For each of the following quantities, guess: **would it be well-modeled by a Poisson random variable**?

- The number of goals in a soccer game (e.g. in the English Premier League)

- The number of points in an American football game (e.g. in the NFL)

- The number of raindrops to hit a given square foot of sidewalk during a rain shower

- The number of customers arriving at Rubio's in the Price center during a given 20-minute period
