function analogues.

**Lemma 50.10 (Product Rules).** Suppose that \( t \to U(t) \in L(X) \), \( t \to V(t) \in L(X) \) and \( t \to x(t) \in X \) are differentiable at \( t = t_0 \), then
1. \( \frac{d}{dt} |_{t_0} [U(t) x(t)] \in X \) exists and
\[
\frac{d}{dt} |_{t_0} [U(t) x(t)] = \left[ \dot{U}(t_0) x(t_0) + U(t_0) \dot{x}(t_0) \right]
\]
and
2. \( \frac{d}{dt} |_{t_0} [U(t) V(t)] \in L(X) \) exists and
\[
\frac{d}{dt} |_{t_0} [U(t) V(t)] = \left[ \dot{U}(t_0) V(t_0) + U(t_0) \dot{V}(t_0) \right].
\]
3. If \( U(t_0) \) is invertible, then \( t \to U(t)^{-1} \) is differentiable at \( t = t_0 \) and
\[
\frac{d}{dt} |_{t_0} U(t)^{-1} = -U(t_0)^{-1} U(t_0) U(t_0)^{-1}. \tag{50.6}
\]

**Proof.** The reader is asked to supply the proof of the first two items in Exercise 50.9. Before proving item 3., let us assume that \( U(t)^{-1} \) is differentiable, then using the product rule we would learn
\[
0 = \frac{d}{dt} |_{t_0} I = \frac{d}{dt} |_{t_0} [U(t)^{-1} U(t)] = \left[ \frac{d}{dt} |_{t_0} U(t)^{-1} \right] U(t_0) + U(t_0)^{-1} \dot{U}(t_0).
\]
Solving this equation for \( \frac{d}{dt} |_{t_0} U(t)^{-1} \) gives the formula in Eq. (50.6). The problem with this argument is that we have not yet shown \( t \to U(t)^{-1} \) is invertible at \( t_0 \). Here is the formal proof. Since \( U(t) \) is differentiable at \( t_0 \), \( U(t) \to U(t_0) \) as \( t \to t_0 \) and by Corollary 14.22 \( U(t_0 + h) \) is invertible for \( h \) near 0 and
\[
U(t_0 + h)^{-1} \to U(t_0)^{-1} \text{ as } h \to 0.
\]

Therefore, using Lemma 14.11 we may let \( h \to 0 \) in the identity,
\[
\frac{U(t_0 + h)^{-1} - U(t_0)^{-1}}{h} = \frac{U(t_0 + h) - U(t_0)}{h} U(t_0)^{-1},
\]
to learn
\[
\lim_{h \to 0} \frac{U(t_0 + h)^{-1} - U(t_0)^{-1}}{h} = -U(t_0)^{-1} \dot{U}(t_0) U(t_0)^{-1}.
\]
Suppose that $s \to x(s) \in X$ is differentiable at $s = s_0$ and $t \to T(t) \in \mathbb{R}$ is differentiable at $t = t_0$ and $T(t_0) = s_0$, then $t \to x(T(t))$ is differentiable at $t_0$ and
\[
\frac{d}{dt}|_{t_0} x(T(t)) = x'(T(t_0)) T'(t_0).
\]

The proof of the chain rule is essentially the same as the real valued function case, see Exercise 50.10.

Proposition 50.12. Suppose that $f : [a, b] \to X$ is a continuous function such that $f(t)$ exists and is equal to zero for $t \in (a, b)$. Then $f$ is constant.

Proof. Let $\varepsilon > 0$ and $\alpha \in (a, b)$ be given. (We will later let $\varepsilon \downarrow 0$.) By the definition of the derivative, for all $\tau \in (a, b)$ there exists $\delta_\tau > 0$ such that
\[
\|f(t) - f(\tau)\| = \|f(t) - f(\tau) - f'(\tau)(t - \tau)\| \leq \varepsilon |t - \tau| \quad \text{if } |t - \tau| < \delta_\tau.
\]

Let $A = \{t \in [a, b] : \|f(t) - f(\alpha)\| \leq \varepsilon(t - \alpha)\}$ (50.8) and $t_0$ be the least upper bound for $A$. We will now use a standard argument which is sometimes referred to as continuous induction to show $t_0 = b$. Eq. (50.7) with $\tau = \alpha$ shows $t_0 > \alpha$ and a simple continuity argument shows $t_0 \in A$, i.e.
\[
\|f(t_0) - f(\alpha)\| \leq \varepsilon(t_0 - \alpha). \tag{50.9}
\]

For the sake of contradiction, suppose that $t_0 < b$. By Eqs. (50.7) and (50.9),
\[
\|f(t) - f(\alpha)\| \leq \|f(t) - f(t_0)\| + \|f(t_0) - f(\alpha)\| \leq \varepsilon(t_0 - \alpha) + \varepsilon(t - t_0) = \varepsilon(t - \alpha)
\]
for $0 \leq t - t_0 < \delta_0$ which violates the definition of $t_0$ being an upper bound. Thus we have shown $b \in A$ and hence
\[
\|f(b) - f(\alpha)\| \leq \varepsilon(b - \alpha).
\]

Since $\varepsilon > 0$ was arbitrary we may let $\varepsilon \downarrow 0$ in the last equation to conclude $f(b) = f(\alpha)$. Since $\alpha \in (a, b)$ was arbitrary it follows that $f(b) = f(\alpha)$ for all $\alpha \in (a, b)$ and then by continuity for all $\alpha \in [a, b]$, i.e. $f$ is constant.

Remark 50.13. The usual real variable proof of Proposition 50.12 makes use of Rolle’s theorem which in turn uses the extreme value theorem. This latter theorem is not available to vector valued functions. However with the aid of the Hahn Banach Theorem 31.4 (or Corollary 31.5) below and Lemma 50.7 it is possible to reduce the proof of Proposition 50.12 and the proof of the Fundamental Theorem of Calculus 50.14 to the real valued case, see Exercise 31.3.

Theorem 50.14 (Fundamental Theorem of Calculus). Suppose that $f \in C([a, b], X)$, Then

1. $\frac{d}{dt} \int_a^t f(\tau) \, d\tau = f(t)$ for all $t \in (a, b)$.
2. Now assume that $F \in C([a, b], X)$, $F$ is continuously differentiable on $(a, b)$ (i.e. $F'(t)$ exists and is continuous for $t \in (a, b)$) and $F$ extends to a continuous function on $[a, b]$ which is still denoted by $F$. Then
\[
\int_a^b F'(t) \, dt = F(b) - F(a).
\]

Proof. Let $h > 0$ be a small number and consider
\[
\left\|\int_a^{t+h} f(\tau) \, d\tau - \int_a^t f(\tau) \, d\tau - f(t)h \right\| = \left\| \int_a^t (f(\tau) - f(t)) \, d\tau \right\|
\leq \int_a^{t+h} \|f(\tau) - f(t)\| \, d\tau \leq h\varepsilon(h),
\]
where $\varepsilon(h) := \max_{\tau \in [t, t+h]} \|f(\tau) - f(t)\|$. Combining this with a similar computation when $h < 0$ shows, for all $h \in \mathbb{R}$ sufficiently small, that
\[
\left\|\int_a^{t+h} f(\tau) \, d\tau - \int_a^t f(\tau) \, d\tau - f(t)h \right\| \leq |h|\varepsilon(h),
\]
where now $\varepsilon(h) := \max_{\tau \in [t-h, t+h]} \|f(\tau) - f(t)\|$. By continuity of $f$ at $t$, $\varepsilon(h) \to 0$ and hence $\frac{d}{dt} \int_a^t f(\tau) \, d\tau$ exists and is equal to $f(t)$. For the second item, set $G(t) := \int_a^t F'(\tau) \, d\tau - F(t)$. Then $G$ is continuous by Lemma 50.7 and $G(t) = 0$ for all $t \in (a, b)$ by item 1. An application of Proposition 50.12 shows $G$ is a constant and in particular $G(b) = G(a)$, i.e. $\int_a^b F'(\tau) \, d\tau = F(b) - F(a)$.

Corollary 50.15 (Mean Value Inequality). Suppose that $f : [a, b] \to X$ is a continuous function such that $f(t)$ exists for $t \in (a, b)$ and $f$ extends to a continuous function on $[a, b]$. Then
\[
\|f(b) - f(a)\| \leq \int_a^b \|f'(t)\| \, dt \leq (b-a) \cdot \|f\|_{\infty} \tag{50.10}
\]

Proof. By the fundamental theorem of calculus, $f(b) - f(a) = \int_a^b f'(t) \, dt$ and then by Lemma 50.7
\[
\|f(b) - f(a)\| = \left\| \int_a^b f'(t) \, dt \right\| \leq \int_a^b \|f'(t)\| \, dt \leq \int_a^b \|f(t)\| \, dt \leq \int_a^b \|f\|_{\infty} \, dt \leq (b-a) \cdot \|f\|_{\infty}.
\]
Corollary 50.16 (Change of Variable Formula). Suppose that \( f \in C([a,b],X) \) and \( T : [c,d] \to (a,b) \) is a continuous function such that \( T(s) \) is continuously differentiable for \( s \in (c,d) \) and \( T'(s) \) extends to a continuous function on \([c,d] \). Then

\[
\int_c^d f(T(s)) T'(s) \, ds = \int_{T(c)}^{T(d)} f(t) \, dt.
\]

Proof. For \( t \in (a,b) \) define \( F(t) := \int_{T(c)}^t f(\tau) \, d\tau \). Then \( F \in C^1((a,b),X) \)

and by the fundamental theorem of calculus and the chain rule,

\[
\frac{d}{ds} F(T(s)) = F'(T(s)) T'(s) = f(T(s)) T'(s).
\]

Integrating this equation on \( s \in [c,d] \) and using the chain rule again gives

\[
\int_c^d f(T(s)) T'(s) \, ds = F(T(d)) - F(T(c)) = \int_{T(c)}^{T(d)} f(t) \, dt.
\]

\[\blacksquare\]

50.2 Integral Operators as Examples of Bounded Operators

In the examples to follow, all integrals are the standard Riemann integrals and we will make use of the following notation.

Notation 50.17 Given an open set \( U \subset \mathbb{R}^d \), let \( C_c(U) \) denote the collection of real valued continuous functions \( f \) on \( U \) such that

\[
\text{supp}(f) := \{ x \in U : f(x) \neq 0 \}
\]

is a compact subset of \( U \).

Example 50.18. Suppose that \( K : [0,1] \times [0,1] \to \mathbb{C} \) is a continuous function. For \( f \in C([0,1]) \), let

\[
Tf(x) = \int_0^1 K(x,y) f(y) \, dy.
\]

Since

\[
|Tf(x) - Tf(z)| \leq \int_0^1 |K(x,y) - K(z,y)||f(y)| \, dy
\]

\[
\leq \|f\|_\infty \max_y |K(x,y) - K(z,y)|
\]

(50.11)

and the latter expression tends to 0 as \( x \to z \) by uniform continuity of \( K \). Therefore \( Tf \in C([0,1]) \) and by the linearity of the Riemann integral, \( T : C([0,1]) \to C([0,1]) \) is a linear map. Moreover,

\[
|Tf(x)| \leq \int_0^1 |K(x,y)||f(y)| \, dy \leq \int_0^1 |K(x,y)| \, dy \cdot \|f\|_\infty \leq A \|f\|_\infty
\]

where

\[
A := \sup_{x \in [0,1]} \int_0^1 |K(x,y)| \, dy < \infty.
\]

(50.12)

This shows \( |T| \leq A < \infty \) and therefore \( T \) is bounded. We may in fact show \( \|T\| = A \). To do this let \( x_0 \in [0,1] \) be such that

\[
\sup_{x \in [0,1]} \int_0^1 |K(x,y)| \, dy = \int_0^1 |K(x_0,y)| \, dy.
\]

Such an \( x_0 \) can be found since, using a similar argument to that in Eq. (50.11),

\[
x \to \int_0^1 |K(x,y)| \, dy
\]

is continuous. Given \( \varepsilon > 0 \), let

\[
f_\varepsilon(y) := \frac{K(x_0,y)}{\sqrt{\varepsilon + |K(x_0,y)|}}
\]

and notice that \( \lim_{\varepsilon \to 0} \|f_\varepsilon\|_\infty = 1 \) and

\[
\|Tf_\varepsilon\|_\infty \geq \|Tf_\varepsilon(x_0)\| = Tf_\varepsilon(x_0) = \int_0^1 \frac{|K(x_0,y)|^2}{\sqrt{\varepsilon + |K(x_0,y)|^2}} \, dy.
\]

Therefore,

\[
\|T\| \geq \lim_{\varepsilon \to 0} \frac{1}{\|f_\varepsilon\|_\infty} \int_0^1 \frac{|K(x_0,y)|^2}{\sqrt{\varepsilon + |K(x_0,y)|^2}} \, dy
\]

\[
= \lim_{\varepsilon \to 0} \int_0^1 \frac{|K(x_0,y)|^2}{\sqrt{\varepsilon + |K(x_0,y)|^2}} \, dy = A
\]

since

\[
0 \leq |K(x_0,y)| - \frac{|K(x_0,y)|^2}{\sqrt{\varepsilon + |K(x_0,y)|^2}}
\]

\[
= \frac{|K(x_0,y)|}{\sqrt{\varepsilon + |K(x_0,y)|^2}} \left[ \sqrt{\varepsilon + |K(x_0,y)|^2} - |K(x_0,y)| \right]
\]

\[
\leq \sqrt{\varepsilon + |K(x_0,y)|^2} - |K(x_0,y)|
\]
and the latter expression tends to zero uniformly in \( y \) as \( \varepsilon \downarrow 0 \).

We may also consider other norms on \( C([0,1]) \). Let (for now) \( L^1([0,1]) \) denote \( C([0,1]) \) with the norm
\[
\|f\|_1 = \int_0^1 |f(x)| \, dx,
\]
then \( T : L^1([0,1], dm) \to C([0,1]) \) is bounded as well. Indeed, let \( M = \sup \{|K(x,y) : x, y \in [0,1]\} \), then
\[
|(Tf)(x)| \leq \int_0^1 |K(x,y)f(y)| \, dy \leq M \|f\|_1
\]
which shows \( \|Tf\|_\infty \leq M \|f\|_1 \) and hence,
\[
\|T\|_{L^1 \to C} \leq \max \{|K(x,y) : x, y \in [0,1]\} < \infty.
\]
We can in fact show that \( \|T\| = M \) as follows. Let \((x_0, y_0) \in [0,1]^2\) satisfying \( |K(x_0,y_0)| = M \). Then given \( \varepsilon > 0 \), there exists a neighborhood \( U = I \times J \) of \((x_0,y_0)\) such that \( |K(x,y) - K(x_0,y_0)| < \varepsilon \) for all \((x,y) \in U\). Let \( f \in C_c(I, [0,\infty)) \) such that \( \int_0^1 f(x) \, dx = 1 \). Choose \( \alpha \in \mathbb{C} \) such that \( |\alpha| = 1 \) and \( \alpha K(x_0,y_0) = M \), then
\[
|(T\alpha f)(x_0)| = \left| \int_0^1 K(x_0,y)\alpha f(y) \, dy \right| = \left| \int_I K(x_0,y)\alpha f(y) \, dy \right|
\]
\[
\geq \Re \int_I \alpha K(x_0,y) f(y) \, dy
\]
\[
\geq \int_I (M - \varepsilon) f(y) \, dy = (M - \varepsilon) \|f\|_{L^1}
\]
and hence
\[
\|T\alpha f\|_C \geq (M - \varepsilon) \|\alpha f\|_{L^1}
\]
showing that \( \|T\| \geq M - \varepsilon \). Since \( \varepsilon > 0 \) is arbitrary, we learn that \( \|T\| \geq M \) and hence \( \|T\| = M \).

One may also view \( T \) as a map from \( T : C([0,1]) \to L^1([0,1]) \) in which case one may show
\[
\|T\|_{L^1 \to C} \leq \int_0^1 \max_y |K(x,y)| \, dx < \infty.
\]

### 50.3 Linear Ordinary Differential Equations

Let \( X \) be a Banach space, \( J = (a,b) \subset \mathbb{R} \) be an open interval with \( 0 \in J \), \( h \in C(J,X) \) and \( A \in C(J,L(X)) \). In this section we are going to consider the ordinary differential equation,
\[
y'(t) = A(t)y(t) + h(t) \quad \text{and} \quad y(0) = x \in X,
\]
where \( y \) is an unknown function in \( C^1(J,X) \). This equation may be written in its equivalent (as the reader should verify) integral form, namely we are looking for \( y \in C(J,X) \) such that
\[
y(t) = x + \int_0^t h(\tau) \, d\tau + \int_0^t A(\tau)y(\tau) \, d\tau.
\]
In what follows, we will abuse notation and use \( \|\cdot\| \) to denote the operator norm on \( L(X) \) associated to the norm, \( \|\cdot\| \), on \( X \) and let \( \|\varphi\|_\infty := \max_{t \in J} \|\varphi(t)\| \) for \( \varphi \in BC(J,X) \) or \( BC(J,L(X)) \).

**Notation 50.19** For \( t \in \mathbb{R} \) and \( n \in \mathbb{N} \), let
\[
\Delta_n(t) = \begin{cases}
\{ (\tau_1, \ldots, \tau_n) : 0 \leq \tau_1 \leq \cdots \leq \tau_n \leq t \} & \text{if } t \geq 0 \\
\{ (\tau_1, \ldots, \tau_n) : t \leq \tau_n \leq \cdots \leq \tau_1 \leq t \} & \text{if } t \leq 0
\end{cases}
\]
and also write \( d\tau = d\tau_1 \ldots d\tau_n \) and
\[
\int_{\Delta_n(t)} \psi(\tau_1, \ldots, \tau_n) \, d\tau := (-1)^{n-1} \, \int_0^t \, \int_0^{\tau_n} \, \int_0^{\tau_{n-1}} \cdots \int_0^{\tau_2} \, \int_0^{\tau_1} \psi(\tau_1, \ldots, \tau_n) \, d\tau_1 \ldots d\tau_n
\]
where
\[
1_{t<0} = \begin{cases}
1 & \text{if } t < 0 \\
0 & \text{if } t \geq 0
\end{cases}
\]

**Lemma 50.20.** Suppose that \( \psi \in C(\mathbb{R}, \mathbb{R}) \), then
\[
(-1)^{n-1} \int_{\Delta_n(t)} \psi(\tau_1) \ldots \psi(\tau_n) \, d\tau = \frac{1}{n!} \left( \int_0^t \psi(\tau) \, d\tau \right)^n.
\]

**Proof.** Let \( \Psi(t) := \int_0^t \psi(\tau) \, d\tau \). The proof will go by induction on \( n \). The case \( n = 1 \) is easily verified since
\[
(-1)^{1-1} \int_{\Delta_1(t)} \psi(\tau_1) \, d\tau_1 = \int_0^t \psi(\tau) \, d\tau = \Psi(t).
\]
Now assume the truth of Eq. (50.15) for \( n - 1 \) for some \( n \geq 2 \), then
\[
(-1)^{n-1} \int_{\Delta_n(t)} \psi(\tau_1) \ldots \psi(\tau_n) \, d\tau
\]
\[
= \int_0^t \, \int_0^{\tau_n} \, \int_0^{\tau_{n-1}} \cdots \int_0^{\tau_2} \, \int_0^{\tau_1} \psi(\tau_1) \ldots \psi(\tau_n) \, d\tau_1 \ldots d\tau_n
\]
\[
= \int_0^t \psi^{n-1}(\tau_n) \psi(\tau_n) \, d\tau_n = \int_0^t \psi^{n-1}(\tau_n) \Psi(\tau_n) \, d\tau_n
\]
\[
= \int_0^t \Psi(\tau) \frac{(n-2)!}{(n-1)!} \, d\tau = \Psi(t) \frac{n-1}{n!}.
\]
wherein we made the change of variables, \( u = \Psi(\tau_n) \), in the second to last equality.

**Remark 50.21.** Eq. \([50.15]\) is equivalent to
\[
\int_{\Delta_n(t)} \psi(\tau_1) \cdots \psi(\tau_n) d\tau = \frac{1}{n!} \left( \int_{\Delta_1(t)} \psi(\tau) d\tau \right)^n
\]
and another way to understand this equality is to view \( \int_{\Delta_n(t)} \psi(\tau_1) \cdots \psi(\tau_n) d\tau \) as a multiple integral (see Chapter 47 below) rather than an iterated integral. Indeed, taking \( t > 0 \) for simplicity and letting \( S_n \) be the permutation group on \( \{1, 2, \ldots, n\} \) we have
\[
[0, t]^n = \bigcup_{\sigma \in S_n} \{(\tau_1, \ldots, \tau_n) \in \mathbb{R}^n : 0 \leq \tau_{\sigma 1} \leq \cdots \leq \tau_{\sigma n} \leq t \}
\]
with the union being “essentially” disjoint. Therefore, making a change of variables and using the fact that \( \psi(\tau_1) \cdots \psi(\tau_n) \) is invariant under permutations, we find
\[
\left( \int_0^t \psi(\tau) d\tau \right)^n = \int_{[0, t]^n} \psi(\tau_1) \cdots \psi(\tau_n) d\tau
\]
\[
= \sum_{\sigma \in S_n} \int_{\{(\tau_1, \ldots, \tau_n) \in \mathbb{R}^n : 0 \leq \tau_{\sigma 1} \leq \cdots \leq \tau_{\sigma n} \leq t \}} \psi(\tau_1) \cdots \psi(\tau_n) d\tau
\]
\[
= \sum_{\sigma \in S_n} \int_{\{(s_1, \ldots, s_n) : 0 \leq s_1 \leq \cdots \leq s_n \leq t \}} \psi(\tau_1) \cdots \psi(\tau_n) d\tau
\]
\[
= \sum_{\sigma \in S_n} \int_{\{(s_1, \ldots, s_n) : 0 \leq s_1 \leq \cdots \leq s_n \leq t \}} \psi(s_1) \cdots \psi(s_n) d\tau
\]
\[
= n! \int_{\Delta_n(t)} \psi(\tau_1) \cdots \psi(\tau_n) d\tau.
\]

**Theorem 50.22.** Let \( \varphi \in BC(J, X) \), then the integral equation
\[
y(t) = \varphi(t) + \int_0^t A(\tau)y(\tau) d\tau \tag{50.16}
\]
has a unique solution given by
\[
y(t) = \varphi(t) + \sum_{n=1}^\infty (-1)^{n+1} e \int_{\Delta_n(t)} A(\tau_1) \cdots A(\tau_n) \varphi(\tau_1) \cdots \varphi(\tau_n) d\tau \tag{50.17}
\]
and this solution satisfies the bound
\[
\|y\| \leq \|\varphi\| e \int_J \|A(\tau)\| d\tau.
\]

**Proof.** Define \( A : BC(J, X) \to BC(J, X) \) by
\[
(Ay)(t) = \int_0^t A(\tau)y(\tau) d\tau.
\]
Then \( y \) solves Eq. \([50.14]\) if \( y = \varphi + Ay \) or equivalently iff \( (I - A)y = \varphi \). An induction argument shows
\[
(A^n \varphi)(t) = \int_0^t d\tau_n A(\tau_n)(A^{n-1} \varphi)(\tau_n)
\]
\[
= \int_0^t d\tau_n \int_0^{\tau_n} d\tau_{n-1} A(\tau_n)A(\tau_{n-1})(A^{n-2} \varphi)(\tau_{n-1})
\]
\[\vdots\]
\[
= \int_0^t d\tau_n \int_0^{\tau_n} \cdots \int_0^{\tau_2} d\tau_1 A(\tau_n) \cdots A(\tau_1) \varphi(\tau_1)
\]
\[= (-1)^{n+1} e \int_{\Delta_n(t)} A(\tau_n) \cdots A(\tau_1) \varphi(\tau_1) d\tau.
\]
Taking norms of this equation and using the triangle inequality along with Lemma \([50.20]\) gives,
\[
\|A^n \varphi\| \leq \|\varphi\| \cdot \int_{\Delta_n(t)} \|A(\tau_1)\| \cdots \|A(\tau_n)\| d\tau
\]
\[
\leq \|\varphi\| \cdot \frac{1}{n!} \left( \int_{\Delta_1(t)} \|A(\tau)\| d\tau \right)^n
\]
\[
\leq \|\varphi\| \cdot \frac{1}{n!} \left( \int_J \|A(\tau)\| d\tau \right)^n.
\]
Therefore,
\[
\|A^n\|_{op} \leq \frac{1}{n!} \left( \int_J \|A(\tau)\| d\tau \right)^n, \tag{50.18}
\]
and
\[
\sum_{n=0}^\infty \|A^n\|_{op} \leq e \int_J \|A(\tau)\| d\tau < \infty
\]
where \( \|\cdot\|_{op} \) denotes the operator norm on \( L(BC(J, X)) \). An application of Proposition \([14.21]\) now shows \( (I - A)^{-1} = \sum_{n=0}^\infty A^n \) exists and
\[
\|(I - A)^{-1}\|_{op} \leq e \int_J \|A(\tau)\| d\tau.
\]
It is now only a matter of working through the notation to see that these assertions prove the theorem.
Corollary 50.23. Suppose \( h \in C(J, X) \) and \( x \in X \), then there exists a unique solution, \( y \in C^1(J, X) \), to the linear ordinary differential Eq. \((50.13)\).

