Today: Kolmogorov's equations

Next: PK 6.4, 6.6, Durrett 4.3

Week 3:

- homework 2 (due Friday April 15)
- Midterm 1 date changed: **Friday, April 22**

Chapman-Kolmogorov equation

$$P_{ij}(t+s) = P(X_{t+s} = j \mid X_0 = i) \quad \text{condition on the value of } X_t$$

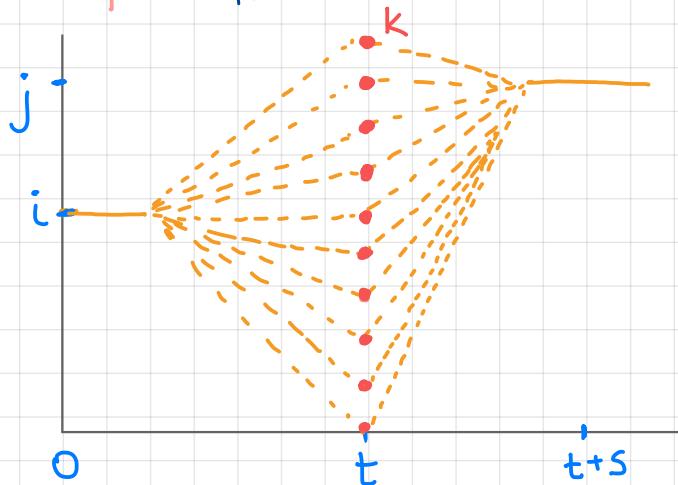

$$= \sum_{k=0}^N P(X_{t+s} = j \mid X_0 = i, X_t = k) P(X_t = k \mid X_0 = i)$$

Markov

$$= \sum_{k=0}^N P(X_{t+s} = j \mid X_t = k) P(X_t = k \mid X_0 = i)$$

stationary trans. prob.

$$= \sum_{k=0}^N P(X_s = j \mid X_0 = k) P(X_t = k \mid X_0 = i) = \sum_{k=0}^N P_{ik}(t) P_{kj}(s)$$

Or in matrix form

$$P(t+s) = P(t)P(s)$$

Kolmogorov forward equations

Apply Chapman-Kolmogorov equations to compute

$$P_{ij}(t+h) :$$

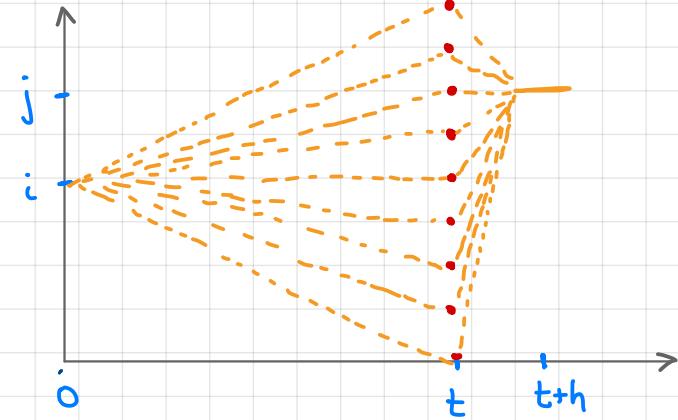

$$P_{ij}(t+h) = \sum_{k=0}^n P_{ik}(t) P_{kj}(h) \quad (*)$$

Use infinitesimal description:

$$P(h) = I + Qh + o(h)$$

$$P_{kj}(h) = \begin{cases} q_{kj} h + o(h), & k \neq j \\ 1 + q_{jj} h + o(h), & k = j \end{cases}$$

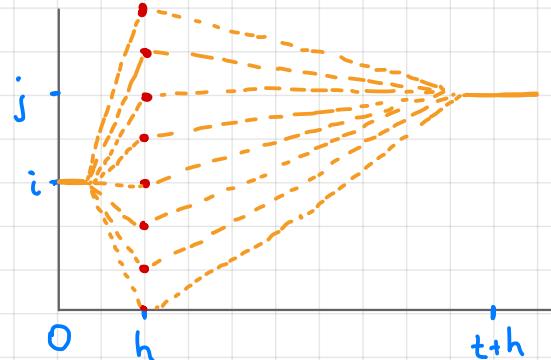

$$\begin{aligned} (*) &= P_{ij}(t) (1 + q_{jj} h + o(h)) + \sum_{\substack{k=0 \\ k \neq j}}^N P_{ik}(t) (q_{kj} h + o(h)) \\ &= P_{ij}(t) + \underbrace{\sum_{k=0}^N P_{ik}(t) q_{kj} h}_{[P(t)Q]_{ij}} + o(h) \end{aligned} \quad / \Rightarrow P(t+h) = P(t) + P(t)Qh$$

