

MATH180C: Introduction to Stochastic Processes II

[Lecture A00: math.ucsd.edu/~ynemish/teaching/180cA](http://math.ucsd.edu/~ynemish/teaching/180cA)

[Lecture B00: math.ucsd.edu/~ynemish/teaching/180cB](http://math.ucsd.edu/~ynemish/teaching/180cB)

Today: Brownian motion

Next: PK 8.1-8.2

Week 9:

- homework 7 (due Friday, May 27)
- HW6 regrades are active on Gradescope until May 28, 11 PM

Brownian motion. History

- Critical observation: **Robert Brown (1827)**, botanist, movement of pollen grains in water
- First (?) mathematical analysis of Brownian motion: **Louis Bachelier (1900)**, modeling stock market fluctuations
- Brownian motion in physics: **Albert Einstein (1905)** and **Marian Smoluchowski (1906)**, explained the phenomenon observed by Brown
- First rigorous construction of mathematical Brownian motion: **Norbert Wiener (1923)**

Brownian motion $\stackrel{\uparrow}{=}$ Wiener process
in mathematics

Brownian motion. Motivation

- almost all interesting classes of stochastic processes contain Brownian motion: BM is a
 - martingale
 - Markov process
 - Gaussian process
 - Lévy process (independent stationary increments)
- BM allows explicit calculations, which are impossible for more general objects
- BM can be used as a building block for other processes
- BM has many beautiful mathematical properties

Brownian motion. Definition

Def. **Brownian motion** with diffusion coefficient σ^2 is a continuous time stochastic process $(B_t)_{t \geq 0}$ satisfying

(i)

(ii)

(iii)

$\sigma^2 = 1 \leftarrow$ standard BM

BM as a continuous time continuous space Markov process

Recall: continuous time discrete space MC $(X_t)_{t \geq 0}$ is characterized by the transition probability function

$$P_{ij}(t) =$$

$(X_t)_{t \geq 0}$ has stationary transition probability functions)

In particular, $P(X_{s+t} \in A \mid X_s = i) =$

In the continuous state space case the transition probabilities are described by the transition density

(i)

$$(ii) \quad P(X_{s+t} \in A \mid X_s = x) =$$

for any $x \in \mathbb{R}, A \subset \mathbb{R}$

\uparrow density of X_{s+t} given $X_s = x$

BM as a continuous time continuous space Markov process

Proposition. Let $(B_t)_{t \geq 0}$ be a standard BM.

Then $(B_t)_{t \geq 0}$ is a Markov process with transition density

Informal explanation: Independent stationary increments imply that $(B_t)_{t \geq 0}$ is Markov with stationary transition density. Given $B_s = x$, information before time s is irrelevant.

$$P(B_{s+t} \leq u \mid B_s = x) =$$

BM as a continuous time continuous space Markov process

Let $t_1 < t_2 < \dots < t_n < \infty$, $(a_i, b_i) \subset \mathbb{R}$. Then

$$P(B_{t_1} \in (a_1, b_1), B_{t_2} \in (a_2, b_2)) =$$

=

=

=

More generally,

$$P(B_{t_1} \in (a_1, b_1), B_{t_2} \in (a_2, b_2), \dots, B_{t_n} \in (a_n, b_n)) \\ = \int_{(a_1, b_1)} \dots \int_{(a_n, b_n)} p_{t_1}(0, x_1) p_{t_2 - t_1}(x_1, x_2) \dots p_{t_n - t_{n-1}}(x_{n-1}, x_n) dx_1 \dots dx_n$$

Diffusion equation. Transition semigroup. Generator

Let $(X_t)_{t \geq 0}$ be a Markov process.

Suppose we want to know how the distribution of X_t evolves in time:

We call $(P_t)_{t \geq 0}$ the transition semigroup $[P_{s+t} f(x) = P_s(P_t f(x))]$ CK

Proposition Let $(P_t)_{t \geq 0}$ be the transition semigroup of BM.

Then (i) the "infinitesimal generator" of $P(t)$ is given by

(ii) density p_t satisfies

[K backward]

(iii) density p_t satisfies

[K forward]

↑ diffusion equation

BM as a Gaussian process

Def. Stochastic process $(X_t)_{t \geq 0}$ is called a Gaussian process

if for any $0 \leq t_1 < t_2 < \dots < t_n$

$(X_{t_1}, \dots, X_{t_n})$ is a Gaussian vector, or equivalently

for any $c_1, \dots, c_n \in \mathbb{R}$

is a Gaussian r.v.

Recall that the distribution of a Gaussian vector is uniquely defined by its mean and covariance matrix.

Similarly, each Gaussian process is uniquely described by

$$\mu(t) = E(X_t) \quad \text{and} \quad \Gamma(s, t) = \text{Cov}(X_s, X_t) \geq 0$$

↑ covariance function

BM as a Gaussian process

Proposition BM is a Gaussian process with
and

Proof. For any $0 \leq t_1 < t_2 < \dots < t_n$, $B_{t_j} - B_{t_{j-1}}$ are indep.

Gaussian, thus $\sum_{i=1}^n c_i B_{t_i} =$
is also Gaussian.

By definition

. Let $s < t$.

Then $\Gamma(s, t) =$
=
=
=

Some properties of BM

Proposition. Let $(B_t)_{t \geq 0}$ be a standard BM. Then

- (i) For any $s > 0$, the process $(B_{t+s} - B_s)_{t \geq 0}$ is a BM independent of $(B_u, 0 \leq u \leq s)$.
- (ii) The process $(B_{t+s} - B_t)_{t \geq 0}$ is a BM
- (iii) For any $c > 0$, the process $(B_{ct})_{t \geq 0}$ is a BM
- (iv) The process $(X_t)_{t \geq 0}$ defined by $X_t = B_{ct} - B_t$ for $t > 0$ is a BM.

Proof (i) Define $X_t = B_{t+s} - B_s$. Then

\Rightarrow independent Gaussian increments,

$(X_t)_{t \geq 0}$ has continuous paths \Rightarrow

(iv) X_t is Gaussian, for $s < t$

Proof of $\lim_{t \rightarrow 0} X_t = 0$ is more technical, thus omitted.