**Proof.** Let
\[
\varphi(t) = x + \int_0^t h(\tau) \, d\tau.
\]
By applying Theorem 50.22 with \( J \) replaced by any open interval \( J_0 \) such that \( 0 \in J_0 \) and \( J_0 \) is a compact subinterval \(^1\) of \( J \), there exists a unique solution \( y_{J_0} \) to Eq. \((50.13)\) which is valid for \( t \in J_0 \). By uniqueness of solutions, if \( J_1 \) is a subinterval of \( J \) such that \( J_0 \subset J_1 \) and \( \bar{J}_1 \) is a compact subinterval of \( J \), we have \( y_{J_0} = y_{J_0} \) on \( J_0 \). Because of this observation, we may construct a solution \( y \) to Eq. \((50.13)\) which is defined on the full interval \( J \) by setting \( y(t) = y_{J_0}(t) \) for any \( J_0 \) as above which also contains \( t \in J \).

Corollary 50.24. Suppose that \( A \in L(X) \) is independent of time, then the solution to
\[
y(t) = Ay(t) \quad \text{with} \quad y(0) = x
\]
is given by \( y(t) = e^{tA}x \) where
\[
e^{tA} = \sum_{n=0}^{\infty} \frac{t^n}{n!} A^n.
\]
Moreover,
\[
e^{(t+s)A} = e^{tA} e^{sA} \quad \text{for all} \quad s, t \in \mathbb{R}.
\]

**Proof.** The first assertion is a simple consequence of Eq. \((50.17)\) and Lemma 50.20 with \( \psi = 1 \). The assertion in Eq. \((50.20)\) may be proved by explicit computation but the following proof is more instructive. Given \( x \in X \), let \( y(t) := e^{(t+s)A}x \). By the chain rule,
\[
\frac{d}{dt} y(t) = \frac{d}{d\tau}|_{\tau=t+s} e^{\tau A} x = A e^{\tau A} x|_{\tau=t+s} = A e^{(t+s)A} x = Ay(t) \quad \text{with} \quad y(0) = e^{sA}x.
\]
The unique solution to this equation is given by
\[
y(t) = e^{tA}x(0) = e^{tA} e^{sA} x.
\]
This completes the proof since, by definition, \( y(t) = e^{(t+s)A}x \).

We also have the following converse to this corollary whose proof is outlined in Exercise 50.20 below.

Theorem 50.25. Suppose that \( T_t \in L(X) \) for \( t \geq 0 \) satisfies

1. (Semi-group property.) \( T_0 = I \) and \( T_t T_s = T_{t+s} \) for all \( s, t \geq 0 \).
2. (Norm Continuity) \( t \to T_t \) is continuous at 0, i.e. \( \|T_t - I\|_{L(X)} \to 0 \) as \( t \downarrow 0 \).

Then there exists \( A \in L(X) \) such that \( T_t = e^{tA} \) where \( e^{tA} \) is defined in Eq. \((50.19)\).

50.3.1 Logarithm’s without power series

BRUCE: this needs a little editing and suplementations. Our goal here is to find invert the function \( A \to e^{tA} \) for \( A \) near zero. One way to do this is through the use of power series arguments. I would like to avoid those here. We begin with the real variable fact that
\[
\ln(1 + x) = \int_0^1 \frac{d}{ds} \ln(1 + sx) \, ds = \int_0^1 x (1 + sx)^{-1} \, ds.
\]
\(\mathrm{Hence}, \) provided \( 1 + sA \) is invertible for \( 0 \leq s \leq 1 \) we define
\[
\ln(1 + A) = \int_0^1 A (1 + sA)^{-1} \, ds.
\]
One way to satsify this invertiblity requirement is to assume that \( A \) is nilpotent and another is to assume that \( \sum_{n=0}^{\infty} \|A^n\| < \infty \) (for example assume that \( \|A\| < 1 \)). In either of these cases,
\[
(1 + sA)^{-1} = \sum_{n=0}^{\infty} (-s)^n A^n.
\]
(We may also suppose that \( A^* = A \) and \( A \geq 0 \).) Differentiating Eq. \((50.21)\) shows
\[
\partial_B \ln(1 + A) = \int_0^1 \left[ B (1 + sA)^{-1} - A (1 + sA)^{-1} sB (1 + sA)^{-1} \right] ds
\]
\[
= \int_0^1 \left[ B - sA (1 + sA)^{-1} B \right] (1 + sA)^{-1} \, ds.
\]
Combining this last equality with
\[
sA (1 + sA)^{-1} = (1 + sA - 1) (1 + sA)^{-1} = 1 - (1 + sA)^{-1}
\]
shows,
\[
\partial_B \ln(1 + A) = \int_0^1 (1 + sA)^{-1} B (1 + sA)^{-1} \, ds.
\]
Alternatively put if \( g(t) = 1 + A(t) \), then
\[
\frac{d}{dt} \ln(g(t)) = \int_0^1 (1 + sA(t))^{-1} \dot{A}(t) (1 + sA(t))^{-1} \, ds \\
= \int_0^1 (1 + s(g(t) - 1))^{-1} \dot{g}(t) (1 + s(g(t) - 1))^{-1} \, ds \\
= \int_0^1 (1 - s + sg(t))^{-1} \dot{g}(t) (1 - s + sg(t))^{-1} \, ds.
\]

If \([A, B] = 0\) this Eq. (50.22) reduces to
\[
\partial_B \ln(1 + A) = B \int_0^1 (1 + sA)^{-2} \, ds.
\]

Working informally for the moment,
\[
\int_0^t (1 + sA)^{-2} \, ds = -\frac{1}{A} (1 + sA)^{-1} \bigg|_0^t = \frac{1 - (1 + tA)^{-1}}{A} \\
= \frac{(1 + tA) - 1}{A(1 + tA)} = t(1 + tA)^{-1}.
\]

This last expression is in fact correct since
\[
\frac{d}{dt} \left[ t(1 + tA)^{-1} \right] = (1 + tA)^{-1} - At(1 + tA)^{-2} \\
= (1 + tA)^{-1} (1 - At) (1 + tA)^{-1} = (1 + tA)^{-1}.
\]

Hence if \([A, B] = 0\), then
\[
\partial_B \ln(1 + A) = B (1 + A)^{-1}.
\]

So for \( 1 + A(t) = e^{tC} \) we have
\[
\frac{d}{dt} \ln \left( e^{tC} \right) = \dot{A}(t) (1 + A(t))^{-1} = Ce^{tC} e^{-tC} = C
\]
from which we conclude directly that \( \ln \left( e^{tC} \right) = \ln(I) + tC = tC \) showing \( \ln(e^{tC}) = C \). Moreover, if we now consider \( C(t) = \ln(I + tA) \) we have
\[
\frac{d}{dt} e^{C(t)} = \dot{C}(t) e^{C(t)} = A(1 + tA)^{-1} e^{C(t)} \text{ with } e^{C(0)} = I.
\]

On the other hand \( g(t) := 1 + tA \) solves,
\[
\dot{g}(t) = A = A (1 + tA)^{-1} g(t) \text{ with } g(0) = I.
\]

Therefore it follows that \( e^{C(t)} = 1 + tA \) and we have shown
\[
e^{\ln(t+A)} = I + A.
\]

This has all been done with out the aid of power series.

50.4 Classical Weierstrass Approximation Theorem

Definition 50.26 (Support). Let \( f : X \rightarrow Z \) be a function from a metric space \((X, \rho)\) to a vector space \(Z\). The support of \( f \) is the closed subset, \( \text{supp}(f) \), of \( X \) defined by
\[
\text{supp}(f) := \{ x \in X : f(x) \neq 0 \}.
\]

Example 50.27. For example if \( f : \mathbb{R} \rightarrow \mathbb{R} \) is defined by \( f(x) = \sin(x)1_{[0,4\pi]}(x) \in \mathbb{R} \), then
\[
\{ f \neq 0 \} = (0, 4\pi) \setminus \{ \pi, 2\pi, 3\pi \}
\]
and therefore \( \text{supp}(f) = [0, 4\pi] \).

For the remainder of this section, \( Z \) will be used to denote a Banach space.

Definition 50.28 (Convolution). For \( f, g \in C(\mathbb{R}) \) with either \( f \) or \( g \) having compact support, we define the convolution of \( f \) and \( g \) by
\[
f * g(x) = \int_{\mathbb{R}} f(x-y) g(y) \, dy = \int_{\mathbb{R}} f(y) g(x-y) \, dy.
\]

We will also use this definition when one of the functions, either \( f \) or \( g \), takes values in a Banach space \( Z \).

Lemma 50.29 (Approximate \( \delta \)-sequences). Suppose that \( \{ q_n \}_{n=1}^{\infty} \) is a sequence non-negative continuous real valued functions on \( \mathbb{R} \) with compact support that satisfy
\[
\int_{\mathbb{R}} q_n(x) \, dx = 1 \quad \text{and} \quad \lim_{n \to \infty} \int_{|x| \geq \varepsilon} q_n(x) \, dx = 0 \text{ for all } \varepsilon > 0. \tag{50.23}
\]

If \( f \in BC(\mathbb{R}, Z) \), then
\[
q_n * f(x) := \int_{\mathbb{R}} q_n(y) f(x-y) \, dy
\]
converges to \( f \) uniformly on compact subsets of \( \mathbb{R} \).

Proof. Let \( x \in \mathbb{R} \), then because of Eq. (50.23),
\[
\| q_n * f(x) - f(x) \| = \left\| \int_{\mathbb{R}} q_n(y) (f(x-y) - f(x)) \, dy \right\| \\
\leq \int_{\mathbb{R}} q_n(y) \| f(x-y) - f(x) \| \, dy.
\]
Let \( M = \sup \{ \| f(x) \| : x \in \mathbb{R} \} \). Then for any \( \varepsilon > 0 \), using Eq. (50.23),
\[
\| q_n \ast f(x) - f(x) \| \leq \int_{|y| \leq \varepsilon} q_n(y) \| f(x - y) - f(x) \| dy \\
+ \int_{|y| > \varepsilon} q_n(y) \| f(x - y) - f(x) \| dy \\
\leq \sup_{|w| \leq \varepsilon} \| f(x + w) - f(x) \| + 2M \int_{|y| > \varepsilon} q_n(y)dy.
\]
So if \( K \) is a compact subset of \( \mathbb{R} \) (for example a large interval) we have
\[
\sup_{(x) \in K} \| q_n \ast f(x) - f(x) \| \\
\leq \sup_{|w| \leq \varepsilon, x \in K} \| f(x + w) - f(x) \| + 2M \int_{|y| > \varepsilon} q_n(y)dy
\]
and hence by Eq. (50.24),
\[
\limsup_{n \to \infty} \sup_{x \in K} \| q_n \ast f(x) - f(x) \| \\
\leq \sup_{|w| \leq \varepsilon, x \in K} \| f(x + w) - f(x) \|.
\]
This finishes the proof since the right member of this equation tends to 0 as \( \varepsilon \downarrow 0 \) by uniform continuity of \( f \) on compact subsets of \( \mathbb{R} \).

Let \( q_n : \mathbb{R} \to [0, \infty) \) be defined by
\[
q_n(x) := \frac{1}{c_n} (1 - x^2)^n 1_{|x| \leq 1} \text{ where } c_n := \int_{-1}^1 (1 - x^2)^n dx \quad (50.25)
\]
Figure 50.2 displays the key features of the functions \( q_n \).

**Lemma 50.30.** The sequence \( \{ q_n \}_{n=1}^\infty \) is an approximate \( \delta \) – sequence, i.e. they satisfy Eqs. (50.23) and (50.24).

**Proof.** By construction, \( q_n \in C_c(\mathbb{R}, [0, \infty)) \) for each \( n \) and Eq. (50.23) holds. Since
\[
\int_{|x| \geq \varepsilon} q_n(x) dx = \frac{2}{\varepsilon} \int_0^1 (1 - x^2)^n dx \\
\leq \frac{1}{\varepsilon} \int_0^1 (1 - x^2)^n dx = \frac{1}{\varepsilon} (1 - x^2 + 1)_{1}^0 \\
= \frac{1}{\varepsilon} \frac{1}{2} (1 - 2^n)_{1}^0 \\
\to 0 \text{ as } n \to \infty,
\]
the proof is complete. 

\[\text{Fig. 50.2. A plot of } q_1, q_{50}, \text{ and } q_{100}. \text{ The most peaked curve is } q_{100} \text{ and the least is } q_1. \text{ The total area under each of these curves is one.} \]

**Notation 50.31** Let \( \mathbb{Z}^d_+ := \mathbb{N} \cup \{ 0 \} \) and for \( x \in \mathbb{R}^d \) and \( \alpha \in \mathbb{Z}^d_+ \) let \( x^\alpha = \prod_{i=1}^d x_i^\alpha_i \) and \( |\alpha| = \sum_{i=1}^d \alpha_i \). A polynomial on \( \mathbb{R}^d \) with values in \( \mathbb{Z} \) is a function \( p : \mathbb{R}^d \to \mathbb{Z} \) of the form
\[
p(x) = \sum_{\alpha : |\alpha| \leq N} p_\alpha x^\alpha \text{ with } p_\alpha \in \mathbb{Z} \text{ and } N \in \mathbb{Z}^d_+.
\]
If \( p_\alpha \neq 0 \) for some \( \alpha \) such that \( |\alpha| = N \), then we define \( \deg(p) := N \) to be the degree of \( p \). If \( \mathbb{Z} \) is a complex Banach space, the function \( p \) has a natural extension to \( z \in \mathbb{C}^d \), namely \( p(z) = \sum_{\alpha : |\alpha| \leq N} p_\alpha z^\alpha \text{ where } z^\alpha = \prod_{i=1}^d z_i^\alpha_i \).

Given a compact subset \( K \subset \mathbb{R}^d \) and \( f \in C(\mathbb{R}^d, \mathbb{R}) \) we are going to show, in the Weierstrass approximation theorem 50.35 below, that \( f \) may be uniformly approximated by polynomial functions on \( K \). The next theorem addresses this question when \( K \) is a compact subinterval of \( \mathbb{R} \).

**Theorem 50.32 (Weierstrass Approximation Theorem).** Suppose \(-\infty < a < b < \infty, J = [a, b] \) and \( f \in C(J, \mathbb{R}) \). Then there exists polynomials \( p_n \) on \( \mathbb{R} \) such that \( p_n \to f \) uniformly on \( J \).

\[\text{Note that } f \text{ is automatically bounded because if not there would exist } u_n \in K \text{ such that } \lim_{n \to \infty} |f(u_n)| = \infty. \text{ Using Theorem 50.2 we may, by passing to a subsequence if necessary, assume } u_n \to u \in K \text{ as } n \to \infty. \text{ Now the continuity of } f \text{ would then imply}
\]
\[\lim_{n \to \infty} |f(u_n)| = |f(u)| \]
\[\text{which is absurd since } f \text{ takes values in } \mathbb{C} \].
Proof. By replacing \( f \) by \( F \) where

\[
F(t) := f(a + t(b - a)) - [f(a) + t(f(b) - f(a))] \quad \text{for} \quad t \in [0, 1],
\]
it suffices to assume \( a = 0, b = 1 \) and \( f(0) = f(1) = 0 \). Furthermore we may now extend \( f \) to a continuous function on all \( \mathbb{R} \) by setting \( f \equiv 0 \) on \( \mathbb{R} \setminus [0, 1] \).

With \( q_n \) defined as in Eq. (50.25), let \( f_n(x) := (q_n + f)(x) \) and recall from Lemma 50.29 that \( f_n(x) \to f(x) \) as \( n \to \infty \) with the convergence being uniform in \( x \in [0, 1] \). This completes the proof since \( f_n \) is equal to a polynomial function on \( [0, 1] \). Indeed, there are polynomials \( a_k(y) \), such that

\[
(1 - (x - y)^2)^n = \sum_{k=0}^{2n} a_k(y) x^k,
\]

and therefore, for \( x \in [0, 1] \),

\[
f_n(x) = \int_{K} q_n(x - y) f(y) \, dy = \int_{[0,1]} f(y) \left[(1 - (x - y)^2)^n 1_{[x-y] \leq 1}\right] \, dy
= \int_{[0,1]} f(y)(1 - (x - y)^2)^n \, dy
= \frac{1}{c_n} \int_{[0,1]} f(y) \sum_{k=0}^{2n} a_k(y) x^k \, dy = \frac{2n}{c_n} A_k x^k
\]

where

\[
A_k = \frac{1}{c_n} \int_{[0,1]} f(y) a_k(y) \, dy.
\]

Lemma 50.33. Suppose \( J = [a, b] \) is a compact subinterval of \( \mathbb{R} \) and \( K \) is a compact subset of \( \mathbb{R}^{d-1} \), then the linear mapping \( R : C(J \times K, Z) \to C(J, C(K, Z)) \) defined by \( (Rf)(t) = f(t, \cdot) \in C(K, Z) \) for \( t \in J \) is an isometric isomorphism of Banach spaces.

Proof. By uniform continuity of \( f \) on \( J \times K \) (see Theorem 50.2),

\[
||(Rf)(t) - (Rf)(s)||_{C(K, Z)} = \max_{y \in K} ||f(t, y) - f(s, y)||_Z \to 0 \quad \text{as} \quad s \to t
\]

which shows that \( Rf \) is indeed in \( C(J, C(K, Z)) \). Moreover,

\[
\|Rf\|_{C(J \to C(K, Z))} = \max_{t \in J} \| (Rf)(t) \|_{C(K, Z)} = \max_{t \in J} \max_{y \in K} ||f(t, y)||_Z = \|f\|_{C(J \times K, Z)},
\]

showing \( R \) is isometric and therefore injective.

To see that \( R \) is surjective, let \( F \in C(J, C(K, Z)) \) and define \( f(t, y) := F(t)(y) \). Since

\[
||f(t, y) - f(s, y')||_Z \leq ||f(t, y) - f(s, y)||_Z + ||f(s, y) - f(s, y')||_Z
\]

it follows by the continuity of \( t \to F(t) \) and \( y \to F(s)(y) \) that

\[
||f(t, y) - f(s, y')||_Z \to 0 \quad \text{as} \quad (t, y) \to (s, y').
\]

This shows \( f \in C(J \times K, Z) \) and thus completes the proof because \( Rf = F \) by construction.

Corollary 50.34 (Weierstrass Approximation Theorem). Let \( d \in \mathbb{N} \), \( J_i = [a_i, b_i] \) be compact subintervals of \( \mathbb{R} \) for \( i = 1, 2, \ldots, d \), \( J := J_1 \times \cdots \times J_d \) and \( f \in C(J, Z) \). Then there exists polynomials \( p_n \) on \( \mathbb{R}^d \) such that \( p_n \to f \) uniformly on \( J \).

Proof. The proof will be by induction on \( d \) with the case \( d = 1 \) being the content of Theorem 50.32. Now suppose that \( d > 1 \) and the theorem holds with \( d \) replaced by \( d - 1 \). Let \( K := J_2 \times \cdots \times J_d \), \( Z_0 = C(K, Z) \); \( R : C(J_1 \times K, Z) \to C(J_1, Z_0) \) be as in Lemma 50.33 and \( F := Rf \). By Theorem 50.32 for any \( \varepsilon > 0 \) there exists a polynomial function

\[
p(t) = \sum_{k=0}^{n} c_k t^k
\]

with \( c_k \in Z_0 = C(K, Z) \) such that \( ||F - p||_{C(J_1, Z_0)} < \varepsilon \). By the induction hypothesis, there exists polynomial functions \( q_k : K \to Z \) such that

\[
||c_k - q_k||_{Z_0} < \frac{\varepsilon}{n (|a| + |b|)^k}
\]

It is now easily verified (you check) that the polynomial function,

\[
\rho(x) := \sum_{k=0}^{n} x_1^k q_k(x_2, \ldots, x_d)
\]

satisfies \( ||f - \rho||_{C(J, Z)} < 2\varepsilon \) and this completes the induction argument and hence the proof.

The reader is referred to Chapter 47 for two more alternative proofs of this corollary.
Theorem 50.35 (Weierstrass Approximation Theorem). Suppose that $K \subset \mathbb{R}^d$ is a compact subset and $f \in C(K, \mathbb{C})$. Then there exists polynomials $p_n$ on $\mathbb{R}^d$ such that $p_n \to f$ uniformly on $K$.

**Proof.** Choose $\lambda > 0$ and $b \in \mathbb{R}^d$ such that

$$K_0 := \lambda K - b := \{\lambda x - b : x \in K\} \subset B_d$$

where $B_d := (0,1)^d$. The function $F(y) := f(\lambda^{-1}(y+b))$ for $y \in K_0$ is in $C(K_0, \mathbb{C})$ and if $\hat{p}_n(y)$ are polynomials on $\mathbb{R}^d$ such that $\hat{p}_n \to F$ uniformly on $K_0$ then $p_n(x) := \hat{p}_n(\lambda x - b)$ are polynomials on $\mathbb{R}^d$ such that $p_n \to f$ uniformly on $K$. Hence we may now assume that $K$ is a compact subset of $B_d$. Let $g \in C(K \cup B^c_d)$ be defined by

$$g(x) = \begin{cases} 0 & \text{if } x \in \mathbb{R}^d, \\ f(x) & \text{if } x \in K \end{cases}$$

and then use the Tietze extension Theorem 14.4 (applied to the real and uniformly on $K$.

Conversely a polynomial

**Example 50.38.** Let $S_1 = \{z \in \mathbb{C} : |z| = 1\}$ and $A$ be the set of polynomials in $(z, \bar{z})$ restricted to $S_1$. Then $A$ is dense in $C(S^1)$ since $\bar{z} = z^{-1}$ on $S^1$.

we have shown polynomials in $z$ and $z^{-1}$ are dense in $C(S^1)$. This example generalizes in an obvious way to $K = (S^1)^d \subset \mathbb{C}^d$.

**Exercise 50.4.** Suppose $-\infty < a < b < \infty$ and $f \in C([a, b], \mathbb{C})$ satisfies

$$\int_a^b f(t) t^n dt = 0 \text{ for } n = 0, 1, 2, \ldots.$$ Show $f \equiv 0$.

**Exercise 50.5.** Suppose $f \in C(\mathbb{R}, \mathbb{C})$ is a $2\pi$ – periodic function (i.e. $f(x + 2\pi) = f(x)$ for all $x \in \mathbb{R}$) and

$$\int_0^{2\pi} f(x) e^{inx} dx = 0 \text{ for all } n \in \mathbb{Z},$$

show again that $f \equiv 0$. **Hint:** Use Example 50.38 to show that any $2\pi$ – periodic continuous function $g$ on $\mathbb{R}$ is the uniform limit of trigonometric polynomials of the form

$$p(x) = \sum_{k=-n}^{n} p_k e^{ikx} \text{ with } p_k \in \mathbb{C} \text{ for all } k.$$

50.5 Iterated Integrals

**Theorem 50.39 (Baby Fubini Theorem).** Let $a_i, b_i \in \mathbb{R}$ with $a_i \neq b_i$ for $i = 1, 2, \ldots, n$, $f(t_1, t_2, \ldots, t_n) \in C$ be a continuous function of $(t_1, t_2, \ldots, t_n)$ where $t_i$ between $a_i$ and $b_i$ for each $i$ and for any given permutation, $\sigma$, of $\{1, 2, \ldots, n\}$ let

$$I_{\sigma}(f) := \int_{a_{\sigma_1}}^{b_{\sigma_1}} dt_{\sigma_1} \cdots \int_{a_{\sigma_n}}^{b_{\sigma_n}} dt_{\sigma_n} f(t_1, t_2, \ldots, t_n).$$

Then $I_{\sigma}(f)$ is well defined and independent of $\sigma$, i.e. the order of iterated integrals is irrelevant under these hypothesis.