$$\frac{d}{dt} P(t) = P(t) Q$$

Kolmogorov backward equations

$$\begin{aligned} P_{ij}(t+h) &= \sum_{k=0}^N P_{ik}(h) P_{kj}(t) \\ &= (1 + q_{ii} h + o(h)) P_{ij}(t) \\ &\quad + \sum_{\substack{k=0 \\ k \neq i}}^N (q_{ik} h + o(h)) P_{kj} \\ &\quad [Q P(t)]_{ij} \\ &= P_{ij}(t) + \underbrace{\sum_{k=0}^N q_{ik} P_{kj}(t)}_{h} h + o(h) \end{aligned}$$

$$\hookrightarrow \boxed{\frac{d}{dt} P(t) = Q P(t)}$$

$$P(0) = I$$

Kolmogorov equations. Remarks

1. e^{tQ} satisfies both (forward and backward) equations.

Indeed, omitting technical details, differentiate term-by-term

$$\frac{d}{dt} e^{tQ} = \frac{d}{dt} \left(\sum_{k=0}^{\infty} \frac{Q^k t^k}{k!} \right) = \sum_{k=1}^{\infty} \frac{Q^k t^{k-1}}{(k-1)!} = \sum_{\ell=0}^{\infty} \frac{Q^{\ell+1} t^{\ell}}{\ell!} = Q \sum_{\ell=0}^{\infty} \frac{Q^\ell t^\ell}{\ell!} = \sum_{\ell=0}^{\infty} \frac{Q^\ell t^\ell}{\ell!} Q$$

Now $\sum_{k=1}^{\infty} \frac{Q^k}{(k-1)!} t^{k-1} = \sum_{\ell=0}^{\infty} \frac{Q^{\ell+1}}{\ell!} t^{\ell} = Q e^{tQ} = e^{tQ} Q$

2. Redundancy is related to the stationarity of transition probabilities. If transition probabilities

$$P_{ij}(s,t) = P(X_t=j | X_s=i)$$
 are not stationary, then

$\frac{\partial}{\partial t} P_{ij}(s,t) \rightarrow$ forward equation , $\frac{\partial}{\partial s} P_{ij}(s,t) \rightarrow$ backward equation

Example

Two-state MC

$$Q = \begin{pmatrix} -\alpha & \alpha \\ \beta & -\beta \end{pmatrix}$$

$$Q^2 = \begin{pmatrix} -\alpha & \alpha \\ \beta & -\beta \end{pmatrix} \begin{pmatrix} -\alpha & \alpha \\ \beta & -\beta \end{pmatrix} = \begin{pmatrix} \alpha(\alpha+\beta) & -\alpha(\alpha+\beta) \\ -\beta(\alpha+\beta) & \beta(\alpha+\beta) \end{pmatrix} = -(\alpha+\beta)Q$$

$$\hookrightarrow Q^k = (-1)^{k-1} (\alpha+\beta)^{k-1} Q, \quad k \geq 1$$

$$e^{tQ} = \sum_{k=0}^{\infty} \frac{Q^k t^k}{k!} = I + \sum_{k=1}^{\infty} \frac{(-1)^{k-1} (\alpha+\beta)^{k-1} t^k}{k!} Q$$

$$= I - \frac{1}{\alpha+\beta} \sum_{k=1}^{\infty} \frac{(-(\alpha+\beta))^k t^k}{k!} Q$$

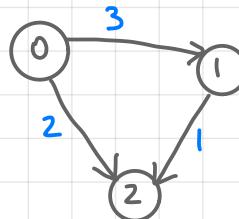

$$= I - \frac{1}{\alpha+\beta} (e^{-(\alpha+\beta)t} - 1) Q$$

$$= I + \frac{1}{\alpha+\beta} Q - \frac{1}{\alpha+\beta} e^{-(\alpha+\beta)t} Q$$

Example

Let $(X_t)_{t \geq 0}$ be a MC with generator Q

$$Q = \begin{pmatrix} -5 & 3 & 2 \\ 0 & -1 & 1 \\ 0 & 0 & 0 \end{pmatrix}$$

Compute $P_{01}(t)$

For any K , $Q^K = \begin{pmatrix} * & * & * \\ 0 & * & * \\ 0 & 0 & * \end{pmatrix}$, $\Rightarrow P_{10}(t) = P_{20}(t) = P_{21}(t) = 0$

$$P'(t) = \begin{pmatrix} P_{00} & P_{01} & P_{02} \\ 0 & P_{11} & P_{12} \\ 0 & 0 & P_{22} \end{pmatrix} \begin{pmatrix} -5 & 3 & 2 \\ 0 & -1 & 1 \\ 0 & 0 & 0 \end{pmatrix}$$

