

## Office Hours

Tuesdays 3-4pm

AP&M 6321

Thursdays 11am-12pm

## Homework 1

Write answers on separate sheet of paper.  
Show your work.

## Book Reference

Diagnostic Tests      pages xxiv - xxvii      (beginning of book)

Appendices      pages A1 - A80      (end of book.)

Canvas online Diagnostic Test has instructions in  
Assignments section of canvas

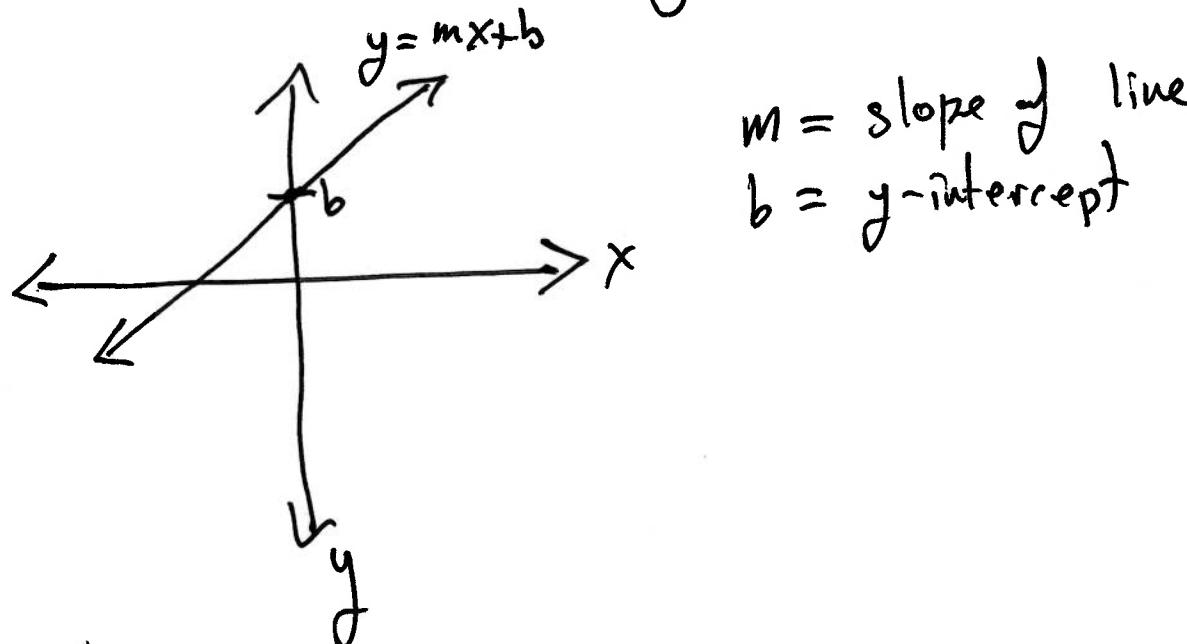

## 1.2 A Catalog of Essential Functions

### Linear Functions

$f(x) = mx + b$  where  $m$  and  $b$  are constants

$m$  = rate of increase

$b$  = starting point

$m$  = slope of line  
 $b$  =  $y$ -intercept

### Polynomials (polys)

$$P(x) = a_n x^n + a_{n-1} x^{n-1} + \dots + a_2 x^2 + a_1 x + a_0$$

where  $a_0, a_1, \dots, a_n$  are constants called the coefficients of  $P$ , and  $n$  is a nonnegative integer.

$n = \text{degree of } P$ .