**Proof.** Let $J_i := [\min(a_i, b_i), \max(a_i, b_i)]$, $J := J_1 \times \cdots \times J_n$ and $|J_i| := \max(a_i, b_i) - \min(a_i, b_i)$. Using the uniform continuity of $f$ (Theorem 50.2) and the continuity of the Riemann integral, it is easy to prove (compare with the proof of Lemma 50.33) that the map

$$(t_1, \ldots, \hat{t}_{\sigma_n}, \ldots, t_n) \in (J_1 \times \cdots \times J_{\sigma_n} \times \cdots \times J_n) \to \int_{a_{\sigma_n}}^{b_{\sigma_n}} dt_{\sigma_n} f(t_1, t_2, \ldots, t_n)$$

is continuous, where the hat is used to denote a missing element from a list. From this remark, it follows that each of the integrals in Eq. 50.26 are well defined.
and hence so is $I_\sigma(f)$. Moreover by an induction argument using Lemma 50.33 and the boundedness of the Riemann integral, we have the estimate,

$$\|I_\sigma(f)\|_Z \leq \left( \prod_{i=1}^{n} |I_i| \right) \|f\|_{C(J, Z)}. \quad (50.27)$$

Now suppose $\tau$ is another permutation. Because of Eq. (50.27), $I_\sigma$ and $I_\tau$ are bounded operators on $C(J, Z)$ and so to shows $I_\sigma = I_\tau$ is suffices to shows there are equal on the dense set of polynomial functions (see Corollary 50.34 in $C(J, Z)$). Moreover by linearity, it suffices to show $I_\sigma(f) = I_\tau(f)$ when $f$ has the form

$$f(t_1, t_2, \ldots, t_n) = t_1^{k_1} \ldots t_n^{k_n} z$$

for some $k_i \in \mathbb{N}_0$ and $z \in Z$. However for this function, explicit computations show

$$I_\sigma(f) = I_\tau(f) = \left( \prod_{i=1}^{n} \frac{a_i^{k_i+1} - a_i^{k_i+1}}{k_i + 1} \right) z.$$

**Proposition 50.40 (Equality of Mixed Partial Derivatives).** Let $Q = (a, b) \times (c, d)$ be an open rectangle in $\mathbb{R}^2$ and $f \in C(Q, Z)$. Assume that $\frac{\partial}{\partial s} f(s, t), \frac{\partial}{\partial t} f(s, t)$ and $\frac{\partial^2}{\partial s \partial t} f(s, t)$ exists and are continuous for $(s, t) \in Q$, then $\frac{\partial}{\partial s} \frac{\partial}{\partial t} f(s, t)$ exists for $(s, t) \in Q$ and

$$\frac{\partial}{\partial s} \frac{\partial}{\partial t} f(s, t) = \frac{\partial}{\partial t} \frac{\partial}{\partial s} f(s, t) \quad \text{for} \quad (s, t) \in Q. \quad (50.28)$$

**Proof.** Fix $(s_0, t_0) \in Q$. By two applications of Theorem 50.14

$$f(s, t) = f(s_0, t) + \int_{s_0}^{s} \frac{\partial}{\partial \sigma} f(\sigma, t) d\sigma$$

$$= f(s_0, t) + \int_{s_0}^{s} s \frac{\partial}{\partial \sigma} f(\sigma, t_0) d\sigma + \int_{s_0}^{s} \int_{t_0}^{t} \frac{\partial}{\partial \tau} \frac{\partial}{\partial \sigma} f(\sigma, \tau) d\sigma$$

and then by Fubini’s Theorem 50.39 we learn

$$f(s, t) = f(s_0, t) + \int_{s_0}^{s} \frac{\partial}{\partial \sigma} f(\sigma, t_0) d\sigma + \int_{t_0}^{t} \int_{s_0}^{s} \frac{\partial}{\partial \sigma} \frac{\partial}{\partial \tau} f(\sigma, \tau).$$

Differentiating this equation in $t$ and then in $s$ (again using two more applications of Theorem 50.14) shows Eq. (50.28) holds.

**50.6 Exercises**

Throughout these problems, $(X, \|\cdot\|)$ is a Banach space.

**Exercise 50.6.** Show $f = (f_1, \ldots, f_n) \in \tilde{S}([a, b], \mathbb{R}^n)$ iff $f_i \in \tilde{S}([a, b], \mathbb{R})$ for $i = 1, 2, \ldots, n$ and

$$f(t) = \left( \int_{a}^{b} f_1(t) dt, \ldots, \int_{a}^{b} f_n(t) dt \right).$$

Here $\mathbb{R}^n$ is to be equipped with the usual Euclidean norm. **Hint:** Use Lemma 50.7 to prove the forward implication.

**Exercise 50.7.** Give another proof of Proposition 50.40 which does not use Fubini’s Theorem 50.39 as follows.

1. By a simple translation argument we may assume $(0, 0) \in Q$ and we are trying to prove Eq. (50.28) holds at $(s, t) = (0, 0)$.
2. Let $h(s, t) := \frac{\partial}{\partial t} f(s, t)$ and

$$G(s, t) := \int_{0}^{s} d\sigma \int_{0}^{t} d\tau h(\sigma, \tau)$$

so that Eq. (50.29) states

$$f(s, t) = f(0, t) + \int_{0}^{s} \frac{\partial}{\partial \sigma} f(\sigma, t_0) d\sigma + G(s, t)$$

and differentiating this equation at $t = 0$ shows

$$\frac{\partial}{\partial t} f(s, 0) = \frac{\partial}{\partial t} f(0, 0) + \frac{\partial}{\partial t} G(s, 0). \quad (50.30)$$

Now show using the definition of the derivative that

$$\frac{\partial}{\partial t} G(s, 0) = \int_{0}^{s} d\sigma h(\sigma, 0). \quad (50.31)$$

**Hint:** Consider

$$G(s, t) - t \int_{0}^{s} d\sigma h(\sigma, 0) = \int_{0}^{s} d\sigma \int_{0}^{t} d\tau [h(\sigma, \tau) - h(\sigma, 0)].$$

3. Now differentiate Eq. (50.30) in $s$ using Theorem 50.14 to finish the proof.
Exercise 50.8. Give another proof of Eq. (50.20) in Theorem 50.39 based on Proposition 50.40. To do this let $t_0 \in (c,d)$ and $s_0 \in (a,b)$ and define
\begin{equation}
G(s,t) := \int_{t_0}^{t} d\tau \int_{s_0}^{s} d\sigma f(\sigma,\tau)
\end{equation}
Show $G$ satisfies the hypothesis of Proposition 50.40 which combined with two applications of the fundamental theorem of calculus implies
\begin{equation}
\frac{\partial}{\partial t} \frac{\partial}{\partial s} G(s,t) = \frac{\partial}{\partial s} \frac{\partial}{\partial t} G(s,t) = f(s,t).
\end{equation}
Use two more applications of the fundamental theorem of calculus along with the observation that $G = 0$ if $t = t_0$ or $s = s_0$ to conclude
\begin{equation}
G(s,t) = \int_{s_0}^{s} d\sigma \int_{t_0}^{t} d\tau \frac{\partial}{\partial \sigma} \frac{\partial}{\partial \tau} G(\sigma,\tau) = \int_{s_0}^{s} d\sigma \int_{t_0}^{t} d\tau \frac{\partial}{\partial \tau} f(\sigma,\tau).
\end{equation}
Finally let $s = b$ and $t = d$ in Eq. (50.32) and then let $s_0 \downarrow a$ and $t_0 \downarrow c$ to prove Eq. (50.26).

Exercise 50.9 (Product Rule). Prove items 1. and 2. of Lemma 50.10. This can be modeled on the standard proof for real valued functions.

Exercise 50.10 (Chain Rule). Prove the chain rule in Proposition 50.11. Again this may be modeled on the standard proof for real valued functions.

Exercise 50.11. To each $A \in L(X)$, we may define $L_A, R_A: L(X) \to L(X)$ by $L_A B = AB$ and $R_A B = BA$ for all $B \in L(X)$. Show $L_A, R_A \in L(L(X))$ and that
\begin{equation}
\|L_A\|_{L(L(X))} = \|A\|_{L(X)} = \|R_A\|_{L(L(X))}.
\end{equation}

Exercise 50.12. Suppose that $A : \mathbb{R} \to L(X)$ is a continuous function and $U, V : \mathbb{R} \to L(X)$ are the unique solution to the linear differential equations
\begin{equation}
\dot{V}(t) = A(t)V(t) \quad \text{with} \quad V(0) = I
\end{equation}
and
\begin{equation}
\dot{U}(t) = -U(t)A(t) \quad \text{with} \quad U(0) = I.
\end{equation}
Prove that $V(t)$ is invertible and that $V^{-1}(t) = U(t)^{-1}$ where by abuse of notation I am writing $V^{-1}(t)$ for $[V(t)]^{-1}$. Hints: 1) show $\frac{d}{dt} U(t)V(t) = 0$ (which is sufficient if $\dim(X) < \infty$) and 2) show $y(t) := V(t)U(t)$ solves a linear differential ordinary differential equation that has $y \equiv I$ as an obvious solution. (The results of Exercise 50.11 may be useful here.) Then use the uniqueness of solutions to linear ODEs.

Exercise 50.13. Suppose that $(X,\|\cdot\|)$ is a Banach space, $J = (a,b)$ with $-\infty < a < b < \infty$ and $f_n : \mathbb{R} \to X$ are continuously differentiable functions such that there exists a summable sequence $\{a_n\}_{n=1}^\infty$ satisfying
\begin{equation}
\|f_n(t)\| + \|\dot{f}_n(t)\| \leq a_n \quad \text{for all} \quad t \in J \text{ and } n \in \mathbb{N}.
\end{equation}
Show:
1. $\sup \left\{ \left\| \int_{t+h}^{t} f_n(\tau) \, d\tau \right\| : (t,h) \in J \times \mathbb{R} \quad \exists \quad t + h \in J \text{ and } h \neq 0 \right\} \leq a_n$.
2. The function $F : \mathbb{R} \to X$ defined by
\begin{equation}
F(t) := \sum_{n=1}^\infty f_n(t) \quad \text{for all} \quad t \in J
\end{equation}
is differentiable and for $t \in J$,
\begin{equation}
\dot{F}(t) = \sum_{n=1}^\infty \dot{f}_n(t).
\end{equation}

Exercise 50.14. Suppose that $A \in L(X)$. Show directly that:
1. $e^{tA}$ define in Eq. (50.19) is convergent in $L(X)$ when equipped with the operator norm.
2. $e^{tA}$ is differentiable in $t$ and that $\frac{d}{dt} e^{tA} = Ae^{tA}$.

Exercise 50.15. Suppose that $A \in L(X)$ and $v \in X$ is an eigenvector of $A$ with eigenvalue $\lambda$, i.e. that $Av = \lambda v$. Show $e^{tA} v = e^{\lambda t} v$. Also show that if $X = \mathbb{R}^n$ and $A$ is a diagonalizable $n \times n$ matrix with
\begin{equation}
A = SDS^{-1} \quad \text{with} \quad D = \text{diag}(\lambda_1, \ldots, \lambda_n)
\end{equation}
then $e^{tA} = Se^{tD}S^{-1}$ where $e^{tD} = \text{diag}(e^{\lambda_1 t}, \ldots, e^{\lambda_n t})$. Here $\text{diag}(\lambda_1, \ldots, \lambda_n)$ denotes the diagonal matrix $A$ such that $A_{ii} = \lambda_i$ for $i = 1, 2, \ldots, n$.

Exercise 50.16. Suppose that $A, B \in L(X)$ and $[A, B] := AB - BA = 0$. Show that $e^{(A+B)} = e^A e^B$.

Exercise 50.17. Suppose that $A \in C(\mathbb{R}, L(X))$ satisfies $[A(t), A(s)] = 0$ for all $s, t \in \mathbb{R}$. Show
\begin{equation}
y(t) := e \left( \int_0^t A(\tau) \, d\tau \right) x
\end{equation}
is the unique solution to $\dot{y}(t) = A(t)y(t)$ with $y(0) = x$.
Exercise 50.18. Compute $e^{tA}$ when

$$ A = \begin{pmatrix} 0 & 1 \\ -1 & 0 \end{pmatrix} $$

and use the result to prove the formula

$$ \cos(s + t) = \cos s \cos t - \sin s \sin t. $$

Hint: Sum the series and use $e^{tA}e^{sA} = e^{(t+s)A}$.

Exercise 50.19. Compute $e^{tA}$ when

$$ A = \begin{pmatrix} 0 & a & b \\ 0 & 0 & c \\ 0 & 0 & 0 \end{pmatrix} $$

with $a, b, c \in \mathbb{R}$. Use your result to compute $e^{(\lambda t + A)}$ where $\lambda \in \mathbb{R}$ and $I$ is the $3 \times 3$ identity matrix. Hint: Sum the series.

Exercise 50.20. Prove Theorem 50.25 using the following outline.

1. Using the right continuity at 0 and the semigroup property for $T_t$, show there are constants $M$ and $C$ such that $\|T_t\|_{L(X)} \leq MC^t$ for all $t > 0$.
2. Show $t \in [0, \infty) \rightarrow T_t \in L(X)$ is continuous.
3. For $\varepsilon > 0$, let $S_\varepsilon := \frac{1}{\varepsilon} \int_t^{t+\varepsilon} T_t \, d\tau \in L(X)$. Show $S_\varepsilon \rightarrow I$ as $\varepsilon \downarrow 0$ and conclude from this that $S_\varepsilon$ is invertible when $\varepsilon > 0$ is sufficiently small. For the remainder of the proof fix such a small $\varepsilon > 0$.
4. Show

$$ T_t S_\varepsilon = \frac{1}{\varepsilon} \int_t^{t+\varepsilon} T_\tau \, d\tau $$

and conclude from this that

$$ \lim_{\varepsilon \downarrow 0} \left( \frac{T_t - I}{\varepsilon} \right) S_\varepsilon = \frac{1}{\varepsilon} (T_\varepsilon - Id_X). $$

5. Using the fact that $S_\varepsilon$ is invertible, conclude $A = \lim_{\varepsilon \downarrow 0} \frac{1}{\varepsilon} (T_\varepsilon - Id_X)$ exists in $L(X)$ and that

$$ A = \frac{1}{\varepsilon} (T_\varepsilon - Id_X) S_\varepsilon^{-1}. $$

6. Now show, using the semigroup property and step 5., that $\frac{d}{dt} T_t = A T_t$ for all $t > 0$.
7. Using step 6., show $\frac{d}{dt} e^{-tAT_t} = 0$ for all $t > 0$ and therefore $e^{-tAT_t} = e^{-0AT_0} = I$.

Exercise 50.21 (Duhamel’ s Principle I). Suppose that $A : \mathbb{R} \rightarrow L(X)$ is a continuous function and $V : \mathbb{R} \rightarrow L(X)$ is the unique solution to the linear differential equation in Eq. (50.33). Let $x \in X$ and $h \in C(\mathbb{R}, X)$ be given. Show that the unique solution to the differential equation:

$$ \dot{y}(t) = A(t)y(t) + h(t) \text{ with } y(0) = x $$

is given by

$$ y(t) = V(t)x + V(t) \int_0^t V(\tau)^{-1} h(\tau) \, d\tau. $$

Hint: compute $\frac{d}{dt} [V^{-1}(t)y(t)]$ (see Exercise 50.12) when $y$ solves Eq. (50.35).

Exercise 50.22 (Duhamel’ s Principle II). Suppose that $A : \mathbb{R} \rightarrow L(X)$ is a continuous function and $V : \mathbb{R} \rightarrow L(X)$ is the unique solution to the linear differential equation in Eq. (50.33). Let $W_0 \in L(X)$ and $H \in C(\mathbb{R}, L(X))$ be given. Show that the unique solution to the differential equation:

$$ \dot{W}(t) = A(t)W(t) + H(t) \text{ with } W(0) = W_0 $$

is given by

$$ W(t) = V(t)W_0 + V(t) \int_0^t V(\tau)^{-1} H(\tau) \, d\tau. $$
Ordinary Differential Equations in a Banach Space

Let $X$ be a Banach space, $U \subset_o X$, $J = (a, b) \ni 0$ and $Z \in C(J \times U, X)$. The function $Z$ is to be interpreted as a time dependent vector-field on $U \subset X$. In this section we will consider the ordinary differential equation (ODE for short)

$$\dot{y}(t) = Z(t, y(t)) \quad \text{with} \quad y(0) = x \in U. \quad (51.1)$$

The reader should check that any solution $y \in C^1(J, U)$ to Eq. (51.1) gives a solution $y \in C(J, U)$ to the integral equation:

$$y(t) = x + \int_0^t Z(\tau, y(\tau)) \, d\tau \quad (51.2)$$

and conversely if $y \in C(J, U)$ solves Eq. (51.2) then $y \in C^1(J, U)$ and $y$ solves Eq. (51.1).

Remark 51.1. For notational simplicity we have assumed that the initial condition for the ODE in Eq. (51.1) is taken at $t = 0$. There is no loss in generality in doing this since if $\tilde{y}$ solves

$$\frac{d\tilde{y}}{dt}(t) = \tilde{Z}(t, \tilde{y}(t)) \quad \text{with} \quad \tilde{y}(t_0) = x \in U$$

iff $y(t) := \tilde{y}(t + t_0)$ solves Eq. (51.1) with $Z(t, x) = \tilde{Z}(t + t_0, x)$.

51.1 Examples

Let $X = \mathbb{R}$, $Z(x) = x^n$ with $n \in \mathbb{N}$ and consider the ordinary differential equation

$$\dot{y}(t) = Z(y(t)) = y^n(t) \quad \text{with} \quad y(0) = x \in \mathbb{R}. \quad (51.3)$$

If $y$ solves Eq. (51.3) with $x \neq 0$, then $y(t)$ is not zero for $t$ near 0. Therefore up to the first time $y$ possibly hits 0, we must have

$$t = \int_0^t \frac{\dot{y}(\tau)}{y(\tau)^n} \, d\tau = \int_{y(0)}^{y(t)} u^{-n} \, du = \begin{cases} \frac{[y(t)]^{1-n} - x^{1-n}}{1-n} & \text{if} \ n > 1 \\ \ln \frac{y(t)}{x} & \text{if} \ n = 1 \end{cases}$$

and solving these equations for $y(t)$ implies

$$y(t) = y(t, x) = \begin{cases} \frac{x}{\sqrt[1-n]{(1-n)tx^{n-1}}} & \text{if} \ n > 1 \\ e^t x & \text{if} \ n = 1 \end{cases} \quad (51.4)$$

The reader should verify by direct calculation that $y(t, x)$ defined above does indeed solve Eq. (51.3). The above argument shows that these are the only possible solutions to the Equations in (51.3).

Notice that when $n = 1$, the solution exists for all time while for $n > 1$, we must require

$$1 - (n - 1)tx^{n-1} > 0$$

or equivalently that

$$t < \frac{1}{(1-n)x^{n-1}} \text{ if } x^{n-1} > 0 \quad \text{and} \quad t > \frac{1}{(1-n)|x|^{n-1}} \text{ if } x^{n-1} < 0.$$

Moreover for $n > 1$, $y(t, x)$ blows up as $t$ approaches $(n - 1)^{-1} x^{1-n}$. The reader should also observe that, at least for $s$ and $t$ close to 0,

$$y(t, y(s, x)) = y(t + s, x) \quad (51.5)$$

for each of the solutions above. Indeed, if $n = 1$ Eq. (51.5) is equivalent to the well know identity, $e^te^s = e^{t+s}$ and for $n > 1$,
function \( t > 0 \) which solves Eq. (51.6) for \( x \) from being the unique solution. For example letting 
\( u = \sqrt{\frac{x}{1 - (n - 1)x^n}} \) and therefore, 
\[ y(t) = \frac{\sqrt{1 - (n - 1)t}y(s, x)}{\sqrt{1 - (n - 1)x^n}} \]
\[ = \frac{\sqrt{1 - (n - 1)x^n - (n - 1)t x^n - 1}}{\sqrt{1 - (n - 1)x^n}} = \frac{\sqrt{1 - (n - 1)(s + t)x^n - 1}}{\sqrt{1 - (n - 1)x^n}} = y(t + s, x). \]

Now suppose \( Z(x) = |x|^\alpha \) with \( 0 < \alpha < 1 \) and we now consider the ordinary differential equation
\[ \dot{y}(t) = Z(y(t)) = |y(t)|^\alpha \text{ with } y(0) = x \in \mathbb{R}. \] (51.6)

Working as above we find, if \( x \neq 0 \) that
\[ t = \int_0^t \frac{\dot{y}(\tau)}{|y(\tau)|^\alpha} d\tau = \int_{y(0)}^{y(t)} |u|^{-\alpha} du = \frac{|y(t)|^{1-\alpha} - x^{1-\alpha}}{1-\alpha}. \]
where \( u^{-\alpha} := |u|^{-\alpha} \text{ sgn}(u) \). Since \( \text{sgn}(y(t)) = \text{sgn}(x) \) the previous equation implies
\[ \text{sgn}(x)(1-\alpha)t = \text{sgn}(x) \left[ |y(t)|^{1-\alpha} - |x|^{1-\alpha} \right] \]
and therefore,
\[ y(t, x) = \text{sgn}(x) \left( |x|^{1-\alpha} + \text{sgn}(x)(1-\alpha)t \right)^{\frac{1}{1-\alpha}} \] (51.7)
is uniquely determined by this formula until the first time \( t \) where \( |x|^{1-\alpha} + \text{sgn}(x)(1-\alpha)t = 0 \).

As before \( y(t) = 0 \) is a solution to Eq. (51.6) when \( x = 0 \), however it is far from being the unique solution. For example letting \( x \downarrow 0 \) in Eq. (51.7) gives a function
\[ y(t, 0+) = ((1-\alpha)t)^{\frac{1}{1-\alpha}} \]
which solves Eq. (51.6) for \( t > 0 \). Moreover if we define
\[ y(t) := \begin{cases} 
(1-\alpha)t^{\frac{1}{1-\alpha}} & \text{if } t > 0, \\
0 & \text{if } t \leq 0, 
\end{cases} \]
(for example if \( \alpha = 1/2 \) then \( y(t) = \frac{1}{4}t^2 \) \( t \geq 0 \) then the reader may easily check \( y \) also solve Eq. (51.6)). Furthermore, \( y_a(t) := y(t-a) \) also solves Eq. (51.6) for all \( a \geq 0 \), see Figure 51.1 below.

With these examples in mind, let us now go to the general theory. The case of linear ODE’s has already been studied in Section 50.3 above.

51.2 Uniqueness Theorem and Continuous Dependence on Initial Data

Lemma 51.2 (Gronwall’s Lemma). Suppose that \( f, \varepsilon, \) and \( k \) are non-negative locally integrable functions of \( t \in [0, \infty) \) such that
\[ f(t) \leq \varepsilon(t) + \left| \int_0^t k(\tau)f(\tau) d\tau \right|. \] (51.8)

Then
\[ f(t) \leq \varepsilon(t) + \left| \int_0^t k(\tau)\varepsilon(\tau)e^{\int_0^\tau k(s)ds} d\tau \right|. \] (51.9)

and in particular if \( \varepsilon \) and \( k \) are constants we find that
\[ f(t) \leq \varepsilon e^{k|t|}. \] (51.10)
Proof. I will only prove the case \( t \geq 0 \). The case \( t \leq 0 \) can be derived by applying the \( t \geq 0 \) to \( f(t) = f(-t) \), \( \dot{k}(t) = k(-t) \) and \( \varepsilon(t) = \varepsilon(-t) \).

Set \( F(t) = \int_0^t k(\tau)f(\tau)\,d\tau \). Then by \eqref{eq:51.8} and the Lebesgue version of the fundamental theorem of calculus,

\[
\dot{F} = kf \leq k\varepsilon + kF \quad \text{a.e.}
\]

Hence,

\[
\frac{d}{dt} \left( e^{-\int_0^t k(s)\,ds} F(t) \right) \overset{a.e.}{=} e^{-\int_0^t k(s)\,ds} \left( F(t) - k(t)F(t) \right) \leq k(t)\varepsilon(t) e^{-\int_0^t k(s)\,ds}.
\]

Integrating this last inequality from 0 to \( t \) and then solving for \( F \) yields:

\[
F(t) \leq e^{\int_0^t k(s)\,ds} \cdot \int_0^t d\tau k(\tau)\varepsilon(\tau) e^{-\int_0^\tau k(s)\,ds} = \int_0^t d\tau k(\tau)\varepsilon(\tau)e^{\int_{\tau}^t k(s)\,ds}.
\]

But by the definition of \( F \) and Eq. \eqref{eq:51.8} we have,

\[
f(t) \leq \varepsilon(t) + F(t) \leq \int_0^t d\tau k(\tau)\varepsilon(\tau)e^{\int_{\tau}^t k(s)\,ds}
\]

which is Eq. \eqref{eq:51.9}. Equation \eqref{eq:51.10} follows from \eqref{eq:51.9} by a simple integration.

\[\square\]

Corollary 51.3 (Continuous Dependence on Initial Data). Let \( U \subset \mathbb{R} \times X \), \( 0 \in (a,b) \) and \( Z : (a,b) \times X \to X \) be a continuous function which is \( K \)-Lipschitz function on \( U \), i.e., \( \|Z(t,x) - Z(t,x')\| \leq K\|x-x'\| \) for all \( x \) and \( x' \) in \( U \). Suppose \( y_1, y_2 : (a,b) \to U \) solve

\[
\frac{dy_i(t)}{dt} = Z(t,y_i(t)) \quad \text{with} \quad y_i(0) = x_i \quad \text{for} \quad i = 1,2. \tag{51.11}
\]

Then

\[
\|y_2(t) - y_1(t)\| \leq \|x_2 - x_1\| e^{K|t|} \tag{51.12}
\]

and in particular, there is at most one solution to Eq. \eqref{eq:51.1} under the above Lipschitz assumption on \( Z \).

Proof. Let \( f(t) := \|y_2(t) - y_1(t)\| \). Then by the fundamental theorem of calculus,

\[
f(t) = \|y_2(0) - y_1(0) + \int_0^t (\dot{y}_2(\tau) - \dot{y}_1(\tau))\,d\tau\| \leq f(0) + \int_0^t \|Z(\tau,y_2(\tau)) - Z(\tau,y_1(\tau))\|\,d\tau \leq \|x_2 - x_1\| + K \int_0^t f(\tau)\,d\tau.
\]

Therefore by Gronwall’s inequality we have,

\[
\|y_2(t) - y_1(t)\| = f(t) \leq \|x_2 - x_1\| e^{K|t|}.
\]

\[\square\]

51.3 Local Existence (Non-Linear ODE)

Lemma 51.4. Suppose that \( K(t) \) is a locally integrable function of \( t \in [0,\infty) \) and \( \{\varepsilon_n(t)\}_{n=0}^\infty \) is a sequence of non-negative continuous functions such that

\[
\varepsilon_{n+1}(t) \leq \int_0^t K(\tau)\varepsilon_n(\tau)\,d\tau \quad \text{for all} \quad n \geq 0 \tag{51.13}
\]

and \( \varepsilon_0(t) \leq \delta < \infty \) for all \( t \in [0,\infty) \). Then

\[
\varepsilon_n(t) \leq \frac{\delta}{n!} \left[ \int_0^t K(s)\,ds \right]^n. \tag{51.14}
\]

Proof. The proof is by induction. Notice that

\[
\varepsilon_1(t) \leq \int_0^t K(\tau)\varepsilon_0(\tau)\,d\tau \leq \delta \int_0^t K(\tau)\,d\tau
\]

as desired. If Eq. \eqref{eq:51.14} holds for level \( n \), then

\[
\varepsilon_{n+1}(t) \leq \int_0^t K(\tau)\varepsilon_n(\tau)\,d\tau \leq \frac{\delta}{n!} \int_0^t K(\tau) \left[ \int_0^\tau K(s)\,ds \right]^{n+1}\,d\tau
\]

\[
= \frac{\delta}{n!} \int_0^t \frac{d}{n + 1} \left[ \int_0^\tau K(s)\,ds \right]^{n+1}\,d\tau
\]

which is Eq. \eqref{eq:51.14} at level \( n + 1 \).

