

## Math 103A W23 HW 2

### 7. Suggested answer:

#### 1.5 Question 7

**Proposition** The set  $\mathbb{S} = \mathbb{R} \setminus \{-1\}$  combined with the operation  $a \circ b = a + b + ab$  makes an abelian group.

*Proof.* In order to prove that this set makes an abelian group, we must prove 5 things: closedness, associativity, identity, inverse, and commutativity.

**Closedness** In order to prove that the operation described is a mapping onto itself, we must prove that no  $(a, b)$  where  $a$  and  $b$  are real map onto  $-1$ . This is logically equivalent to saying that, if  $a \circ b = -1$ , and  $a$  and  $b$  are real and  $a$  is not  $-1$ ,  $b$  must be  $-1$  (and vice versa, however  $a$  and  $b$  are symmetric).

We can use algebra to manipulate the expression  $-1 = a + b + ab$

$$-1 = a + b(1 + a)$$

$$-1 - a = b(1 + a)$$

$$\frac{-1-a}{1+a} = b$$

$$(-1) \frac{1+a}{1+a} = b = -1$$

This proves that no two numbers  $(a, b)$  inside the set  $S$  result in the output  $-1$ , and since the products and sums of real numbers must be real, we can conclude that  $\circ$  is a closed operation under  $\mathbb{S}$ .

**Associativity** We can prove associativity by stating that, as  $a + b + ab + c + c(a + b + ab) = a + (b + c + bc) + a(b + c + bc)$ ,  $a \circ (b \circ c)$  is by definition equal to  $(a \circ b) \circ c$ .

**Identity** We can prove that  $0$  is the identity by proving that, by definition,  $a \circ 0 = a + 0 + 0a = a$ , and similarly  $0 \circ a = 0 + a + 0a = a$ .

**Inverse** We can prove that every element in  $\mathbb{S}$  has an inverse by writing out the equation  $a \circ a^{-1} = a + a^{-1} + aa^{-1} = 0$

$$a^{-1}(1 + a) + a = 0$$

$$a^{-1} = \frac{-a}{1+a}$$

This proves  $a^{-1}$  exists, and because  $a = 1 + a$  has no solutions, we know that all  $a$  in  $\mathbb{S}$  has an  $a^{-1}$  that is also within  $\mathbb{S}$ .

Lastly, we can prove commutativity by stating that, as  $b + a + ba = a + b + ab$ ,  $b \circ a$  is by definition equal to  $a \circ b$ .

This proves all the axioms required to conclude that the group given is both a group and an abelian group. □

#### Comments:

The solution clearly states the elements needed to prove the proposition: closedness(closure), associativity, identity, inverse and commutativity.

#### Common Mistakes:

Most students correctly calculated the inverse but neglected to show that the inverse resides in the group. For this question, we need to show that  $\frac{-a}{1+a}$  can't equal  $-1$ .

16. **Suggested answer:**

16.

**Proposition.** *There exists a group  $G$  and elements  $g, h \in G$  such that  $(gh)^n \neq g^n h^n$ .*

*Proof.* Let  $G$  be the symmetry group of an equilateral triangle,  $D_3$ . Let  $g = \begin{pmatrix} A & B & C \\ B & C & A \end{pmatrix}$  and  $h = \begin{pmatrix} A & B & C \\ A & C & B \end{pmatrix}$ . Then  $g \circ h = \begin{pmatrix} A & B & C \\ B & A & C \end{pmatrix}$  so  $(g \circ h)^2 = \begin{pmatrix} A & B & C \\ A & B & C \end{pmatrix}$ . We also have  $g^2 = \begin{pmatrix} A & B & C \\ C & B & A \end{pmatrix}$  and  $h^2 = \begin{pmatrix} A & B & C \\ A & B & C \end{pmatrix}$  so  $g^2 \circ h^2 = \begin{pmatrix} A & B & C \\ C & B & A \end{pmatrix}$ . Thus,  $(g \circ h)^2 \neq g^2 \circ h^2$ .  $\square$

**Comments:**

A very straightforward answer/example.

39. Suggested answer:

29) Proposition: Let  $\mathbb{T} = \{z \in \mathbb{C}^* \mid |z|=1\}$ .  $\mathbb{T}$  is a group.

Proof: Let  $x, y, z \in \mathbb{T}$  such that  $x = a_1 + b_1 i$ ,  $y = a_2 + b_2 i$ ,  $z = a_3 + b_3 i$ .