Example:  $P(x) = 2x^6 - x^4 - \frac{2}{5}x^2 + \sqrt{2}$

degree of  $P$  is 6

coefficients of  $P$  are  $\sqrt{2}, 0, -\frac{2}{5}, 0, -1, 0, 2$

A poly of degree 1 is a linear function

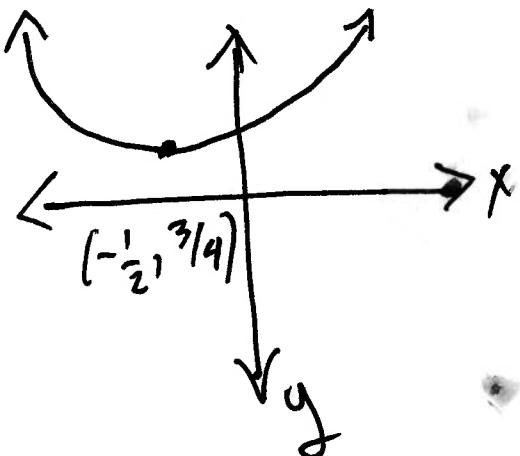

$$P(x) = mx + b, \quad m, b \text{ constants}$$

A poly of degree 2 is called a quadratic function.

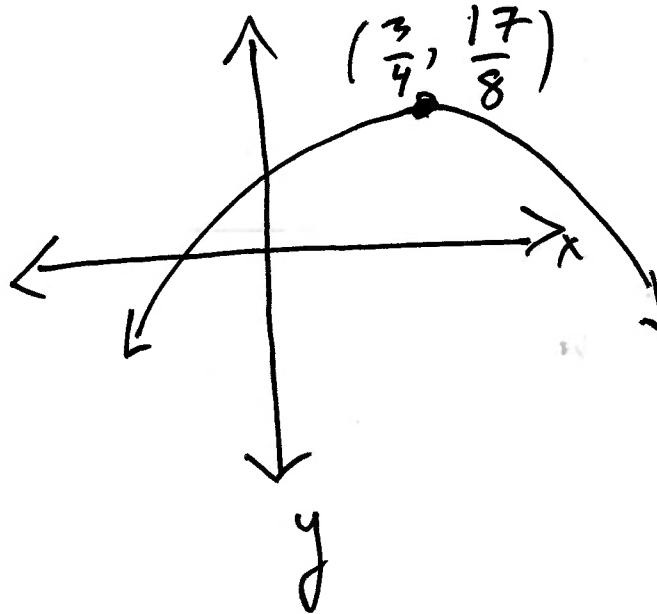

$$P(x) = ax^2 + bx + c, \quad a, b, c \text{ constants}$$

The graph of a quadratic function is a parabola.

Examples

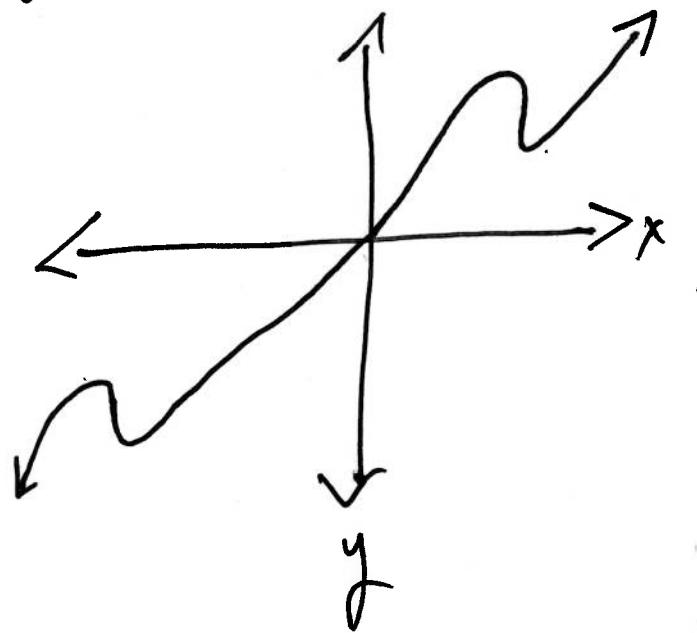

$$y = x^2 + x + 1$$

$$y = -2x^2 + 3x + 1$$

The graphs of higher degree polynomials can be complicated.