We now show that Eq. \eqref{eq:51.1} has a unique solution when \( Z \) satisfies the Lipschitz condition in Eq. \eqref{eq:51.16}. See Exercise 24.14 below for another existence theorem.

Theorem 51.5 (Local Existence). Let \( T > 0 \), \( J = (-T,T) \), \( x_0 \in X \), \( r > 0 \) and

\[
C(x_0,r) := \{x \in X : \|x - x_0\| \leq r\}
\]

be the closed \( r \)-ball centered at \( x_0 \in X \). Assume
Using the estimate in Eq. (51.18) repeatedly we find

\[ M = \sup \{ \| Z(t,x) \| : (t,x) \in J \times C(x_0,r) \} < \infty \]  

(51.15)

and there exists \( K < \infty \) such that

\[ \| Z(t,x) - Z(t,y) \| \leq K \| x - y \| \text{ for all } x, y \in C(x_0,r) \text{ and } t \in J. \]  

(51.16)

Let \( T_0 < \min \{ r/M,T \} \) and \( J_0 := (-T_0, T_0) \), then for each \( x \in B(x_0, r - MT_0) \) there exists a unique solution \( y(t) = y(t, x) \) to Eq. (51.2) in \( C(J_0, C(x_0, r)) \). Moreover \( y(t, x) \) is jointly continuous in \((t, x)\). The uniqueness assertion has already been proved in Corollary 51.3. To prove existence, let \( C := C(x_0, r) \), \( Y := C(J_0, C(x_0, r)) \) and

\[ S_x(y)(t) := x + \int_0^t Z(\tau, y(\tau)) d\tau. \]  

(51.17)

With this notation, Eq. (51.2) becomes \( y = S_x(y) \), i.e. we are looking for a fixed point of \( S_x \). If \( y \in Y \), then

\[ \| S_x(y)(t) - x_0 \| \leq \| x - x_0 \| + \left| \int_0^t \| Z(\tau, y(\tau)) \| d\tau \right| \leq \| x - x_0 \| + M |t| \]

\[ \leq \| x - x_0 \| + M T_0 \leq r - M T_0 + M T_0 = r, \]

showing \( S_x(Y) \subset Y \) for all \( x \in B(x_0, r - MT_0) \). Moreover if \( y, z \in Y \),

\[ \| S_x(y)(t) - S_x(z)(t) \| = \left| \int_0^t \| Z(\tau, y(\tau)) - Z(\tau, z(\tau)) \| d\tau \right| \]

\[ \leq \left| \int_0^t \| Z(\tau, y(\tau)) - Z(\tau, z(\tau)) \| d\tau \right| \]

\[ \leq K \left| \int_0^t \| y(\tau) - z(\tau) \| d\tau \right|. \]  

(51.18)

Let \( y_0(t, x) = x \) and \( y_n(\cdot, x) \in Y \) defined inductively by

\[ y_n(\cdot, x) := S_x(y_{n-1}(\cdot, x)) = x + \int_0^t Z(\tau, y_{n-1}(\tau, x)) d\tau. \]  

(51.19)

Using the estimate in Eq. (51.18) repeatedly we find

\[ \| y_{n+1}(t) - y_n(t) \| \]

\[ \leq K \left| \int_0^t \| y_n(\tau) - y_{n-1}(\tau) \| d\tau \right| \]

\[ \leq K^2 \left| \int_0^t \int_0^t \| y_{n-1}(\tau) - y_{n-2}(\tau) \| d\tau \right| \]

\[ \leq K^n \left| \int_0^t \int_0^t \cdots \int_0^t d\tau \right| \]

\[ \leq K^n \| y_1(\cdot, x) - y_0(\cdot, x) \| \int_0^t \| Z(\tau, x) \| d\tau \| \leq M_0, \]

where

\[ M_0 = \max \left\{ \int_0^{T_0} \| Z(\tau, x) \| d\tau, \int_0^0 \| Z(\tau, x) \| d\tau \right\} \leq MT_0, \]

shows

\[ \| y_{n+1}(t, x) - y_n(t, x) \| \]

\[ \leq M_0 \frac{K^n |t|^n}{n!} \leq M_0 \frac{K^n T_0^n}{n!} \]

and this implies

\[ \sum_{n=0}^{\infty} \sup \{ \| y_{n+1}(\cdot, x) - y_n(\cdot, x) \|_{\infty, J_0} : t \in J_0 \} \]

\[ \leq M_0 \frac{K^n T_0^n}{n!} = M_0 e^{KT_0} < \infty \]

where

\[ \| y_{n+1}(\cdot, x) - y_n(\cdot, x) \|_{\infty, J_0} := \sup \{ \| y_{n+1}(t, x) - y_n(t, x) \| : t \in J_0 \}. \]

So \( y(t, x) := \lim_{n \to \infty} y_n(t, x) \) exists uniformly for \( t \in J \) and using Eq. (51.16) we also have...
Then for all \( y \) equation it follows that 
\[
\lim_{n \to \infty} \|y(t, x) - y_n(t, x)\|_{J_0} = 0
\]
Now passing to the limit in Eq. 51.19 shows \( y \) solves Eq. 51.2. From this equation it follows that \( y(t, x) \) is differentiable in \( t \) and \( y \) satisfies Eq. 51.1. The continuity of \( y(t, x) \) follows from Corollary 51.3 and mean value inequality (Corollary 50.15):
\[
\|y(t, x) - y(t', x')\| \leq \|y(t, x) - y(t, x')\| + \|y(t', x') - y(t', x')\|
\]
\[
= \|y(t, x) - y(t, x')\| + \int_{t'}^t \|Z(\tau, y(\tau, x'))\| \, d\tau
\]
\[
\leq \|y(t, x) - y(t, x')\| + \int_{t'}^t \|Z(\tau, y(\tau, x'))\| \, d\tau
\]
\[
\leq \|x - x'\| + \int_{t'}^t \|Z(\tau, y(\tau, x'))\| \, d\tau
\]
\[
\leq \|x - x'\| + M |t - t'|
\]
The continuity of \( y(t, x) \) is now a consequence Eq. 51.1 and the continuity of \( y \) and \( Z \).

Corollary 51.6. Let \( J = (a, b) \) and suppose \( Z \in C(J \times X, X) \) satisfies
\[
\|Z(t, x) - Z(y, y)\| \leq K \|x - y\| \quad \text{for all } x, y \in X \text{ and } t \in J.
\]
Then for all \( x \in X \), there is a unique solution \( y(t, x) \) (for \( t \in J \)) to Eq. 51.1. Moreover \( y(t, x) \) and \( \dot{y}(t, x) \) are jointly continuous in \( (t, x) \).

Proof. Let \( J_0 = (a_0, b_0) \) be a precompact subinterval of \( J \) and \( Y := BC(J_0, X) \). By compactness, \( M := \sup_{t \in J_0} \|Z(t, 0)\| < \infty \) which combined with Eq. 51.2 implies
\[
\sup_{t \in J} \|Z(t, x)\| \leq M + K \|x\| \quad \text{for all } x \in X.
\]
Using this estimate and Lemma 50.7 one easily shows \( S_x(Y) \subset Y \) for all \( x \in X \). The proof of Theorem 51.5 now goes through without any further change.

51.4 Global Properties

Definition 51.7 (Local Lipschitz Functions). Let \( U \subset_o X \), \( J \) be an open interval and \( Z \in C(J \times U, X) \). The function \( Z \) is said to be locally Lipschitz in \( x \) if for all \( x \in U \) and all compact intervals \( I \subset J \) there exists \( K = K(x, I) < \infty \) and \( \varepsilon = \varepsilon(x, I) > 0 \) such that \( B(x, \varepsilon(x, I)) \subset U \) and
\[
\|Z(t, x) - Z(t, y)\| \leq K(x, I)\|x - y\| \quad \forall x, y \in B(x, \varepsilon(x, I)) \quad \forall t \in I.
\]
For the rest of this section, we will assume \( J \) is an open interval containing 0, \( U \) is an open subset of \( X \) and \( Z \in C(J \times U, X) \) is a locally Lipschitz function.

Lemma 51.8. Let \( Z \in C(J \times U, X) \) be a locally Lipschitz function in \( X \) and \( E \) be a compact subset of \( U \) and \( J \) be a compact subset of \( J \). Then there exists \( \varepsilon > 0 \) such that \( Z(t, x) \) is bounded for \( (t, x) \in I \times E \) and \( Z(t, x) \) is \( K \)-Lipschitz on \( E \) for all \( t \in I \), where
\[
E_x := \{ x \in U : \text{dist}(x, E) < \varepsilon \}.
\]

Proof. Let \( \varepsilon(x, I) \) and \( K(x, I) \) be as in Definition 51.7 above. Since \( E \) is compact, there exists a finite subset \( A \subset E \) such that \( E \subset V := \bigcup_{x \in A} B(x, \varepsilon(x, I)/2) \). If \( y \in V \), there exists \( x \in A \) such that \( \|y - x\| < \varepsilon(x, I)/2 \) and therefore
\[
\|Z(t, y)\| \leq \|Z(t, x)\| + K(x, I)\|y - x\| \leq \|Z(t, x)\| + K(x, I)\varepsilon(x, I)/2 \leq \sup_{x \in A, t \in I} \{ \|Z(t, x)\| + K(x, I)\varepsilon(x, I)/2 \} = M < \infty.
\]
This shows \( Z \) is bounded on \( I \times V \). Let
\[
\varepsilon := d(E, V^c) \leq \frac{1}{2} \text{min}_{x \in A} \varepsilon(x, I)
\]
and notice that \( \varepsilon > 0 \) since \( E \) is compact, \( V^c \) is closed and \( E \subset V^c \). If \( y, z \in E_x \) and \( \|y - z\| < \varepsilon \), then as before there exists \( x \in A \) such that \( \|y - x\| < \varepsilon(x, I)/2 \).

Thus if we let \( K := \max \{2M/\varepsilon, K_0\} \), we have shown
\[
\|Z(t, y) - Z(t, z)\| \leq K\|y - z\| \quad \text{for all } y, z \in E_x \text{ and } t \in I.
\]
Proposition 51.9 (Maximal Solutions). Let $Z \in C(J \times U, X)$ be a locally Lipschitz function in $x$ and let $x \in U$ be fixed. Then there is an interval $J_x = (a(x), b(x))$ with $a \in [-\infty, 0)$ and $b \in (0, \infty]$ and a $C^1$-function $y : J \to U$ with the following properties:

1. $y$ solves ODE in Eq. (51.1).
2. If $\tilde{y} : J = (a, b) \to U$ is another solution of Eq. (51.1) (we assume that $0 \in J$) then $J \subset J$ and $\tilde{y} = y|_J$.

The function $y : J \to U$ is called the maximal solution to Eq. (51.1).

Proof. Suppose that $y_i : J_i = (a_i, b_i) \to U$, $i = 1, 2$, are two solutions to Eq. (51.1). We will start by showing that $y_1 = y_2$ on $J_1 \cap J_2$. To do this let $J_0 = (a_0, b_0)$ be chosen so that $0 \in J_0 \subset J_1 \cap J_2$, and let $E := y_1(J_0) \cup y_2(J_0)$ be a compact subset of $X$. Suppose that $y_1|_{J_0}, y_2|_{J_0} : J_0 \to E$ both solve Eq. (51.1) and therefore equal by Corollary 51.3. Since $J_0 = (a_0, b_0)$ was chosen arbitrarily so that $[a_0, b_0] \subset J_1 \cap J_2$, we may conclude that $y_1 = y_2$ on $J_1 \cap J_2$. Let $(y_\alpha, J_\alpha) = (a_\alpha, b_\alpha)\alpha \in A$ denote the possible solutions to (51.1) such that $0 \in J_\alpha$. Define $J_x = \cup J_\alpha$ and set $y = y_\alpha$ on $J_\alpha$. We have just checked that $y$ is well defined and the reader may easily check that this function $y : J_x \to U$ satisfies all the conclusions of the theorem.

Notation 51.10 For each $x \in U$, let $j_x = (a(x), b(x))$ be the maximal interval on which Eq. (51.1) may be solved, see Proposition 51.9. Set $D(Z) := \cup_{x \in U} (j_x \times \{x\}) \subset J \times U$ and let $\varphi : D(Z) \to U$ be defined by $\varphi(t, x) = y(t)$ where $y$ is the maximal solution to Eq. (51.1). (So for each $x \in U$, $\varphi(\cdot, x)$ is the maximal solution to Eq. (51.1).)

Proposition 51.11. Let $Z \in C(J \times U, X)$ be a locally Lipschitz function in $x$ and $y : J = (a(x), b(x)) \to U$ be the maximal solution to Eq. (51.1). If $b(x) < b$, then either $\limsup_{t \to b(x)} \|Z(t, y(t))\| = \infty$ or $y(b(x)−) := \lim_{t \to b(x)} y(t)$ exists and $y(b(x)−) \notin U$. Similarly, if $a > a(x)$, then either $\limsup_{t \to a(x)} \|y(t)\| = \infty$ or $y(a(x)+) := \lim_{t \to a(x)} y(t)$ exists and $y(a(x)+) \notin U$.

1 Here is an alternate proof of the uniqueness. Let $T := \sup\{t \in [0, \min\{b_1, b_2\}] : y_1 = y_2 \text{ on } [0, t]\}$. (T is the first positive time after which $y_1$ and $y_2$ disagree.)

Suppose, for sake of contradiction, that $T < \min\{b_1, b_2\}$. Notice that $y_1(T) = y_2(T) = : x'$. Applying the local uniqueness theorem to $y_1(\cdot, T)$ and $y_2(\cdot, T)$ thought as function from $(-\delta, \delta) \to B(x', \epsilon(x'))$ for some $\delta$ sufficiently small, we learn that $y_1(\cdot, T) = y_2(\cdot, T)$ on $(-\delta, \delta)$. But this shows that $y_1 \equiv y_2$ on $[0, T + \delta]$ which contradicts the definition of $T$. Hence we must have $T = \min\{b_1, b_2\}$, i.e. $y_1 = y_2$ on $J_1 \cap J_2 \cap [0, \infty)$. A similar argument shows that $y_1 = y_2$ on $J_1 \cap J_2 \cap (-\infty, 0]$ as well.

Proof. Suppose that $b < b(x)$ and $M := \limsup_{t \to b(x)} \|Z(t, y(t))\| < \infty$. Then there is a $b_0 \in (0, b(x))$ such that $\|Z(t, y(t))\| \leq 2M$ for all $t \in (b_0, b(x))$. Thus, by the usual fundamental theorem of calculus argument,

$$\|y(t) - y(t')\| \leq \int_t^{t'} \|Z(t, y(t'))\| dt \leq 2M|t - t'|$$

for all $t, t' \in (b_0, b(x))$. From this it is easy to conclude that $y(b(x)−) = \lim_{t \to b(x)} y(t)$ exists. If $y(b(x)−) \notin U$, by the local existence Theorem 51.5 there exists $\delta > 0$ and $w \in C^1((b(x)−, \delta, b(x) + \delta), U)$ such that

$$\dot{w}(t) = Z(t, w(t)) \text{ and } w(b(x)) = y(b(x)−).$$

Now define $\tilde{y} : (a, b(x) + \delta) \to U$ by

$$\tilde{y}(t) = \begin{cases} y(t) & \text{if } t \in J_x \\ w(t) & \text{if } t \in (b(x), b(x) + \delta) \end{cases}$$

The reader may now easily show $\tilde{y}$ solves the integral Eq. (51.2) and hence also solves Eq. (51.1) for $t \in (a, b(x) + \delta)$. But this violates the maximality of $y$ and hence we must have that $y(b(x)−) \notin U$. The assertions for $t$ near $a(x)$ are proved similarly.

Example 51.12. Let $X = \mathbb{R}^2$, $J = \mathbb{R}$, $U = \{(x, y) \in \mathbb{R}^2 : 0 < r < 1\}$ where $r^2 = x^2 + y^2$ and

$$Z(x, y) = \frac{1}{r}(x, y) + \frac{1}{1 - r^2}(-y, x).$$

Then the unique solution $(x(t), y(t))$ to

$$\frac{d}{dt}(x(t), y(t)) = Z(x(t), y(t)) \text{ with } (x(0), y(0)) = \left(\frac{1}{2}, 0\right)$$

is given by

$$(x(t), y(t)) = \left(t + \frac{1}{2}, \cos\left(\frac{1}{1/2 - t}\right) \cdot \sin\left(\frac{1}{1/2 - t}\right)\right)$$

for $t \in J_{1/2, 0} = (-1/2, 1/2)$. Notice that $\|Z(x(t), y(t))\| \to \infty$ as $t \uparrow 1/2$ and dist$(x(t), y(t), U^c) \to 0$ as $t \uparrow 1/2$.

2 See the argument in Proposition 51.14 for a slightly different method of extending $y$ which avoids the use of the integral equation (51.2).
Example 51.13. (Not worked out completely.) Let $X = U = \ell^2$, $\psi \in C^\infty(\mathbb{R}^2)$ be a smooth function such that $\psi = 1$ in a neighborhood of the line segment joining $(1, 0)$ to $(0, 1)$ and being supported within the $1/10$ – neighborhood of this segment. Choose $a_n \uparrow \infty$ and $b_n \uparrow \infty$ and define

$$Z(x) = \sum_{n=1}^{\infty} a_n \psi(b_n(x_n, x_{n+1}))(e_{n+1} - e_n).$$  \hfill (51.24)$$

For any $x \in \ell^2$, only a finite number of terms are non-zero in the above sum in a neighborhood of $x$. Therefor $Z : \ell^2 \to \ell^2$ is a smooth and hence locally Lipschitz vector field. Let $(y(t), J = (a, b))$ denote the maximal solution to

$$\dot{y}(t) = Z(y(t)) \text{ with } y(0) = e_1.$$  

Then if the $a_n$ and $b_n$ are chosen appropriately, then $b < \infty$ and there will exist $t_n \uparrow b$ such that $y(t_n)$ is approximately $e_n$ for all $n$. So again $y(t_n)$ does not have a limit yet $sup_{t \in [0, b]} ||y(t)|| < \infty$. The idea is that $Z$ is constructed to “blow” the particle from $e_1$ to $e_2$ to $e_3$ to $e_4$ etc. etc. with the time it takes to travel from $e_n$ to $e_{n+1}$ being on order $1/n^2$. The vector field in Eq. (51.24) is a first approximation at a vector field, it may have to be adjusted a little more to provide an honest example. In this example, we are having problems because $y(t)$ is “going off in dimensions.”

Here is another version of Proposition 51.11 which is more useful when $dim(X) < \infty$.

Proposition 51.14. Let $Z \in C(J \times U, X)$ be a locally Lipschitz function in $x$ and $y : J_x = (a(x), b(x)) \to U$ be the maximal solution to Eq. (51.1).

1. If $b(x) < b$, then for every compact subset $K \subset U$ there exists $T_K < b(x)$ such that $y(t) \notin K$ for all $t \in [T_K, b(x))$.

2. When $dim(X) < \infty$, we may write this condition as: if $b(x) < b$, then either

$$\limsup_{t \uparrow |b(x)} ||y(t)|| = \infty \text{ or } \liminf_{t \uparrow |b(x)} \text{ dist}(y(t), U^c) = 0.$$

Proof. 1) Suppose that $b(x) < b$ and, for sake of contradiction, there exists a compact set $K \subset U$ and $t_n \uparrow b(x)$ such that $y(t_n) \in K$ for all $n$. Since $K$ is compact, by passing to a subsequence if necessary, we may assume $\gamma := \lim_{n \to \infty} y(t_n)$ exists in $K \subset U$. By the local existence Theorem 51.5 there exists $T_0 > 0$ and $\delta > 0$ such that for each $x' \in B(\gamma, \delta)$ there exists a unique solution $w(\cdot, x') \in C^1((-T_0, T_0), U)$ solving

$$w(t, x') = Z(t, w(t, x'))$$

and $w(0, x') = x'$.

Now choose $n$ sufficiently large so that $t_n \in (b(x) - T_0/2, b(x))$ and $y(t_n) \in B(\gamma, \delta)$. Define $\tilde{y} : (a(x), b(x) + T_0/2) \to U$ by

$$\tilde{y}(t) = \begin{cases} y(t) & \text{if } t \in J_x \\ w(t - t_n, y(t_n)) & \text{if } t \in (t_n - T_0, b(x) + T_0/2). \end{cases}$$

wherein we have used $(t_n - T_0, b(x) + T_0/2) \subset (t_n - T_0, t_n + T_0)$. By uniqueness of solutions to ODE’s $\tilde{y}$ is well defined, $\tilde{y} \in C^1((a(x), b(x) + T_0/2), X)$ and $\tilde{y}$ solves the ODE in Eq. (51.1). But this violates the maximality of $y$.

2) For each $n \in \mathbb{N}$ let

$$K_n := \{ x \in U : ||x|| \leq n \text{ and dist}(x, U^c) \geq 1/n \}.$$

Then $K_n \uparrow U$ and each $K_n$ is a closed bounded set and hence compact if $dim(X) < \infty$. Therefore if $b(x) < b$, by item 1., there exists $T_n \in [0, b(x))$ such that $y(t) \notin K_n$ for all $t \in [T_n, b(x))$ or equivalently $||y(t)|| > n$ or $\text{dist}(y(t), U^c) < 1/n$ for all $t \in [T_n, b(x))$.

Remark 51.15 (This remark is still rather rough). In general it is not true that the functions $a$ and $b$ are continuous. For example, let $U$ be the region in $\mathbb{R}^2$ described in polar coordinates by $r > 0$ and $0 < \theta < 3\pi/2$ and $Z(x, y) = (0, -1)$ as in Figure 51.2 below. Then $b(x, y) = \infty$ for all $x \geq 0$ and $y > 0$ while $b(x, y) = \infty$ for all $x < 0$ and $y \in \mathbb{R}$ which shows $b$ is discontinuous. On the other hand notice that

$$\{ b > t \} = \{ x < 0 \} \cup \{ (x, y) : x \geq 0, y > t \}$$

is an open set for all $t > 0$. An example of a vector field for which $b(x)$ is discontinuous is given in the top left hand corner of Figure 51.2. The map $\psi(r \cos \theta, \sin \theta) := (\ln r, \tan (3\theta - \pi/2))$, would allow the reader to find an example on $\mathbb{R}^2$ if so desired. Some calculations shows that $Z$ transferred to $\mathbb{R}^2$ by the map $\psi$ is given by the new vector

$$\tilde{Z}(x, y) = -e^{-x} \left( \sin \left( \frac{3\pi}{8} + \frac{3}{4} \tan^{-1}(y) \right), \cos \left( \frac{3\pi}{8} + \frac{3}{4} \tan^{-1}(y) \right) \right).$$

(Bruce: Check this!)