① associativity  
 $(xy)z = [(a_1 + b_1 i)(a_2 + b_2 i)](a_3 + b_3 i)$   
 $= (a_1 a_2 + a_1 b_2 i + a_2 b_1 i - b_1 b_2)(a_3 + b_3 i)$   
 $= (a_1 a_2 - b_1 b_2 + (a_1 b_2 + a_2 b_1)i)(a_3 + b_3 i)$   
 $= a_1 a_2 a_3 - a_1 b_1 b_2 + (a_1 a_2 b_3 + a_2 a_3 b_1 + (a_1 a_2 b_3 - b_1 b_2 b_3)i - a_1 b_2 b_3 - a_2 b_1 b_3)$   
 $= (a_1 a_2 a_3 - a_1 b_2 b_3 - a_2 b_1 b_3 - a_3 b_1 b_2) + (a_1 a_2 b_3 + a_2 a_3 b_1 + a_2 a_3 b_1 - b_1 b_2 b_3)i$

$x(yz) = (a_1 + b_1 i)[(a_2 + b_2 i)(a_3 + b_3 i)]$   
 $= (a_1 + b_1 i)(a_2 a_3 + a_2 b_3 i + a_3 b_2 i - b_2 b_3)$   
 $= (a_1 + b_1 i)(a_2 a_3 - b_2 b_3 + (a_2 b_3 + a_3 b_2)i)$   
 $= a_1 a_2 a_3 - a_1 b_2 b_3 + (a_1 a_2 b_3 + a_1 a_3 b_2)i + (a_2 a_3 b_1 - b_1 b_2 b_3)i - a_2 b_1 b_3 - a_3 b_1 b_2$   
 $= (a_1 a_2 a_3 - a_1 b_2 b_3 - a_2 b_1 b_3 - a_3 b_1 b_2) + (a_1 a_2 b_3 + a_1 a_3 b_2 + a_2 a_3 b_1 - b_1 b_2 b_3)i$

$\therefore (xy)z = x(yz)$

② identity  
 The identity element is  $e = a_0 + b_0 i$  when  $a_0 = 1$  and  $b_0 = 0$ , i.e.  $e = 1$ .  
 $e \cdot x = 1(a_1 + b_1 i) = a_1 + b_1 i = x$   
 $x \cdot e = (a_1 + b_1 i) \cdot 1 = a_1 + b_1 i = x$   
 Also,  $e \in \mathbb{T}$  since  $|e| = |1| = 1$ .

③ inverse  
 The inverse for any  $x \in \mathbb{T}$  such that  $x = a_1 + b_1 i$  is  $\frac{1}{x} = \frac{1}{a_1 + b_1 i}$ . Since  $|x|=1$ , then  $|\frac{1}{x}| = \frac{1}{|x|} = 1$ . Also,  $a_1 + b_1 i \neq 0$  since  $x \in \mathbb{C}^*$ . Thus,  $\frac{1}{x} \in \mathbb{T}$   
 $x \cdot x^{-1} = x \cdot \frac{1}{x} = (a_1 + b_1 i) \cdot \frac{1}{a_1 + b_1 i} = \frac{a_1 + b_1 i}{a_1 + b_1 i} = 1 = e$   
 $x^{-1} \cdot x = \frac{1}{x} \cdot x = \frac{1}{a_1 + b_1 i} \cdot (a_1 + b_1 i) = \frac{a_1 + b_1 i}{a_1 + b_1 i} = 1 = e$

④ closure  
 For  $x \in \mathbb{T}$ ,  $y \in \mathbb{T}$ , we can take the product  $xy$ :  
 $xy = (a_1 + b_1 i)(a_2 + b_2 i)$   
 $= a_1 a_2 + (a_1 b_2 + a_2 b_1)i - b_1 b_2$   
 $= (a_1 a_2 - b_1 b_2) + (a_1 b_2 + a_2 b_1)i$

Since  $x, y \in \mathbb{T}$ ,  
 $|a_1 + b_1 i| = a_1^2 + b_1^2 = 1$   
 $|a_2 + b_2 i| = a_2^2 + b_2^2 = 1$

for  $xy$ ,  
 $|(a_1 + b_1 i)(a_2 + b_2 i)| = |a_1 + b_1 i| \cdot |a_2 + b_2 i|$   
 $= 1 \cdot 1 = 1$  thus,  $xy \in \mathbb{T}$   $\therefore \mathbb{T}$  is a group ■

**Comments:**

Again, the elements of the proof are very clear: associativity, identity, inverse and closure.

**Common Mistakes:**

1. Similar to the common mistake in Q7, we need to show that the identity/inverse we found resides within the group. For this question, we need to show that the identity 1 has  $|1| = 1$ , and the inverse  $\frac{1}{x}$  has  $|\frac{1}{x}| = 1$ .
2. Notice that you can utilize the properties of modulus of complex number to simplify your proof for closure and inverse.