Ex

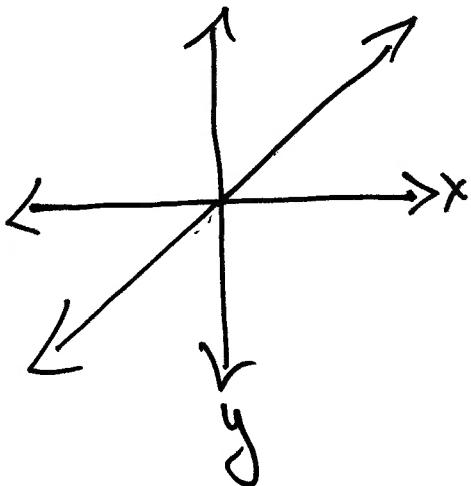

$$y = 3x^5 - 25x^3 + 60x$$

## Power Functions

$f(x) = x^a$  where  $a$  is a constant

Type 1  $a = n$  where  $n$  is a positive integer  $n = 1, 2, 3, \dots$

$$n=1, y=x$$

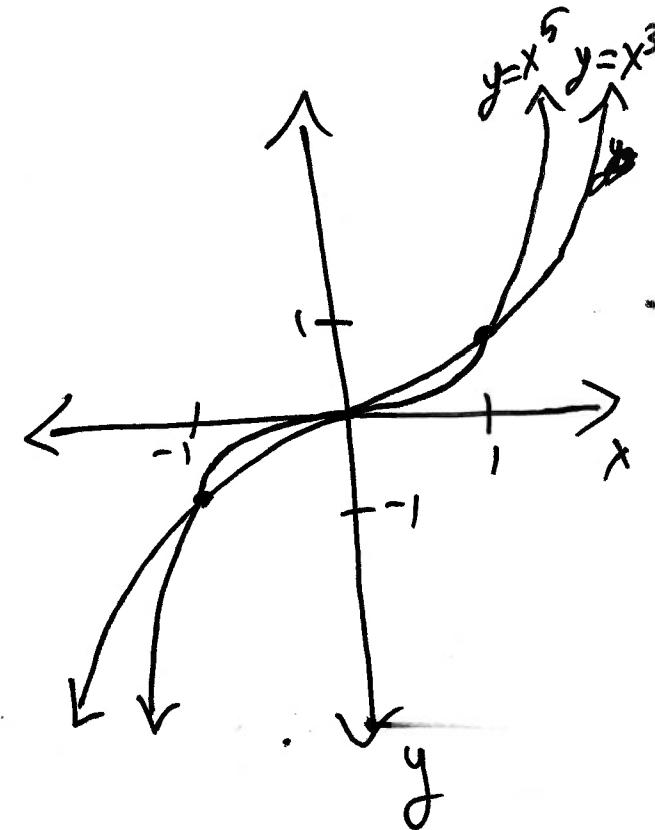

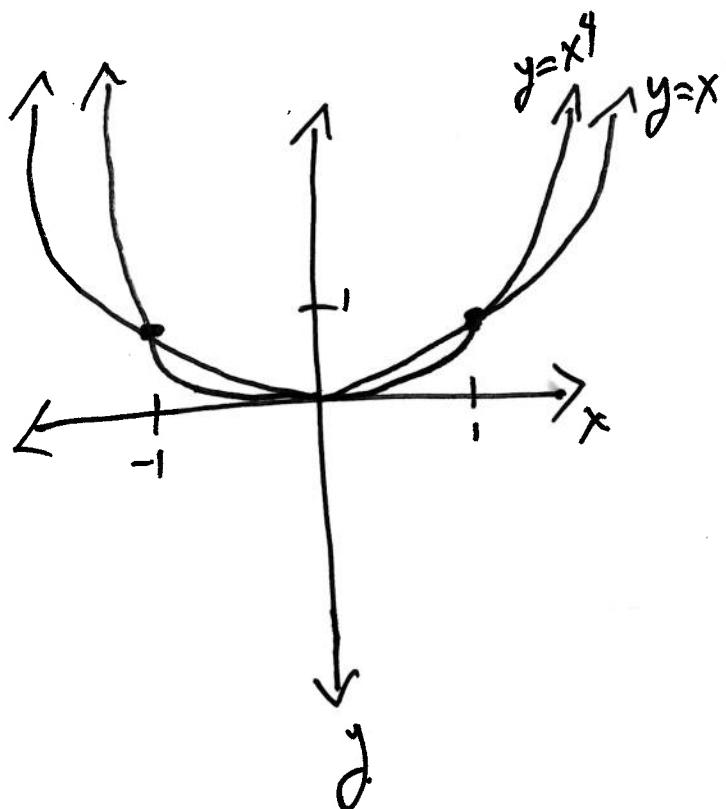

~~$x < 0 \text{ and } y > 0$~~

$$n=2, f(x) = x^2$$

$$n=4, f(x) = x^4$$

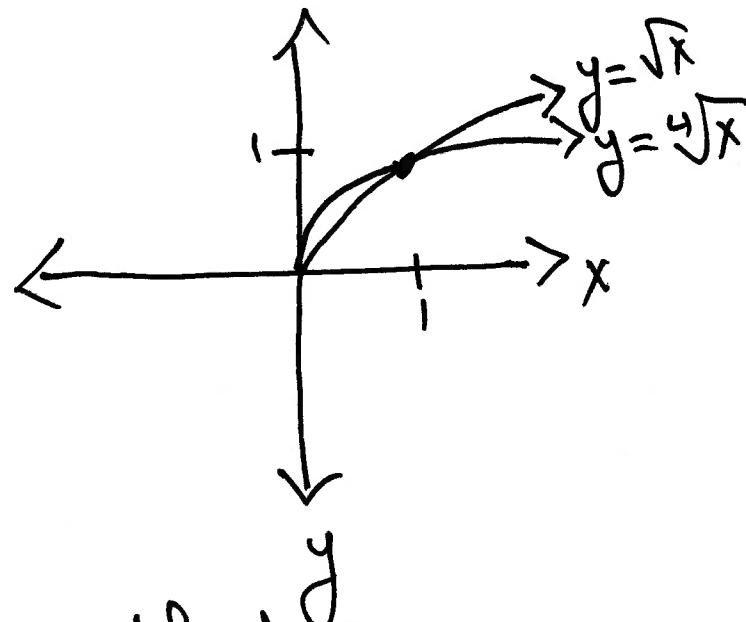

$$n=3, f(x) = x^3$$

$$n=5, f(x) = x^5$$