Theorem 51.16 (Global Continuity). Let $Z \in C(J \times U, X)$ be a locally Lipschitz function in $x$. Then $D(Z)$ is an open subset of $J \times U$ and the functions $\varphi : D(Z) \to U$ and $\varphi : D(Z) \to U$ are continuous. More precisely, for all $x_0 \in U$ and all open intervals $J_0$ such that $0 \in J_0 \subseteq J_{x_0}$ there exists $\delta = \delta(x_0, J_0, Z) > 0$ and $C = C(x_0, J_0, Z) < \infty$ such that for all $x \in B(x_0, \delta)$, $J_0 \subseteq J_x$ and

$$||\varphi(\cdot, x) - \varphi(\cdot, x_0)||_{BC(J_0, U)} \leq C \| x - x_0 \|.$$  \hfill (51.25)
and assuming $x \in \mathbb{R}$ and let $0<\varepsilon<\Delta$ constant for $Z$ be given as in Lemma 51.8, i.e. $K$ is the Lipschitz constant for $Z$ on $E_e$. Also recall the notation: $\Delta(t) = [0,t]$ if $t > 0$ and $\Delta(t) = [t,0]$ if $t < 0$. Suppose that $x \in E_e$, then by Corollary 51.3

$$\|\varphi(t,x) - \varphi(t,x_0)\| \leq \|x - x_0\|e^{K|t|} \leq \|x - x_0\|e^{K|J_0|}$$

(51.26)

for all $t \in J_0 \cap J_x$ such that $\varphi(\Delta_1(t),x) \subset E_e$. Letting $\delta := \varepsilon e^{-K|J_0|}/2$, and assuming $x \in B(x_0, \delta)$, the previous equation implies

$$\|\varphi(t,x) - \varphi(t,x_0)\| \leq \varepsilon/2 < \varepsilon \quad \forall t \in J_0 \cap J_x \ni \varphi(\Delta_1(t),x) \subset E_e.$$  

This estimate further shows that $\varphi(t,x)$ remains bounded and strictly away from the boundary of $U$ for all such $t$. Therefore, it follows from Proposition 51.9 and “continuous induction” that $J_0 \subset J_x$ and Eq. (51.26) is valid for all $t \in J_0$. This proves Eq. (51.25) with $C := e^{K|J_0|}$. Suppose that $(t_0, x_0) \in D(Z)$ and let $0 \in J_0 \cap J_x$ such that $t_0 \in J_0$ and $\delta$ be as above. Then we have just shown $J_0 \times B(x_0, \delta) \subset D(Z)$ which proves $D(Z)$ is open. Furthermore, since the evaluation map

$$(t_0, y) \in J_0 \times BC(J_0, U) \rightarrow y(t_0) \in X$$

is continuous (as the reader should check) it follows that $\varphi = e \circ (x \rightarrow \varphi(t,x)) : J_0 \times B(x_0, \delta) \rightarrow U$ is also continuous; being the composition of continuous maps. The continuity of $\varphi(t_0, x)$ is a consequence of the continuity of $\varphi$ and the differential equation 51.1. Alternatively using Eq. (51.2),

$$\|\varphi(t_0,x) - \varphi(t,x_0)\| \leq \|\varphi(t_0,x) - \varphi(t_0,x_0)\| + \|\varphi(t_0,x_0) - \varphi(t,x_0)\|$$

$$\leq C \|x - x_0\| + \left|\int_{t_0}^t \|Z(t,\varphi(t,x_0))\| \, dt\right|$$

$$\leq C \|x - x_0\| + M|t_0 - t|$$

where $C$ is the constant in Eq. (51.2) and $M = \sup_{t \in J_0} \|Z(t,\varphi(t,x_0))\| < \infty$. This clearly shows $\varphi$ is continuous.

### 51.5 Semi-Group Properties of time independent flows

To end this chapter we investigate the semi-group property of the flow associated to the vector-field $Z$. It will be convenient to introduce the following suggestive notation. For $(t,x) \in D(Z)$, set $e^{tZ}(x) = \varphi(t,x)$. So the path $t \rightarrow e^{tZ}(x)$ is the maximal solution to

$$\frac{d}{dt}e^{tZ}(x) = Z(e^{tZ}(x)) \quad \text{with} \quad e^0Z(x) = x.$$  

This exponential notation will be justified shortly. It is convenient to have the following conventions.

**Notation 51.17** We write $f : X \rightarrow X$ to mean a function defined on some open subset $D(f) \subset X$. The open set $D(f)$ will be called the domain of $f$. Given two functions $f : X \rightarrow X$ and $g : X \rightarrow X$ with domains $D(f)$ and $D(g)$ respectively, we define the composite function $f \circ g : X \rightarrow X$ to be the function with domain

$$D(f \circ g) = \{x \in X : x \in D(g) \quad \text{and} \quad g(x) \in D(f)\} = g^{-1}(D(f))$$

given by the rule $f \circ g(x) = f(g(x))$ for all $x \in D(f \circ g)$. We now write $f = g$ iff $D(f) = D(g)$ and $f(x) = g(x)$ for all $x \in D(f) = D(g)$. We will also write $f \subset g$ iff $D(f) \subset D(g)$ and $g|_{D(f)} = f$.

**Theorem 51.18.** For fixed $t \in \mathbb{R}$ we consider $e^{tZ}$ as a function from $X$ to $X$ with domain $D(e^{tZ}) = \{x \in U : (t,x) \in D(Z)\}$, where $D(\varphi) = D(Z) \subset \mathbb{R} \times U$, $D(Z)$ and $\varphi$ are defined in Notation 51.10. Conclusions:

1. If $t, s \in \mathbb{R}$ and $t \cdot s \geq 0$, then $e^{tZ} \circ e^{sZ} = e^{(t+s)Z}$.
2. If $t \in \mathbb{R}$, then $e^{tZ} \circ e^{-tZ} = Id_{D(e^{-tZ})}$. 
3. For arbitrary $t, s \in \mathbb{R}$, $e^{tZ} \circ e^{sZ} \subset e^{(t+s)Z}$.

**Proof.** Item 1. For simplicity assume that $t, s \geq 0$. The case $t, s \leq 0$ is left to the reader. Suppose that $x \in D(e^{tZ} \circ e^{sZ})$. Then by assumption $x \in D(e^{sZ})$ and $e^{sZ}(x) \in D(e^{tZ})$. Define the path $y(t)$ via:

$$
  y(t) = \begin{cases} 
  e^{tZ}(x) & \text{if } 0 \leq t \leq s \\
  e^{(t-s)Z}(x) & \text{if } s \leq t \leq t+s
  \end{cases}
$$

It is easy to check that $y$ solves $\dot{y}(t) = Z(y(t))$ with $y(0) = x$. But since $e^{tZ}(x)$ is the maximal solution we must have that $x \in D(e^{(t+s)Z})$ and $y(t+s) = e^{(t+s)Z}(x)$. That is $e^{(t+s)Z}(x) = e^{tZ} \circ e^{sZ}(x)$. Hence we have shown that $e^{tZ} \circ e^{sZ} \subset e^{(t+s)Z}$. To finish the proof of item 1, it suffices to show that $D(e^{(t+s)Z}) \subset D(e^{tZ} \circ e^{sZ})$. Take $x \in D(e^{(t+s)Z})$, then clearly $x \in D(e^{sZ})$. Set $y(t) = e^{(t+s)Z}(x)$ defined for $0 \leq t \leq t$. Then $y$ solves

$$
  \dot{y}(t) = Z(y(t)) \quad \text{with } y(0) = e^{sZ}(x).
$$

But since $\tau \to e^{\tau Z}(e^{sZ}(x))$ is the maximal solution to the above initial valued problem we must have that $y(\tau) = e^{\tau Z}(e^{sZ}(x))$, and in particular at $\tau = t$, $e^{(t+s)Z}(x) = e^{tZ}(e^{sZ}(x))$. This shows that $x \in D(e^{(t+s)Z})$ and in fact $e^{(t+s)Z} \subset e^{tZ} \circ e^{sZ}$.

Item 2. Let $x \in D(e^{-tZ})$ – again assume for simplicity that $t \geq 0$. Set $y(t) = e^{(t-t)Z}(x)$ defined for $0 \leq t \leq t$. Notice that $y(0) = e^{-tZ}(x)$ and $\dot{y}(t) = Z(y(t))$. This shows that $y(t) = e^{tZ}(e^{-tZ}(x))$ and in particular that $x \in D(e^{tZ} \circ e^{-tZ})$ and $e^{tZ} \circ e^{-tZ}(x) = x$. This proves item 2.

Item 3. I will only consider the case that $s < 0$ and $t + s \geq 0$, the other cases are handled similarly. Write $u$ for $t + s$, so that $t = -s + u$. We know that $e^{tZ} = e^{uZ} \circ e^{-sZ}$ by item 1. Therefore

$$
  e^{tZ} \circ e^{sZ} = (e^{uZ} \circ e^{-sZ}) \circ e^{sZ}.
$$

Notice in general, one has $(f \circ g) \circ h = f \circ (g \circ h)$ (you prove). Hence, the above displayed equation and item 2. imply that

$$
  e^{tZ} \circ e^{sZ} = e^{uZ} \circ (e^{-sZ} \circ e^{sZ}) = e^{(t+s)Z} \subset e^{(t+s)Z}.
$$

The following result is trivial but conceptually illuminating partial converse to Theorem 51.18.

**Proposition 51.19 (Flows and Complete Vector Fields).** Suppose $U \subset X$, $\varphi \in C(\mathbb{R} \times U, U)$ and $\varphi(t)(x) = \varphi(t,x)$. Suppose $\varphi$ satisfies:

1. $\varphi_0 = I_U$,
2. $\varphi_t \circ \varphi_s = \varphi_{t+s}$ for all $t, s \in \mathbb{R}$, and
3. $Z(x) := \varphi(0,x)$ exists for all $x \in U$ and $Z \in C(U, X)$ is locally Lipschitz.

Then $\varphi_t = e^{tZ}$.

**Proof.** Let $x \in U$ and $y(t) := \varphi_t(x)$. Then using Item 2,

$$
  \dot{y}(t) = \frac{d}{ds} |y(t+s)| = \frac{d}{ds} |\varphi(t+s)| = \frac{d}{ds} |\varphi_s \circ \varphi_t(x)| = Z(y(t)).
$$

Since $y(0) = x$ by Item 1. and $Z$ is locally Lipschitz by Item 3., we know by uniqueness of solutions to ODE’s (Corollary 51.3) that $\varphi_t(x) = y(t) = e^{tZ}(x)$.

### 51.6 Exercises

**Exercise 51.1.** Find a vector field $Z$ such that $e^{(t+s)Z}$ is not contained in $e^{tZ} \circ e^{sZ}$.

**Definition 51.20.** A locally Lipschitz function $Z : U \subset X \to X$ is said to be a complete vector field if $D(Z) = \mathbb{R} \times U$. That is for any $x \in U$, $t \to e^{tZ}(x)$ is defined for all $t \in \mathbb{R}$.

**Exercise 51.2.** Suppose that $Z : X \to X$ is a locally Lipschitz function. Assume there is a constant $C > 0$ such that

$$
  \|Z(x)\| \leq C(1 + \|x\|) \quad \text{for all } x \in X.
$$

Then $Z$ is complete. **Hint:** use Gronwall’s Lemma (51.2) and Proposition (51.11).

**Exercise 51.3.** Suppose $y$ is a solution to $\dot{y}(t) = |y(t)|^{1/2}$ with $y(0) = 0$. Show there exists $a, b \in [0, \infty]$ such that

$$
  y(t) = \begin{cases} 
  \frac{1}{4} (t - b)^2 & \text{if } t \geq b \\
  0 & \text{if } -a < t < b \\
  -\frac{1}{4} (t + a)^2 & \text{if } t \leq -a.
  \end{cases}
$$

**Exercise 51.4.** Using the fact that the solutions to Eq. (51.13) are never 0 if $x \neq 0$, show that $y(t) = 0$ is the only solution to Eq. (51.13) with $y(0) = 0$.

**Exercise 51.5 (Higher Order ODE).** Let $X$ be a Banach space, $\mathcal{U} \subset X$ and $f \in C(J \times \mathcal{U}, X)$ be a Locally Lipschitz function in $x = (x_1, \ldots, x_n)$. Show the $n^{th}$ ordinary differential equation,

$$
  y^{(n)}(t) = f(t, y(t), \dot{y}(t), \ldots, y^{(n-1)}(t)) \quad \text{with } y^{(k)}(0) = y^k_0 \quad \text{for } k < n
$$

(51.27)
where \((y_0^0, \ldots, y_0^n)\) is given in \(U\), has a unique solution for small \(t \in J\). **Hint:** let \(y(t) = (y(t), y(t), \ldots, y(t^{n-1})(t))\) and rewrite Eq. (51.27) as a first order ODE of the form
\[
\dot{y}(t) = Z(t, y(t)) \text{ with } y(0) = (y_0^0, \ldots, y_0^n).
\]

**Exercise 51.6.** Use the results of Exercises 50.19 and 51.5 to solve
\[
\dot{y}(t) - 2\dot{y}(t) + y(t) = 0 \text{ with } y(0) = a \text{ and } \dot{y}(0) = b.
\]

**Hint:** The 2 \(\times\) 2 matrix associated to this system, \(A\), has only one eigenvalue 1 and may be written as \(A = I + B\) where \(B^2 = 0\).

**Exercise 51.7 (Non-Homogeneous ODE).** Suppose that \(U \subset_o X\) is open and \(Z : \mathbb{R} \times U \to X\) is a continuous function. Let \(J = (a, b)\) be an interval and \(t_0 \in J\). Suppose that \(y \in C^1(J, U)\) is a solution to the “non-homogeneous” differential equation:
\[
\dot{y}(t) = Z(t, y(t)) \text{ with } y(t_0) = x \in U.
\]

Define \(Y \in C^1(J - t_0, \mathbb{R} \times U)\) by \(Y(t) := (t + t_0, y(t + t_0))\). Show that \(Y\) solves the “homogeneous” differential equation
\[
\tilde{Y}(t) = \tilde{Z}(Y(t)) \text{ with } Y(0) = (t_0, y_0),
\]
where \(\tilde{Z}(t, x) := (1, Z(x))\). Conversely, suppose that \(Y \in C^1(J - t_0, \mathbb{R} \times U)\) is a solution to Eq. (51.28). Show that \(Y(t) = (t + t_0, y(t + t_0))\) for some \(y \in C^1(J, U)\) satisfying Eq. (51.28). (In this way the theory of non-homogeneous O.D.E.’s may be reduced to the theory of homogeneous O.D.E.’s.)

**Exercise 51.8 (Differential Equations with Parameters).** Let \(W\) be another Banach space, \(U \times V \subset_o X \times W\) and \(Z \in C(U \times V, X)\) be a locally Lipschitz function on \(U \times V\). For each \((x, w) \in U \times V\), let \(t \in J_{x,w} \to \varphi(t, x, w)\) denote the maximal solution to the ODE
\[
\dot{y}(t) = Z(y(t), w) \text{ with } y(0) = x.
\]

Prove
\[
D := \{(t, x, w) \in \mathbb{R} \times U \times V : t \in J_{x,w}\}
\]
is open in \(\mathbb{R} \times U \times V\) and \(\varphi\) and \(\dot{\varphi}\) are continuous functions on \(D\).

**Hint:** If \(y(t)\) solves the differential equation in (51.30), then \(v(t) := (y(t), w)\) solves the differential equation,
\[
\dot{v}(t) = \tilde{Z}(v(t)) \text{ with } v(0) = (x, w),
\]
where \(\tilde{Z}(x, w) := (Z(x, w), 0) \in X \times W\) and let \(\psi(t, (x, w)) := v(t)\). Now apply the Theorem 51.16 to the differential equation (51.32).

**Exercise 51.9 (Abstract Wave Equation).** For \(A \in L(X)\) and \(t \in \mathbb{R}\), let
\[
\cos(tA) := \sum_{n=0}^{\infty} \frac{(-1)^n}{(2n)!} t^{2n} A^{2n} \text{ and } \sin(tA) := \sum_{n=0}^{\infty} \frac{(-1)^n}{(2n+1)!} t^{2n+1} A^{2n+1}.
\]

Show that the unique solution \(y \in C^2(\mathbb{R}, X)\) to
\[
\ddot{y}(t) + A^2 y(t) = 0 \text{ with } y(0) = y_0 \text{ and } \dot{y}(0) = \dot{y}_0 \in X
\]
is given by
\[
y(t) = \cos(tA) y_0 + \frac{\sin(tA)}{A} \dot{y}_0.
\]

**Remark 51.21.** Exercise 51.9 can be done by direct verification. Alternatively and more instructively, rewrite Eq. (51.33) as a first order ODE using Exercise 51.5. In doing so you will be lead to compute \(e^{tB}\) where \(B \in L(\mathbb{R} \times X)\) is given by
\[
B = \begin{pmatrix} 0 & I \\ -A^2 & 0 \end{pmatrix},
\]
where we are writing elements of \(\mathbb{R} \times X\) as column vectors, \(\begin{pmatrix} x_1 \\ x_2 \end{pmatrix}\). You should then show
\[
e^{tB} = \begin{pmatrix} \cos(tA) & \sin(tA) \\ -A \sin(tA) & \cos(tA) \end{pmatrix}
\]
where
\[
A \sin(tA) := \sum_{n=0}^{\infty} \frac{(-1)^n}{(2n+1)!} t^{2n+1} A^{2n+1}.
\]

**Exercise 51.10 (Duhamel’s Principle for the Abstract Wave Equation).** Continue the notation in Exercise 51.9 but now consider the ODE,
\[
\ddot{y}(t) + A^2 y(t) = f(t) \text{ with } y(0) = y_0 \text{ and } \dot{y}(0) = \dot{y}_0 \in X
\]
where \(f \in C(\mathbb{R}, X)\). Show the unique solution to Eq. (51.34) is given by
\[
y(t) = \cos(tA) y_0 + \frac{\sin(tA)}{A} \dot{y}_0 + \int_0^t \sin((t - \tau) A) f(\tau) d\tau
\]

**Hint:** Again this could be proved by direct calculation. However it is more instructive to deduce Eq. (51.35) from Exercise 51.21 and the comments in Remark 51.21.
Banach Space Calculus

In this section, $X$ and $Y$ will be Banach space and $U$ will be an open subset of $X$.

**Notation 52.1** ($\varepsilon$, $O$, and $o$ notation) Let $0 \in U \subset_0 X$, and $f : U \to Y$ be a function. We will write:

1. $f(x) = \varepsilon(x)$ if $\lim_{x \to 0} \|f(x)\| = 0$.
2. $f(x) = O(x)$ if there are constants $C < \infty$ and $r > 0$ such that $\|f(x)\| \leq C\|x\|$ for all $x \in B(0,r)$. This is equivalent to the condition that $\limsup_{x \to 0} (\|x\|^{-1}\|f(x)\|) < \infty$, where
   \[
   \limsup_{x \to 0} \frac{\|f(x)\|}{\|x\|} := \limsup_r \{\|f(x)\| : 0 < \|x\| \leq r\}.
   \]
3. $f(x) = o(x)$ if $f(x) = \varepsilon(x)O(x)$, i.e. $\lim_{x \to 0} \|f(x)\|/\|x\| = 0$.

**Example 52.2.** Here are some examples of properties of these symbols.

1. A function $f : U \subset_0 X \to Y$ is continuous at $x_0 \in U$ if $f(x_0 + h) = f(x_0) + \varepsilon(h)$.
2. If $f(x) = \varepsilon(x)$ and $g(x) = \varepsilon(x)$ then $f(x) + g(x) = \varepsilon(x)$.
   Now let $g : Y \to Z$ be another function where $Z$ is another Banach space.
3. If $f(x) = O(x)$ and $g(y) = o(y)$ then $g \circ f(x) = o(x)$.
4. If $f(x) = \varepsilon(x)$ and $g(y) = \varepsilon(x)$ then $g \circ f(x) = \varepsilon(x)$.

**52.1 The Differential**

**Definition 52.3.** A function $f : U \subset_0 X \to Y$ is **differentiable** at $x_0 \in U$ if there exists a linear transformation $A \in L(X,Y)$ such that
\[
\lim_{h \to 0} \frac{f(x_0 + h) - f(x_0) - Ah}{\|h\|} = 0.
\]
We denote $A$ by $f'(x_0)$ or $Df(x_0)$ if it exists. As with continuity, $f$ is **differentiable** on $U$ if $f$ is differentiable at all points in $U$.

**Remark 52.4.** The linear transformation $A$ in Definition 52.3 is necessarily unique. Indeed if $A_1$ is another linear transformation such that Eq. (52.1) holds with $A$ replaced by $A_1$, then
\[
(A - A_1)h = o(h),
\]
i.e.
\[
\lim_{h \to 0} \frac{\|A - A_1\|}{\|h\|} = 0.
\]
On the other hand, by definition of the operator norm,
\[
\lim_{h \to 0} \frac{\|A - A_1\|}{\|h\|} = \|A - A_1\|.
\]
The last two equations show that $A = A_1$.

**Exercise 52.1.** Show that a function $f : (a, b) \to X$ is a differentiable at $t \in (a, b)$ in the sense of Definition 52.3 iff it is differentiable in the sense of Definition 50.9. Also show $Df(t)v = tf'(t)$ for all $v \in \mathbb{R}$.

**Example 52.5.** If $T \in L(X,Y)$ and $x, h \in X$, then
\[
T(x + h) - T(x) - Th = 0
\]
which shows $T'(x) = T$ for all $x \in X$.

**Example 52.6.** Assume that $GL(X,Y)$ is non-empty. Then by Corollary 14.22, $GL(X,Y)$ is an open subset of $L(X,Y)$ and the inverse map $f : GL(X,Y) \to GL(Y,X)$, defined by $f(A) := A^{-1}$, is continuous. We will now show that $f$ is differentiable and
\[
f'(A)B = -A^{-1}BA^{-1}
\]
for all $B \in L(X,Y)$. This is a consequence of the identity,
\[
f(A + H) - f(A) = (A + H)^{-1}(A - (A + H))A^{-1} = -(A + H)^{-1}HA^{-1}
\]
which may be used to find the estimate,
The differential

The following theorem summarizes some basic properties of the differential.

**Theorem 52.7.** The differential \( D \) has the following properties:

1. **Linearity:** \( D \) is linear, i.e. \( D(f + \lambda g) = Df + \lambda Dg \).
2. **Product Rule:** If \( f : U \subset \alpha \rightarrow X \rightarrow Y \) and \( A : U \subset \alpha \rightarrow X \rightarrow L(Y, Z) \) are differentiable at \( x_0 \) then so is \( x \rightarrow (Af)(x) := A(x)f(x) \) and

\[
D(Af)(x_0)h = (DA(x_0)hf(x_0) + A(x_0)Df(x_0)h).
\]

3. **Chain Rule:** If \( f : U \subset \alpha \rightarrow X \rightarrow V \subset \beta \subset Y \) is differentiable at \( x_0 \in U \), and \( g : V \subset \beta \rightarrow Z \) is differentiable at \( y_0 := f(x_0) \), then \( g \circ f \) is differentiable at \( x_0 \) and \( (g \circ f)'(x_0) = g'(y_0)f'(x_0) \).
4. **Converse Chain Rule:** Suppose that \( f : U \subset \alpha \rightarrow X \rightarrow V \subset \beta \subset Y \) is continuous at \( x_0 \in U \), \( g : V \subset \beta \rightarrow Z \) is differentiable at \( y_0 := f(x_0) \), \( g'(y_0) \) is invertible, and \( g \circ f \) is differentiable at \( x_0 \), then \( f \) is differentiable at \( x_0 \) and

\[
f'(x_0) := (g'(y_0))^{-1}(g \circ f)'(x_0). \tag{52.2}
\]

**Proof.** Linearity. Let \( f, g : U \subset \alpha \rightarrow X \rightarrow Y \) be two functions which are differentiable at \( x_0 \in U \) and \( \lambda \in \mathbb{R} \), then

\[
(f + \lambda g)(x_0 + h) = f(x_0) + Df(x_0)h + o(h) + \lambda(g(x_0) + Dg(x_0)h) + o(h)
\]

which implies that \( (f + \lambda g) \) is differentiable at \( x_0 \) and that

\[
D(f + \lambda g)(x_0) = Df(x_0) + \lambda Dg(x_0).
\]

**Product Rule.** The computation,

\[
A(x_0 + h)f(x_0 + h) = (A(x_0) + DA(x_0)h + o(h))(f(x_0) + f'(x_0)h + o(h))
\]

verifies the product rule holds. This may also be considered as a special case of Proposition 52.9.

**Chain Rule.** Using \( f(x_0 + h) - f(x_0) = O(h) \) (see Eq. (52.1)) and \( o(O(h)) = o(h) \),

\[
(g \circ f)(x_0 + h) = g(g(x_0))(g(x_0 + h) - f(x_0)) + o(f(x_0 + h) - f(x_0))
\]

Comparing these two equations shows that

\[
f(x_0 + h) - f(x_0) + o(f(x_0 + h) - f(x_0)) = g'(f(x_0))^{-1}(g \circ f)'(x_0)h + o(h)
\]

which is equivalent to

\[
f(x_0 + h) - f(x_0) + o(f(x_0 + h) - f(x_0)) = g'(f(x_0))^{-1}(g \circ f)'(x_0)h + o(h)
\]

Taking the norm of both sides of Eq. (52.3) and making use of Eq. (52.4) shows, for \( h \) close to zero, that

\[
||f(x_0 + h) - f(x_0)|| \leq \frac{1}{2} ||f(x_0 + h) - f(x_0)||
\]

for all \( h \) sufficiently close to 0. (We may replace \( \frac{1}{2} \) by any number \( \alpha > 0 \) above.)
\[ \| f(x_0 + h) - f(x_0) \| \]
\[ \leq \| g'(f(x_0))^{-1}(g \circ f)'(x_0) \| \| h \| + o(\| h \|) + \frac{1}{2} \| f(x_0 + h) - f(x_0) \|. \]

Solving for \( \| f(x_0 + h) - f(x_0) \| \) in this last equation shows that
\[ f(x_0 + h) - f(x_0) = O(h). \] (52.5)

(This is an improvement, since the continuity of \( f \) only guaranteed that \( f(x_0 + h) - f(x_0) = \varepsilon(h) \).) Because of Eq. (52.5), we now know that \( o(\| f(x_0 + h) - f(x_0) \|) = o(h) \), which combined with Eq. (52.3) shows that
\[ f(x_0 + h) - f(x_0) = g'(f(x_0))^{-1}(g \circ f)'(x_0)h + o(h) \]
i.e. \( f \) is differentiable at \( x_0 \) and \( f'(x_0) = g'(f(x_0))^{-1}(g \circ f)'(x_0) \).