$$P'_{00}(t) = -5 P_{00}(t), P_{00}(0) = 1 \Rightarrow P_{00}(t) = e^{-5t}$$

$$P'_{11}(t) = -P_{11}(t), P_{11}(0) = 1 \Rightarrow P_{11}(t) = e^{-t}$$

$$P'_{22}(t) = 0, P_{22}(0) = 1 \Rightarrow P_{22}(t) = 1$$

$$P'_{01}(t) = 3 P_{00}(t) - P_{01}(t)$$

$$P_{01}(0) = 0$$

$$P'_{01}(t) = \dots$$

$$P_{01}(t) = \dots$$

$$P_{01}(t) = \frac{3}{4} (e^{-t} - e^{-5t})$$

Forward and backward equations for B&D processes

Forward equation:

$$P_{ij}(t+h) = \sum_{k=0}^{\infty} P_{ik}(t) P_{kj}(h)$$

$$= P_{ij}(t) (1 - (\lambda_j + \mu_j)h + o(h))$$

$$+ P_{i,j-1}(t) (\lambda_{j-1}h + o(h)) + P_{i,j+1}(t) (\mu_{j+1}h + o(h))$$

$$+ \sum_{\substack{k=0 \\ |k-j|>1}}^{\infty} P_{ik}(t) \underset{k_j}{\cancel{o(h)}} \overbrace{o_{ij}(h)}$$

If $\Theta_{ij} = o(h)$ (requires additional technical assumptions)

$$\begin{cases} \dot{P}_{ij}(t) = \lambda_{j-1} P_{i,j-1}(t) - (\lambda_j + \mu_j) P_{ij}(t) + \mu_{j+1} P_{i,j+1}(t) \\ \dot{P}_{io}(t) = -\lambda_0 P_{io}(t) + \mu_i P_{ii}(t) \end{cases}, \quad \text{with } P_{ij}(0) = \delta_{ij}$$

Forward and backward equations for B&D processes

Similarly, we derive the backward equations

$$\begin{cases} P_{ij}'(t) = \mu_i P_{i-1,j}(t) - (\lambda_i + \mu_i) P_{ij}(t) + \lambda_i P_{i+1,j}(t) \\ P_{0j}'(t) = -\lambda_0 P_{0j}(t) + \lambda_0 P_{ij}(t) \quad , \quad \text{with} \quad P_{ij}(0) = \delta_{ij} \end{cases}$$

Example Linear growth with immigration.

Recall $\lambda_k = \lambda \cdot k + a$ immigration
linear birth rate

$$\mu_k = \mu \cdot k$$

\uparrow linear death rate

Example: Linear growth with immigration.

Use forward equations to compute $E(X_t | X_0 = i)$

$$\begin{cases} P_{ij}'(t) = \lambda_{j-1} P_{i,j-1}(t) - (\lambda_j + \mu_j) P_{ij}(t) + \mu_{j+1} P_{i,j+1}(t) \\ P_{io}'(t) = -\lambda_0 P_{io}(t) + \mu_1 P_{i1}(t) \end{cases}, \quad M'(t) = \sum_{j=0}^{\infty} j \cdot P_{ij}'(t)$$

$$E(X_t | X_0 = i) = \sum_{j=0}^{\infty} j \cdot P(X_t = j | X_0 = i) = \sum_{j=0}^{\infty} j \cdot P_{ij}(t) =: M(t)$$

$$P_{ij}'(t) = (\lambda(j-1) + \alpha) P_{i,j-1}(t) - ((\lambda + \mu)j + \alpha) P_{ij}(t) + \mu(j+1) P_{i,j+1}(t)$$

Example: Linear growth with immigration.

$$M'(t) = \dots$$

$$= \dots$$

$$= (\lambda - \mu) M(t) + a$$

$$\begin{pmatrix} & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \end{pmatrix} \begin{pmatrix} -\lambda_0 & \lambda_0 & 0 & \dots & 0 \\ \mu_1 & -(\mu_1 + \lambda_1) & \lambda_1 & & \\ & & & & \\ & & & & \\ & & & & \end{pmatrix} \begin{pmatrix} P_{00} & P_{01} & \dots \\ P_{10} & P_{11} & \dots \\ \vdots & \vdots & \ddots \end{pmatrix}$$

$$P_{0j}' = -\lambda_0 P_{0j} + \lambda_0 P_{1j}$$

$$\begin{cases} M'(t) = (\lambda - \mu) M(t) + a \\ M(0) = i \end{cases}$$

$$M(t) = i + at \quad \text{if } \lambda = \mu$$

$$M(t) = \frac{a}{\lambda - \mu} (e^{(\lambda - \mu)t} - 1) + i e^{(\lambda - \mu)t} \quad \text{if } \lambda \neq \mu$$