Type 2  $a = \sqrt[n]{x}$  where  $n$  is a positive integer  $\geq 2$

$$n=2 \quad f(x) = x^{\frac{1}{2}} = \sqrt{x}$$

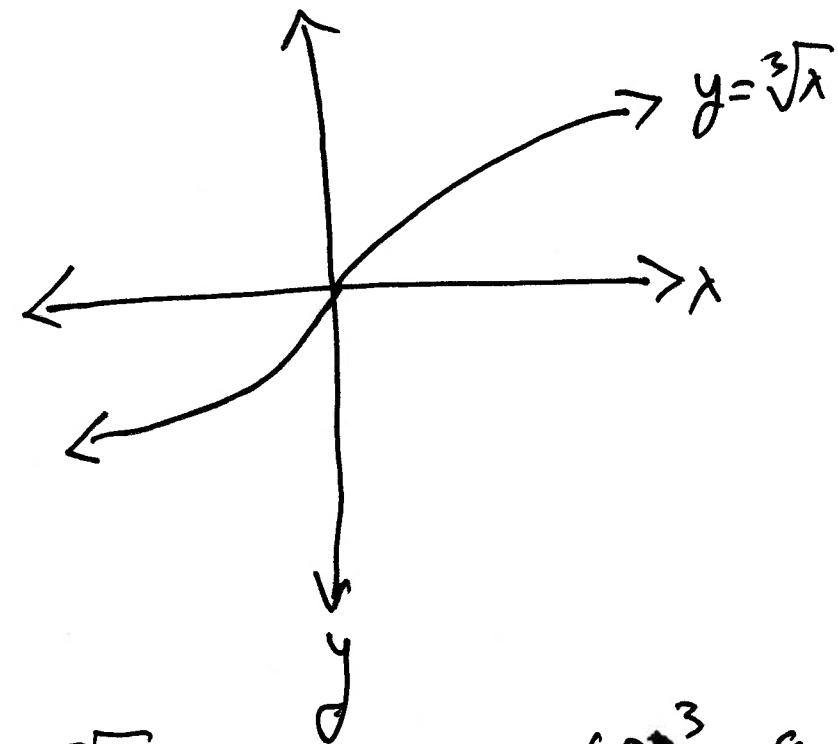

undefined for  $x < 0$

$f(-4) = \sqrt{-4}$  does not make sense

~~not defined.~~

$$n=4, \quad f(x) = x^{\frac{1}{4}}$$

$$n=3 \quad f(x) = x^{\frac{1}{3}} = \sqrt[3]{x}$$

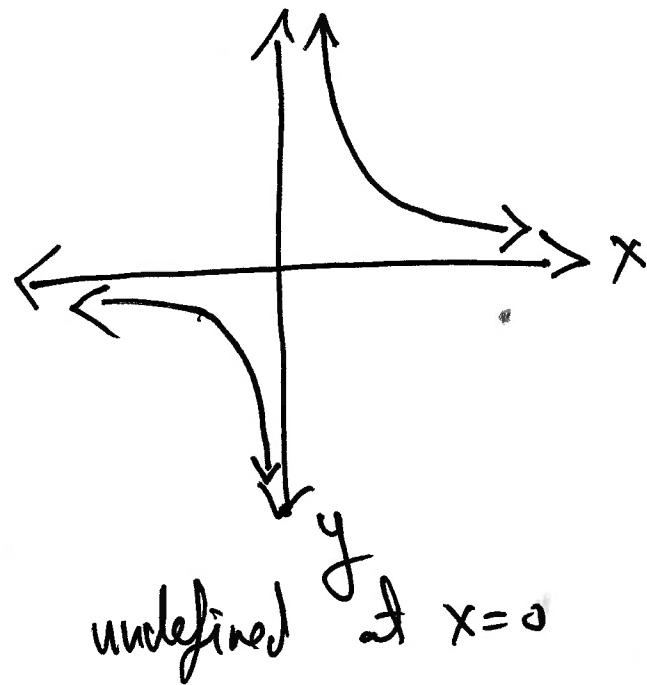

$$f(-8) = \sqrt[3]{-8} = -2 \quad \text{because } (-2)^3 = -8$$

$$n=5 \quad f(x) = x^{\frac{1}{5}}$$

Type 3  $a = -1$ ,  $f(x) = x^{-1} = \frac{1}{x}$

$$f\left(\frac{1}{1000}\right) = \frac{1}{\frac{1}{1000}} = 1000 \cdot \frac{1000}{1} = 1000$$

$$f(1000) = \frac{1}{1000}$$

$$f\left(-\frac{1}{1000}\right) = \frac{1}{-\frac{1}{1000}} = \frac{1}{1} \cdot -\frac{1000}{1} = -1000$$

$$f(-1000) = \frac{1}{-1000} = -\frac{1}{1000}$$

$f(x) = \frac{1}{x}$  has vertical asymptote  $y$ -axis (line  $x=0$ )  
has horizontal asymptote  $x$ -axis (line  $y=0$ )