**Corollary 52.8 (Chain Rule).** Suppose that \( \sigma : (a, b) \to U \subset \sigma X \) is differentiable at \( t \in (a, b) \) and \( f : U \subset \sigma X \to Y \) is differentiable at \( \sigma(t) \in U \). Then \( f \circ \sigma \) is differentiable at \( t \) and
\[ d(f \circ \sigma)(t)/dt = f'(\sigma(t))\dot{\sigma}(t). \]

**Proposition 52.9 (Product Rule II).** Suppose that \( X := X_1 \times \cdots \times X_n \) with each \( X_i \) being a Banach space and \( T : X_1 \times \cdots \times X_n \to Y \) is a multilinear map, i.e.
\[ x_i \in X_i \to T(x_1, \ldots, x_i-1, x_i, x_i+1, \ldots, x_n) \in Y \]
is linear when \( x_1, \ldots, x_i-1, x_i+1, \ldots, x_n \) are held fixed. Then the following are equivalent:

1. \( T \) is continuous.
2. \( T \) is continuous at \( 0 \in X \).
3. There exists a constant \( C < \infty \) such that
\[ \| T(x) \|_Y \leq C \prod_{i=1}^n \| x_i \|_{X_i}, \] (52.6)

for all \( x = (x_1, \ldots, x_n) \in X \).
4. \( T \) is differentiable at all \( x \in X_1 \times \cdots \times X_n \).

Moreover if \( T \) the differential of \( T \) is given by
\[ T'(x)h = \sum_{i=1}^n T(x_1, \ldots, x_i-1, h_i, x_i+1, \ldots, x_n) \] (52.7)
where \( h = (h_1, \ldots, h_n) \in X \).

**Proof.** Let us equip \( X \) with the norm
\[ \| x \|_X := \max \{ \| x_i \|_{X_i} \}. \]

If \( T \) is continuous then \( T \) is continuous at 0. If \( T \) is continuous at 0, using \( T(0) = 0 \), there exists a \( \delta > 0 \) such that \( \| T(x) \|_Y \leq 1 \) whenever \( \| x \|_X \leq \delta \). Now if \( x \in X \) is arbitrary, let \( x' := \delta \left( \| x_1 \|^{-1}_{X_1} x_1, \ldots, \| x_n \|^{-1}_{X_n} x_n \right) \). Then \( \| x' \|_X \leq \delta \) and hence
\[ \left\| \left( \delta^n \prod_{i=1}^n \| x_i \|^{-1}_{X_i} \right) T(x_1, \ldots, x_n) \right\|_Y = \| T(x') \| \leq 1 \]

from which Eq. (52.6) follows with \( C = \delta^{-n} \).

Now suppose that Eq. (52.6) holds. For \( x, h \in X \) and \( \varepsilon \in \{0,1\}^n \) let \( \varepsilon = \sum_{i=1}^n \varepsilon_i \) and
\[ x^\varepsilon(h) := ((1 - \varepsilon_1)x_1 + \varepsilon_1 h_1, \ldots, (1 - \varepsilon_n)x_n + \varepsilon_n h_n) \in X. \]

By the multi-linearity of \( T \),
\[ T(x + h) = T(x_1 + h_1, \ldots, x_n + h_n) = \sum_{\varepsilon \in \{0,1\}^n} T(x^\varepsilon(h)) \]
\[ = T(x) + \sum_{i=1}^n T(x_1, \ldots, x_i-1, h_i, x_i+1, \ldots, x_n) + \sum_{\varepsilon \in \{0,1\}^n; |\varepsilon| \geq 2} T(x^\varepsilon(h)). \] (52.8)

From Eq. (52.6),
\[ \left\| \sum_{\varepsilon \in \{0,1\}^n; |\varepsilon| \geq 2} T(x^\varepsilon(h)) \right\|_Y = O\left( \| h \|^2 \right), \]

and so it follows from Eq. (52.8) that \( T'(x) \) exists and is given by Eq. (52.7). This completes the proof since it is trivial to check that \( T \) being differentiable at \( x \in X \) implies continuity of \( T \) at \( x \in X \). \( \blacksquare \)

**Exercise 52.2.** Let \( \det : L(\mathbb{R}^n) \to \mathbb{R} \) be the determinant function on \( n \times n \) matrices and for \( A \in L(\mathbb{R}^n) \) we will let \( A_i \) denote the \( i \)th column of \( A \) and write \( A = (A_1| A_2 | \ldots | A_n) \).

1. Show \( \det'(A) \) exists for all \( A \in L(\mathbb{R}^n) \) and
are linear and bounded. So by the chain and the product rule we find

$$\det'(A) H = \sum_{i=1}^{n} \det(A_1|...|A_{i-1}|H_i|A_{i+1}|...|A_n)$$  \hspace{1cm} (52.9)$$

for all $H \in L(\mathbb{R}^n)$. \textbf{Hint:} recall that $\det(A)$ is a multilinear function of its columns.

2. Use Eq. (52.9) along with basic properties of the determinant to show\n
$$A \in GL(\mathbb{R}^n), \text{ show} \det'(I) H = \text{tr}(H).$$

3. Suppose now that $A \in GL(\mathbb{R}^n)$, show\n
$$\det'(A) H = \det(A) \text{tr}(A^{-1} H).$$

\textbf{Hint:} Notice that $\det(A + H) = \det(A) \det(I + A^{-1} H)$.

4. If $A \in L(\mathbb{R}^n)$, show $\det(e^A) = e^{\text{tr}(A)}$. \textbf{Hint:} use the previous item and Corollary 52.8 to show

$$\frac{d}{dt} \det(e^{tA}) = \det(e^{tA}) \text{tr}(A).$$

\textbf{Definition 52.10.} Let $X$ and $Y$ be Banach spaces and let $L^1(X,Y) := L(X,Y)$ and for $k \geq 2$ let $L^k(X,Y)$ be defined inductively by $L^{k+1}(X,Y) = L(X,L^k(X,Y))$. For example $L^2(X,Y) = L(X,L(X,Y))$ and $L^3(X,Y) = L(X,L(X,L(X,Y))).$

Suppose $f : U \subset \subset X \to Y$ is a function. If $f$ is differentiable on $U$, then it makes sense to ask if $f' = Df : U \to L(X,Y) = L^1(X,Y)$ is differentiable. If $Df$ is differentiable on $U$ then $f'' = D^2f := D(Df) : U \to L^2(X,Y)$. Similarly we define $f^{(n)} = D^n f : U \to L^n(X,Y)$ inductively.

\textbf{Definition 52.11.} Given $k \in \mathbb{N}$, let $C^k(U,Y)$ denote those functions $f : U \to Y$ such that $f^{(j)} := D^j f : U \to L^j(X,Y)$ exists and is continuous for $j = 1,2,\ldots,k$.

\textbf{Example 52.12.} Let us continue on with Example 52.6 but now let $X = Y$ to simplify the notation. So $f : GL(X) \to GL(X)$ is the map $f(A) = A^{-1}$ and

$$f'(A) = -L_{A^{-1}} R_{A^{-1}}, \text{ i.e. } f' = -L_f R_f,$$

where $L_{AB} = AB$ and $R_{AB} = BA$ for all $A,B \in L(X)$. As the reader may easily check, the maps

$$A \in L(X) \to L_A, R_A \in L(L(X))$$

are linear and bounded. So by the chain and the product rule we find $f''(A)$ exists for all $A \in L(X)$ and

$$f''(A) B = -L_f'(A) B R_f - L_f R_f'(A) B.$$

More explicitly

$$[f''(A) B] C = A^{-1} B A^{-1} C A^{-1} + A^{-1} C A^{-1} B A^{-1}.$$  \hspace{1cm} (52.10)$$

Working inductively one shows $f : GL(X) \to GL(X)$ defined by $f(A) := A^{-1}$ is $C^\infty$.

\textbf{52.3 Partial Derivatives}

\textbf{Definition 52.13 (Partial or Directional Derivative).} Let $f : U \subset \subset X \to Y$ be a function, $x_0 \in U$, and $v \in X$. We say that $f$ is differentiable at $x_0$ in the direction $v$ iff $\frac{df}{dt}(x_0 + tv) =: (\partial_v f)(x_0)$ exists. We call $(\partial_v f)(x_0)$ the directional or partial derivative of $f$ at $x_0$ in the direction $v$.

Notice that if $f$ is differentiable at $x_0$, then $\partial_v f(x_0)$ exists and is equal to $f'(x_0)v$, see Corollary 52.8.

\textbf{Proposition 52.14.} Let $f : U \subset \subset X \to Y$ be a continuous function and $D \subset X$ be a dense subspace of $X$. Assume $\partial_v f(x)$ exists for all $x \in U$ and $v \in D$, and there exists a continuous function $A : U \to L(X,Y)$ such that $\partial_v f(x) = A(x)v$ for all $v \in D$ and $x \in U \cap D$. Then $f \in C^1(U,Y)$ and $Df = A$.

\textbf{Proof.} Let $x_0 \in U, \varepsilon > 0$ such that $B(x_0, 2\varepsilon) \subset U$ and $M := \sup\{\|A(x)\| : x \in B(x_0,2\varepsilon)\} < \infty$. For $x \in B(x_0,\varepsilon) \cap D$ and $v \in D \cap B(0,\varepsilon)$, by the fundamental theorem of calculus,

$$f(x + v) - f(x) = \int_0^1 \frac{df(x + tv)}{dt}dt = \int_0^1 (\partial_v f)(x + tv)dt = \int_0^1 A(x + tv)v dt.$$  \hspace{1cm} (52.11)$$

For general $x \in B(x_0,\varepsilon)$ and $v \in B(0,\varepsilon)$, choose $x_n \in B(x_0,\varepsilon) \cap D$ and $v_n \in D \cap B(0,\varepsilon)$ such that $x_n \to x$ and $v_n \to v$. Then

$\text{It should be noted well, unlike in finite dimensions closed and bounded sets need not be compact, so it is not sufficient to choose \(epsilon \) sufficiently small so that \(B(x_0,2\epsilon) \subset U \). Here is a counterexample. Let \(X \equiv H \) be a Hilbert space, \(\{e_n\}_{n=1}^\infty \) be an orthonormal set. Define \(f(x) \equiv \sum_{n=1}^{\infty} \phi(||x - e_n||)\), where \(\phi\) is any continuous function on \(\mathbb{R}\) such that \(\phi(0) = 1\) and \(\phi\) is supported in \((-1,1)\). Notice that \(\|e_n - e_m\|^2 = 2 \) for all \(m \neq n\), so that \(\|e_n - e_m\| = \sqrt{2}\). Using this fact it is rather easy to check that for any \(x_0 \in H\), there is an \(\epsilon > 0\) such that for all \(x \in B(x_0,\epsilon)\), only one term in the sum defining \(f\) is non-zero. Hence, \(f\) is continuous. However, \(f(e_n) = n \to \infty\) as \(n \to \infty\).}
holds for all \( n \). The left side of this last equation tends to \( f(x + v) - f(x) \) by the continuity of \( f \). For the right side of Eq. (52.12) we have

\[
\| \int_0^1 A(x + tv)v \, dt - \int_0^1 A(x_n + tv_n)v_n \, dt \| \\
\leq \int_0^1 \| A(x + tv) - A(x_n + tv_n) \| \| v \| \, dt + M \| v - v_n \|.
\]

It now follows by the continuity of \( A \), the fact that \( \| A(x + tv) - A(x_n + tv_n) \| \leq M \), and the dominated convergence theorem that right side of Eq. (52.12) converges to \( \int_0^1 A(x + tv)v \, dt \). Hence Eq. (52.11) is valid for all \( x \in B(x_0, \varepsilon) \) and \( v \in B(0, \varepsilon) \). We also see that

\[
f(x + v) - f(x) - A(x)v = \varepsilon(v)v,
\]

where \( \varepsilon(v) := \int_0^1 [A(x + tv) - A(x)] \, dt \). Now

\[
\| \varepsilon(v) \| \leq \int_0^1 \| A(x + tv) - A(x) \| \, dt \\
\leq \max_{t \in [0,1]} \| A(x + tv) - A(x) \| \to 0 \text{ as } v \to 0,
\]

by the continuity of \( A \). Thus, we have shown that \( f \) is differentiable and that \( Df(x) = A(x) \). \( \blacksquare \)

**Corollary 52.15.** Suppose now that \( X = \mathbb{R}^d \), \( f : U \subset X \to Y \) be a continuous function such that \( \partial_i f(x) := \partial_{e_i} f(x) \) exists and is continuous on \( U \) for \( i = 1, 2, \ldots, d \), where \( \{e_i\}_{i=1}^d \) is the standard basis for \( \mathbb{R}^d \). Then \( f \in C^1(U, Y) \) and \( Df(x) e_i = \partial_i f(x) \) for all \( i \).

**Proof.** For \( x \in U \), let \( A(x) : \mathbb{R}^d \to Y \) be the unique linear map such that \( A(x) e_i = \partial_i f(x) \) for \( i = 1, 2, \ldots, d \). Then \( A : U \to \mathcal{L}(\mathbb{R}^d, Y) \) is a continuous map. Now let \( v \in \mathbb{R}^d \) and \( v^{(i)} := (v_1, v_2, \ldots, v_i, 0, \ldots, 0) \) for \( i = 1, 2, \ldots, d \) and \( v^{(0)} := 0 \). Then for \( t \in \mathbb{R} \) near 0, using the fundamental theorem of calculus and the definition of \( \partial_i f(x) \),

\[
f(x + tv) - f(x) = \sum_{i=1}^d \left[ f(x + tv^{(i)}) - f(x + tv^{(i-1)}) \right]
\]

\[
= \sum_{i=1}^d \int_0^1 \frac{d}{ds} f(x + tv^{(i-1)} + tv_1 e_i) \, ds
\]

\[
= \sum_{i=1}^d tv_i \int_0^1 \partial_i f(x + tv^{(i-1)} + tv_1 e_i) \, ds
\]

\[
= \sum_{i=1}^d tv_i \int_0^1 A \left( x + tv^{(i-1)} + tv_1 e_i \right) e_i \, ds.
\]

Using the continuity of \( A \), it now follows that

\[
\lim_{t \to 0} \frac{f(x + tv) - f(x)}{t} = \sum_{i=1}^d v_i \lim_{t \to 0} \int_0^1 A \left( x + tv^{(i-1)} + tv_1 e_i \right) e_i \, ds
\]

\[
= \sum_{i=1}^d v_i \int_0^1 A(x) e_i \, ds = A(x) v
\]

which shows \( \partial_i f(x) \) exists and \( \partial_i f(x) = A(x) \). The result now follows from an application of Proposition 52.14. \( \blacksquare \)

### 52.4 Higher Order Derivatives

It is somewhat inconvenient to work with the Banach spaces \( \mathcal{L}^k(X, Y) \) in Definition 52.10. For this reason we will introduce an isomorphic Banach space, \( M_k(X, Y) \).

**Definition 52.16.** For \( k \in \{1, 2, 3, \ldots\} \), let \( M_k(X, Y) \) denote the set of functions \( f : X^k \to Y \) such that

1. For \( i \in \{1, 2, \ldots, k\} \), \( v \in X \to f(v_1, v_2, \ldots, v_{i-1}, v, v_{i+1}, \ldots, v_k) \in Y \) is linear \( ^2 \) for all \( \{v_i\}_{i=1}^n \subset X \).
2. The norm \( \|f\|_{M_k(X,Y)} \) should be finite, where

\[
\|f\|_{M_k(X,Y)} := \sup \{ \|f(v_1, v_2, \ldots, v_k)\|_Y : \{v_i\}_{i=1}^k \subset X \setminus \{0\} \}
\]

\( ^2 \) I will routinely write \( f(v_1, v_2, \ldots, v_k) \) rather than \( f(v_1, v_2, \ldots, v_k) \) when the function \( f \) depends on each of variables linearly, i.e. \( f \) is a multi-linear function.
Lemma 52.17. There are linear operators $j_k : \mathcal{L}^k(X,Y) \to M_k(X,Y)$ defined inductively as follows: $j_1 = Id_{\mathcal{L}(X,Y)}$ (notice that $M_1(X,Y) = \mathcal{L}(X,Y)$) and

$$
(j_{k+1} A)(v_0, v_1, \ldots, v_k) = (j_k(A v_0))(v_1, v_2, \ldots, v_k) \quad \forall v_i \in X.
$$

(Notice that $Av_0 \in \mathcal{L}^k(X,Y).$) Moreover, the maps $j_k$ are isometric isomorphisms.

Proof. To get a feeling for what $j_k$ is let us write out $j_2$ and $j_3$ explicitly. If $A \in \mathcal{L}^2(X,Y) = L(X,L(X,Y))$, then $(j_2 A)(v_1, v_2) = (A v_1) v_2$ and if $A \in \mathcal{L}^3(X,Y) = L(X,L(X,L(X,Y)))$, $(j_3 A)(v_1, v_2, v_3) = ((A v_1) v_2) v_3$ for all $v_i \in X$. It is easily checked that $j_k$ is linear for all $k$. We will now show by induction that $j_k$ is an isometry and in particular that $j_k$ is injective. Clearly this is true if $k = 1$ since $j_1$ is the identity map. For $A \in \mathcal{L}^{k+1}(X,Y)$,

$$
\|j_{k+1} A\|_{M_{k+1}(X,Y)} := \sup \{ \| (j_{k+1} A v_0) (v_1, v_2, \ldots, v_k) \|_Y : \{v_i\}_{i=0}^k \subset X \setminus \{0\} \}
$$

$$
= \sup \{ \| (j_k(A v_0)) (v_1, v_2, \ldots, v_k) \|_Y : v_0 \in X \setminus \{0\} \}
$$

$$
= \sup \{ \| A v_0 \|_{\mathcal{L}^k(X,Y)} : v_0 \in X \setminus \{0\} \}
$$

$$
= \| A \|_{L(X,\mathcal{L}^k(X,Y))} := \| A \|_{\mathcal{L}^{k+1}(X,Y)},
$$

wherein the second to last inequality we have used the induction hypothesis. This shows that $j_{k+1}$ is an isometry provided $j_k$ is an isometry. To finish the proof it suffices to show that $j_k$ is surjective for all $k$. Again this is true for $k = 1$. Suppose that $j_k$ is invertible for some $k \geq 1.$ Given $f \in M_{k+1}(X,Y)$ we must produce $A \in \mathcal{L}^{k+1}(X,Y) = L(X,\mathcal{L}^k(X,Y))$ such that $j_{k+1} A = f.$ If such an equation is to hold, then for $v_0 \in X$, we would have $j_k(A v_0) = f(v_0, \ldots)$. That is $Av_0 = j^{-1}_k(f(v_0, \ldots))$. It is easily checked that $A$ so defined is linear, bounded, and $j_{k+1} A = f$. $\blacksquare$

From now on we will identify $\mathcal{L}^k$ with $M_k$ without further mention. In particular, we will view $D^k f$ as function on $U$ with values in $M_k(X,Y)$.

Theorem 52.18 (Differentiability). Suppose $k \in \{1, 2, \ldots\}$ and $D$ is a dense subspace of $X$, $f : U \subset X \to Y$ is a function such that $(\partial_{v_1} \partial_{v_2} \cdots \partial_{v_l} f)(x)$ exists for all $x \in D \cap U$, $\{v_i\}_{i=1}^l \subset D$, and $l = 1, 2, \ldots k$. Further assume there exists continuous functions $A_l : U \subset X \to M_l(X,Y)$ such that $(\partial_{v_1} \partial_{v_2} \cdots \partial_{v_l} f)(x) = A_l(x)(v_1, v_2, \ldots, v_l)$ for all $x \in D \cap U$, $\{v_i\}_{i=1}^l \subset D$, and $l = 1, 2, \ldots k$. Then $D^k f(x)$ exists and is equal to $A_k(x)$ for all $x \in U$ and $l = 1, 2, \ldots, k$.

Proof. We will prove the theorem by induction on $k$. We have already proved the theorem when $k = 1$, see Proposition 52.14. Now suppose that $k > 1$ and that the statement of the theorem holds when $k$ is replaced by $k - 1$. Hence we know that $D^l f(x) = A_l(x)$ for all $x \in U$ and $l = 1, 2, \ldots, k - 1$. We are also given that

$$
(\partial_{v_1} \partial_{v_2} \cdots \partial_{v_l} f)(x) = A_k(x)(v_1, v_2, \ldots, v_k) \quad \forall x \in U \cap D, \{v_i\} \subset D. \tag{52.14}
$$

Now we may write $(\partial_{v_2} \cdots \partial_{v_l} f)(x)$ as $(D^{k-1} f)(v_2, v_3, \ldots, v_k)$ so that Eq. 52.14 may be written as

$$
\partial_{v_1}(D^{k-1} f)(v_2, v_3, \ldots, v_k) = A_k(x)(v_1, v_2, \ldots, v_k) \quad \forall x \in U \cap D, \{v_i\} \subset D. \tag{52.15}
$$

So by the fundamental theorem of calculus, we have that

$$
((D^{k-1} f)(x + v_1) - (D^{k-1} f)(x))(v_2, v_3, \ldots, v_k)
$$

$$
= \int_0^1 A_k(x + tv_1)(v_1, v_2, \ldots, v_k) dt \tag{52.16}
$$

for all $x \in U \cap D$ and $\{v_i\} \subset D$ with $v_1$ sufficiently small. By the same argument given in the proof of Proposition 52.14 the Eq. 52.16 remains valid for all $x \in U$ and $\{v_i\} \subset X$ with $v_1$ sufficiently small. We may write this last equation alternatively as,

$$
(D^{k-1} f)(x + v_1) - (D^{k-1} f)(x) = \int_0^1 A_k(x + tv_1)(v_1, \cdots) dt. \tag{52.17}
$$

Hence

$$
(D^{k-1} f)(x + v_1) - (D^{k-1} f)(x) - A_k(x)(v_1, \cdots) = \int_0^1 [A_k(x + tv_1) - A_k(x)](v_1, \cdots) dt
$$

from which we get the estimate,

$$
\| (D^{k-1} f)(x + v_1) - (D^{k-1} f)(x) - A_k(x)(v_1, \cdots) \| \leq \varepsilon(v_1) \| v_1 \| \tag{52.18}
$$

where $\varepsilon(v_1) := \int_0^1 \| A_k(x + tv_1) - A_k(x) \| dt$. Notice by the continuity of $A_k$ that $\varepsilon(v_1) \to 0$ as $v_1 \to 0$. Thus it follow from Eq. 52.18 that $D^k f(x)$ is differentiable and that $(D^k f)(x) = A_k(x)$.

Example 52.19. Let $f : GL(X,Y) \to GL(Y,X)$ be defined by $f(A) := A^{-1}$. We assume that $GL(X,Y)$ is not empty. Then $f$ is infinitely differentiable and
\[ (D^k f)(A) \langle V_1, V_2, \ldots, V_k \rangle = (-1)^k \sum_{\sigma} \{ B^{-1} V_{\sigma(1)} B^{-1} V_{\sigma(2)} B^{-1} \cdots B^{-1} V_{\sigma(k)} B^{-1} \}, \tag{52.19} \]

where \( \sigma \) is over all permutations of \( \{1, 2, \ldots, k\} \).

Let me check Eq. (52.19) in the case that \( k = 2 \). Notice that we have already shown that \( \langle \partial_v f(B) \rangle = Df(B) V_1 = -B^{-1} V_1 B^{-1} \). Using the product rule we find that

\[ \langle \partial_v \partial_v f(B) \rangle = B^{-1} V_2 B^{-1} V_1 B^{-1} + B^{-1} V_1 B^{-1} V_2 B^{-1} =: A_2(B) \langle V_1, V_2 \rangle. \]

Notice that \( \|A_2(B) \langle V_1, V_2 \rangle\| \leq 2 \|B^{-1}\| \|V_1\| \cdot \|V_2\| \), so that \( \|A_2(B)\| \leq 2 \|B^{-1}\|^3 < \infty \). Hence \( A_2 : GL(X, Y) \to M_2(L(X, Y), L(Y, X)) \). Also

\[ \|A_2(B) - A_2(C)\| \langle V_1, V_2 \rangle \leq 2 \|B^{-1}V_2B^{-1}V_1B^{-1} - C^{-1}V_2C^{-1}V_1C^{-1}\| \]
\[ \leq 2 \|B^{-1}V_2B^{-1}V_1B^{-1} - B^{-1}V_2B^{-1}V_1C^{-1}\| + 2 \|B^{-1}V_2B^{-1}V_1C^{-1} - B^{-1}V_2C^{-1}V_1C^{-1}\| \]
\[ \leq 2 \|B^{-1}\|^2 \|V_2\| \|V_1\| \|B^{-1} - C^{-1}\| \]
\[ + 2 \|B^{-1}\| \|C^{-1}\| \|V_2\| \|V_1\| \|B^{-1} - C^{-1}\|. \]

This shows that

\[ \|A_2(B) - A_2(C)\| \leq 2 \|B^{-1} - C^{-1}\| (\|B^{-1}\|^2 + \|B^{-1}\| \|C^{-1}\| + \|C^{-1}\|^2). \]

Since \( B \to B^{-1} \) is differentiable and hence continuous, it follows that \( A_2(B) \) is also continuous in \( B \). Hence by Theorem 52.18 \( D^2 f(A) \) exists and is given as in Eq. (52.19).

Example 52.20. Suppose that \( f : \mathbb{R} \to \mathbb{R} \) is a \( C^\infty \) function and \( F(x) := \int_0^1 f(x(t)) \, dt \) for \( x \in X := C([0,1], \mathbb{R}) \) equipped with the norm \( \|x\| := \max_{t \in [0,1]} |x(t)| \). Then \( F : X \to \mathbb{R} \) is also infinitely differentiable and

\[ (D^k f)(x) \langle v_1, v_2, \ldots, v_k \rangle = \int_0^1 f^{(k)}(x(t)) v_1(t) \cdots v_k(t) \, dt, \tag{52.20} \]

for all \( x \in X \) and \( \{v_i\} \subset X \).

