

**MATH 142A - INTRODUCTION TO ANALYSIS  
PRACTICE FINAL**

WINTER 2022

1. Let  $a, b, c \in \mathbb{R}$  be such that  $a < b < c$  and  $(c - a)(c - b) = (b - a)^2$ . Show that

$$(1) \quad r := \frac{c - a}{b - a}$$

is not a rational number.

Hint: Show that  $r$  satisfies a polynomial equation with integer coefficients.

2. Using only Definition 9.8 prove that

$$(2) \quad \lim_{n \rightarrow \infty} \log_{10}(\log_{10} n) = +\infty.$$

Clearly indicate how you chose  $N(M)$  for any  $M > 0$ , and write explicitly  $N(2)$ ,  $N(5)$ ,  $N(10)$ .

3. Determine if the series

$$(3) \quad \sum_{n=1}^{\infty} \frac{2^n n!}{n^n}$$

converges. Justify your answer.

4. Let  $a \in \mathbb{R}$  and let  $f : [a, +\infty) \rightarrow \mathbb{R}$  be a function such that

- (i)  $f \in C([a, +\infty))$
- (ii)  $\lim_{x \rightarrow +\infty} f(x) = p \in \mathbb{R}$

Prove that  $f$  is *uniformly continuous* on  $[a, +\infty)$ .

5. Compute the derivative of the function  $f : (0, +\infty) \rightarrow \mathbb{R}$  given by

$$(4) \quad f(x) = x + x^x.$$

Provide all intermediate steps.

6. Prove that the inequality

$$(5) \quad py^{p-1}(x - y) \leq x^p - y^p \leq px^{p-1}(x - y)$$

holds for  $0 < y < x$  and  $p > 1$ .

7. Let

$$(6) \quad f : \left(-\frac{\pi}{2}, \frac{\pi}{2}\right) \rightarrow \mathbb{R}, \quad f(x) = \log(\cos x).$$

Find a polynomial  $P(x)$  such that

$$(7) \quad f(x) - P(x) = o(x^3) \quad \text{as } x \rightarrow 0.$$