### Rational Functions

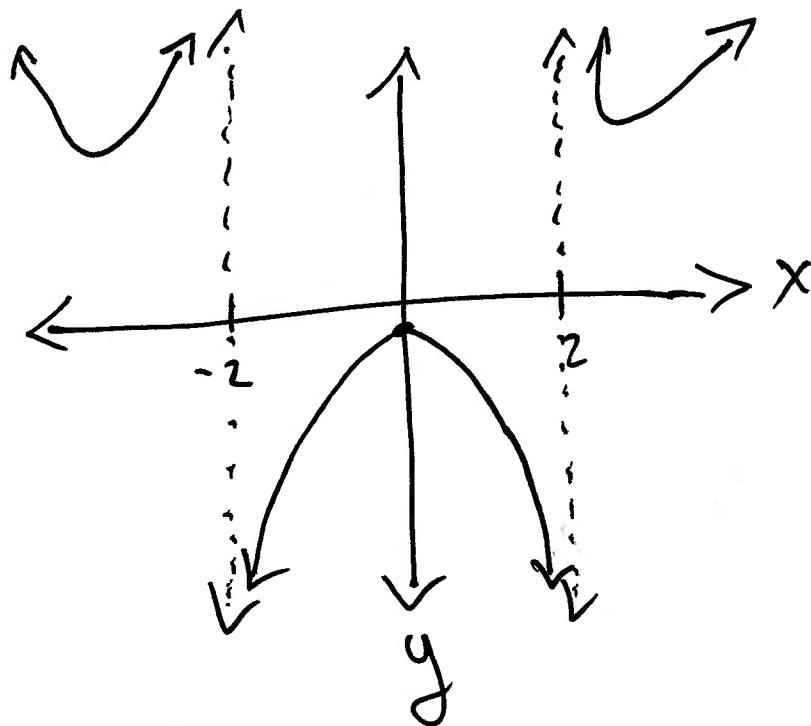

A rational function is a ratio of two polys  $f(x) = \frac{P(x)}{Q(x)}$   
where  $P$  and  $Q$  are polys.

Example  $f(x) = \frac{2x^4 - x^2 + 1}{x^2 - 4}$

denominator  $x^2 - 4 = (x-2)(x+2)$

$$0 = (x-2)(x+2)$$

$$x = 2 \text{ or } -2.$$

Graphing rational functions is complicated...