To verify this example, notice that

\[ (\partial_v F)(x) := \frac{d}{ds} |_{s=0} F(x + sv) = \frac{d}{ds} |_{s=0} \int_0^1 f(x(t) + sv(t)) \, dt \]
\[ = \int_0^1 \frac{d}{ds} |_{s=0} f(x(t) + sv(t)) \, dt = \int_0^1 f'(x(t)) v(t) \, dt. \]

Similar computations show that

\[ (\partial_v \partial_v \cdots \partial_v f)(x) = \int_0^1 f^{(k)}(x(t)) v_1(t) \cdots v_k(t) \, dt =: A_k(x) \langle v_1, v_2, \ldots, v_k \rangle. \]

Now for \( x, y \in X \),

\[ |A_k(x) \langle v_1, v_2, \ldots, v_k \rangle - A_k(y) \langle v_1, v_2, \ldots, v_k \rangle| \]
\[ \leq \int_0^1 |f^{(k)}(x(t)) - f^{(k)}(y(t))| \cdot |v_1(t) \cdots v_k(t)| \, dt \]
\[ \leq \int_0^1 \left( \prod_{i=1}^k |v_i| \right) \int_0^1 |f^{(k)}(x(t)) - f^{(k)}(y(t))| \, dt, \]

which shows that

\[ \|A_k(x) - A_k(y)\| \leq \int_0^1 |f^{(k)}(x(t)) - f^{(k)}(y(t))| \, dt. \]

This last expression is easily seen to go to zero as \( y \to x \) in \( X \). Hence \( A_k \) is continuous. Thus we may apply Theorem 52.18 to conclude that Eq. (52.20) is valid.

52.5 Inverse and Implicit Function Theorems

In this section, let \( X \) be a Banach space, \( R > 0, U = B = B(0, R) \subset X \) and \( \varepsilon : U \to X \) be a continuous function such that \( \varepsilon(0) = 0 \). Our immediate goal is to give a sufficient condition on \( \varepsilon \) so that \( F(x) := x + \varepsilon(x) \) is a homeomorphism from \( U \) to \( F(U) \) with \( F(U) \) being an open subset of \( X \). Let’s start by looking at the one dimensional case first. So for the moment assume that \( X = \mathbb{R} \), \( U = (-1, 1) \), and \( \varepsilon : U \to \mathbb{R} \) is \( C^1 \). Then \( F \) will be injective iff \( F \) is either strictly increasing or decreasing. Since we are thinking that \( F \) is a “small” perturbation of the identity function we will assume that \( F \) is strictly increasing, i.e. \( F' > 1 + \varepsilon' > 0 \). This positivity condition is not so easily interpreted for operators on a Banach space. However the condition that \( |\varepsilon'| < 1 \) is easily interpreted in the Banach space setting and it implies \( 1 + \varepsilon' > 0 \).

Lemma 52.21. Suppose that \( U = B = B(0, R) \mathbb{R} > 0 \) is a ball in \( X \) and \( \varepsilon : B \to X \) is a \( C^1 \) function such that \( \|D\varepsilon\| < \alpha < \infty \) on \( U \). Then

\[ \|\varepsilon(x) - \varepsilon(y)\| \leq \alpha \|x - y\| \text{ for all } x, y \in U. \tag{52.21} \]
Proof. By the fundamental theorem of calculus and the chain rule:

\[
\varepsilon(y) - \varepsilon(x) = \int_0^1 \frac{d}{dt}\varepsilon(x + t(y - x)) dt \\
= \int_0^1 |D\varepsilon(x + t(y - x))(y - x)| dt.
\]

Therefore, by the triangle inequality and the assumption that \(\|D\varepsilon(x)\| \leq \alpha\) on \(B\),

\[
\|\varepsilon(y) - \varepsilon(x)\| \leq \int_0^1 \|D\varepsilon(x + t(y - x))\| dt \cdot \|(y - x)\| \leq \alpha \|(y - x)\|.
\]

\[\Box\]

Remark 52.22. It is easily checked that if \(\varepsilon : U = B(0, R) \to X\) is \(C^1\) and satisfies \((52.21)\), then \(\|D\varepsilon\| \leq \alpha\) on \(U\).

Using the above remark and the analogy to the one dimensional example, one is lead to the following proposition.

Proposition 52.23. Suppose \(\alpha \in (0, 1), R > 0, U = B(0, R) \subset X\) and \(\varepsilon : U \to X\) is a \(C^1\) function such that \(\varepsilon(0) = 0\) and

\[
\|\varepsilon(x) - \varepsilon(y)\| \leq \alpha\|x - y\| \quad \forall x, y \in U. \tag{52.22}
\]

Then \(F : U \to X\) defined by \(F(x) := x + \varepsilon(x)\) for \(x \in U\) satisfies:

1. \(F\) is an injective map and \(G = F^{-1} : V \to U\) is continuous where \(V := F(U)\).

2. If \(x_0 \in U\), \(z_0 = F(x_0)\) and \(r > 0\) such that \(B(x_0, r) \subset U\), then

\[
B(z_0, (1 - \alpha) r) \subset F(B(x_0, r)) \subset B(z_0, (1 + \alpha) r). \tag{52.23}
\]

In particular, for all \(r \leq R\),

\[
B(0, (1 - \alpha) r) \subset F(B(0, r)) \subset B(0, (1 + \alpha) r), \tag{52.24}
\]

see Figure 52.1 below.

3. \(V := F(U)\) is open subset of \(X\) and \(F : U \to V\) is a homeomorphism.

Proof.

1. Using the definition of \(F\) and the estimate in Eq. \((52.22)\),

\[
\|x - y\| = \|(F(x) - F(y)) - (\varepsilon(x) - \varepsilon(y))\| \\
\leq \|F(x) - F(y)\| + \|\varepsilon(x) - \varepsilon(y)\| \\
\leq \|F(x) - F(y)\| + \alpha\|(x - y)\|
\]

for all \(x, y \in U\). This implies

\[
\|x - y\| \leq (1 - \alpha)^{-1}\|F(x) - F(y)\| \tag{52.25}
\]

which shows \(F\) is injective on \(U\) and hence shows the inverse function \(G = F^{-1} : V = F(U) \to U\) is well defined. Moreover, replacing \(x, y\) in Eq. \((52.25)\) by \(G(x)\) and \(G(y)\) respectively with \(x, y \in V\) shows

\[
\|G(x) - G(y)\| \leq (1 - \alpha)^{-1}\|x - y\| \quad \forall x, y \in V. \tag{52.26}
\]

Hence \(G\) is Lipschitz on \(V\) and hence continuous.

2. Let \(x_0 \in U\), \(r > 0\) and \(z_0 = F(x_0) = x_0 + \varepsilon(x_0)\) be as in item 2. The second inclusion in Eq. \((52.23)\) follows from the simple computation:

\[
\|F(x_0 + h) - z_0\| = \|h + \varepsilon(x_0 + h) - \varepsilon(x_0)\| \\
\leq \|h\| + \|\varepsilon(x_0 + h) - \varepsilon(x_0)\| \\
\leq (1 + \alpha)\|h\| < (1 + \alpha) r
\]

for all \(h \in B(0, r)\). To prove the first inclusion in Eq. \((52.23)\), we must find, for every \(z \in B(z_0, (1 - \alpha)r)\), an \(h \in B(0, r)\) such that \(z = F(x_0 + h)\) or equivalently an \(h \in B(0, r)\) solving

\[
z - z_0 = F(x_0 + h) - F(x_0) = h + \varepsilon(x_0 + h) - \varepsilon(x_0).
\]

Let \(k := z - z_0\) and for \(h \in B(0, r)\), let \(\delta(h) := \varepsilon(x_0 + h) - \varepsilon(x_0)\). With this notation it suffices to show for each \(k \in B(z_0, (1 - \alpha)r)\) there exists \(h \in B(0, r)\) such that \(k = h + \delta(h)\). Notice that \(\delta(0) = 0\) and

\[
\|\delta(h_1) - \delta(h_2)\| = \|\varepsilon(x_0 + h_1) - \varepsilon(x_0 + h_2)\| \leq \alpha \|h_1 - h_2\| \tag{52.27}
\]

for all \(h_1, h_2 \in B(0, r)\). We are now going to solve the equation \(k = h + \delta(h)\) for \(h\) by the method of successive approximations starting with \(h_0 = 0\) and then defining \(h_n\) inductively by

\[
\text{Fig. 52.1. Nesting of } F(B(x_0, r)) \text{ between } B(z_0, (1 - \alpha)r) \text{ and } B(z_0, (1 + \alpha)r).
\]
\[ h_{n+1} = k - \delta(h_n) \]  

(52.28)

A simple induction argument using Eq. (52.27) shows that

\[ \|h_{n+1} - h_n\| \leq \alpha^n \|k\| \]  

for all \( n \in \mathbb{N}_0 \)

and in particular that

\[
\|h_N\| = \left\| \sum_{n=0}^{N-1} (h_{n+1} - h_n) \right\| \leq \sum_{n=0}^{N-1} \|h_{n+1} - h_n\| \\
\leq \sum_{n=0}^{N-1} \alpha^n \|k\| = \frac{1 - \alpha^N}{1 - \alpha} \|k\|. 
\]  

(52.29)

Since \( \|k\| < (1 - \alpha) r \), this implies that \( \|h_N\| < r \) for all \( N \) showing the approximation procedure is well defined. Let

\[ h := \lim_{N \to \infty} h_n = \sum_{n=0}^{\infty} (h_{n+1} - h_n) \in X \]

which exists since the sum in the previous equation is absolutely convergent. Passing to the limit in Eqs. (52.29) and (52.28) shows that \( \|h\| \leq \frac{(1 - \alpha)^{-1} \|k\|}{1 - \alpha} < r \) and \( h = k - \delta(h) \), i.e. \( h \in B(0, r) \) solves \( k = h + \delta(h) \) as desired.

3. Given \( x_0 \in U \), the first inclusion in Eq. (52.23) shows that \( z_0 = F(x_0) \) is in the interior of \( F(U) \). Since \( z_0 \in F(U) \) was arbitrary, it follows that \( V = F(U) \) is open. The continuity of the inverse function has already been proved in item 1.

For the remainder of this section let \( X \) and \( Y \) be two Banach spaces, \( U \subset X \), \( k \geq 1 \), and \( f \in C^{k}(U,Y) \).

**Lemma 52.24.** Suppose \( x_0 \in U \), \( R > 0 \) is such that \( B^X(x_0, R) \subset U \) and \( T : B^X(x_0, R) \to Y \) is a \( C^1 \) - function such that \( T'(x_0) \) is invertible. Let

\[ \alpha(R) := \sup_{x \in B^X(x_0, R)} \left\| T'(x_0)^{-1} T'(x) - I \right\|_{L(Y,X)} 
\]  

(52.30)

and \( \varepsilon \in C^1(B^X(0, R), X) \) be defined by

\[ \varepsilon(h) = T'(x_0)^{-1} [T(x_0 + h) - T(x_0)] - h \]  

(52.31)

so that

\[ T(x_0 + h) = T(x_0) + T'(x_0)(h + \varepsilon(h)). \]  

(52.32)

Then \( \varepsilon(h) = o(h) \) as \( h \to 0 \) and

\[ \left\| \varepsilon(h') - \varepsilon(h) \right\| \leq \alpha(R) \|h' - h\| \]  

for all \( h, h' \in B^X(0, R) \).

(52.33)

If \( \alpha(R) < 1 \) (which may be achieved by shrinking \( R \) if necessary), then \( T'(x) \) is invertible for all \( x \in B^X(x_0, R) \) and

\[ \sup_{x \in B^X(x_0, R)} \left\| T'(x)^{-1} \right\|_{L(Y,X)} \leq \frac{1}{1 - \alpha(R)} \left\| T'(x_0)^{-1} \right\|_{L(Y,X)}. \]  

(52.34)

**Proof.** By definition of \( T'(x_0) \) and using \( T'(x_0)^{-1} \) exists,

\[ T(x_0 + h) - T(x_0) = T'(x_0)(h + o(h)) \]

from which it follows that \( \varepsilon(h) = o(h) \). In fact by the fundamental theorem of calculus,

\[ \varepsilon(h) = \int_0^1 (T'(x_0)^{-1} T'(x_0 + th) - I) \, dt \]

but we will not use this here. Let \( h, h' \in B^X(0, R) \) and apply the fundamental theorem of calculus to \( t \to T(x_0 + t(h' - h)) \) to conclude

\[ \varepsilon(h') - \varepsilon(h) = T'(x_0)^{-1} \left[ T(x_0 + h') - T(x_0 + h) \right] - (h' - h) \]

\[ = \left[ \int_0^1 (T'(x_0)^{-1} T'(x_0 + t(h' - h)) - I) \, dt \right] (h' - h). \]

Taking norms of this equation gives

\[ \left\| \varepsilon(h') - \varepsilon(h) \right\| \leq \left[ \int_0^1 \left\| T'(x_0)^{-1} T'(x_0 + t(h' - h)) - I \right\| dt \right] \|h' - h\| \]

\[ \leq \alpha(R) \|h' - h\|. \]

It only remains to prove Eq. (52.34), so suppose now that \( \alpha(R) < 1 \). Then by Proposition (4.21) \( T'(x_0)^{-1} T'(x) = I - (I - T'(x_0)^{-1} T'(x)) \) is invertible and

\[ \left\| \left[ T'(x_0)^{-1} T'(x) \right]^{-1} \right\| \leq \frac{1}{1 - \alpha(R)} \]  

for all \( x \in B^X(x_0, R) \).

Since \( T'(x) = T'(x_0) \left[ T'(x_0)^{-1} T'(x) \right] \) this implies \( T'(x) \) is invertible and

\[ \left\| T'(x)^{-1} \right\| = \left\| \left[ T'(x_0)^{-1} T'(x) \right]^{-1} T'(x_0)^{-1} \right\| \leq \frac{1}{1 - \alpha(R)} \left\| T'(x_0)^{-1} \right\| \]  

for all \( x \in B^X(x_0, R) \).
Theorem 52.25 (Inverse Function Theorem). Suppose $U \subset X$, $k \geq 1$ and $T \in C^k(U,Y)$ such that $T'(x)$ is invertible for all $x \in U$. Further assume $x_0 \in U$ and $R > 0$ such that $B^X(x_0, R) \subset U$.

1. For all $r \leq R$,
   \[ T(B^X(x_0, r)) \subset T(x_0) + T'(x_0) B^X(0, (1 + \alpha(r)) r). \]  
   (52.35)

2. If we further assume that
   \[ \alpha(R) := \sup_{x \in B^X(x_0, R)} \| T'(x) - T'(x_0) \| < 1, \]
   which may always be achieved by taking $R$ sufficiently small, then
   \[ T(x_0) + T'(x_0) B^X(0, (1 - \alpha(r)) r) \subset T(B^X(x_0, r)) \]
   for all $r \leq R$, see Figure 52.4.

3. $T : U \to Y$ is an open mapping, in particular $V := T(U) \subset Y$.

4. Again if $R$ is sufficiently small so that $\alpha(R) < 1$, then $T_{|B^X(x_0, R)} : B^X(x_0, R) \to T(B^X(x_0, R))$ is invertible and $T_{|B^X(x_0, R)}^{-1} : T(B^X(x_0, R)) \to B^X(x_0, R)$ is a $C^k$-map.

5. If $T$ is injective, then $T^{-1} : V \to U$ is also a $C^k$-map and
   \[ (T^{-1})' (y) = [T'(T^{-1}(y))]^{-1} \text{ for all } y \in V. \]

Proof. Let $\varepsilon \in C^1 (B^X(0, R), X)$ be as defined in Eq. (52.31).

1. Using Eqs. (52.32) and (52.24),
   \[ T(B^X(x_0, r)) = T(x_0) + T'(x_0) (I + \varepsilon) (B^X(0, r)) \]
   \[ \subset T(x_0) + T'(x_0) B^X(0, (1 + \alpha(r)) r) \]
   which proves Eq. (52.35).

2. Now assume $\alpha(R) < 1$, then by Eqs. (52.37) and (52.24),
   \[ T(x_0) + T'(x_0) B^X(0, (1 - \alpha(r)) r) \]
   \[ \subset T(x_0) + T'(x_0) (I + \varepsilon) (B^X(0, r)) = T(B^X(x_0, r)) \]
   which proves Eq. (52.36).

3. Notice that $h \in X \to T(x_0) + T'(x_0) h \in Y$ is a homeomorphism. The fact that $T$ is an open map follows easily from Eq. (52.36) which shows that $T(x_0)$ is interior of $T(W)$ for any $W \subset X$ with $x_0 \in W$.

4. The fact that $T_{|B^X(x_0, R)} : B^X(x_0, R) \to T(B^X(x_0, R))$ is invertible with a continuous inverse follows from Eq. (52.32) and Proposition 52.23. It now follows from the converse to the chain rule, Theorem 52.7, that $g := T_{|B^X(x_0, R)}^{-1} : T(B^X(x_0, R)) \to B^X(x_0, R)$ is differentiable and
   \[ g'(y) = [T'(g(y))]^{-1} \text{ for all } y \in T(B^X(x_0, R)). \]
   This equation shows $g$ is $C^1$. Now suppose that $k \geq 2$. Since $T' \in C^{k-1}(B,L(X))$ and $i(A) := A^{-1}$ is a smooth map by Example 52.19, $g' = i \circ T' \circ g$ is $C^1$, i.e. $g$ is $C^2$. If $k \geq 2$, we may use the same argument to now show $g$ is $C^3$. Continuing this way inductively, we learn $g$ is $C^k$.

5. Since differentiability and smoothness is local, the assertion in item 5. follows directly from what has already been proved.

Theorem 52.26 (Implicit Function Theorem). Suppose that $X, Y$, and $W$ are three Banach spaces, $k \geq 1$, $A \subset X \times Y$ is an open set, $(x_0, y_0)$ is a point in $A$, and $f : A \to W$ is a $C^k$-map such that $f(x_0, y_0) = 0$. Assume that $D_2 f(x_0, y_0) := D(f(x_0, y_0)) : Y \to W$ is a bounded invertible linear transformation. Then there is an open neighborhood $U_0$ of $x_0$ in $X$ such that for all connected open neighborhoods $U$ of $x_0$ contained in $U_0$, there is a unique continuous function $u : U \to Y$ such that $u(x_0) = y_0$, $(x, u(x)) \in A$ and $f(x, u(x)) = 0$ for all $x \in U$. Moreover $u$ is necessarily $C^k$ and
   \[ Du(x) = -D_2 f(x, u(x))^{-1} D_1 f(x, u(x)) \text{ for all } x \in U. \]  
   (52.38)
Proof. By replacing $f$ by $(x, y) \to D_2f(x_0, y_0)^{-1}f(x, y)$ if necessary, we may assume without loss of generality that $W = Y$ and $D_2f(x_0, y_0) = I_Y$. Define $F : A \to X \times Y$ by $F(x, y) := (x, f(x, y))$ for all $(x, y) \in A$. Notice that

$$DF(x, y) = \begin{bmatrix} I & D_1f(x, y) \\ 0 & D_2f(x, y) \end{bmatrix}$$

which is invertible if $D_2f(x, y)$ is invertible and if $D_2f(x, y)$ is invertible then

$$DF(x, y)^{-1} = \begin{bmatrix} I & -D_1f(x, y)D_2f(x, y)^{-1} \\ 0 & D_2f(x, y)^{-1} \end{bmatrix}.$$ 

Since $D_2f(x_0, y_0) = I$ is invertible, the inverse function theorem guarantees that there exists a neighborhood $U_0$ of $x_0$ and $V_0$ of $y_0$ such that $U_0 \times V_0 \subset A$, $F(U_0 \times V_0)$ is open in $X \times Y$, $F|_{(U_0 \times V_0)}$ has a $C^k$-inverse which we call $F^{-1}$. Let $\pi_2(x, y) := y$ for all $(x, y) \in X \times Y$ and define $C^k$ – function $u_0$ on $U_0$ by $u_0(x) := \pi_2 \circ F^{-1}(x, 0)$. Since $F^{-1}(x, 0) = (\tilde{x}, u_0(x))$ iff

$$(x, 0) = F(\tilde{x}, u_0(x)) = (\tilde{x}, f(\tilde{x}, u_0(x))),$$

it follows that $x = \tilde{x}$ and $f(x, u_0(x)) = 0$. Thus

$$(x, u_0(x)) = F^{-1}(x, 0) \in U_0 \times V_0 \subset A$$

and $f(x, u_0(x)) = 0$ for all $x \in U_0$. Moreover, $u_0$ is $C^k$ being the composition of the $C^k$ functions, $x \to (x, f(x))$, $F^{-1}$, and $\pi_2$. So if $U \subset U_0$ is a connected set containing $x_0$, we may define $u := u_0|_{U}$ to show the existence of the functions $u$ as described in the statement of the theorem. The only statement left to prove is the uniqueness of such a function $u$. Suppose that $u_1 : U \to Y$ is another continuous function such that $u_1(x_0) = y_0$, and $(x, u_1(x)) \in A$ and $f(x, u_1(x)) = 0$ for all $x \in U$. Let

$$O := \{x \in U|u(x) = u_1(x)\} = \{x \in U|u_0(x) = u_1(x)\}.$$ 

Clearly $O$ is a (relatively) closed subset of $U$ which is not empty since $x_0 \in O$. Because $U$ is connected, if we show that $O$ is also an open set we will have shown that $O = U$ or equivalently that $u_1 = u_0$ on $U$. So suppose that $x \in O$, i.e. $u_0(x) = u_1(x)$. For $\tilde{x}$ near $x \in U$,

$$0 = 0 = 0 = f(\tilde{x}, u_0(\tilde{x})) - f(\tilde{x}, u_1(\tilde{x})) = R(\tilde{x})(u_1(\tilde{x}) - u_0(\tilde{x}))$$

and define

$$R(\tilde{x}) := \int_0^1 D_2f((\tilde{x}, u_0(\tilde{x}) + t(u_1(\tilde{x}) - u_0(\tilde{x})))dt.$$ 

From Eq. (52.40) and the continuity of $u_0$ and $u_1$, $\lim_{\tilde{x} \to x} R(\tilde{x}) = D_2f(x, u_0(x))$ which is invertible. Thus $R(\tilde{x})$ is invertible for all $\tilde{x}$ sufficiently close to $x$ which combined with Eq. (52.39) implies that $u_1(\tilde{x}) = u_0(\tilde{x})$ for all $\tilde{x}$ sufficiently close to $x$. Since $x \in O$ was arbitrary, we have shown that $O$ is open.

52.6 Smooth Dependence of ODE’s on Initial Conditions*

In this subsection, let $X$ be a Banach space, $U \subset_o X$ and $J$ be an open interval with $0 \in J$.

Lemma 52.27. If $Z \in C(J \times U, X)$ such that $D_xZ(x, t)$ exists for all $(t, x) \in J \times U$ and $D_xZ(t, x) \in C(J \times U, X)$ then $Z$ is locally Lipschitz in $x$, see Definition 51.7.

Proof. Suppose $I \subset J$ and $x \in U$. By the continuity of $DZ$, for every $t \in I$ there an open neighborhood $N_t$ of $t \in I$ and $\varepsilon_t > 0$ such that $B(x, \varepsilon_t) \subset U$ and

$$\sup \{|DZ(t', x')| : (t', x') \in N_t \times B(x, \varepsilon_t)\} < \infty.$$ 

By the compactness of $I$, there exists a finite subset $A \subset I$ such that $I \subset \cup_{t \in A} N_t$. Let $\varepsilon(x, I) := \min \{\varepsilon_t : t \in A\}$ and

$$K(x, I) := \sup \{|DZ(t, x')| : (t, x') \in I \times B(x, \varepsilon(x, I))\} < \infty.$$ 

Then by the fundamental theorem of calculus and the triangle inequality,

$$||Z(t, x_1) - Z(t, x_0)|| \leq \left(\int_0^1 ||DZ(t, s(x_1 - x_0)|| ds\right) ||x_1 - x_0||$$

for all $x_0, x_1 \in B(x, \varepsilon(x, I))$ and $t \in I$.

Theorem 52.28 (Smooth Dependence of ODE’s on Initial Conditions). Let $X$ be a Banach space, $U \subset_o X$, $Z \in C(\mathbb{R} \times U, X)$ such that $D_xZ(x, t) \in C(\mathbb{R} \times U, X)$ and $D_xZ \in C(\mathbb{R} \times U, X)$ and $\varphi : D(Z) \subset \mathbb{R} \times X \to X$ denote the maximal solution operator to the ordinary differential equation

$$\dot{y}(t) = Z(t, y(t)) \text{ with } y(0) = x \in U,$$ 

see Notation 51.10 and Theorem 51.16. Then $\varphi \in C^1(D(Z), U)$, $\partial_t D_x\varphi(t, x)$ exists and is continuous for $(t, x) \in D(Z)$ and $D_x\varphi(t, x)$ satisfies the linear differential equation,

\begin{align*}
\partial_t \varphi &= D_xZ(x, \varphi(t, x)) \\
\partial_t \varphi &= \dot{\varphi}(t, x) \text{ and } \partial_t \varphi(t, x) &= D_x\varphi(t, x) \text{ for all } x \in U.
\end{align*}
\[
\frac{d}{dt}D_xf(t,x) = \left[(D_xZ)(t,\varphi(t,x))\right]D_x\varphi(t,x) \quad \text{with} \quad D_x\varphi(0,x) = I_X
\]  
(52.42)

for \( t \in J_x \).

**Proof.** Let \( x_0 \in U \) and \( J \) be an open interval such that \( 0 \in J \subset \tilde{J} \subset J_{x_0} \), \( y_0 := y(\cdot,x_0)_{|J} \) and

\[
\mathcal{O}_\varepsilon := \{ y \in BC(J,U) : \|y - y_0\|_{\infty} < \varepsilon \} \subset_0 BC(J,X).
\]

By Lemma \[52.27\] \( Z \) is locally Lipschitz and therefore Theorem \[51.16\] is applicable. By Eq. \[ (51.25) \] of Theorem \[51.16\] there exists \( \varepsilon > 0 \) and \( \delta > 0 \) such that \( G : B(x_0,\delta) \to \mathcal{O}_\varepsilon \) defined by \( G(x) := \varphi(\cdot,x)_{|J} \) is continuous. By Lemma \[52.29\] below, for \( \varepsilon \) sufficiently small the function \( F : \mathcal{O}_\varepsilon \to BC(J,X) \) defined by

\[
F(y) := y - \int_0^t Z(t,y(t))dt
\]

is \( C^1 \) and

\[
DF(y)v = v - \int_0^t D_yZ(t,y(t))v(t)dt.
\]

(52.43)

(52.44)

By the existence and uniqueness for linear ordinary differential equations, Theorem \[50.22\] \( DF(y) \) is invertible for any \( y \in BC(J,U) \). By the definition of \( \varphi \), \( F(G(x)) = h(x) \) for all \( x \in B(x_0,\delta) \) where \( h : X \to BC(J,X) \) is defined by \( h(x)(t) = x \) for all \( t \in J \), i.e. \( h(x) \) is the constant path at \( x \). Since \( h \) is a bounded linear map, \( h \) is smooth and \( Dh(x) = h \) for all \( x \in X \). We may now apply the converse to the chain rule in Theorem \[52.7\] to conclude \( G \in C^1(B(x_0,\delta),\mathcal{O}) \) and

\[
DG(x) = [DF(G(x))]^{-1}Dh(x)
\]

or equivalently, \( DF(G(x))DG(x) = h \) which in turn is equivalent to

\[
D_x\varphi(t,x) - \int_0^t \left[DZ(\varphi(\tau,x),D_x\varphi(\tau,x) \right]d\tau = I_X.
\]

As usual this equation implies \( D_x\varphi(t,x) \) is differentiable in \( t \), \( D_x\varphi(t,x) \) is continuous in \( t \), and \( D_x\varphi(t,x) \) satisfies Eq. \[ (52.42) \].

**Lemma 52.29.** Continuing the notation used in the proof of \[52.28\] and further let

\[
f(y) := \int_0^t Z(\tau, y(\tau))d\tau \quad \text{for} \quad y \in \mathcal{O}_\varepsilon.
\]

Then \( f \in C^1(\mathcal{O}_\varepsilon,Y) \) and for all \( y \in \mathcal{O}_\varepsilon \),

\[
f'(y)h = \int_0^t D_xZ(\tau, y(\tau))h(\tau)d\tau =: A_yh.
\]

**Proof.** Let \( h \in Y \) be sufficiently small and \( \tau \in J \), then by fundamental theorem of calculus,

\[
Z(\tau,y(\tau) + h(\tau)) = \int_0^1 [D_xZ(\tau,y(\tau) + rh(\tau)) - D_xZ(\tau,y(\tau))]dr
\]

and therefore,

\[
f(y + h) - f(y) - A_yh(t)
\]

\[
= \int_0^1 [Z(\tau,y(\tau) + h(\tau)) - Z(\tau,y(\tau)) - D_xZ(\tau,y(\tau))h(\tau)]d\tau
\]

\[
= \int_J \int_0^1 dr [D_xZ(\tau,y(\tau) + rh(\tau)) - D_xZ(\tau,y(\tau))]h(\tau).
\]

Therefore,

\[
\| f(y + h) - f(y) - A_yh \|_{\infty} \leq \| h \|_{\infty} \delta(h)
\]

(52.45)

where

\[
\delta(h) := \int_J \int_0^1 dr \| D_xZ(\tau, y(\tau) + rh(\tau)) - D_xZ(\tau, y(\tau)) \|.
\]

With the aid of Lemmas \[52.27\] and Lemma \[51.8\]

\[
(r,\tau,h) \in [0,1] \times J \times Y \to \| D_xZ(\tau, y(\tau) + rh(\tau)) \|
\]

is bounded for small \( h \) provided \( \varepsilon > 0 \) is sufficiently small. Thus it follows from the dominated convergence theorem that \( \delta(h) \to 0 \) as \( h \to 0 \) and hence Eq. \[ (52.45) \] implies \( f'(y) \) exists and is given by \( A_y \). Similarly,

\[
\| f'(y + h) - f'(y) \|_{op}
\]

\[
\leq \int_J \| D_xZ(\tau, y(\tau) + h(\tau)) - D_xZ(\tau, y(\tau)) \| d\tau \to 0 \quad \text{as} \quad h \to 0
\]

showing \( f' \) is continuous.

**Remark 52.30.** If \( Z \in C^k(U,X) \), then an inductive argument shows that \( \varphi \in C^{k}(DZ,U) \). For example if \( Z \in C^2(U,X) \) then \( (y(t),u(t)) := (\varphi(t,x),D_x\varphi(t,x)) \) solves the ODE,

\[
\frac{d}{dt} (y(t),u(t)) = \tilde{Z}((y(t),u(t))) \quad \text{with} \quad (y(0),u(0)) = (x,Id_X)
\]

where \( \tilde{Z} \) is the \( C^1 \) – vector field defined by
Therefore Theorem 52.28 may be applied to this equation to deduce: $D_x^2 \varphi(t, x)$ and $D_x^2 \varphi(t, x)$ exist and are continuous. We may now differentiate Eq. 52.42 to find $D_x^2 \varphi(t, x)$ satisfies the ODE,

$$\frac{d}{dt} D_x^2 \varphi(t, x) = \left[ \partial \partial_{D_x \varphi(t, x)} D_x Z \right] (t, \varphi(t, x)) \right] D_x \varphi(t, x)$$

with $D_x^2 \varphi(0, x) = 0$.

### 52.7 Existence of Periodic Solutions

A detailed discussion of the inverse function theorem on Banach and Frechét spaces may be found in Richard Hamilton’s, “The Inverse Function Theorem of Nash and Moser.” The applications in this section are taken from this paper. Theorem 52.31 (Taken from Hamilton, p. 110.). Let $p : U := (a, b) \to V := (c, d)$ be a smooth function with $p’ > 0$ on $(a, b)$. For every $g \in C^{\infty}_c(\mathbb{R}, (c, d))$ there exists a unique function $y \in C^{\infty}_c(\mathbb{R}, (a, b))$ such that

$$\dot{y}(t) + p(y(t)) = g(t).$$

**Proof.** Let $\tilde{V} := C^1_c(\mathbb{R}, (c, d)) \subset C^0_c(\mathbb{R}, \mathbb{R})$ and $\tilde{U} \subset C^1_c(\mathbb{R}, (a, b))$ be given by

$$\tilde{U} := \left\{ y \in C^1_c(\mathbb{R}, \mathbb{R}) : a < y(t) < b \quad \& \quad c < \dot{y}(t) + p(y(t)) < d \quad \forall t \right\}.$$

The proof will be completed by showing $P : \tilde{U} \to \tilde{V}$ defined by

$$P(y)(t) = \dot{y}(t) + p(y(t)) \text{ for } y \in \tilde{U} \text{ and } t \in \mathbb{R}$$

is bijective. Note that if $P(y)$ is smooth then so is $y$.

**Step 1.** The differential of $P$ is given by $P'(y)h = \dot{h} + p'(y)h$, see Exercise 52.8. We will now show that the linear mapping $P'(y)$ is invertible. Indeed let $f = p'(y) > 0$, then the general solution to the Eq. $\dot{h} + fh = k$ is given by

$$h(t) = e^{-\int_0^t f(\tau) d\tau} h_0 + \int_0^t e^{-\int_\tau^t f(\sigma) d\sigma} k(\tau) d\tau$$

where $h_0$ is a constant. We wish to choose $h_0$ so that $h(2\pi) = h_0$, i.e. so that

$$h_0 \left( 1 - e^{-c(f)} \right) = \int_0^{2\pi} e^{-\int_\tau^t f(\sigma) d\sigma} k(\tau) d\tau$$

where

$$c(f) = \int_0^{2\pi} f(\tau) d\tau = \int_0^{2\pi} p'(y(\tau)) d\tau > 0.$$ 

The unique solution $h \in C^1_{2\pi}(\mathbb{R}, \mathbb{R})$ to $P'(y)h = k$ is given by

$$h(t) = \left( 1 - e^{-c(f)} \right)^{-1} \int_0^{2\pi} e^{-\int\tau^t f(\sigma) d\sigma} k(\tau) d\tau + \int_0^{2\pi} e^{-\int_\tau^t f(\sigma) d\sigma} k(\tau) d\tau .$$

Therefore $P'(y)$ is invertible for all $y$. Hence by the inverse function Theorem (Theorem 52.25), $P : U \to \tilde{V}$ is an open mapping which is locally invertible.

**Step 2.** Let us now prove $P : \tilde{U} \to \tilde{V}$ is injective. For this suppose $y_1, y_2 \in \tilde{U}$ such that $P(y_1) = g = P(y_2)$ and let $z = y_2 - y_1$. Since

$$\dot{z}(t) + p(y_2(t)) - p(y_1(t)) = g(t) - g(t) = 0,$$

if $t_m \in \mathbb{R}$ is point where $z(t_m)$ takes on its maximum, then $\dot{z}(t_m) = 0$ and hence

$$p(y_2(t_m)) - p(y_1(t_m)) = 0.$$ 

Since $p$ is increasing this implies $y_2(t_m) = y_1(t_m)$ and hence $z(t_m) = 0$. This shows $z(t) \leq 0$ for all $t$ and a similar argument using a minimizer of $z$ shows $z(t) \geq 0$ for all $t$. So we conclude $y_1 = y_2$.

**Step 3.** Let $W := P(\tilde{U})$, we wish to show $W = \tilde{V}$. By step 1, we know $W$ is an open subset of $\tilde{V}$ and since $\tilde{V}$ is connected, to finish the proof it suffices to show $W$ is relatively closed in $\tilde{V}$. So suppose $y_j \in \tilde{U}$ such that $g_j := P(y_j) \to g$ in $\tilde{V}$. We must now show $g \in W$, i.e. $g = P(y)$ for some $y \in W$. If $t_m$ is a maximizer of $y_j$, then $y_j(t_m) = 0$ and hence $g_j(t_m) = p(y_j(t_m)) < d$ and therefore $y_j(t_m) < b$ because $p$ is increasing. A similar argument works for the minimizers then we allows us to conclude Ran($p \circ y_j$) $\subset$ Ran($g_j$) $\subset$ (c, d) for all $j$. Since $g_j$ is converging uniformly to $g$, there exists $c < \gamma < \delta < d$ such that $\text{Ran}(p \circ y_j) \subset \text{Ran}(g_j) \subset [\gamma, \delta]$ for all $j$. Again since $p’ > 0$,

$$\text{Ran}(y_j) \subset p^{-1}([\gamma, \delta]) = [\alpha, \beta] \subset (a, b)$$

for all $j$.

In particular sup $\{|y_j(t)| : t \in \mathbb{R} \text{ and } j \}$ $\to$ $\infty$ since

$$\dot{y}_j(t) = g_j(t) - p(y_j(t)) \subset [\gamma, \delta] - [\gamma, \delta]$$

which is a compact subset of $\mathbb{R}$. The Ascoli-Arzelà Theorem (see Theorem 24.11 below) now allows us to assume, by passing to a subsequence if necessary, that $y_j$ is converging uniformly to $y \in C^0(\mathbb{R}, [\alpha, \beta])$. It now follows that
Theorem 52.32 (Contraction Mapping Principle). Suppose that

\[ \rho(y(t), y_j(t)) = g_j(t) - p(y_j(t)) \to g - p(y) \]

uniformly in \( t \). Hence we conclude that \( y \in C_{2n}^2(\mathbb{R}, \mathbb{R}) \cap C_{2n}^2([\alpha, \beta]), \) \( y_j \to y \)

and \( P(y) = g \). This has proved that \( g \in W \) and hence that \( W \) is relatively closed in \( V \).

52.8 Contraction Mapping Principle

Some of the arguments used in Chapter 51 as well as this chapter may be abstracted to a general principle of finding fixed points on a complete metric space. This is the content of this section.

Theorem 52.32 (Contraction Mapping Principle). Suppose that \( (X, \rho) \) is a complete metric space and \( S : X \to X \) is a contraction, i.e. there exists \( \alpha \in (0, 1) \) such that \( \rho(S(x), S(y)) \leq \alpha \rho(x, y) \) for all \( x, y \in X \). Then \( S \) has a unique fixed point in \( X \), i.e. there exists a unique point \( x \in X \) such that \( S(x) = x \).

Proof. For uniqueness suppose that \( x \) and \( x' \) are two fixed points of \( S \), then

\[ \rho(x, x') = \rho(S(x), S(x')) \leq \alpha \rho(x, x'). \]

Therefore \( (1 - \alpha) \rho(x, x') \leq 0 \) which implies that \( \rho(x, x') = 0 \) since \( 1 - \alpha > 0 \). Thus \( x = x' \). For existence, let \( x_0 \in X \) be any point in \( X \) and define \( x_n \in X \) inductively by \( x_{n+1} = S(x_n) \) for \( n \geq 0 \). We will show that \( x := \lim_{n \to \infty} x_n \) exists in \( X \) and because \( S \) is continuous this will imply,

\[ x = \lim_{n \to \infty} x_{n+1} = \lim_{n \to \infty} S(x_n) = S(\lim_{n \to \infty} x_n) = S(x), \]

showing \( x \) is a fixed point of \( S \). So to finish the proof, because \( X \) is complete, it suffices to show \( \{x_n\} \) is a Cauchy sequence in \( X \). An easy inductive computation shows, for \( n \geq 0 \), that

\[ \rho(x_{n+1}, x_n) = \rho(S(x_n), S(x_{n-1})) \leq \alpha \rho(x_n, x_{n-1}) \leq \cdots \leq \alpha^n \rho(x_1, x_0). \]

Another inductive argument using the triangle inequality shows, for \( m > n \), that

\[ \rho(x_m, x_n) \leq \rho(x_m, x_{m-1}) + \rho(x_{m-1}, x_n) \leq \cdots \leq \sum_{k=n}^{m-1} \rho(x_{k+1}, x_k). \]

Combining the last two inequalities gives (using again that \( \alpha \in (0, 1) \)),

\[ \rho(x_m, x_n) \leq \sum_{k=n}^{m-1} \alpha^k \rho(x_1, x_0) \leq \rho(x_1, x_0) \sum_{l=0}^{\infty} \alpha^l = \rho(x_1, x_0) \frac{\alpha^n}{1 - \alpha}. \]

This last equation shows that \( \rho(x_m, x_n) \to 0 \) as \( m, n \to \infty \), i.e. \( \{x_n\} \) is a Cauchy sequence.

Corollary 52.33 (Contraction Mapping Principle II). Suppose that \( (X, \rho) \) is a complete metric space and \( S : X \to X \) is a continuous map such that \( S^n \) is a contraction for some \( n \in \mathbb{N} \). Here

\[ S^n := S \circ S \circ \ldots \circ S \]

and we are assuming there exists \( \alpha \in (0, 1) \) such that \( \rho(S^n(x), S^n(y)) \leq \alpha \rho(x, y) \) for all \( x, y \in X \). Then \( S \) has a unique fixed point in \( X \).

Proof. Let \( T := S^n \), then \( T : X \to X \) is a contraction and hence \( T \) has a unique fixed point \( x \in X \). Since any fixed point of \( S \) is also a fixed point of \( T \), we see if \( S \) has a fixed point then it must be \( x \). Now

\[ T(S(x)) = S^n(S(x)) = S(S^n(x)) = S(T(x)) = S(x), \]

which shows that \( S(x) \) is also a fixed point of \( T \). Since \( T \) has only one fixed point, we must have that \( S(x) = x \). So we have shown that \( x \) is a fixed point of \( S \) and this fixed point is unique.

Lemma 52.34. Suppose that \( (X, \rho) \) is a complete metric space, \( n \in \mathbb{N}, \) \( Z \) is a topological space, and \( \alpha \in (0, 1) \). Suppose for each \( z \in Z \) there is a map \( S_z : X \to X \) with the following properties:

- Contraction property \( \rho(S_z^n(x), S_z^n(y)) \leq \alpha \rho(x, y) \) for all \( x, y \in X \) and \( z \in Z \).
- Continuity in \( z \) For each \( x \in X \) the map \( z \to S_z(x) \) in \( X \) is continuous.

By Corollary 52.33 above, for each \( z \in Z \) there is a unique fixed point \( G(z) \in X \) of \( S_z \).

Conclusion: The map \( G : Z \to X \) is continuous.

Proof. Let \( T_z := S_z^n \). If \( z, w \in Z \), then

\[ \rho(G(z), G(w)) = \rho(T_z(G(z)), T_w(G(w))) \leq \rho(T_z(G(z)), T_w(G(z))) + \rho(T_w(G(z)), T_w(G(w))) \leq \rho(T_z(G(z)), T_w(G(z))) + \alpha \rho(G(z), G(w)). \]

Solving this inequality for \( \rho(G(z), G(w)) \) gives

\[ \rho(G(z), G(w)) \leq \frac{1}{1 - \alpha} \rho(T_z(G(z)), T_w(G(z))). \]

Since \( w \to T_w(G(z)) \) is continuous it follows from the above equation that \( G(w) \to G(z) \) as \( w \to z \), i.e. \( G \) is continuous.
52.9 Exercises

Exercise 52.3. Suppose that \( A : \mathbb{R} \to L(X) \) is a continuous function and \( V : \mathbb{R} \to L(X) \) is the unique solution to the linear differential equation
\[
\dot{V}(t) = A(t)V(t) \quad \text{with} \quad V(0) = I.
\] (52.47)
Assuming that \( V(t) \) is invertible for all \( t \in \mathbb{R} \), show that \( V^{-1}(t) := [V(t)]^{-1} \) must solve the differential equation
\[
\frac{d}{dt} V^{-1}(t) = -V^{-1}(t)A(t) \quad \text{with} \quad V^{-1}(0) = I.
\] (52.48)
See Exercise 50.12 as well.

Exercise 52.4 (Differential Equations with Parameters). Let \( W \) be another Banach space, \( U \times V \subset \mathbb{R} \times W \) and \( Z \in C^1(U \times V, X) \). For each \((x, w) \in U \times V\), let \( t \in J_{x,w} \to \varphi(t, x, w) \) denote the maximal solution to the ODE
\[
\dot{y}(t) = Z(y(t), w) \quad \text{with} \quad y(0) = x
\] (52.49)
and
\[
D := \{(t, x, w) \in \mathbb{R} \times U \times V : t \in J_{x,w}\}
\]
as in Exercise 51.8.

1. Prove that \( \varphi \) is \( C^1 \) and that \( D_w\varphi(t, x, w) \) solves the differential equation:
\[
\frac{d}{dt} D_w\varphi(t, x, w) = (D_w Z)(\varphi(t, x, w), w) D_w\varphi(t, x, w) + (D_w Z)(\varphi(t, x, w), w)
\]
with \( D_w\varphi(0, x, w) = 0 \in L(W, X) \). \textbf{Hint:} See the hint for Exercise 51.8 with the reference to Theorem 51.16 being replace by Theorem 52.28.

2. Also show with the aid of Duhamel’s principle (Exercise 50.22) and Theorem 52.28 that
\[
D_w\varphi(t, x, w) = D_w\varphi(0, x, w) + \int_0^t D_w\varphi(\tau, x, w) (D_w Z)(\varphi(\tau, x, w), w) d\tau
\]

Exercise 52.5. (Differential of \( e^A \)) Let \( f : L(X) \to GL(X) \) be the exponential function \( f(A) = e^A \). Prove that \( f \) is differentiable and that
\[
Df(A)B = \int_0^1 e^{(1-t)A}Be^tA dt.
\] (52.50)
\textbf{Hint:} Let \( B \in L(X) \) and define \( w(t, s) = e^{t(A+sB)} \) for all \( t, s \in \mathbb{R} \). Notice that
\[
dw(t, s)/dt = (A + sB)w(t, s) \quad \text{with} \quad w(0, s) = I \in L(X).
\] (52.51)

Use Exercise 52.4 to conclude that \( w \) is \( C^1 \) and that \( w'(t, 0) := dw(t, s)/ds|_{s=0} \) satisfies the differential equation,
\[
\frac{d}{dt} w'(t, 0) = Aw'(t, 0) + Be^tA \quad \text{with} \quad w(0, 0) = 0 \in L(X).
\] (52.52)
Solve this equation by Duhamel’s principle (Exercise 50.22) and then apply Proposition 52.14 to conclude that \( f \) is differentiable with differential given by Eq. (52.50).

Exercise 52.6 (Local ODE Existence). Let \( S_t \) be defined as in Eq. (51.17) from the proof of Theorem 51.5. Verify that \( S_t \) satisfies the hypothesis of Corollary 52.33. In particular we could have used Corollary 52.33 to prove Theorem 51.35.

Exercise 52.7 (Local ODE Existence Again). Let \( J = (-1, 1) \), \( Z \in C^1(X, X) \), \( Y := BC(J, X) \) and for \( y \in Y \) and \( s \in J \) let \( y_s(t) := y(st) \). Use the following outline to prove the ODE
\[
\dot{y}(t) = Z(y(t)) \quad \text{with} \quad y(0) = x
\] (52.53)
has a unique solution for small \( t \) and this solution is \( C^1 \) in \( x \).

1. If \( y \) solves Eq. (52.53) then \( y_s \) solves
\[
\dot{y}_s(t) = sZ(y_s(t)) \quad \text{with} \quad y_s(0) = x
\]
or equivalently
\[
y_s(t) = x + s \int_0^t Z(y(\tau)) d\tau.
\] (52.54)

2. Let \( F : J \times Y \to J \times Y \) be defined by
\[
F(s, y) := (s, y(t) - s \int_0^t Z(y(\tau)) d\tau).
\]
Show the differential of \( F \) is given by
\[
F'(s, y)(a, v) = \left( a, t \to v(t) - s \int_0^t Z'(y(\tau))v(\tau) d\tau - a \int_0^t Z(y(\tau)) d\tau \right).
\]
3. Verify \( F'(0, y) : \mathbb{R} \times Y \to \mathbb{R} \times Y \) is invertible for all \( y \in Y \) and notice that \( F(0, y) = (0, y) \).
4. For \( x \in X \), let \( C_x \in Y \) be the constant path at \( x \), i.e. \( C_x(t) = x \) for all \( t \in J \). Use the inverse function Theorem 52.22 to conclude there exists \( \varepsilon > 0 \) and a \( C^1 \) map \( \varphi : (-\varepsilon, \varepsilon) \times B(x_0, \varepsilon) \to Y \) such that
\[
F(s, \varphi(s, x), s, C_x) \text{ for all } (s, x) \in (-\varepsilon, \varepsilon) \times B(x_0, \varepsilon).
\]
5. Show, for \( s \leq \varepsilon \) that \( y(s) := \varphi(s,x)(t) \) satisfies Eq. [52.54]. Now define \( y(t,x) = \varphi(\varepsilon/2,x)(2t/\varepsilon) \) and show \( y(t,x) \) solve Eq. [52.53] for \( |t| < \varepsilon/2 \) and \( x \in B(x_0,\varepsilon) \).

**Exercise 52.8.** Show \( P \) defined in Theorem 52.31 is continuously differentiable and \( P'(y)h = h + p'(y)h \).

**Exercise 52.9.** Embedded sub-manifold problems.

**Exercise 52.10.** Lagrange Multiplier problems.

### 52.9.1 Alternate construction of \( g \). To be made into an exercise.

Suppose \( U \subset \subset X \) and \( f : U \to Y \) is a \( C^2 \) function. Then we are looking for a function \( g(y) \) such that \( f(g(y)) = y \). Fix an \( x_0 \in U \) and \( y_0 = f(x_0) \in Y \). Suppose such a \( g \) exists and let \( x(t) = g(y_0 + th) \) for some \( h \in Y \). Then differentiating \( f(x(t)) = y_0 + th \) implies

\[
\frac{d}{dt}f(x(t)) = f'(x(t)) \dot{x}(t) = h
\]

or equivalently that

\[
\dot{x}(t) = [f'(x(t))]^{-1} h = Z(h,x(t)) \quad \text{with} \quad x(0) = x_0 \quad (52.55)
\]

where \( Z(h,x) = [f'(x(t))]^{-1} h \). Conversely if \( x \) solves Eq. (52.55) we have \( \frac{d}{dt}f(x(t)) = h \) and hence that

\[
f(x(1)) = y_0 + h.
\]

Thus if we define

\[
g(y_0 + h) := e^{Z(h,\cdot)}(x_0),
\]

then \( f(g(y_0 + h)) = y_0 + h \) for all \( h \) sufficiently small. This shows \( f \) is an open mapping.