Algebraic Functions — anything you can write down using

Exponential Functions — section 1.5

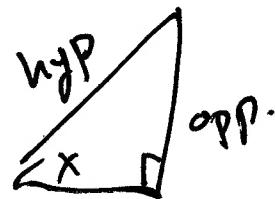

Logarithm Functions — section 1.6

+, -, ×, division and  
taking roots

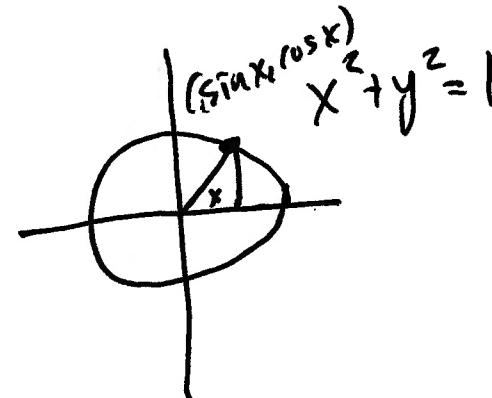

ex  $f(x) = \frac{\sqrt{x^2 + 1}}{x^4 + x^2 + 1} + x^{3/7}$

# Trig Functions

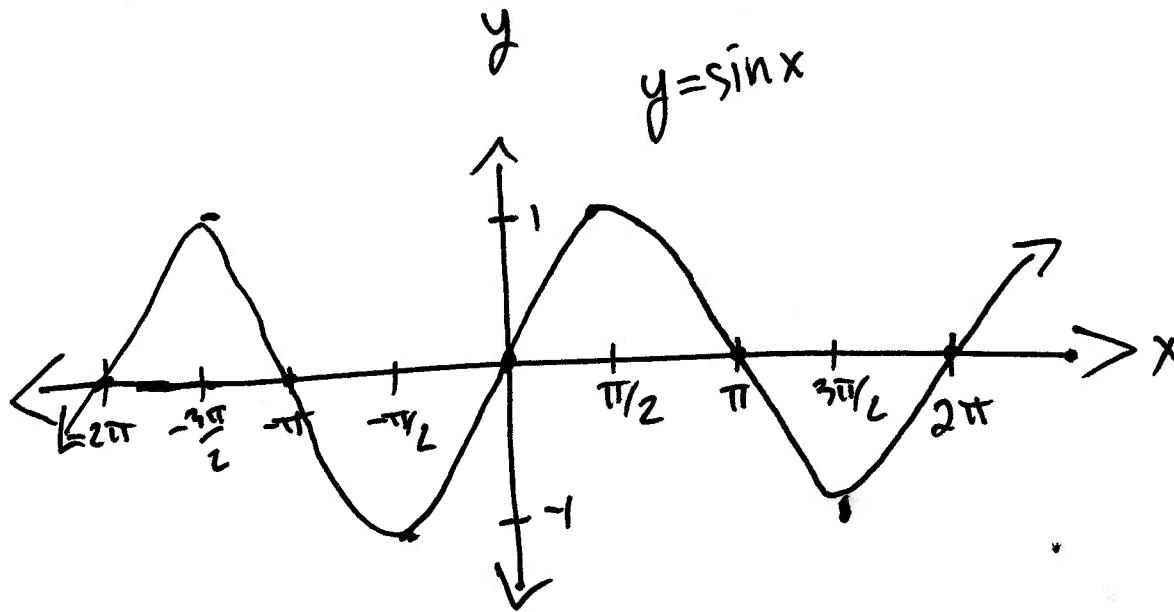

$$f(x) = \sin(x), \quad f(x) = \cos(x), \quad f(x) = \tan(x)$$

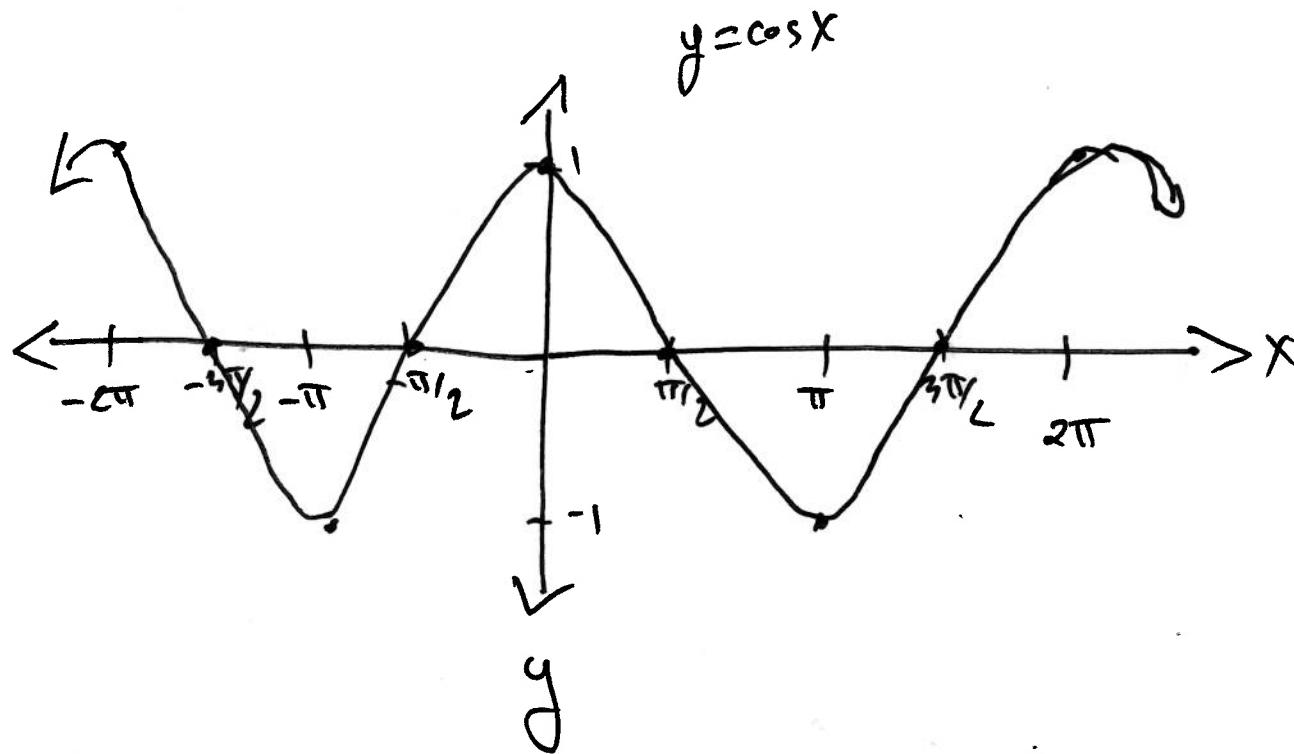

$$\sin(x) = \frac{\text{opp.}}{\text{hyp}}$$
